A. Identify field installed wiring and components and provide warning signs as specified in Division 26, Section “Electrical Identification.”

B. Provide nameplates on each compartment.

3.3 GROUNDING

A. Tighten connections to comply with tightening torques specified in UL Standards 486A and 486B.

B. Ground equipment to main electrical ground bus indicated. Provide maximum 5 ohm ground resistance at switchboard location.

3.4 FIELD QUALITY CONTROL

A. Visual and Mechanical Inspections: Include the following inspections and related work:
   1. Inspect for defects and physical damage, testing laboratory, labels, and nameplate compliance with up to date circuit connections.
   2. Verify that current transformers meet specified requirements.
   3. Perform operational test and exercise of mechanical components and other operable devices in accordance with manufacturer's instruction manual.
   4. Check switchboard anchorage, area clearances, and alignment and fit of components.
   5. Check tightness of bolted electrical connections with calibrated torque wrench. Refer to manufacturer's instructions for proper torque values.
   6. Clean switchboard interior and exterior using manufacturer's approved methods and materials.
   7. Perform visual and mechanical inspection and related work for OCPDs as specified in Division 26, Section “Overcurrent Protective Devices”.

3.5 CLEANING

A. Upon completion of installation, inspect interior and exterior of switchboards. Remove paint splatters and other spots, dirt, and debris. Touch up scratches and mars of finish to match original finish.

3.6 PROTECTION

A. Apply temporary heat in accordance with manufacturer's recommendation within each section of switchboards throughout periods during which the switchboard is not in a space that is continuously under normal control of temperature and humidity.

3.7 DEMONSTRATION

A. Arrange and pay for the services of factory authorized service representatives to demonstrate switchboards and train Owner's maintenance personnel.

B. Conduct a minimum of one half day of training in operation and maintenance as specified under "Instructions to Owner Employees" in Division 01. Include both classroom training and hands on equipment operation and maintenance procedures.

C. Schedule training with at least 7 days' advance notification.

END OF SECTION 26 2413

SECTION 26 2416

PANELBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. The Contractor shall provide the labor, tools, equipment, and materials necessary to install panelboards and enclosures in accordance with the plans and as specified herein.

B. Types of panelboards and enclosures required for the project include the following:
   1. Panelboards.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work associated with panelboards in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
   1. Electrical Code Compliance: Comply with applicable local code requirements of the authority having jurisdiction and National Electrical Code (NEC) Article 384 as applicable to installation, and construction of electrical panelboards and enclosures.
   2. Underwriters' Laboratories, Inc. (UL) Compliance: Comply with applicable requirements of UL 67, "Electric Panelboards," and UL Numbers 50, 869, 486A, 486B, and 1053 pertaining to panelboards, accessories and enclosures. Provide panelboard units which are UL-listed and -labeled.
   3. Special Use Markings: Provide panelboards, constructed for special use, with appropriate UL markings which indicate that they are suitable for special type of use/application.
   4. National Electrical Manufacturers Association (NEMA) Compliance: Comply with NEMA Standards Pub/No. 250, "Enclosures for Electrical Equipment (1,000 Volts Maximum)," Pub/No. PB 1, "Panelboards," and Pub/No. PB 1.1, "Instructions for Safe Installation, Operation and Maintenance of Panelboards Rated 600 Volts or Less."

1.4 SUBMITTALS

A. Submit manufacturer's data on panelboards, components, and enclosures.

B. Submit shop drawings from manufacturers of panelboards including dimensioned plans, sections, and elevations. Show tabulations of installed devices, major features, and voltage rating. Include the following:
   1. Enclosure type with details for types other than NEMA Type 1.
   2. Bus configuration and current ratings.
   3. Short circuit current rating of panelboard.

4. Features, characteristics, ratings, and factory settings of individual protective devices and auxiliary components.

C. Reference Submittals
1. Manufacturer's descriptive literature.
2. Operating and maintenance instructions.
3. Spare parts list.

1.5 DELIVERY, HANDLING, AND STORAGE

A. Deliver panelboards and components properly packaged in factory-fabricated-type containers.

B. Handle panelboards and components carefully to avoid breakages, impacts, denting, and scoring finished. Do not install damaged equipment; replace and return damaged units to equipment manufacturer.

C. Store panelboards and components in original packaging and in a clean, dry space; protect from weather and construction traffic.

1.6 SEQUENCING AND SCHEDULING

A. Coordinate installation of panelboards and enclosures with installation of wires/cables, electrical boxes and fittings, and raceway work.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General
1. Comply with manufacturer's standard materials, design and construction in accordance with published product information.
2. All panelboards shall be from the same manufacturer.

B. Panelboards
1. Dead-front safety type.
2. Fully rated (series rating is not acceptable).
3. Minimum RMS symmetrical short circuit current rating.
a. 10,000 Amperes at 120/240V.
b. 18,000 amperes at 277V.
c. 35,000 amperes at 480V.
4. Voltage rating, phase as shown.
5. Anti-burn solder-less pressure type lugs approved for use with copper conductors.
6. Copper bus bars, full-sized copper neutral bar.
7. Two hundred percent rated solid neutral bus bar where shown.
8. Factory installed copper grounding bars.
9. Provide suitable lugs on neutral bus for each outgoing feeder required.

C. Enclosure
1. Galvanized sheet steel cabinet-type enclosure.
2. NEMA 1 or 12 rated as shown.
3. Fabricated by same manufacturer as panelboard.

4. Multiple knockouts and wiring gutters.
5. Cover with adjustable trim clamps, and doors with flush locks and keys
6. All panelboard enclosures keyed alike; 2 keys with each lock.
7. Concealed piano door hinges.
8. Interior circuit directory frame and card with clear plastic covering.
9. Baked gray enamel finish over a rust inhibitor coating.

D. Molded Case Circuit Breakers
1. As specified is Division 26, Section “Overcurrent Protective Devices.”
2. Quantities, ratings, types and arrangements as shown on the schedules.
3. Main breakers where provided mounted vertically and above the branch circuit breakers.
4. Provide circuit breakers as specified in Division 26, Section “Overcurrent Protective Devices”. Panelboards shall have main circuit breaker or main lugs, and branch circuit breakers as shown on the schedules.
5. Provide circuit breaker handle locks for all circuit breakers that supply exit and emergency lighting, fire alarm equipment, and where indicated on plan or schedule.

E. Accessories
1. Ground fault protection units where shown.
2. Surge Protective Devices in all panelboards as specified in Division 26, Section “Surge Protective Devices”.
3. Breaker Handle Locking Clips
   a. All branch breakers that supply exit and emergency lighting
   b. All branch breakers that supply fire alarm and security equipment.
   c. Where shown.

F. Provide equipment identification nameplates complying with Division 26, Section “Electrical Identification”.

2.2 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide panelboard products of one of the following (for each type and rating of panelboard and enclosure):
1. Eaton Corporation.
2. General Electric Company.
3. Square D Company.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install panelboards and enclosures as indicated, in accordance with manufacturer's written instructions, applicable requirements of NEC standards and National Electrical Contractors Association's (NECA) "Standards of Installation," and in compliance with recognized industry practices to ensure that products fulfill requirements.

B. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque-tightening values for equipment connectors. Where manufacturer's torque requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Standards 486A and 486B.

C. Fasten surface-mounted enclosures firmly to walls with 1/4-inch space between wall and panelboard, ensuring that they are permanently and mechanically anchored.

D. Provide properly wired electrical connections for panelboards within enclosures.

E. Fill out the circuit directory card for each panelboard.
   1. Type the directory, do not hand write.
   2. Do not fill in the directory until after balancing the loads.

3.2 EXAMINATION

A. Examine areas and conditions under which panelboards and enclosures are to be installed, and notify Engineer in writing of conditions detrimental to proper completion of work. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer.

3.3 GROUNDING

A. Provide equipment grounding connections for panelboard enclosures as indicated. Tighten connections to comply with tightening torques specified in UL 486A to ensure permanent and effective grounds. All panelboards shall be properly grounded. Special requirements shall be as indicated on plans.

3.4 FIELD QUALITY CONTROL

A. Prior to energizing electrical circuitry, check all accessible connections to manufacturer's tightening torque specifications.

B. Prior to energizing of panelboards, check with ground resistance tester phase-to-phase and phase-to-ground insulation resistance levels to ensure requirements are fulfilled.

C. Prior to energizing, check panelboards for electrical continuity of circuits, and for short circuits.

D. Measure steady state load currents at each panelboard feeder and rearrange circuits in the panelboard to balance the phase loads within 10% of each other. Maintain proper phasing for multi-wire branch circuits.

3.5 ADJUSTING AND CLEANING

A. Adjust operating mechanisms for free mechanical movement.

B. Touch up scratched or marred surfaces to match original finishes.

3.6 DEMONSTRATION

A. Subsequent to wire and cable hook-ups, energize panelboards and demonstrate functioning in accordance with requirements. Where necessary, correct malfunctioning units, and then retest to demonstrate compliance.

END OF SECTION 26 2416

SECTION 26 2419

MOTOR CONTROL CENTERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to furnish and install MCCs in accordance with the plans and as specified herein.
   1. This section includes MCCs for use on alternating current (AC) circuits rated 600 volts (V) or less. Extent of MCC work is indicated by drawings and schedules.
   2. Types of MCC components specified in this section include the following:
      a. MCC supporting structures.
      b. Bus systems.
      c. Unit compartments.
      d. Motor controller units.
      e. Feeder units.
      f. Overload protection.
      g. Overcurrent protection.
      h. Control components.

B. Related Documents
   1. Drawings and general provisions of the Contract.
   2. General and Supplementary Conditions.
   3. All Division 1 specification sections.
   4. Division 26 Section “Electrical Identification”.
   5. Division 26 Section “Control Devices”.
   6. Division 26 Section “Overcurrent Protective Devices”.
   7. Division 26 Section “Motor Controllers”.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work to furnish and install in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
   1. Unless otherwise stated, references are to the latest edition of the standard.
      a. Underwriter's Laboratory (UL)
         1) 845, “Motor Control Centers.”
         2) 486A/486B, “Wire Connectors and Soldering Lugs for Use With Copper Conductors.”
      b. National Electrical Manufacturers Association (NEMA)
         1) 250, “Enclosures for Electrical Equipment (1000 Volts Maximum).”
         2) ICS 2, “Standards for Industrial Control Devices, Controllers and Assemblies.”

3) ICS 2.3, “Instructions for Handling, Installation, Operation, and Maintenance of Motor Control Centers.”
4) ICS 18, “Industrial Control and Systems: Motor Control Systems.”

c. National Fire Protection Association (NFPA)
1) NFPA70 – The National Electrical Code.

B. Manufacturer's Field Representative
1. The Manufacturer of the Work of this Section shall provide a qualified field representative at the site.
2. Such Manufacturer's field representative shall instruct the Contractor's personnel in the proper handling, installation, start-up, operation, and maintenance of the equipment.
3. Such Manufacturer's field representative shall instruct the Owner's personnel in the proper start-up, operation, and maintenance of the equipment.

C. Testing: Manufacturer's standard factory tests shall be performed.

1.4 DEFINITIONS

A. Abbreviations
1. AHJ. Authority having jurisdiction.
2. FVNR. Full voltage non-reversing.
3. MCC. Motor control center.
4. NRTL. Nationally recognized testing laboratory.
5. SCADA. Supervisory control and data acquisition.
6. SPD. Surge protective device.

B. Seismic Withstand: When subjected to the specified seismic forces, seismic withstand means:
1. The unit will remain in place.
2. No parts will separate from the unit.
3. The unit will be fully operational after the seismic event.

1.5 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and material specifications as required.

B. Reference Submittals
1. Installer's certification.
2. Manufacturer's certification.
3. Manufacturer's descriptive literature.
4. Certified production test reports.
5. Operating and maintenance instructions.

C. Submit the following in accordance with Conditions of Contract and Division 01 specification sections:
1. Product Data: Submit manufacturer's technical product data on MCC. Application data to include, but not limited to, the following:
a. Voltage.
b. Phase.
c. Frequency.
d. Horizontal bus capacity.

e. Vertical bus capacity.
f. Short circuit ratings.
g. Main and branch circuit breakers ratings.
h. Types of motor controllers.
i. Types of wiring (NEMA type wiring).
j. Enclosures.
k. Sections.
l. Motor size and overload heaters.

2. Shop Drawings: Submit layout drawings of MCCs showing accurate scaled basic equipment sections including, but not limited to, motor controllers, device panels, and circuit breakers. Show spatial relationships of MCC components to proximate electrical equipment. Submit unit wiring diagrams and elementary control diagrams. Clearly differentiate on wiring diagrams those conductors which are factory installed and those which are field installed.
   a. Front view elevation.
   b. Floor plan.
   c. Single line.
   d. Unit wiring diagrams depicting remote devices.
   e. Nameplate schedule.
   f. Starter and component schedule.
   g. Conduit entry/exit locations.
3. Maintenance Data: Submit maintenance data and parts list for each MCC; including "troubleshooting" maintenance guide. Include that data, product data, and shop drawings in a maintenance manual.
4. Overload Relay Heater List: Submit for approval overload relay heater sizes for each new motor starter furnished or existing motor starter modified. Motor overload relay heater size shall be based on actual motor nameplate data (shop drawing is not acceptable) and power factor correction size; where applicable. Submit for approval motor overload relay heater sizing criteria, manufacturer, support calculations, motor nameplate data, capacitor nameplate data, and manufacturer tables used.
5. Submit agenda of training class.

D. A Renewal Parts List shall be submitted by the Manufacturer and Contractor showing the important maintenance items which will need to be available for proper maintenance and to provide normal equipment life.

E. Contract Closeout Submittals
1. Project record documents.
2. Operation and maintenance (O&M) data
   a. Submit O&M manual prior to delivery of the products.
   b. Include instructions on start-up, operation, and maintenance.
   c. Include a complete parts list and a recommended spare parts list.

1.6 QUALITY ASSURANCE

A. Regulatory requirements: Perform all work in compliance with the following:
1. All applicable federal, state, and local codes and regulatory requirements.
2. National Electrical Code (NEC).

B. Testing Agency Qualifications
1. Member of NETA.

2. Acceptable to authorities having jurisdiction.
3. Field Supervisor currently certified by the NETA.

C. Product Selection for Restricted Space
1. Drawings indicate maximum dimensions for MCCs.
2. Comply with indicated maximum dimensions.

1.7 DELIVERY, HANDLING, AND STORAGE

A. General: Comply with Division 1 Product Requirements Sections.

B. Packing and shipping
1. Package equipment as required to prevent damage during shipment.
2. Cover each shipping section with plastic wrapping for moisture protection.
3. Mount on pallets or skids to facilitate handling.
4. Inspect for damage and completeness upon receipt
5. Limit shipping splits to a maximum of 5’-0”.

C. Handling.
1. Conform to the requirements of NEMA ICS 2.3.
2. Use factory installed lifting provisions.

D. Storage and protection
1. Store the products until they can be installed.
2. Meet the storage requirements of the manufacturer.
3. Store so condensation will not occur on or in MCCs. Provide temporary heaters as required to prevent condensation. If the motor control center cannot be placed into service reasonably soon after its receipt, it should be stored in a clean, dry and ventilated building free from temperature extremes. Acceptable storage temperatures are from 0°C (32°F) to 40°C (104°F).

1.8 SEQUENCING AND SCHEDULING

A. Sequence and coordinate equipment installations for efficient flow of the work.

B. Place equipment in service as required to maintain the facility in operation and to allow further construction to proceed.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Motor Control Centers
1. General
a. Provide MCCs and ancillary components of sizes, rating classes, types, and characteristics, indicated; which comply with manufacturer's standard design, materials, components, and construction in accordance with published product information, and as required for complete installation and as specified herein. See the plans for required components.
b. Conduit entrance shall be via a grounding, threaded fitting.

2. Provide MCCs consisting of one or more vertical sections, each with groupings of unit compartments containing motor controllers, feeder, and auxiliary devices as indicated.
3. Design MCC for connection to available faults of not less than 42,000 RMS symmetrical amperes or as shown on plans. Provide MCC with NEMA Class 2, Type B wiring. All wiring shall be identified by permanent plastic heat shrink label at each termination.
4. Provide factory assembled, deadfront, MCC standard supporting structures of Classes and Types indicated; with enclosed vertical sections, as indicated, fastened together to form rigid free standing assembly.
    a. Construct each section 90 inches high with minimum 6 inch horizontal wireways at top and bottom, 20 inches wide, and a minimum of 20 inch section depth except back to back structures shall be 25 inches in depth.
    b. Top horizontal wireway shall be isolated from horizontal bus.
    c. Provide NEMA Type 1 gasketed enclosure.
    d. Construct units with vertical wireway in each vertical structure on right side of unit, accessible through hinged doors, and with supports at proper intervals within for fastening wires/cables. Form supporting members of not less than 13 gauge hot rolled steel.
    e. Construct structure doors with removable pin hinges and secure with quarter turn indicating type fasteners.
    f. Provide removable lifting angle full length of MCC. Design lifting angle to support entire weight of MCC section. Design bottom channels to be removable, provide holes for bolting MCC units to floor.
    g. Provide shipping splits in MCC lineup to allow for shipment of maximum 60 inch long units. Design MCCs so matching vertical sections of same current rating and manufacturer can be added later at either end of lineup without use of transition sections. Provide removable end and top plates to close off openings.
5. Construct bus bars of tin plated copper, braced to withstand faults of 42,000 RMS symmetrical amperes minimum or as indicated on plans. Provide main horizontal bus with rating of 600 amperes, and vertical bus rating of 300 amperes unless otherwise noted. Construct vertical bus bar barriers with automatic shutters to cover bus stab openings when units are removed.
    a. Provide tin plated copper ground bus running full width of MCC at bottom of lineup. Drill ground bus and furnish lugs as indicated
6. Provide draw out type unit compartments with doors, unit support pans, saddles, and disconnect operators. Enclose and isolate each unit from adjacent units. Design units so that faults will be contained within compartments and with a minimum withstandability equal to that of the bus bracing. Provide draw out units with a de-energized position where the unit is still supported by the structure, but no electrical connection is made. Provide a method of locking the unit in the de-energized position. Design plug in units of the same type and size to be interchangeable with each other. Provide plug on connections for each electrical power phase. Design the contact fingers to be floating and self-aligning. Tin plate the contacts for low resistance connections. Interiors shall be painted white or off white. Units shall be equipped with side-mounted, positive latch pull-apart type control terminal blocks rated 600 volts. Knockouts shall be provided for the addition of future terminal blocks. All control wire to be 14 gauge minimum.
7. Provide external operator handles for controllers, switches, and circuit breakers. Design handle with up-down motion and with down position indicating OFF. Construct handles which permit locking handle in OFF position with three padlocks.
8. Provide unit doors securely mounted with a minimum of two rugged concealed type hinges which allows doors to swing open minimum of 115 degrees for ease of unit

maintenance and withdrawal. Fasten doors to structure so that they remain in place when unit is withdrawn.

a. Closed door must cover unit space when unit has been temporarily removed. Provide interlock for each unit door with associated disconnect mechanism to prevent door from opening when unit is energized.

9. Circuit Breakers: See Division 26 Section “Overcurrent Protective Devices”. Devices shall have a minimum RMS symmetrical interrupting rating of 42,000 A at 480/277V.
10. Main Circuit Breakers: Provide solid state trip circuit breakers. See plans and/or schedules for size. See Division 26 Section “Overcurrent Protective Devices”. Devices shall have a minimum RMS symmetrical interrupting rating of 42,000 A at 480/277V.
11. Provide combination type motor controller units, types as specified in Division 26 Section “Motor Controllers”, with thermal magnetic circuit breaker or fused switch and ambient compensated, manual reset, inverse time, thermal overload relay. Overload protection shall be provided in each phase conductor. Provide overload heaters sized based upon motor nameplate current. Provide a 120 volt control power transformer for each motor controller unit with two primary fuses and one secondary fuse. The transformer secondary shall be grounded. Provide a minimum of three normally open and one normally closed auxiliary contacts. Units shall be NEMA rated.
12. All control component conductors shall be landed with vinyl insulated locking fork terminals. Elapsed time meters shall be mounted in the unit doors and shall have a 120 volt synchronous motor driving a mechanical register. The register shall indicate up to 99,999.9 hours. Each motor starter NEMA Size 2 or larger shall have a current sensing phase unbalance relay to trip the starter on loss of phase or phase unbalance of 50 percent or more when at 50 percent or more load.
13. Provide equipment/system identification nameplates complying with Division 26 Section “Electrical Identification”, in accordance with Motor Control Schedule on drawings. Tags shall be engraved plastic laminate.
14. Thoroughly clean interior and exterior of supporting structures and unit compartments prior to coating of MCC, including bolted joints, with rust-inhibiting prime coat. Provide two finish coats of manufacturer's standard color baked on enamel finish.
15. Provide Allen-Bradley PowerMonitor 5000 with Ethernet/IP communications for power monitoring where shown on the Drawings.
16. Provide SPDs as shown and as specified in Division 26 Section “Surge Protective Devices”.

B. Extra Materials

1. Furnish six spares of each type and rating of fuse and fusible devices required. Include spares for:
   a. Control power fuses.
   b. Fuses and fusible devices for fused circuit breakers.
   c. Fuses for fusible switches.
2. Spare Indicating Lights: Furnish six of each type required.
3. Touch-Up Paint: Furnish three 1/2 pint containers.

2.2 ACCEPTABLE MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products of one of the following:

1. Allen-Bradley.
2. Cutler-Hammer.
3. Square D.

4. Or Approved Equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions
   1. Inspect installed work prior to performing the work of this section.
   2. Verify that the project has progressed to a point where this installation may begin.

B. Discrepancies
   1. Immediately notify the A/E in writing of conditions detrimental to proper completion of the work.
   2. Correct all unsatisfactory conditions before proceeding with installation.
   3. Resolution must be acceptable to the A/E.

3.2 PREPARATION

A. Surface Preparation
   1. Carefully lay out the work in advance.
   2. Perform any cutting, drilling, etc. without damaging the building surfaces or equipment.

B. Rough-in
   1. Refer to equipment submittals for rough-in requirements.
   2. Verify rough-in locations by field measurements.

3.3 INSTALLATION

A. Installation of Motor Control Centers
   1. Install MCCs as indicated, in accordance with equipment manufacturer's written instructions, and with recognized industry practices; complying with applicable requirements of NEC, NEMA's Standard Pub/No. ICS-2, and NEC "Standard of Installation."
   2. Provide and install housekeeping pads for all motor control centers.
   3. Coordinate with other electrical work including wiring/cabling and raceway work, as necessary to interface installation of motor control centers with other work. Install control wiring from master terminal block in top and bottom horizontal wireways to each associated unit compartment terminal blocks.
   4. Install fuses, if any, in motor control center units.
   5. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Standard 486A and B.
   6. Control wiring shall be as shown on the contract drawings except as modified by the approval and submittal process. Interface all local and remote devices into the control wiring and operational systems for each load.

B. Adjusting and Cleaning
   1. Adjust operating mechanisms for free mechanical movement.
   2. Touch up scratched or marred surfaces to match original finishes.

C. Grounding: Provide equipment grounding connections for MCCs as indicated. Tighten connections to comply with tightening torques specified in UL Standard 486A to assure permanent and effective grounds.

3.4 FIELD QUALITY CONTROL

A. Prior to energization of MCCs, check with insulation resistance tester for proper values of phase-to-phase and phase-to-ground insulation resistances. Log that data, and submit to Engineer.

B. Prior to energization of circuitry, check control center electrical circuits for continuity and for short circuits.

C. Subsequent to wire/cable and raceway hook ups, energize MCC circuitry check each motor for proper phase rotation, and demonstrate capability and compliance with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units and proceed with retesting.

D. Install approved overloads after all wiring is checked.

E. The following minimum work shall be performed by the Contractor under the technical direction of the manufacturer's service representative.
   1. Perform insulation tests on each phase and verify low resistance ground connection on ground bus.
   2. Torque all bolted connections made in the field and verify all factory bolted connections.
   3. Verify proper application of motor overloads and motor circuit protectors against actual nameplate data.
   4. Prior to energizing MCCs, check electrical circuits for continuity and for short circuits.
   5. After energizing MCCs, check each motor for proper phase rotation.
   6. Repair or replace any defective equipment or wiring then re-test.
   7. The Contractor shall provide three (3) copies of the manufacturer's field startup report before final payment is made.

3.5 FIELD ADJUSTMENTS

A. Follow the manufacturer's instructions and the contract documents concerning any short circuit device settings, heater selection, timing relays, or startup of components.

3.6 CLEANING

A. Touch up scratched or marred surfaces to match original finishes.

3.7 MANUFACTURER'S CERTIFICATION

A. A qualified factory-trained manufacturer's representative shall certify in writing that the equipment has been installed, adjusted, and tested in accordance with the manufacturer's recommendations. Equipment shall be inspected prior to the generation of any reports.

B. The Contractor shall provide three (3) copies of the manufacturer's representative's certification before final payment is made.

3.8 TRAINING

A. The Contractor shall provide a training session for one normal workday (8 hours) at the jobsite or other office location chosen by the Owner.

B. The training session shall be conducted by a manufacturer's qualified representative.

C. The training program shall consist of the following:
   1. Review of the MCC one-line drawings and schedules.
   2. Review of the factory record shop drawings and placement of the various cells.
   3. Review of each type of starter cell, components within, control and power wiring.
   4. Review contactor coil replacement, and contact replacement procedures.
   5. Discuss the maintenance timetable and procedures to be followed in an ongoing maintenance program.
   6. Provide three ring binders to participants complete with copies of drawings and other course material covered.

END OF SECTION 26 2419

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 2716

CABINETS, BOXES, AND FITTINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to work of this Section.

B. This section is a Division 26 section, and is a part of each Division 26 section making reference to electrical wiring boxes and fittings specified herein.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to furnish and install electrical boxes and fittings in accordance with the plans and as specified herein.

B. Types of electrical boxes and fittings specified in this section include the following:
1. Outlet boxes.
2. Junction boxes.
3. Pull boxes.
4. Floor boxes.
5. Bushings.
6. Locknuts.
7. Knockout closures.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
1. National Electrical Code (NEC) Compliance. Comply with NEC as applicable to construction and installation of electrical wiring boxes and fittings.
2. Underwriters' Laboratories (UL) Compliance. Comply with applicable requirements of UL 50, UL 514 Series, and UL 886 pertaining to electrical boxes and fittings. Provide electrical boxes, fittings and enclosures which are UL listed and labeled.
3. National Electrical Manufacturer's Association (NEMA) Compliance. Comply with applicable requirements of NEMA Standard Publication Nos. OS1, OS2, and 250 pertaining to outlet and device boxes, covers, and box supports.
4. Federal Specification (FS) Compliance. Comply with applicable requirements of FS W-C-586, "Electrical Cast Metal Conduit Outlet Boxes, Bodies and Entrance Caps."

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and materials certifications as required.

B. Shop Drawings for Electrical Boxes and Fittings: For shop-fabricated junction and pullboxes, show accurately scaled views and spatial relationships to adjacent equipment. Show box types, dimensions, and finishes.

1.5 DEFINITIONS

A. Finished locations. The following are defined as finished locations:
1. Areas with carpet or tile floors.
2. Areas with lay-in ceiling tile, fixed ceiling tile, and special architectural ceiling treatment.
3. Areas with tiled, plastered, or paneled walls.

B. Interior locations. The following are defined as interior locations:
1. Any location within the boundaries of the foundation of any building.
2. Any location within the superstructure of other structures not classified as buildings.

C. Wet locations. The following are defined as wet locations:
1. All exterior locations.
2. All interior locations below grade.
3. All interior locations where wet materials are processed, pumped, transported, or stored.

D. Corrosive locations. The following are defined as corrosive locations.
1. All locations with chemical feed/transfer equipment
2. All locations with chemical storage tanks
3. All locations where chemical storage drums are located.

E. Hazardous (classified) locations. The following are defined as hazardous (classified) locations.
1. All hazardous (classified) locations and their hazard classification are shown.

1.6 DELIVERY, HANDLING, AND STORAGE

A. Store cabinets, boxes and fittings in clean, dry space; protect products from weather, damaging fumes, construction debris and traffic.

PART 2 - PRODUCTS

2.1 ELECTRICAL BOXES AND FITTINGS

A. Electrical cabinets, boxes and fittings of indicated types, sizes, and NEMA enclosure classes. Where not indicated, provide units of types, sizes, and classes appropriate for the use and location. Provide all items complete with covers and accessories required for the intended use. Provide gaskets for units in damp or wet locations. Provide corrosion-resistant box knockout closures to suit respective installation requirements and applications.

2.2 METALLIC OUTLET, DEVICE AND WIRING BOXES

A. General: Conform to UL 514A, "Metallic Outlet Boxes, Electrical" and UL 514B, "Fittings for Conduit and Outlet Boxes." Boxes shall be of type, shape, size, and depth to suit each location and application.

B. Steel Boxes: Conform to NEMA OS 1, "Sheet Steel Outlet Boxes, Device Boxes Covers, and Box Supports." Boxes shall be sheet steel with stamped knockouts, threaded screw holes, and

accessories suitable for each location, including mounting brackets and straps, cable clamps, exterior rings, and fixture studs.

C. Cast Aluminum Boxes: Copper-free aluminum threaded raceway entries and features and accessories suitable for each location including mounting ears, threaded screw holes for devices, and closure plugs.

2.3 NON-METALLIC OUTLET, DEVICE, AND WIRING BOXES

A. General: Conform to NEMA OS 2, "Non-Metallic Outlet Boxes, Device Boxes, Covers, and Box Supports," and UL 514C, "Non-Metallic Outlet Boxes, Flush Device Boxes, and Covers." Boxes shall be molded PVC units of type, shape, size, and depth to suit location and application.

B. Non-Metallic Boxes: Ultraviolet stabilized, non-conductive, high-impact-resistant boxes with integrally molded raceway entrance hubs and removable mounting flanges. Boxes shall be equipped with threaded screw holes for device and cover plate mounting. Each box shall have molded cover of matching polyvinyl chloride (PVC) material suitable for the application.

2.4 PULL AND JUNCTION BOXES

A. General: Comply with UL 50, "Electrical Cabinets and Boxes," for boxes over 100 cubic inches volume. Boxes shall have screwed or bolted-on covers of same material as box and shall be of size and shape to suit application. All boxes 6-inch x 6-inch or larger shall have hinged doors. All boxes used for distribution of emergency power shall be painted red.

B. Hot-Dipped Galvanized Steel Boxes: Sheet steel with welded seams. Where necessary to provide a rigid assembly, construct with internal structural steel bracing. Hot-dip galvanize after fabrication. Cover shall be gasketed.

C. Stainless Steel Boxes: Fabricate of stainless steel conforming to Type 302 of American Society for Testing and Materials (ASTM) A 167, "Specification for Stainless and Heat Resisting Chromium Nickel Steel Plate, Sheet, and Strip." Where necessary to provide a rigid assembly, construct with internal structural stainless steel bracing. Cover shall be gasketed.

D. Cast Aluminum Boxes: Molded of copper-free aluminum, with gasketed cover and integral threaded conduit entrances.

E. Cast Nonmetallic Boxes: Ultraviolet stabilized, non-conductive, high-impact-resistant PVC boxes with gasketed cover and integral mounting flanges.

2.5 STEEL ENCLOSURES WITH HINGED DOORS

A. General: Comply with UL 50, "Cabinets and Enclosures," and NEMA ICS6 "Enclosures for Industrial Control and Systems."

B. Construction: Sheet steel, 16-gauge, minimum, with continuous welded seams. NEMA class as indicated; arranged for surface-mounting.

C. Doors: Hinged directly to cabinet and removable with approximately 3/4-inch flange around all edges, shaped to cover edge of box. Provide handle-operated, key-locking latch. Individual door width shall be no greater than 24 inches. Provide multiple doors where required.

D. Mounting Panel: Provide painted removable internal mounting panel for component installation.

E. Enclosure: NEMA 12, unless noted otherwise. Where door gasketing is required, provide neoprene gasket attached with oil-resistant adhesive, and held in place with steel retaining strips.

2.6 CAST METALLIC ENCLOSURES WITH HINGED DOORS

A. General: Copper-free aluminum with bolted, hinged doors. Where used at hazardous (classified) locations, enclosures shall conform to UL and shall be listed and labeled for the classification of hazard involved.

2.7 MOLDED NONMETALLIC ENCLOSURES WITH HINGED DOOR

A. General: Molded, glass-fiber-reinforced high-impact-strength polyester with bolt or screw-secured doors and solid neoprene gaskets.

2.8 CORROSION INHIBITORS

A. General: All enclosures containing equipment, terminals, or splices shall have a vapor phase corrosion inhibitor. Provide two spares for each one installed.

2.9 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in the Work include, but are not limited to, the following:
1. Adalet-PLM Div.; Scott Fetzer Co.
2. American Electric.
3. Arrow-Hart Div.; Crouse-Hinds, Co.
4. Appleton Electric Co.; Emerson Electric Co.
5. Harvey Hubbell, Inc.
6. OZ/Gedney Co.; General Signal Co.
7. Pass and Seymour, Inc.
8. Thomas & Betts Co., Inc.
9. Walker; Wire Mold Company.
10. Or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION OF ELECTRICAL BOXES AND FITTINGS

A. Install electrical boxes and fittings as indicated, in accordance with manufacturer's written instructions, applicable requirements of NEC and National Electrical Contractor's Association (NECA) "Standard of Installation," and in accordance with recognized industry practices to fulfill project requirements.

B. Install items where indicated and where required to suit code requirements and installation conditions. Cap unused knockout hole where blanks have been removed and plug unused conduit hubs so as to maintain the NEMA rating of the box. Install boxes in locations which ensure ready accessibility to enclosed electrical wiring and avoid installing boxes back-to-back

in walls where there would be less than 6 inches (150 mm) separation. Fasten boxes firmly and rigidly to substrates or structural surfaces to which attached, or solidly embed electrical boxes in concrete or masonry. Do not install aluminum products in concrete.

C. Outlet and device boxes for flush-mounted installation shall be a minimum of 4-inch square or octagonal and positioned accurately to allow for surface finish thickness.

D. Junction boxes, pullboxes, and enclosures with hinged doors which are surface-mounted shall utilize spacers to maintain 1/4-inch clearance from the wall.

E. Floor boxes shall be installed level and flush with finish flooring material.

F. Avoid using round boxes where conduit must enter box through side of box, which would result in difficult and secure connections when fastened with locknut or bushing on rounded surfaces.

G. Provide electrical connections for installed boxes.

3.2 COORDINATION

A. Coordinate installation of electrical cabinets, boxes, and fittings with wire/cable, wiring devices, and raceway installation work.

3.3 APPLICATIONS

A. Outlet Boxes and Fittings: Install outlet and device boxes and associated covers and fittings of materials and NEMA types suitable for each location and in conformance with the following requirements:
   1. Use galvanized flat rolled sheet steel boxes only in finished areas.
   2. Use PVC coated steel boxes in corrosive non-hazardous areas as designated on the plans.
   3. Use boxes suitable for the classification in hazardous area as shown on the plans.
   4. Use cast metal boxes in all other locations.

B. Pull and Junction Boxes: Install pull and junction boxes of materials and NEMA types suitable for each location and in conformance with the following:
   1. Use hot-dipped galvanized steel boxes only in finished areas.
   2. Use stainless steel boxes in corrosive non-hazardous areas and as designated on the plans.
   3. Use boxes suitable for the classification in hazardous area as shown on the plans.
   4. Use NEMA 4X stainless steel or cast metal boxes in all other locations.

C. Enclosures with Hinged Doors: Install enclosures and associated materials and NEMA types suitable for each location and in conformance with the drawings.

D. Floor Boxes: Install cast iron floor boxes at each location indicated.

3.4 GROUNDING

A. General: Upon completion of installation work, properly ground electrical boxes and demonstrate compliance with requirements.

3.5 CLEANING AND FINISH REPAIR

A. General: Upon completion of installation, inspect components, remove burrs, dirt, and construction debris, and repair damaged finish including chips, scratches, abrasions, and weld marks.

END OF SECTION 26 2716

SECTION 26 2726

WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes
1. Receptacles.
2. Heavy-duty receptacles.
3. Hazardous location receptacles.
4. Snap switches.
5. Hazardous location snap switches.
6. Wallbox dimming controls.
7. Occupancy sensing light switches.
8. Communications outlets.
9. Covers and wall plates.

B. Related Sections
1. Division 01 Section “Submittal Procedures”.
2. Division 26 Section “Grounding”.
3. Division 26 Section “Electrical Identification”.

1.3 REFERENCES

A. Unless otherwise stated, references are to the latest edition of the standard.

B. American National Standards Institute (ANSI)
1. ANSI/IEEE C62.41, IEEE Recommended Practice for Surge Voltages in Low-Voltage AC Power Circuits.
2. ANSI/NEMA WD 6, Wiring Devices—Dimensional Requirements.

C. ASTM International (ASTM)
1. ASTM B117, Standard Practice for Operating Salt Spray (Fog) Apparatus.

D. National Electrical Manufacturers Association (NEMA)
1. NEMA 250 Enclosures for Electrical Equipment (1000 Volts Maximum).
2. NEMA Standard FB 11—Plugs, Receptacles, and Connectors of the Pin and Sleeve Type for Hazardous Locations.
3. NEMA WD 1, General Color Requirements for Wiring Devices.

E. Telecommunications Industry Association (TIA)
1. TIA/EIA-568-B.1, Commercial Building Telecommunications Cabling Standard – Part 1: General Requirements.

F. Underwriter's Laboratory (UL)
1. UL 20, Standard for General-Use Snap Switches.
2. UL 498, Standard for Attachment Plugs and Receptacles.
3. UL 894, Standard for Switches For Use In Hazardous (Classified) Locations.
4. UL 943, Standard for Ground-Fault Circuit-Interrupters.
5. UL 1010, Standard for Receptacle-Plug Combinations For Use In Hazardous (Classified) Locations.
6. UL 1203, Standard for Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.
7. UL 1449, Standard for Surge Protection Devices.
8. UL 1472, Solid-State Dimming Controls.
9. UL 1682, Plugs, Receptacles, and Cable Connectors of the Pin and Sleeve Type.
10. UL 1686, Standard for Pin and Sleeve Configurations.
11. UL 1863, Standard for Communications-Circuit Accessories.

1.4 DEFINITIONS

A. Abbreviations
1. AHJ: Authority Having Jurisdiction.
2. NRTL: Nationally Recognized Testing Laboratory.
3. GFCI: Ground-fault circuit interrupting.

B. Finished Locations: The following are defined as finished locations:
1. Areas with carpet or tile floors.
2. Areas with lay-in ceiling tile, fixed ceiling tile, and special architectural ceiling treatment.
3. Areas with tiled, plastered, or paneled walls.

C. Interior Locations: The following are defined as interior locations:
1. Any location within the boundaries of the foundation of any building.
2. Any location within the superstructure of other structures not classified as buildings.

D. Wet Locations: The following are defined as wet locations:
1. All exterior locations.
2. All interior locations below grade.
3. All interior locations where wet materials are processed, pumped, transported, or stored.

E. Corrosive Locations: The following are defined as corrosive locations.
1. All locations with chemical feed/transfer equipment
2. All locations with chemical storage tanks
3. All locations where chemical storage drums are located.

F. Hazardous (Classified) Locations: The following are defined as hazardous (classified) locations.
1. All hazardous (classified) locations and their hazard classification are shown.

1.5 SUBMITTALS

A. General
1. Comply with the requirements of Division 01 section, "Submittal Procedures".
2. Submit information as described below.
3. Provide all information necessary to determine compliance.

B. Product Data
   1. Manufacturer's technical product data sheets for all products specified in this section.
   2. Delete or cross out all inappropriate or non-applicable information.

C. Samples: Submit sample of each type and color of wiring device and wall plate.

1.6 QUALITY ASSURANCE

A. Regulatory Requirements
   1. All applicable federal, state, and local codes and regulatory requirements.
   2. National Electrical Code (NEC).

PART 2 - PRODUCTS

2.1 PRODUCT REQUIREMENTS – GENERAL

A. General
   1. Provide new and unused products of current manufacture.
   2. Provide products free from defects affecting performance.
   3. All units of the same type must be from the same manufacturer.
   4. Provide nameplates conforming to Division 26 section, "Electrical Identification."

B. Listing and Labeling
   1. Provide UL listed and labeled products.
   2. Provide products listed and labeled by an approved independent NRTL.
   3. Products not bearing an NRTL label must be pre-approved in writing by the AHJ.

2.2 RECEPTACLES

A. General
   1. Brass alloy power contacts and terminal screws.
   2. Side and back wired terminals.
   3. Self-grounding clip on mounting screw.
   4. Thermoplastic back cover.
   5. Nylon face.
   6. Suitable for solid or stranded copper wire.

B. General-Purpose Receptacles
   1. Industrial specification grade.
   2. NEMA WD 1, NEMA WD 6, UL 498.
   3. Straight blade NEMA WD6, 5-20R.
   4. One-piece brass alloy mounting strap, ground terminal, and ground contacts.
   5. Single or duplex as shown.

C. GFCI Receptacles
   1. Industrial specification grade.
   2. NEMA WD 1, NEMA WD 6, UL 498, UL 943.
   3. Straight blade NEMA WD6, 5-20R.
   4. One-piece brass alloy mounting strap, ground terminal, and ground contacts.
   5. Single or duplex as shown.
   6. Feed-through type.

7. Suitable for mounting in 2-3/4 inch box without adapter.

D. Isolated ground receptacles.
   1. Industrial specification grade.
   2. NEMA WD 1, NEMA WD 6, UL498.
   3. Straight blade NEMA WD6, 5-20R.
   4. Brass alloy mounting strap.
   5. Brass allow Isolated ground terminal, and ground contacts.
   6. Identified with orange triangle on face.

E. TVSS Receptacles
   1. Industrial specification grade.
   2. NEMA WD 1, NEMA WD 6, UL498, UL 1449, ANSI/IEEE C62.41 Category A and B.
   3. Straight blade NEMA WD6, 5-20R.
   4. One-piece brass alloy mounting strap, ground terminal, and ground contacts.
   5. Integral TVSS in line to ground, line to neutral, and neutral to ground
      a. Multiple metal-oxide varistors.
      b. Nominal clamp level rating of 500 volts.
      c. Minimum single transient pulse energy dissipation of 140 J line to neutral, and 70 J line to ground and neutral to ground.
   6. Condition indicator light and audible alert.
   7. Distinctive marking on face of device to denote TVSS-type unit.

F. Hospital grade receptacles.
   1. Hospital grade.
   2. NEMA WD 1, NEMA WD 6, UL498.
   3. Straight blade NEMA WD6, 5-20R.
   4. One-piece brass alloy mounting strap, ground terminal, and ground contacts.
   5. Identified with green dot on face.

G. Tamper-resistant receptacles.
   1. [Industrial specification grade][Hospital grade].
   2. NEMA WD 1, NEMA WD 6, UL498.
   3. Straight blade NEMA WD6, 5-20R.
   4. One-piece brass alloy mounting strap, ground terminal, and ground contacts.
   5. UL listed as tamper-resistant.
   6. Internal shutter mechanism to limit access to energized components.
   7. Prevents object insertion unless both contacts are engaged.
   8. Identified with green dot on face.
   9. Identified on face as tamper-resistant.

H. Weather-resistant receptacles
   1. Industrial specification grade.
   2. UL listed as weather-resistant.
   3. NEMA WD 1, NEMA WD 6, UL 498.
   4. Ultraviolet light exposure, cold impact, and accelerated aging tests.
   5. Straight blade NEMA WD6, 5-20R.
   6. One-piece brass alloy mounting strap, ground terminal, and ground contacts.
   7. Single or duplex as shown.
   8. Identified on face as weather-resistant.

I. Corrosion-Resistant Receptacles
   1. Industrial specification grade.
   2. NEMA WD 1, NEMA WD 6, UL 498.
   3. Pass ASTM B117, 500-hour salt spray test.
   4. Straight blade NEMA WD6, 5-20R.
   5. One-piece brass alloy mounting strap, ground terminal, and ground contacts.
   6. All metal parts nickel-plated.
   7. Nickel-plated mounting screws.
   8. Single or duplex as shown.

J. Receptacle Colors
   1. Normal Power: Ivory.
   2. Emergency Power: Red.
   3. TVSS Protected: Blue.
   4. Corrosion-resistant: Yellow.

K. Available Manufacturers: Subject to compliance, available manufacturers of the specified products include but are not limited to the following:
   1. Hubbell Incorporated.
   2. Leviton Manufacturing Company Incorporated.
   3. Pass & Seymour/Legrand; Wiring Devices Division.

2.3 HEAVY-DUTY RECEPTACLES

A. General
   1. UL 498, UL 1682, UL 1686.
   2. Pin and sleeve type.
   3. Brass contacts.
   4. Cast aluminum body.
   5. Ampere rating as shown.
   6. Attached screw cap.
   7. Suitable for wet locations.
   8. Color coded and configured to a specific circuit voltage and current rating.
   9. Circuit breaking type, arc from disconnecting under load contained with an arc chamber.

B. Accessories
   1. Cast aluminum back box suitable for installed location.
   2. Matching plug for each receptacle.

C. Manufacturers: Subject to compliance, provide products by one of the following.
   1. Appleton.
   2. Arrow-Hart.
   3. Crouse-Hinds.

2.4 RECEPTACLES IN HAZARDOUS (CLASSIFIED) LOCATIONS

A. General
   1. Receptacles rated for specific hazardous locations shown.

B. General purpose receptacle
   1. UL 1010, NEMA WD 6, NEMA 250.

2. NEMA WD6 5-20R.
3. Cast aluminum body.
4. Brass contacts.
5. Factory sealed.
6. Attached cover with hinge and gasket.
7. Suitable for wet locations.
8. Circuit breaking type, plug cannot be removed until disconnecting mechanism rotated.

C. GFCI receptacle
1. UL 943, UL 1010, UL 1203, NEMA WD 6, NEMA 250.
2. NEMA WD6 5-20R.
3. Cast aluminum body.
4. Brass contacts.
5. Factory sealed receptacle.
6. Separate factory sealed GFCI unit.
7. Feed-thru type.
8. Attached receptacle cover with hinge and gasket.
9. Circuit breaking type, plug cannot be removed until disconnecting mechanism rotated.

D. Heavy-duty receptacle
1. UL 1010, UL 1686, NEMA FB 11, NEMA 250.
2. Pin and sleeve type.
3. Brass contacts.
4. Cast aluminum body.
5. Ampere rating as shown.
6. Attached receptacle cover with hinge and gasket.
7. Suitable for wet locations.
8. Color coded and configured to a specific circuit voltage and current rating.
9. Circuit breaking type, arc from disconnecting under load contained with an arc chamber.

E. Accessories
1. Cast aluminum back box suitable for installed location.
2. Matching plug for each receptacle.

F. Available manufacturers. Subject to compliance, available manufacturers of the specified products include but are not limited to the following:
1. Appleton.
2. Crouse-Hinds.

2.5 SNAP SWITCHES

A. General
1. Single-pole, 2-pole, 3-way, 4-way and illuminated handle snap switches as shown.
2. NEMA WD 1, UL 20.

B. Construction
1. Quiet-type alternating current (ac) switches, 20 ampere, 120-277 volt.
2. Side and back wired, screw pressure terminal.
3. Brass alloy terminal screws.
4. Yoke grounding screw.
5. Thermoplastic back cover.

6. Suitable for solid or stranded copper wire.
7. Switch handle color: Ivory.

C. Available Manufacturers: Subject to compliance, available manufacturers of the specified products include but are not limited to the following:
1. Hubbell Incorporated.
2. Leviton Manufacturing Company Incorporated.
3. Pass & Seymour/Legrand; Wiring Devices Division.

2.6 SNAP SWITCHES IN HAZARDOUS (CLASSIFIED) LOCATIONS

A. General
1. UL 20, UL 894, NEMA WD 1, NEMA 250.
2. Rated 20 ampere, 120-277 volt AC.
3. Quiet-type alternating current (ac) switches, 20 ampere, 120-277 volt.
4. Side and back wired, screw pressure terminal.
5. Brass alloy terminal screws.
6. Yoke grounding screw.
7. Thermoplastic back cover.
8. Suitable for solid or stranded copper wire.
9. Cast metal enclosure and cover rated for specific hazardous locations shown.

B. Available manufacturers: Subject to compliance, available manufacturers of the specified products include but are not limited to the following:
1. Appleton.
2. Crouse-Hinds.

2.7 WALLBOX DIMMING CONTROLS

A. General
1. UL 1472.
2. Solid-state full-wave dimmer.
3. Integral, quiet on/off switch, with audible frequency and EMI/RFI suppression filters.
4. Single-pole, 3-way, and 4-way switching.
5. Continuously adjustable slider control.
6. Illuminated when off.

B. Incandescent lamp dimming controls
1. 120 V.
2. Follow square-law dimming curve.
3. Bypass dimmer module with on/off switch positions.
4. Rated wattage: 600 with no de-rating when ganged with other devices.

C. Fluorescent lamp dimming controls
1. Modular; compatible with dimming ballasts.
2. Trim potentiometer to adjust low-end dimming.
3. Dimmer-ballast combination low end dimming down to 20 percent of full brightness.

D. Available manufacturers: Subject to compliance, available manufacturers of the specified products include but are not limited to the following:
1. Lutron.

2. Or approved equal.

2.8 OCCUPANCY SENSING LIGHT SWITCHES

A. Wall-Switch Sensors
   1. Wall box mounted.
   2. Dual voltage (120 and 277 volts).
   3. Dual technology passive-infrared and ultrasonic.
   4. One hundred eighty degree field of view.
   5. Adjustable time delay up to 30 minutes.
   6. Adjustable sensitivity.
   7. Suitable for electronic ballast inrush currents.
   8. Minimum coverage area of 900 square feet.

B. Long-Range Wall-Switch Sensors
   1. Wall box mounted.
   2. Dual voltage (120 and 277 volts).
   3. Passive infrared type.
   4. One hundred ten degree field of view.
   5. Adjustable time delay up to 30 minutes.
   6. Adjustable sensitivity.
   7. Suitable for electronic ballast inrush currents.
   8. Minimum coverage area of 1200 square feet.

C. Wide-Range Wall-Switch Sensors
   1. Wall box mounted.
   2. Dual voltage (120 and 277 volts).
   3. Passive infrared type.
   4. One hundred fifty degree field of view.
   5. Adjustable time delay up to 30 minutes.
   6. Adjustable sensitivity.
   7. Suitable for electronic ballast inrush currents.
   8. Minimum coverage area of 1200 square feet.

D. Exterior Occupancy Sensors
   1. Weatherproof.
   2. Dual voltage (120 and 277 volts).
   3. Passive infrared type.
   4. One hundred eighty degree field of view.
   5. Adjustable time delay up to 15 minutes.
   6. One hundred ten foot detection range.
   7. Suitable for electronic ballast inrush currents.

E. Manufacturers: Subject to compliance, provide products by one of the following:
   1. Hubbell.
   2. Leviton.
   3. Pass & Seymour.
   4. Watt Stopper.

2.9 COMMUNICATIONS OUTLETS

A. Telephone Outlet
   1. UL 1863, TIA/EIA-568-B.1 Category 5e.
   2. One RJ-45 jack.

B. Combination TV and Telephone Outlet
   1. UL 1863, TIA/EIA-568-B.1 Category 5e.
   2. One RJ-45 jack.
   3. One Type F coaxial cable connector.

C. Available manufacturers: Subject to compliance, available manufacturers of the specified products include but are not limited to the following:
   1. Cooper.
   2. Leviton.

2.10 COVERS AND WALL PLATES

A. General
   1. UL 514D.
   2. Single and combination type with ganging and cut-outs as required.
   3. Metal plate-securing screws to match plate finish.

B. Finished Locations
   1. Minimum 0.05 inch thick.
   2. Type 302 satin stainless steel.

C. Other Interior Locations: Galvanized steel.

D. Weatherproof Covers
   1. Rain-proof while in use in compliance with NEC Article 410-57.
   2. Cast aluminum plate with neoprene gasket.
   3. Hinged, self-closing, cast aluminum device cover.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions
   1. Verify outlet boxes are installed at proper locations and heights.
   2. Verify wall openings are neatly cut and will be completely covered by wall plates.
   3. Verify branch circuit wiring is completed, tested, and ready for connection to wiring devices.

B. Discrepancies
   1. Immediately notify the Engineer in writing of conditions detrimental to proper completion of the work.
   2. Correct all unsatisfactory conditions before proceeding with installation.
   3. Resolution must be acceptable to the Engineer.

C. Clean debris from outlet boxes before installing devices.

3.2 INSTALLATION

A. General
1. Install products following manufacturer's instructions.
2. Coordinate with other work, including painting, electrical boxes and wiring installations.
3. Install devices plumb, level, and secure.
4. Mount receptacles in finished areas at 1’-6” above the finished floor.
5. Mount receptacles in all other areas at 4’-0” above the finished floor.
6. Mount all wall switches at 4'-0" above finished floor.
7. Install wiring devices after wiring work is completed.
8. Install wall plates after painting work is completed.
9. Unless otherwise shown, mount devices flush, with long dimension vertical.
10. Group adjacent switches and receptacles under a single, multi-gang wall plate.
11. Do not use the duplex/split-wire break-off tabs in receptacles as circuit conductors for connecting downstream devices.
12. Install receptacles for electric water coolers (EWC) within the cabinet.

B. Dual-Level Lighting Control
1. Provide dual-level lighting control in spaces 100 square feet and larger.
2. Provide controls to reduce the lighting load by at least 50 percent.
3. Coordinate controls to reduce lighting in a reasonably uniform lighting pattern.
4. Coordinate dual-level lighting controls with day lighting apertures, such as windows.

C. Grounding
1. Ground wiring devices as specified in Division 26 section, "Grounding".
2. Connect grounding terminal to branch circuit equipment grounding conductor.

D. Identification: Identify wiring devices as required in Division 26 section, "Electrical Identification”.

3.3 FIELD QUALITY CONTROL

A. Inspections
1. Inspect each wiring device for defects before installing.
2. Have a qualified manufacturer’s representative inspect the installation.

B. Operate each operable device at least six times with circuit energized.

C. Receptacles
1. Test each 20-ampere receptacles for proper polarity and ground continuity.
2. Use a UL listed test device.

D. GFCI Receptacles
1. Test operation according to manufacturer recommendations.
2. Verify that GFCI will trip at 5 ±1 mA current.
3. Verify that GFCI does not trip at less than 1.8 mA current.

E. Replace damaged or defective wiring devices

3.4 ADJUSTING

A. Adjust each occupancy sensor.

B. Occupancy Sensor Time-Out Controls
   1. Utility, lunch/break, storage, and copier rooms: 5-minute time-out setting.
   2. Conference rooms: 10-minute time-out setting.
   3. Corridors and lobbies: 15-minute time-out setting.
   4. All other locations: longest time out setting, but not more than 30 minutes.

C. Ambient Light Sensor: Set to turn off lights when daylighting exceeds 80% of the design illuminance.

3.5 CLEANING

A. General
   1. Clean devices and wall plates.
   2. Replace stained or improperly painted wall plates or devices.
   3. Adjust devices and wall plates to be flush and level.

END OF SECTION 26 2726

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 2813

OVERCURRENT PROTECTIVE DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to install overcurrent protective devices (OCPDs) in accordance with the plans and as specified herein.

B. Work of this Section includes, but is not limited to:
   1. Fuses
      a. Fuses rated 600A and less.
      b. Fuses rated above 600A.
   2. Circuit breakers.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work associated with overcurrent protective devices in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
   1. Electrical Component Standard: Components and installation shall comply with National Fire Protection Association (NFPA) 70 "National Electrical Code (NEC)."
   2. Listing and Labeling: Provide products specified in this section that are listed and labeled (as defined as they are in the NEC, Article 100).
   3. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in Occupational Safety and Health Administration (OSHA) Regulation 1910.7.

B. Single Source Responsibility: Obtain similar OCPDs from a single manufacturer.

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and materials certifications as required.

B. Submittals: Submit the following in accordance with Conditions of Contract and Division 01 specification sections:
   1. Product data for fuses, circuit breakers, and OCPD accessories specified in this section, including descriptive data and time-current curves for all protective devices and let-through current curves for those with current limiting characteristics. Include coordination charts and tables and related data.

C. Reference Submittals
   1. Manufacturer's descriptive literature.
   2. Operating and maintenance instructions.
   3. Spare parts list.

1.5 DELIVERY, HANDLING, AND STORAGE

A. Deliver OCPDs and components in factory fabricated type containers or wrappings, which properly protect devices from damage.

B. Handle OCPDs carefully to prevent physical damage to OCPDs and components. Do not install damaged OCPDs; remove from site and replace damaged devices with new.

C. Store OCPDs in original packaging and protect from weather and construction traffic. Wherever possible, store indoors; where necessary to store outdoors, store above grade and enclose with watertight wrapping.

1.6 DEFINITIONS

A. OCPD: A device operative on excessive current that causes and maintains the interruption of power in the circuit it protects.

B. Ampere Squared Seconds: An expression of available thermal energy resulting from current flow. With regard to current limiting fuses and circuit breakers, the ampere squared seconds during fault current interruption represents the energy allowed to flow before the fuse or breaker interrupts the fault current within its current limiting range.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General
   1. Provide OCPDs in indicated types, as integral components of panelboards, switchboards, and motor control centers; and also as individually enclosed and mounted single units.
   2. Enclosures: National Electrical Manufacturers Association (NEMA) 250 "Enclosures for Electrical Equipment (1,000 volts Maximum)."

B. Cartridge Fuses
   1. NEMA Standard FU1, "Low Voltage Cartridge Fuses": Unless indicated otherwise, provide nonrenewable cartridge fuses of indicated types, classes, and current ratings that have voltage ratings consistent with the circuits on which used.
   2. Class J Fuses: Underwriters' Laboratories, Inc. (UL) 198C, "High Interrupting Capacity Fuses, Current Limiting Type".
   3. Class L Fuses: UL 198C, "High Interrupting Capacity Fuses, Current Limiting Type".
   4. Class RK1 and RK5 Dual Element Time Delay Fuses: UL 198E, "Class R Fuses".
   5. Provide a complete set of fuses for all fusible equipment on the job.
   6. All fuses shall be of the same manufacturer and shall have an interrupting rating of 200,000 A, RMS symmetrical, except where otherwise noted.
   7. All fuses shall bear UL label and class designation.
   8. Place fuse identification labels showing size and type of fuse installed inside the cover of each switch or piece of equipment.

9. Fuse voltage shall be as required for the service.
10. Fuses Rated 600A and Less
    a. Fuses which protect motor circuits and transformers shall be time delay type, UL Listed, Class RK-1, except where otherwise noted.
    b. Fuses which are protecting circuit breakers, circuit breaker panels, and resistive heating circuits shall be fast-acting, current limiting type, UL listed, Class J, except where otherwise noted.
11. Fuses Rated Above 600 A
    a. Fuses which protect motor circuits shall be time delay, current limiting type, UL listed, NEMA Class L, except where otherwise noted.
    b. Fuses which are protecting circuit breakers, circuit breaker panels, and resistive heating circuits shall be fast-acting, current-limiting type, UL listed, class L.

C. Circuit Breakers
1. Molded case type, with ampere rating, frame size and number of poles as shown.
2. Comply with the following:
    a. UL 489 "Molded Case Circuit Breakers and Circuit Breaker Enclosures."
    b. NEMA AB 1 "Molded Case Circuit Breakers."
    c. Federal Specification W-C-375.
3. Bolt in type, except breakers 225 ampere frame size and larger may be plug in type if held in place by positive locking device requiring mechanical release for removal.
4. Minimum RMS symmetrical short circuit interrupting capacity rating.
    a. 10,000 Amperes at 120/240V.
    b. 18,000 amperes at 277V.
    c. 35,000 amperes at 480V.
5. Quick make, quick break toggle mechanism.
6. Inverse time-current characteristic overload protection for each pole.
7. Instantaneous magnetic trip element short circuit protection for each pole.
8. Solid state trip device for circuit breaker frame sizes over 250 Amperes.
    a. Independently adjustable long time, short time, and instantaneous trip settings.
    b. Ground fault trip unit where shown, adjustable for pick up and time delay.
    c. Settings adjustable from front of breaker controls and/or plug-in element change.
    d. Indicator for cause of trip.
9. Provide circuit breakers appropriate for applications, including Type SWD for switching fluorescent lighting loads, and Type HACR for heating, air-conditioning, and refrigeration equipment.

D. OCPD Accessories
1. Provide key interlocks where shown.
    a. Arrange interlocking so keys are held captive at devices indicated.
    b. Where future key interlocking provisions are indicated, provide necessary mountings and hardware as required for the future installation.
2. Labels: Install label inside enclosure identifying the type of OCPD installed, its overcurrent rating, its interrupt rating and UL class. Where applicable, trip settings and time delays should be provided on permanent labels.

E. Extra Materials: For types and ratings required, furnish spare fuses, amounting to one fuse for every five installed fuses, but not less than one set of three of each type of fuse.

2.2 MANUFACTURERS

A. Subject to compliance with requirements, provide products by the following:
   1. Cartridge Fuses
      a. General Electric Co.
      b. Littelfuse Inc., Tracor, Inc.
   2. Molded Case Circuit Breakers
      a. Eaton Corporation.
      b. General Electric Company.
      c. Square D Company.
      d. Or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General
   1. Install fuses and circuit breakers as indicated, in accordance manufacturer's written instructions and with recognized industry practices to ensure that protective devices comply with requirements. Comply with the NEC, and NEMA Standards.
   2. Inspect each circuit breaker and fuse visually.
   3. Perform several mechanical ON-OFF operations on each circuit breaker and switch.
   4. Verify circuit continuity on each pole in closed position.

B. Independently Mounted OCPDs: Locate as indicated and install in accordance with manufacturer's written installation instructions.

C. OCPDs in distribution equipment shall be factory installed.

3.2 IDENTIFICATION

A. Identify components in accordance with Division 26, Section “Electrical Identification”.

3.3 CONNECTIONS

A. Check connectors, terminals, bus joints, and mountings for tightness. Tighten field connected connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values. Where manufacturer's torque requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Standards 486A and UL 486B.

3.4 GROUNDING

A. Provide equipment grounding connections for individually mounted OCPD units as indicated and as required by NEC. Tighten connectors to comply with tightening torques specified in UL Standard 486A to assure permanent and effective grounding.

3.5 FIELD QUALITY CONTROL

A. Visual and Mechanical Inspection: Include the following inspections and related work.
   1. Overcurrent Protective Device Ratings and Settings: Verify indicated ratings and settings to be appropriate for final system arrangement and parameters. Where discrepancies are found, test organization shall recommend final protective device ratings and settings. Use accepted revised ratings or settings to make the final system adjustments.
   2. Inspect for defects and physical damage, NRTL labeling, and nameplate compliance with current single line diagram.
   3. Exercise and perform operational tests of all mechanical components and other operable devices in accordance with manufacturer's instruction manual.
   4. Check tightness of electrical connections of OCPDs with calibrated torque wrench. Refer to manufacturer's instructions for proper torque values.
   5. Clean OCPDs using manufacturer's approved methods and materials.
   6. Verify installation of proper fuse types and ratings in fusible OCPDs.

3.6 CLEANING

A. Upon completion of installation, inspect OCPDs. Remove paint splatters and other spots, dirt, and debris. Touch up scratches and mars of finish to match original finish.

3.7 DEMONSTRATION

A. Training: Arrange and pay for the services of factory authorized service representatives to demonstrate OCPDs and train Owner's maintenance personnel.

B. Conduct a minimum of one half day of training in operation and maintenance as specified under "Instructions to Owner Employees" in the "Project Closeout" section of these specifications. Include both classroom training and hands-on equipment operation and maintenance procedures.

C. Schedule training with at least 7 days' advance notification.

END OF SECTION 26 2813

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 2816

ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes
   1. Service disconnecting means.
   2. Feeder and branch-circuit protection.
   3. Equipment disconnecting means.
   4. Motor circuit disconnecting means.

B. Related Sections
   1. Division 01 Section “Submittal Procedures”.
   2. Division 01 Section “Operation and Maintenance Data”.
   3. Division 26 Section “Electrical Identification”.
   4. Division 26 Section “Overcurrent Protective Devices”.

1.3 REFERENCES

A. Unless otherwise stated, references are to the latest edition of the standard.

B. Underwriter's Laboratory, Inc. (UL)
   1. UL 98, Enclosed and Dead Front Switches.
   2. UL 486A-486B, Wire Connectors.

C. InterNational Electrical Testing Association (NETA)
   1. ATS, Acceptance Testing Specifications for Electric Power Distribution Equipment and Systems.

D. National Electrical Manufacturers Association (NEMA)
   1. NEMA KS 1, Enclosed Switches.
   2. NEMA 250, Enclosures for Electrical Equipment (1,000 Volts Maximum).
   3. NEMA AB1, Molded Case Circuit Breakers.

E. National Fire Protection Association (NFPA)
   1. NFPA 70, National Electrical Code (NEC).

1.4 DEFINITIONS

A. Abbreviations
   1. AHJ: Authority having jurisdiction.
   2. NRTL: Nationally recognized testing laboratory.

B. Interior Locations: The following are defined as interior locations:
   1. Any location within the boundaries of the foundation of any building.
   2. Any location within the superstructure of other structures not classified as buildings.

C. Wet Locations: The following are defined as wet locations:
   1. All exterior locations.
   2. All interior locations below grade.
   3. All interior locations where wet materials are processed, pumped, transported, or stored.

D. Corrosive Locations: The following are defined as corrosive locations.
   1. All locations with chemical feed/transfer equipment
   2. All locations with chemical storage tanks
   3. All locations where chemical storage drums are located.

E. Hazardous (Classified) Locations: The following are defined as hazardous (classified) locations.
   1. All hazardous (classified) locations and their hazard classification are shown.

F. Seismic Withstand: When subjected to the specified seismic forces, seismic withstand means:
   1. The unit will remain in place.
   2. No parts will separate from the unit.
   3. The unit will be fully operational after the seismic event.

1.5 SUBMITTALS

A. General
   1. Comply with the requirements of Division 01 Section “Submittal Procedures”.
   2. Submit information as described below.
   3. Provide all information needed to determine compliance.

B. Product Data
   1. Manufacturer’s technical product data sheets.
   2. Delete or cross out all inappropriate or non-applicable information.

C. Shop Drawings
   1. Dimensional drawings for enclosures.
   2. Time-current curves, including selectable ranges for each type of circuit breaker.
   3. Wiring Diagrams: Submit wiring diagrams for all products.
      a. Show all components and features specified.
      b. Differentiate between factory installed and field installed wiring and components.

D. Quality Control Submittals
   1. Manufacturer Seismic Qualification Certification
      a. Submit certification that products will withstand seismic forces defined in Division 26 section, "Seismic Controls for Electrical Work."
      b. Indicate whether certification is based on actual testing calculation.
      c. Identify center of gravity and locate and describe mounting and anchorage provisions on a dimensioned outline drawing.
      d. Provide description of equipment anchorage devices on which certification is based and their installation requirements.
   2. Qualification Data: Submit compliance data for testing agencies.

3. Manufacturer’s Instructions. Submit manufacturer's current installation instructions.

E. Contract Closeout Submittals
1. Project record documents.
2. Operation and Maintenance (O&M) Data
a. Comply with Division 01 section, "Operation and Maintenance Data."
b. Include instructions on start-up, operation, and maintenance.
c. Manufacturer's instructions for testing and adjusting switches and circuit breakers.

1.6 QUALITY ASSURANCE

A. Regulatory Requirements: Perform all work in compliance with the following:
1. All applicable federal, state, and local codes and regulatory requirements.
2. National Electrical Code (NEC).

B. Testing Agency Qualifications
1. Member of NETA.
2. Acceptable to authorities having jurisdiction.
3. Field Supervisor currently certified by the NETA.

C. Product Selection for Restricted Space
1. Drawings indicate maximum dimensions for enclosed switches and circuit breakers.
2. Comply with indicated maximum dimensions.

1.7 MAINTENANCE

A. Extra Materials: Provide extra materials described below:
1. Match products installed.
2. Packaged with protective covering for storage.
3. Identified with labels describing contents.
4. Fuses: Provide 3 fuses of each size used on project.

PART 2 - PRODUCTS

2.1 PRODUCT REQUIREMENTS – GENERAL

A. General
1. Provide new and unused products of current manufacture.
2. Provide products free from defects affecting performance.
3. All units of the same type must be from the same manufacturer.

B. Listing and Labeling
1. Provide UL listed and labeled products.
2. Provide products listed and labeled by an approved independent NRTL.
3. Products not bearing an NRTL label must be pre-approved in writing by the AHJ.
4. Provide a service equipment label on all switches and circuit breakers used as a service disconnecting means.

2.2 MANUFACTURERS

A. Subject to compliance, provide products by one of the following:

1. Cutler-Hammer.
2. Square D Company.
3. Or approved equal.

2.3 ENCLOSED SWITCHES

A. General
1. NEMA KS 1, UL-98.
2. Heavy duty safety switch.
3. Quick make, quick break mechanism.
4. Switch blades visible in OFF position with door open.
5. High conductivity copper current carrying parts and silver tungsten switch contacts.
6. Rated for 60 and 75 degree Celsius wire.

B. Operating Handle
1. Handle down in the off position.
2. Pad-lockable in off position with up to three padlocks.
3. Interlocked with cover to prevent opening cover with switch in closed position.
4. Inconspicuous interlock defeat mechanism.

C. Fusible Switches
1. Positive-pressure reinforced fuse clips.
2. Class R rejection type.
3. Fuses as shown and as specified in Division 26 Section “Overcurrent Protective Devices”.

D. Accessories
1. Neutral lug kit.
2. Ground lug.
3. Auxiliary contact.

2.4 ENCLOSED CIRCUIT BREAKERS

A. General
1. Molded case circuit breaker as shown and as specified in Division 26 Section “Overcurrent Protective Devices”.
2. NEMA AB 1.
3. Mechanical lugs sized for quantity, size, and type of conductors shown on the drawings.
4. Shunt trip coil
    a. Where shown on the drawings.
    b. 120 V energized from separate circuit.
    c. Set to trip at 75 percent of rated voltage.

B. Operating Handle
1. Handle down in the off position.
2. Pad-lockable in off position with up to three padlocks.
3. Interlocked with cover to prevent opening cover with switch in closed position.
4. Inconspicuous interlock defeat mechanism.

C. Accessories
1. Neutral lug kit.

2. Ground lug.
3. Auxiliary contact.

2.5 ENCLOSURES

A. General
1. Wet Locations: NEMA 250, Type 4X stainless steel.
2. Corrosive Areas: NEMA 250, Type 4X non-metallic.
3. Class 1 Hazardous Locations: NEMA 250 Type 7 cast aluminum.
4. All Other Locations: NEMA 250, Type 12 painted steel.

B. Finish: Manufacturer's standard paint factory applied before shipping.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions
1. Examine surfaces that will receive the enclosed switches and circuit breakers.
2. Verify that the project has progressed to a point where this installation may begin.

B. Discrepancies
1. Immediately notify the Engineer in writing is any discrepancies are found.
2. Resolve all discrepancies before proceeding with installation.
3. Resolution must be acceptable to the Engineer.

3.2 PREPARATION

A. Surface Preparation
1. Carefully lay out the work in advance.
2. Perform any cutting, drilling, etc. without damaging the building surfaces or equipment.

B. Rough-in
1. Refer to equipment submittals for rough-in requirements.
2. Verify rough-in locations by field measurements.

3.3 INSTALLATION

A. General
1. Comply with the manufacturer's installation instructions.
2. Install enclosed switches and circuit breakers where shown.
3. Locations shown are approximate unless dimensioned.
4. Coordinate layout and installation with other construction, including conduit.
5. Maintain required workspace clearance.
6. Install motor disconnecting means within sight of the motor.
7. Provide suitable means for mounting enclosed switches and circuit breakers.
8. Remove temporary lifting means and blocking of moving parts.
9. Comply with mounting and anchoring requirements of in Division 26 section, "Seismic Controls for Electrical Work."

B. Connections

1. Tighten connectors and terminals according to manufacturer published torque values.
2. Where manufacturer torque values are not indicated, follow UL 486A-486B.
3. Provide effective and permanent grounding connections.

C. Identification
1. Identify field-installed conductors, interconnecting wiring, and components.
2. Provide warning signs as specified in Division 26 section, "Electrical Identification."
3. Label each enclosure as specified in Division 26 section, "Electrical Identification."

3.4 FIELD QUALITY CONTROL

A. Prepare for Acceptance Tests
1. Test insulation resistance for each enclosed switch and circuit breaker.
2. Test continuity of each line- and load-side circuit.

B. Testing
1. Do not start testing until enclosed switches and circuit breakers are installed and electrical circuitry has been energized.
2. Demonstrate product capability and compliance with requirements.
3. Perform visual and mechanical inspection and electrical test indicated in:
   a. NETA ATS, Section 7.5 for switches.
   b. NETA ATS, Section 7.6 for molded-case circuit breakers.
4. Certify compliance with test parameters.
5. Correct malfunctioning units on-site, where possible.
6. Retest to demonstrate compliance; otherwise, replace with new units and retest.

C. Infrared Scanning
1. Perform an infrared scan of each enclosed switch and circuit breaker.
2. Perform scans after Substantial Completion, but before Final Acceptance.
3. Open or remove doors or panels so connections are accessible to portable scanner.
4. Perform a follow-up scan of each unit 11 months after date of Substantial Completion.
5. Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values.
6. Provide calibration record for device.
7. Prepare certified report identifying equipment checked and describing scanning results.
8. Note deficiencies detected, remedial action taken, and observations after remedial action.

3.5 ADJUSTING

A. Set field-adjustable circuit-breaker trip ranges.

3.6 CLEANING

A. General
1. After completing installation, inspect interior and exterior of enclosures.
2. Remove paint splatters and other spots.
3. Vacuum dirt and debris; do not use compressed air to assist in cleaning.
4. Repair exposed surfaces to match original finish.

END OF SECTION 26 2816

SECTION 26 2913

MOTOR CONTROLLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes
1. Manual motor controllers.
2. Magnetic motor controllers.
3. Combination magnetic motor controllers.
4. Solid-state reduced voltage motor controllers.

B. Related Sections
1. Division 01 Section “Submittal Procedures”.
2. Division 01 Section “Operation and Maintenance Data”.
3. Division 26 Section “Basic Electrical Requirements”.
4. Division 26 Section "Basic Electrical Materials and Methods."
5. Division 26 Section “Grounding”.
6. Division 26 Section “Supporting Devices”.
7. Division 26 Section “Electrical Identification”.
8. Division 26 Section “Control Devices”.
9. Division 26 Section “Overcurrent Protective Devices”.
10. Division 26 Section "Motor Controllers."

1.3 REFERENCES

A. Unless otherwise stated, references are to the latest edition of the standard.

B. Underwriter's Laboratory (UL)
1. UL 508, "Standard for Industrial Control Equipment."

C. National Electrical Manufacturers Association (NEMA)
1. NEMA 250, "Enclosures for Electrical Equipment (1000 Volts Maximum)."
2. NEMA ICS 2, "Industrial Control and Systems: Controllers, Contactors, and Overload Relays Rated 600 Volts."

1.4 DEFINITIONS

A. Abbreviations
1. AHJ: Authority having jurisdiction.
2. NRTL: Nationally recognized testing laboratory.
3. SPDT: Single pole double throw.

B. Seismic Withstand: When subjected to the specified seismic forces, seismic withstand means:
   1. The unit will remain in place.
   2. No parts will separate from the unit.
   3. The unit will be fully operational after the seismic event.

C. Finished Locations: The following are defined as finished locations:
   1. Areas with carpet or tile floors.
   2. Areas with lay-in ceiling tile, fixed ceiling tile, and special architectural ceiling treatment.
   3. Areas with tiled, plastered, or paneled walls.

D. Interior Locations: The following are defined as interior locations:
   1. Any location within the boundaries of the foundation of any building.
   2. Any location within the superstructure of other structures not classified as buildings.

E. Wet Locations: The following are defined as wet locations:
   1. All exterior locations.
   2. All interior locations below grade.
   3. All interior locations where wet materials are processed, pumped, transported, or stored.

F. Corrosive Locations: The following are defined as corrosive locations.
   1. All locations with chemical feed/transfer equipment
   2. All locations with chemical storage tanks
   3. All locations where chemical storage drums are located.

G. Hazardous (Classified) Locations: The following are defined as hazardous (classified) locations.
   1. All hazardous (classified) locations and their hazard classification are shown.

1.5 SUBMITTALS

A. General
   1. Comply with the requirements of Division 01 Section “Submittal Procedures”.
   2. Submit information as described below.
   3. Provide all information necessary to determine compliance.

B. Product Data
   1. Manufacturer’s technical product data sheets for all products specified in this section.
   2. Delete or cross out all inappropriate or non-applicable information.

C. Shop Drawings
   1. Materials List: Submit a list with quantities, manufacturer’s name, and catalog numbers.
   2. Dimensional Drawings: Submit dimensional drawings for all products.
   3. Wiring Diagrams: Submit wiring diagrams for all products.
      a. Show all components and features specified.
      b. Differentiate between factory installed and field installed wiring and components.

D. Quality Control Submittals
   1. Test Reports
      a. Factory test report: Submit results of the required factory test prior to shipment.
      b. Field test report: Submit certified copies of the field test reports.
   2. Manufacturer’s Instructions: Submit manufacturer's current installation instructions.
   3. Manufacturer’s field reports.

4. Training data.

E. Contract Closeout Submittals
1. Project record documents.
2. Operation and Maintenance (O&M) Data
a. Submit O&M manual prior to delivery of the products.
b. Comply with Division 01 Section “Operation and Maintenance Data”.
c. Include instructions on start-up, operation, and maintenance.

1.6 QUALITY ASSURANCE

A. Regulatory Requirements
1. All applicable federal, state, and local codes and regulatory requirements.
2. National Electrical Code (NEC).

1.7 MAINTENANCE

A. Extra Materials
1. Maintenance stock of fuses amounting to one unit for every installed unit.
2. One main control board for every three solid-state reduced voltage controllers provided.

PART 2 - PRODUCTS

2.1 PRODUCT REQUIREMENTS – GENERAL

A. General
1. Provide new and unused products of current manufacture.
2. Provide products free from defects affecting performance.
3. Provide units of the same type all made by the same manufacturer.
4. Provide nameplates complying with Division 26 Section “Electrical Identification”.

B. Listing and Labeling
1. Provide UL listed and labeled products.
2. Provide products that have been listed and labeled by an approved independent NRTL.
3. Products not bearing an NRTL label must be pre-approved in writing by the AHJ.

2.2 MANUAL CONTROLLERS

A. Manual Controllers
1. Sizes and ratings as indicated on the drawings.
2. Manually operated quick make, quick break toggle mechanism.
3. One piece melting alloy type thermal overload unit.
4. Controller inoperative when thermal unit removed.
5. Green pilot light.
6. Capable of being padlocked in the OFF position.

2.3 MAGNETIC CONTROLLERS

A. Magnetic Contactors
1. Three pole unless otherwise shown.
2. Sizes as shown.

3. NEMA ICS 2 and UL 508.
4. Integral NEMA sizes, minimum size 1.
5. Coil rated for 120 Volts unless otherwise shown.
6. Double break silver-alloy contacts.

B. Full Voltage Non-Reversing (FVNR) Magnetic Controllers
1. Magnetic contactor as specified above.
2. NEMA sizes as shown.
3. Solid-state overload relay as specified in article "ACCESSORIES" below.
4. Control power transformer as specified in article "ACCESSORIES" below.
5. Enclosure as specified in article "ACCESSORIES" below.

C. Full Voltage Reversing (FVR) Magnetic Controllers
1. Two magnetic contactors as specified above.
2. NEMA sizes as shown.
3. Contactors electrically and mechanically interlocked to prevent simultaneous closing.
4. Solid-state overload relay as specified in article "ACCESSORIES" below.
5. Control power transformer as specified in article "ACCESSORIES" below.
6. Enclosure as specified in article "ACCESSORIES" below.

D. Two-Speed Two-Winding Magnetic Controller
1. Two magnetic contactors as specified above.
2. NEMA sizes as shown.
3. Contactors electrically and mechanically interlocked to prevent simultaneous closing.
4. Two solid-state overload relays as specified in article "ACCESSORIES" below.
5. Control power transformer as specified in article "ACCESSORIES" below.
6. Enclosure as specified in article "ACCESSORIES" below.

2.4 SOLID-STATE CONTROLLERS

A. Solid-State Reduced Voltage Controllers (SSRV)
1. Provide types, ratings, and NEMA sizes as shown on the Contract Drawings.
2. Suitable for use with standard 3 phase squirrel cage induction motors.
3. Silicon controlled rectifiers (SCRs) for controlling motor voltages during acceleration.
4. On-board diagnostics with light emitting diodes (LEDs) to indicate fault conditions.
5. Isolated, convertible SPDT fault contact output for remote indication.
6. Adjustable current limit.
7. Solid-state overload relay as specified in article "ACCESSORIES" below.
8. Closed loop feedback system to maintain motor acceleration at constant rate.
9. Magnetic contactors as specified above.
    a. Bypass contactor.
    b. Input isolation contactor.
    c. Contactor for isolating power factor correction capacitors from SCRs.

2.5 COMBINATION CONTROLLERS

A. General
1. Motor controller, short-circuit protection, and disconnecting means.
2. Controller as described above (i.e., FVNR, FVR, SSRV).

B. Short-Circuit Protection

1. Fuse, molded-case circuit breaker, or motor circuit protector as shown.
2. As specified in Division 26 Section “Overcurrent Protective Devices”.

C. Disconnecting Means
1. External operating handle with an up-down motion and down position indicating OFF.
2. Lockable in the OFF position with up to three padlocks.

2.6 ACCESSORIES

A. General
1. Mount all accessories in the controller enclosure.
2. If an additional enclosure is required, obtain approval from the Engineer.
3. Construct any additional enclosures equal to the controller enclosure.
4. Provide all required interconnections between the enclosures.
5. Provide equipment nameplates complying with Division 26 Section “Electrical Identification”.

B. Solid-State Overload Relay
1. Current sensor in each phase.
2. Switch selectable for the specific motor full load amperes within the starter range.
3. Running overload protection with time-current characteristics closely paralleling that the motors heating damage boundary
4. Accurate to 2 percent.
5. Selectable overload trip class, 5, 10, 15, 20, and 30.
6. Phase failure protection.
7. Current unbalance trip setting adjustable from 10 to 50 percent.
8. Voltage unbalance trip setting adjustable from 5 to 20 percent.
9. Conformally coated to provide corrosion resistance.

C. Control Power Transformer
1. Provide a control power transformer for each motor controller.
2. Secondary voltage to match coil voltage specified above.
3. Provide control power transformers as specified in Section 260900, Control Devices.
4. Size transformer as required to provide adequate capacity to operate the following:
    a. Motor controller contactor coil.
    b. All other devices connected to the control circuit as shown.

D. Control Components
1. As specified in Division 26 Section “Control Devices”.
2. Type and quantity of control components as shown.
3. For spare controllers or where not shown, provide the following:
    a. Hand-Off-PLC selector switch.
    b. Elapsed time meter.
    c. Green run light.

E. Enclosures.
1. NEMA 250, Type 4X in corrosive locations.
2. NEMA 250, Type 4X in wet locations.
3. NEMA 250, Type 7 in Class I hazardous locations.
4. NEMA 250, Type 12 in all other locations.

2.7 MANUFACTURERS

A. Manufacturers: Subject to compliance, provide product manufactured by one of the following:
   1. Allen-Bradley.
   2. Cutler Hammer.
   3. Square D.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions
   1. Inspect installed work prior to performing the work of this section.
   2. Verify that the project has progressed to a point where this installation may begin.

B. Material inspection.

C. Discrepancies
   1. Immediately notify the Engineer in writing of conditions detrimental to proper completion of the work.
   2. Correct all unsatisfactory conditions before proceeding with installation.
   3. Resolution must be acceptable to the Engineer.

3.2 PREPARATION

A. Surface Preparation
   1. Carefully lay out the work in advance.
   2. Perform any cutting, drilling, etc. without damaging the building surfaces or equipment.

B. Rough-in
   1. Refer to equipment submittals for rough-in requirements.
   2. Verify rough-in locations by field measurements.

3.3 INSTALLATION

A. General
   1. Conform to submittal data.
   2. Conform to arrangements indicated.

3.4 FIELD QUALITY CONTROL

A. Inspecting and adjusting
   1. Provide a manufacturer trained technician to inspect and adjust the equipment.
   2. Adjust motor overload trip setting and class to match motor nameplate.
   3. Adjust voltage and current unbalance settings to protect motor without nuisance trips.
   4. Adjust acceleration and deceleration times to prevent pressure surges in water lines.
   5. Make other adjustments to solid state controllers as required for proper operation.

B. After completion of all inspections, perform field testing.

C. Training

1. Train the Owner's personnel in the operation and maintenance of the products.
2. Complete all testing and adjustments before starting on training.
3. Provide for the services of a manufacturer's representative to perform the training.
4. Provide for a minimum of 4 hours of training for 6 people.

END OF SECTION 26 2913

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 2923

VARIABLE FREQUENCY DRIVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General
   1. Drawings and general provisions of Contract.
   2. General and Supplementary Conditions.
   3. Division 01 Specification Sections.

B. Related Sections. The following sections contain requirements that relate to this section:
   1. Division 26 Section “Motor Control Centers”.
   2. Division 26 Section “Overcurrent Protective Devices”.
   3. Division 26 Section “Control Devices”.
   4. Division 40 Section “Instrumentation – General”.

1.2 DESCRIPTION OF WORK

A. Scope of Work.
   1. Extent of variable frequency drive work is shown on the drawings and specified herein.
   2. Provide all labor, materials, tools, and equipment necessary to perform the work.

B. Section Includes. Materials and equipment specified in this section include the following:
   1. Variable Frequency Drives (VFDs).
   2. Drive Accessories.

1.3 QUALITY ASSURANCE

A. Regulatory Requirements
   1. National Electrical Code (NEC).
   2. All applicable federal, state, and local codes and regulatory requirements.

B. Standards: Materials and workmanship shall conform to the following standards:
   1. National Fire Protection Association (NFPA).
   2. Underwriters' Laboratories, Inc. (UL).
   3. Institute of Electrical and Electronic Engineers (IEEE).
   4. National Electrical Manufacturers Association (NEMA).

C. Qualifications
   1. Manufacturer: Firms engaged in the manufacture of VFDs for not less than 5 years.

1.4 SUBMITTALS

A. Product Data
   1. Manufacturer’s technical product data sheets for the VFD and all accessories.
   2. Delete or cross out all inappropriate or non-applicable information.

B. Shop Drawings
   1. Dimensional drawings showing enclosure size and arrangement of all components.
   2. Wiring diagrams in ladder logic form with terminal and wire numbers. Differentiate between factory installed and field installed wiring and components.
   3. Indicate job name, Owner, location, and date on all shop drawings.

C. Material list giving quantities, manufacturer's name, and catalog numbers.

D. Operation and Maintenance (O&M) Manual with the following:
   1. Maintenance data.
   2. Parts list.
   3. Troubleshooting guide.
   4. Product data
   5. Wiring diagrams.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver VFDs and accessories packaged in factory fabricated containers.

B. Store VFDs and accessories in a clean dry space.

C. Handle variable frequency drives and accessories carefully to avoid damage.

D. Return damaged units to equipment manufacturer and replace with new units.

PART 2 - PRODUCTS

2.1 VARIABLE FREQUENCY DRIVES.

A. General
   1. Provide VFDs of sizes, ratings, and torque characteristics required by the driven equipment.
   2. Provide listed and labeled controllers and components.
   3. All drives on the project shall be the same manufacturer and series/class.
   4. Comply with the following:
      a. NEMA Standard ICS 2, "Industrial Control Devices, Controllers and Assemblies,"
      b. NEMA Standard ICS 3.1, "Safety standards for Construction and Guide for Selection, Installation and Operation of Adjustable Speed Drive Systems."
      c. NEMA Pub No.250, "Enclosures for Electrical Equipment (1000 Volts Maximum)."
      d. UL 508C
   5. Provide drives suitable for use with standard squirrel-cage induction motors having a 1.10 service factor.
   6. Construction
      a. Full wave 6-pulse rectifier section.
      b. Direct current (dc) filter section
      c. Pulse width modulated (PWM) inverter section.

B. Features
   1. Designed to shut down without damage under the following conditions:
      a. Short circuit.

b. Overcurrent.
c. Over voltage.
d. Under voltage.
e. Loss of phase.
f. Over-speed.
g. Power unit over-temperature.

2. Selectable sensor-less vector or Volts per Hertz operating modes.
3. Multiple programmable stop modes including: ramp, coast, dc brake, ramp-to-hold, and s-curve.
4. Energy saving mode to automatically reduce output voltage to a lightly loaded motor.
5. Built-in process control algorithm.
6. Electronic motor overload protection.
7. Input line fuses.
8. Output voltage regulator.
9. Status LEDs for power and communications.
10. Door mounted operator interface with the following features:
    a. Membrane keypad with keys for the following:
        1) Drive programming.
        2) Numeric.
        3) Stop and stop.
        4) Automatic/Manual.
        5) Speed increase/decrease.
    b. Back-lit seven-line, 21 character LCD display.
11. Drive parameters stored in EEPROM and re-settable through the keypad.
12. Password security.
13. Process signal inverter to allow speed of drive to vary inversely with input signal.
14. Three programmable skip frequencies.
15. Capable of picking up a load spinning in either direction without tripping drive.
16. All components factory mounted and wired.
17. User programmable inputs and outputs (I/O).
    a. Minimum of two analog inputs, 4-20 mA, isolated.
    b. Minimum of two analog outputs, 4-20 mA, isolated.
    c. Minimum of six digital inputs, and two relay outputs.
18. Ethernet/IP communications.

C. Sizes and Ratings
1. Input Voltage: 480 Volt, three-phase, ±10%.
2. Input Frequency: 60 Hertz (Hz), ±3 Hz.
3. Displacement Power Factor: Between 1.0 and 0.95 lagging.
4. Efficiency: Greater than 96 percent.
5. Output Voltage: Three phase, variable from 0 to 460V.
6. Output Frequency: Variable from 6 to 400 Hz, minimum.
7. Speed Range: 10:1, step-less.
8. Acceleration/Deceleration Rate: Adjustable from 0 to 3600 seconds.
9. Minimum Frequency: Adjustable from 6 to 30 Hz.
10. Maximum Frequency: Adjustable from 60 to 120 Hz.
11. Current Limit: Adjustable from 100 to 150 percent.
12. PWM Carrier Frequency: Adjustable from 2 to 10 kHz.
13. Ambient Temperature Range: 0 to 40 degrees Celsius.
14. Relative Humidity Limit: 95 percent non-condensing.
15. Constant Torque / Heavy Duty rated (125% of installed motor FLA)

2.2 ACCESSORIES.

A. Control Components
   1. As specified in Division 26 Section "Control Devices," and as shown on the drawings.
   2. If not otherwise shown, provide a Hand-Off-PLC selector switch, fused control power transformer, green run pilot light, and red fault light.

B. Enclosures
   1. Configured as motor control center unit compartment where shown as part of a motor control center.
   2. Mount VFDs in NEMA Type 12 enclosures where not shown as part of a motor control center.
   3. Coat the enclosures with the manufacturer's standard color finish.

C. Drive Accessories
   1. Input line reactor, 3 percent impedance.
   2. Input isolation contactor.
   3. Output dV/dt filter.

2.3 EQUIPMENT/SYSTEM IDENTIFICATION

A. Provide equipment/system identification nameplates complying with Division 26, Section “Electrical Identification”.

2.4 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide VFDs by one of the following:
   1. Allen-Bradley Company.
   2. Eaton Corporation.

PART 3 - EXECUTION

3.1 EXAMINATION

A. General
   1. Examine areas where VFDs are to be installed.
   2. Notify the Engineer in writing of conditions detrimental to proper completion of the work.
   3. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer.

3.2 INSTALLATION

A. General
   1. Install VFDs in accordance with the manufacturer's written instructions and recognized industry practices.
   2. Comply with requirements of NEC, UL and NEMA standards.
   3. Install fuses of sizes indicated in each fusible disconnect switch.
   4. Tighten connectors and terminals in accordance with manufacturer requirements, UL Standards 486A/486B, and the NEC.

B. Grounding
   1. Provide equipment grounding connections for VFDs and enclosure as indicated.
   2. Tighten connections to comply with tightening torque specified in UL Standard 486A/486B.

C. Start-up and Programming
   1. Upon completion of the VFD installation, provide for the services of a certified factory service technician to inspect and approve the installation and to program and start-up the drives.
   2. Program the drive command, set-up, and motor parameter settings to match the requirements of the motor, the control diagrams and control descriptions.
   3. All drive communication programming shall be provided by the System Integrator under Division 40, Section "Instrumentation – General". Provide any information necessary to allow the System Integrator to perform the required programming. Programming shall include all network addressing and the reading from or writing to of a minimum of eight registers in each drive.

D. Testing
   1. Provide all equipment required for testing, start-up and performance verification.
   2. Testing shall be witnessed by the Engineer. The Engineer shall be notified at least 48 hours in advance of testing. The current and voltage and power factor shall be monitored at the motor control center or switchboard feeding the controller being tested. Data shall be collected for each motor at rated load and speed with all motors running at rated load and speed.
   3. Prior to energizing of motor controllers, check with ground resistance tester phase-to-phase and phase-to-ground insulation resistance levels to ensure manufacturer's requirements are met. Units not acceptable shall be replaced.
   4. Harmonic Testing. Testing shall be witnessed by the Engineer. The Engineer shall be notified at least 48 hours in advance of testing. The current and voltage harmonic distortion and power factor shall be monitored at the motor control center or switchboard feeding the controller being tested with a BMI Model 3030 harmonic analyzer or equal. Data shall be collected for each motor at rated load and speed with all motors running at rated load and speed. Sufficient data shall be collected to prepare a report to compare the harmonic content of the system to the calculated values in the analysis submitted in accordance with Part 1 of this specification.

3.3 FIELD QUALITY CONTROL

A. General
   1. Prior to energizing the drives, check the phase-to-phase and phase-to-ground insulation resistance levels with ground resistance tester to ensure that requirements are fulfilled.
   2. Prior to energizing, check circuitry for electrical continuity and for short circuits.
   3. Verify that direction of rotation of each motor is correct.

B. Operational Demonstration
   1. Upon completion of installation of the VFDs, energize drive circuitry and demonstrate proper functioning of the equipment in accordance with requirements.
   2. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and retest to demonstrate compliance.

3.4 TRAINING

A. General
   1. Provide for the services of a manufacturer-trained and certified representative to train the Owner's personnel in the proper operation and maintenance of the VFDs.
   2. Provide training for a minimum of 6 people.
   3. Total training time shall be 4-hours minimum per person.

B. Topics covered shall include:
   1. Safety.
   2. Keypad/display interface.
   3. Programming, setup, and configuration.
   4. Operational indicators.
   5. Faults, diagnostic tools, troubleshooting, and preventive maintenance.

C. Provide documentation for each attendee including equipment manuals, drawings and schematics of equipment supplied for this project.

3.5 ADJUSTING AND CLEANING

A. Adjust operating mechanisms, where necessary, for free mechanical movement.

B. Touch up scratched or marred enclosure surfaces to match original finishes.

END OF SECTION 26 2923

SECTION 26 3213

DIESEL ENGINE GENERATOR

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 specification sections, apply to this section.

B. Related Sections
   1. Division 26 Sections.

1.2 DESCRIPTION OF WORK

A. General: Provide all professional services, labor, tools, equipment, and materials necessary for a complete and functional engine-generator system in accordance with the Drawings and as specified herein

B. Types of equipment specified in this section include:
   1. Engine-generator set
   2. Batteries
   3. Battery charger
   4. Exhaust system
   5. Sub-base fuel tank
   6. Weatherproof/Sound Attenuating Enclosure and anchorage to foundation
   7. Door access stairs and platforms and anchorage to foundation

C. Applications for the engine-generator power supply are:
   1. Plant equipment operation

1.3 QUALITY ASSURANCE

A. Codes: Perform all work in compliance with the following:
   1. All applicable federal, state, and local codes and regulatory requirements.
   2. National Electrical Code (NEC).

B. Standards
   1. National Fire Protection Association (NFPA).
   2. Underwriters' Laboratories, Inc. (UL).
   3. American National Standards Institute (ANSI).
   4. National Electrical Manufacturers Association (NEMA).
   5. Institute of Electrical and Electronic Engineers (IEEE).

C. Qualifications
   1. Manufacturer: Minimum of 5 years experience in the manufacture of engine-generator systems of types, ratings, and characteristics specified. Shall have authorized service center located within 100 miles of project site.

2. Installer: Minimum of 3 years successful installation experience on projects utilizing equipment similar to that required for this project.
3. Professional Engineer:
    a. Generator enclosure, fuel tank, and access platforms and stairs drawings and calculations shall be prepared and sealed by a professional engineer licensed in the state of Ohio and qualified in the specialty involved.

D. System Responsibility
1. Engine-generator system and accessories furnished by a single supplier.
2. Supplier responsible for the performance of the entire system.
3. Responsibility shall not be split among suppliers of individual components.

E. Testing
1. Prototype Test
    a. Performed on the model/series of engine-generator set to be supplied.
    b. Perform the following tests:
        1) Maximum power output.
        2) Maximum motor starting capability.
        3) Transient response and steady state governing.
        4) Single step load pickup per NFPA 110.
        5) Harmonic analysis and wave form deviation per MIL-STD-705B, Method 601.4.
        6) Three phase short circuit test for mechanical and electrical strength.
        7) Alternator temperature rise test per NEMA MG1.
        8) Fuel consumption.
        9) Engine alternator cooling airflow.
        10) Structural soundness.
        11) Torsiograph analysis per MIL-STD-705B, Method 504.2.
2. Factory Tests
    a. General
        1) Test performed prior to shipment.
        2) Test performed under load with all accessories.
        3) Test measurements made with a light beam oscillograph.
        4) Voltage dip and frequency deviation measured during the fourth complete cycle following application of the load.
        5) Tests performed in accordance with the manufacturer's standards.
    b. Tests Performed
        1) Stepped load test at 1/2, 3/4, and full load for 5 minutes each step.
        2) Three-quarter block load.
        3) Full single step block load.
    c. Test criteria
        1) Maximum 15 percent RMS voltage dip during full single step block load test.
        2) Maximum 15 percent frequency deviation during full single step block load test.
        3) Voltage and frequency recovery to within ±3 percent of rated in less than 5 seconds.
3. Field Test
    a. General
        1) Testing conducted by a representative of the supplier.
        2) Testing to commence after completion of all associated work.

3) Load bank, fuel, and all testing equipment provided by the Contractor.
4) Test to be witnessed by the Owner or the Owner's Representative.
5) Notify the Owner or the Owner's Representative at least one week in advance.
6) Repeat the test until the equipment performs as specified.

b. Cold-Start Test
1) Performed using the generator's actual load as a test load.
2) Simulate power failure by opening the normal power disconnecting means.
3) Record the following information:
a) Time delay on start.
b) Cranking on time.
c) Time required to achieve rated speed.
d) Voltage and frequency dip on application of load.
e) Time to achieve steady state.
f) Voltage, frequency, and amps at standby state.
g) Oil pressure, water temperature, and battery charge rate at 5-minute intervals for the first 15 minutes and at 15-minute intervals thereafter for 2 hours.
h) Time delay on retransfer after return of normal power.
i) Cool down time delay.

c. Full-Load Test
1) Test to start after cooling time from cold-start test.
2) Perform a one step full load test using a resistive load bank.
3) Perform test with the load bank connected directly to the generator.
4) Record the following information after applying the load:
a) Time required to achieve rated speed.
b) Voltage and frequency dip on application of load.
c) Time to achieve steady state.
d) Voltage, frequency, and amps at standby state.
e) Oil pressure, water temperature, and battery charge rate at 5-minute intervals for the first 15 minutes and at 15-minute intervals thereafter for 2 hours.

d. Crank Cycle Test
1) Disable generator start by manufacturer approved method.
2) Test the crank cycle by switching the generator to run.

e. Safety Shutdowns: Test all the generator safety shutdowns.

1.4 SUBMITTALS

A. General
1. Comply with the requirements of Division 1 Section "Submittals".
2. Submit information as described below.

B. Product Data
1. Manufacturer's technical product data sheets for all equipment specified in this section.
2. Delete or cross out all inappropriate or non-applicable information.

C. Shop Drawing
1. Dimensional drawings for the engine-generator set and all accessories, including access platforms and anchorages.
2. Mounting details.

D. Wiring Diagrams
   1. Show all components and features specified.
   2. Show all connections to feeders, load, and accessory equipment.
   3. Differentiate between factory and field installed wiring and components.

E. Quality Control Submittals
   1. Submit warranty documents.
   2. Manufacturer's current installation recommendations.
   3. Prototype Test Report
      a. Submit certified performance data and oscillograph plots prior to submitting shop drawings.
      b. If required by the manufacturer, hand deliver confidential data to the Owner's Representative.
      c. After acceptance, the information may be released back to the manufacturer.
   4. Submit factory test report prior to shipment.
   5. Submit certified copies of the field test report.
   6. Operation and Maintenance Manuals
      a. Submit in accordance with Division 01.
      b. Include instructions on storage, installation, start-up, operation and maintenance.
      c. Submit a complete parts list and a recommended spare parts list.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Equipment Storage
   1. Store items furnished under this section until time of installation.
   2. Meet the storage requirements of the manufacturer and supplier.
   3. Do not deliver the stored equipment to the site until it is to be installed.

B. Protection
   1. Use all means necessary to protect the materials and equipment before, during, and after installation
   2. Protect the installed work and materials from the activities of all other trades.

C. Replacements: Immediately repair or replace any damaged equipment.

PART 2 - PRODUCTS

2.1 ENGINE-GENERATOR SET

A. General
   1. UL 2200 rated.
   2. Shall be certified for conformance with Tier 2 non-road emissions regulations.
   3. Provide new equipment, of current manufacture, and free from defects or imperfections affecting performance.
   4. All units of the same type of product shall be from the same manufacturer.
   5. Provide an engine-generator set that is a standard model of the manufacturer.
   6. Design Basis
      a. Design is based on a Kohler engine-generator set.
      b. Any changes to building, ventilation, fuel system, exhaust system, and electrical connections required for proper operation of an engine-generator set shall be the responsibility of the Contractor, without additional cost to the Owner.

7. Sizes, Ratings, and Quantities
    a. Output power: 3000 kilowatts (kW) at 0.8 power factor, minimum.
    b. Output: 6 lead dedicated.
    c. Output voltage: 480Y/277 volt, 3-phase, 4-wire, 60 Hertz at rated speed.
    d. Peak motor starting capacity: 3643kVA @ 15.0% voltage dip.
    e. Steady state frequency regulation: ±0.25 percent.
    f. Maximum frequency dip: 15%.
    g. Altitude rating: 1100 feet above sea level.
    h. Temperature: 104 deg F maximum.
    i. Rated for continuous standby operation.
    j. Single step load pickup: Meet NFPA 110 requirements.

B. Engine and Accessories
1. Engine
    a. Liquid cooled.
    b. Four stroke cycle.
    c. Full compression, diesel for use with No. 2 Ultra low sulfur (ULSD) diesel fuel.
    d. Compression ignited.
    e. Replaceable cylinder liners and not less than 6 cylinders.
    f. Valves shall not require adjustment while in service.
2. Governor: Electronic speed sensing isochronous governor.
3. Starting System
    a. Electric starting motor with starter pinion, 24 volts dc.
    b. Automatically disengage starter after engine starts.
4. Engine Fuel System
    a. Primary and secondary replaceable element fuel filters.
    b. Engine driven, mechanical, positive displacement fuel pump.
    c. Individual, adjustment free injectors for each cylinder.
5. Air Cleaners: Engine mounted, replaceable element, dry type air cleaners.
6. Lubrication System
    a. Positive displacement, mechanical, lubricating oil pump.
    b. Full flow, replaceable element, oil filters.
    c. Liquid cooled oil cooler.
    d. Dipstick oil level indicator.
    e. Spring loaded valve to bypass clogged oil filter.
7. Engine Block Heater: Shall be automatically controlled by an adjustable thermostat, but automatically turn off when the engine is running. Heater shall operate on 208 VAC, single phase.

C. Cooling System
1. Radiator
    a. Engine mounted with pusher type fan.
    b. Duct adapter flange.
2. Coolant: Fill with 50 percent solution of ethylene glycol and water.
3. Coolant Heater
    a. Engine mounted.
    b. Voltage: 208 volt, single phase
    c. Wattage: As required to maintain specified coolant temperature.
    d. Thermostatically controlled.
    e. Oil pressure switch disconnect
    f. Temperature range: 130 deg F to 160 deg F.

D. Alarm Sensing: Provide sensing elements for the following alarms and engine shutdowns:
   1. Low coolant temperature alarm.
   2. Low oil pressure alarm.
   3. Low oil pressure shutdown.
   4. High coolant temperature alarm.
   5. High coolant temperature shutdown.
   6. Over-speed shutdown.
   7. Over-crank lockout.

E. Generator
   1. Construction
      a. Standby duty salient pole, synchronous generator.
      b. Full amortisseur windings.
      c. Drip proof, dual bearing, self-aligning.
      d. NEMA Class F insulation.
      e. Directly connected to the engine through a flexible coupling.
      f. Do not connect the generator neutral to ground at the generator.
   2. Exciter
      a. Brushless rotating exciter with a solid-state full-wave rectifier.
      b. Capacity for 150 percent of required excitation at rated load and voltage.
   3. Voltage Regulator
      a. Solid state.
      b. ±0.5 percent no load to full load regulation during steady state conditions.

F. Engine-Generator Set Controls
   1. General
      a. Control panel mounted on engine-generator set.
      b. Rigid metal enclosure.
      c. Provisions for load cable terminations.
      d. Nameplates to identify each device or function.
   2. Controls
      a. Generator output power thermal-magnetic circuit breaker.
      b. Maintained contact, emergency stop, push button.
      c. Output voltage adjustment potentiometer.
      d. Automatic start-stop cranking controls.
      e. Exercise timer.
      f. Contact for motorized louver, opens when engine begins to crank and closes when engine shuts down.
   3. Indicators
      a. Engine oil pressure.
      b. Coolant temperature.
      c. Engine oil temperature.
      d. Engine hour meter.
      e. Voltmeter, all phase to phase and to ground.
      f. Ammeter, all phases.
      g. Frequency meter.
   4. Alarms
      a. Low engine oil pressure alarm light - red.
      b. Low engine oil pressure shutdown light - red.
      c. High coolant temperature alarm light - red.
      d. High coolant temperature shutdown light - red.

e. Low coolant temperature alarm light - red.
f. Over-crank lockout light - red.
g. Audible alarm and reset button.

G. Base
1. Mount the engine-generator set on a structural steel base.
2. Base shall maintain proper alignment between components during shipment, installation, and operation.
3. The engine-generator set shall be free from torsional stress when running within ±10 percent of rated speed.
4. Vibration Isolators:
a. Provide spring type isolators with rubber backing between base and foundation.
b. Isolators shall provide a minimum of 90 percent isolation.

H. Manufacturers: Subject to compliance with the requirements, provide engine-generator sets manufactured by one of the following:
1. Kohler
2. Caterpillar Tractor Company
3. Cummins/Onan

2.2 ENGINE-GENERATOR SET ACCESSORIES

A. Controller
1. Battery powered.
2. Meeting Level 1 requirements of NFPA 110.
3. Provide the following alarms and controls:
a. Audible alarm and silence button.
b. Lamp test button.
c. Over-crank alarm light.
d. Low coolant temperature alarm light.
e. High coolant temperature pre-alarm light.
f. High coolant temperature shutdown light.
g. Low oil pressure pre-alarm light.
h. Low oil pressure shutdown light.
i. Over-speed light.
j. Low fuel light.
k. Control switch not in auto light.

B. Spare Parts: As recommended by the standby generator system manufacturer.

C. Control power transformer and circuit breaker disconnects inside the generator enclosure for all 120 VAC and 208 VAC circuits on and around the generator system. Install 120 VAC receptacles inside the generator enclosure for the battery charger and maintenance access to the system. One 30A, 208V single phase circuit shall be run to the generator system for all necessary system accessories.

2.3 BATTERY SYSTEM

A. Batteries
1. Lead-acid or AGM.
2. Ampere-hour rating equal to or greater than the manufacturer's recommendations.

3. Capacity for a minimum of three cranking cycles in the ambient temperatures specified.
4. Unit mounted rack for battery mounting.
5. Battery cables of adequate size to prevent voltage drop problems during cranking cycle.
6. Battery heater blanket, 208 volt, to maintain batteries between 50 deg F and 90 deg F.

B. Battery Charger
1. 10 amp, minimum, automatic solid-state battery charger.
2. Float and equalize charge rates.
3. Automatic 24-hour equalizing timer.
4. Automatic line voltage compensation.
5. Output voltage regulation.
6. Capable of fully recharging batteries within 24 hours.
7. Fused input and output.
8. Surge and current limit overload protection.
9. Output ammeter and voltmeter
10. Input voltage on pilot light.
11. Equalize charge light.
12. Alarm relays for connection to the generator annunciator.
    a. Low output voltage
    b. High output voltage.
    c. Current failure.
    d. Input power failure.

C. Manufacturers: Subject to compliance with the requirements, provide equipment manufactured by one of the following:
1. Chloride Incorporated.
2. LaMarche Manufacturing Company.
3. Marathon Battery Company.

2.4 EXHAUST SYSTEM

A. Exhaust Silencer
1. Side inlet.
2. Multi-chambered construction.
3. Critical silencing suitable for residential installation.
4. Sized to assure proper operation without excessive back pressure.

B. Exhaust Piping
1. Minimum 24-inch-long flexible stainless steel connecting pipe
2. Additional exhaust pipe as required.
3. Flanged condensate drain and piping to outside of housing.

C. Manufacturers: Subject to compliance with the requirements, provide equipment manufactured by one of the following:
1. Nelson Industries Incorporated.
2. Riley-Beaird, Inc.
3. York Industrial/Exhaust Silencers.

2.5 SUB-BASE MOUNTED FUEL TANK

A. General

1. UL listed and labeled.
2. Conform to applicable NFPA requirements.
3. Comply with Ohio Fire Code requirements.

B. Construction:
1. Constructed of steel plate of thickness required by applicable standards.
2. Double wall construction.
3. Provide openings for vent, fill, fuel level gauge, supply piping, and return piping.
4. Fabricate tank base to mate with generator base
5. Fabricate tank separately from base and bolt to base after fabrication.
6. Bolt completed tank to the generator skid.
7. Provide a minimum of two inches of air space between that tank and the concrete base.
8. Prime and finish paint complete assembly to match color of engine-generator set.
9. Size tank to hold enough fuel to operate the generator at full load for 24 hours.

C. Accessories
1. Provide vent line to outside with approved cast iron screened rain shield.
2. Leak Detection
   a. Provide an inter-tank leak detector with alarm contact
   b. Provide control panel for local and remote annunciation of leak.
3. Provide fuel level gauge with adjustable low level alarm contacts.

2.6 GENERATOR DISCONNECT SWITCH

A. Provide Molded-case type 100 percent rated with ground fault protection.

2.7 WEATHERPROOF/SOUND ATTENUATING ENCLOSURE

A. General: Completely enclosed weatherproof housing to protect the generator from adverse weather conditions.

B. Design:
1. Structure shall be capable of withstanding controlling effects of gravity and lateral loads following basic and load combination in accordance with Laws and Regulations. Comply with 2017 Ohio Building Code, ASCE 7-10 and referenced standards herein.
2. Site specific snow, wind, and seismic factors are shown on the Drawings.
3. Structure shall be designed to withstand all shipping and erection loads.
4. Generator enclosure is classified as a Risk Category IV per table 1604.5 of the Ohio Building Code for seismic load determination.
5. Seismic Design Category C.

C. Construction
1. Constructed of reinforced sheet steel, primed and painted.
2. Hinged, lockable, removable side panels.
3. Hinged, lockable door over the generator control panel.
4. Louvered vent air openings.
5. Generator silencer mounted inside housing and be designed to limit exhaust noise to below 85 db(A) @ 23 ft. when generator is installed where shown on the Drawings and operating at full load. The seven different locations shall be determined by the Owner.
6. All fasteners shall be stainless steel.

7. Install at least three switch controlled vapor tight incandescent lights inside the enclosure. Light power circuit shall include timer for automatic shut-off.
8. Provide framing, supports, and anchorage to foundation as required to provide access platforms and stairs to all access doors on the enclosure. All framing, grating, and railing shall be aluminum. Anchorage to foundation shall comply with Section 05 0533, Anchor Systems.

PART 3 - EXECUTION

3.1 PREPARATION

A. Inspection
1. Inspect installed work of all other trades prior to performing work of this section.
2. Verify that the project has progressed to a point where this installation may begin.

B. Discrepancies
1. Immediately notify the Engineer in writing if any discrepancies are found.
2. Do not proceed with the installation until all discrepancies have been resolved in a manner acceptable to the Engineer.

3.2 INSTALLATION

A. Engine-Generator Set
1. Provide a concrete pad as shown on the Drawings.
2. Install the generator using the vibration isolators provided with the set.
3. Level the generator set and secure in place as recommended by the manufacturer.

B. Connections
1. Tighten all connections in accordance with manufacturer's published torque values.
2. Where manufacturer's requirements are not indicated, comply with UL Standard 486A.

C. Grounding
1. Do not connect the neutral wire to ground at the generator when using a three-pole transfer switch.
2. Provide a permanent engraved nameplate installed at the location where the generator neutral conductor is connected to a grounding electrode conductor per NEC Article 700-8(b), 701-9(b), or 702-8(a).

D. Spare Parts: Tag all spare parts and store, on the site, as directed by the Owner.

E. Instruction
1. Provide for training by a qualified representative of the manufacturer.
2. Provide a minimum of 1 day of start-up and operation training.
3. Provide a minimum of 1 day of maintenance training.
4. Training will not commence until all required tests have been performed and final approval has been given.

F. Load bank, fuel, and all testing equipment not provided by the generator manufacturer shall be provided by the Contractor. Contractor shall coordinate these requirements with the generator manufacturer.

G. Automatic transfer switch manufacturer's startup technician shall be present during generator startup. Contractor shall coordinate this requirement with both equipment suppliers.

H. Field tests shall be repeated until equipment performs as specified.

I. After startup procedures have been successfully completed and accepted by the Owner, the Contactor shall fill the fuel tank to full capacity.

END OF SECTION 26 3213

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 3600

TRANSFER SWITCHES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to furnish and install transfer switches in accordance with the plans and as specified herein.

B. Types of transfer switches required for the project include the following:
   1. Automatic transfer switches.

C. Extent of transfer switch work, which includes furnishing and installing control devices, is indicated by drawings and schedules and as specified herein

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work to furnish and install transfer switches in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
   1. Electrical Code Compliance: Comply with applicable local electrical code requirements of the authority having jurisdiction and National Electrical Code (NEC) as applicable to construction and installation of electrical power transfer switches.
   2. Underwriters' Laboratories, Inc. (UL) Compliance: Comply with applicable requirements of UL 1008 "Automatic Transfer Switches" and UL 486A "Wire Connectors and Soldering Lugs for Use with Copper Conductors." Provide transfer switches and components which are UL listed and labeled and rated for short circuit interrupt and withstand ratings indicated.
   3. National Electrical Manufacturers Association (NEMA) Compliance: Comply with applicable requirements of NEMA Standard Pub/Nos. ICS 2 "Industrial Control Devices, Controllers and Assemblies," ICS 6 and 250, pertaining to transfer switches.
   4. National Fire Protection Association (NFPA) Compliance: Comply with applicable requirements of NFPA 101 "Code for Safety to Life from Fire in Buildings and Structures" pertaining to transfer switches.
   5. Comply with applicable requirements of NFPA 110 "Emergency and Standby Power Systems.

B. Qualifications
   1. Manufacturer's Qualifications: Firms regularly engaged in manufacture of electrical power transfer switches, of types, ratings, and capacities required, whose products have been in satisfactory use in similar service for not less than 5 years.

2. Installer's Qualifications: Firm with at least 3 years of successful installation experience on projects utilizing electrical power transfer switches similar to that required for this project.

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and materials certifications as required.

B. Submit the following in accordance with conditions of Contract and Division 01 specification sections:
   1. Product Data: Submit manufacturer's data and installation instructions for electrical power transfer switches.
   2. Shop Drawings: Submit layout drawings of electrical power transfer switches showing accurately scaled equipment locations and spatial relationships to associated electrical equipment in proximity.
   3. Wiring Diagrams: Submit elementary control or ladder wiring diagrams for electrical transfer switches, and associated control devices showing connections to prime and alternate power sources, electrical load, and equipment components. Differentiate between portions of wiring that are manufacturer installed and portions that are field installed.
   4. Product Certificates: Signed by manufacturer certifying that products furnished comply with requirements and that switches have been tested for short-circuit closing and withstand ratings applicable to units for Project.
   5. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
   6. Maintenance Data: For each type of product to include in the maintenance manuals specified in Division 01. Include all features and operating sequences, both automatic and manual. List all factory settings of relays and provide relay-setting and calibration instructions.

1.5 DELIVERY, HANDLING, AND STORAGE

A. Deliver transfer switches and associated devices in factory fabricated type containers or wrappings, which properly protect equipment from damage.

B. Handle transfer switches and associated devices carefully to prevent physical damage to equipment. Do not install damaged equipment; remove from site and replace damaged equipment with new equipment.

C. Store transfer switches and associated devices in original packaging, and protect from weather and construction traffic. Wherever possible, store indoors; where necessary to store outdoors, store above grade and enclose with watertight wrapping and only after permission from the A/E.

1.6 SPECIAL WARRANTY

A. General: The transfer switches shall be warranted for a minimum period of 5 years or 1,500 hours, whichever comes first, from the date of final acceptance. Satisfactory warranty documents must be provided. The first year, all travel time, mileage, labor, and parts shall be covered; the second and third years, labor and parts only. The fourth and fifth years, parts only

shall be covered. Such warranty shall be a direct agreement between a specific vendor and the Owner, signed by both the supplier and Owner and delivered via the A/E to the Owner.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General: Except as otherwise indicated, provide manufacturer's standard design, materials, and components as indicated by published product information, designed and constructed as recommended by manufacturer for duty indicated, and as required for a complete installation.

B. Automatic Transfer Switches
   1. Sizes, Ratings, and Quantities: Provide [**3-**] [**4-**]pole automatic transfer switches with [**switching neutral**] [**solid neutral**] voltage and ampere ratings as shown on plan. Switch shall have a short circuit current withstand rating of 50,000 amps RMS symmetrical.
   2. General: Provide automatic transfer switches to automatically transfer the facility load to the generator during power outages. The switches shall be electrically operated, mechanically held units with a neutral position and both electrical and mechanical interlocks to prevent simultaneous energizing of both sides. Switches shall have a manual operating handle with transfer speed equal to automatic operation. The manual operating handle shall be dead front and all power cable, contacts, and lugs shall be covered to protect personnel from injury if the switch is closed into a bolted fault condition. Switches shall be capable of switching both inductive and noninductive loads. All terminals and lugs shall be suitable for copper wire.
   3. Enclosure: The transfer switch shall have a NEMA 1 enclosure. Enclosures for switches 1,000 amps and above shall be freestanding. The enclosure shall have a swing-out service panel, a door lock, and a through-the-door manual operator. The enclosure shall be coated with the manufacturer's standard color acrylic enamel finish over a corrosion resistant primer.
   4. Control Section: All controls for each automatic transfer switch shall be located on a swing out dead front panel with clearly labeled functional names. All voltage sensors, relays, and timers shall be plug-in type with retainer clip. All voltage sensors shall be 3 phase. The switch shall have a contact to start the generator on power failure and a normally open auxiliary contact for both sides of the switch. All control and auxiliary contacts shall be wired to terminal blocks. Provide the following control devices mounted in the front of the panel. Switch shall have voltage sensor on each phase for normal and generator.
      a. A green push-to-test normal position light.
      b. An amber push-to-test neutral position light.
      c. A red push-to-test standby (emergency) position light.
      d. A key operated test/normal selector switch.
      e. A load/no load test selector switch.
      f. A manual/auto selection switch to disable (manual) or enable (auto) power to the electric operator.
   5. Operation Sequence
      a. The switch shall signal the generator to start (adjustable 0 to 3 second time delay) when normal supply voltage falls to less than 70 percent of nominal.
      b. The switch shall transfer the load to the generator after the generator reaches rated voltage and frequency (adjustable 0 to 7 second time delays).
      c. The switch shall transfer the load back to the normal source after return of normal voltage to 90 percent of nominal voltage (adjustable 0 to 30 minute time delay).

d. The switch shall stop in the neutral position for each transfer direction (Range: adjustable 0.5 to 5 seconds.)
e. The switch shall signal the generator to stop after cool down time following transfer back to the normal source (adjustable 1 to 5 minute time delay).
f. The switch shall bypass the time delay and transfer the load back to the normal source if the generator output fails after return of normal power.

6. Accessories
   a. Provide transfer switches with auxiliary control relays which energize when the transfer switch is in the "standby power" position and the generator is running. Relay shall de-energize upon transfer to normal power. Provide six normally closed and two normally open contacts for each relay. One NC contact shall be utilized by each group of elevators. See Division 26 Section “Control Devices”, for relay requirements.
   b. Provide a test and retransfer timing circuit in each transfer switch feeding elevator loads. The circuit shall have a contact for each group of elevators. The contact shall close 20 seconds prior to transferring back from standby to normal power, and open upon transfer completion.
7. Engine Shutdown Contacts: Time delay adjustable from 0 to 5 minutes; factory set at 5 minutes. Initiates shutdown at remote engine-generator controls after retransfer of load to normal source.
8. Engine-Generator Exerciser: Solid-state, programmable-time switch starts engine-generator set and transfers load to it from normal source for a preset time, then retransfers and shuts down engine after a preset cool-down period. Initiates exercise cycle at preset intervals adjustable from 7 to 30 days. Running periods are adjustable from 10 to 30 minutes. Factory-set periods are for 7 days, 20 minutes, and 5 minutes, respectively. Exerciser features include the following:
   a. Exerciser Transfer Selector Switch: Permits selection between exercise with and without load transfer.
   b. Push-button programming control with digital display of settings.
   c. Integral battery operation of time switch when normal control power is not available.

2.2 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide transfer switches of one of the following:
   1. Automatic Transfer Switches
      a. Eaton Corporation
      b. Square D Company
      c. Kohler
      d. Lake Shore Electric Corporation
      e. Russelectric Inc.
      f. Cummins Bridgeway.
      g. ASCO.
      h. Or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Examine areas and conditions under which transfer switches are to be installed and notify the A/E in writing of conditions detrimental to proper completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable to the A/E.

B. Install transfer switches, including associated control devices as indicated, in accordance with equipment manufacturer's written instructions, and with recognized industry practices, to ensure that transfer switches comply with requirements. Comply with applicable requirements of NEC and NFPA pertaining to wiring practices and installation of electrical power transfer switches.

C. Provide and install housekeeping pads for all floor mounted transfer switches.

D. All power wiring shall be lashed and anchored to withstand short circuit currents.

E. Coordinate with other electrical work, including raceways, and electrical boxes and fittings, as necessary to interface installation of transfer switch work with other work.

F. Tighten electrical connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Standards 486A and 486B.

3.2 GROUNDING

A. Provide equipment grounding connections for transfer switch units as indicated. Tighten connectors to comply with tightening torques specified in UL Standard 486A to assure permanent and effective grounding.

3.3 FIELD QUALITY CONTROL

A. Test transfer switches, by means of simulated power outage; automatic start-up by remote automatic starting, transfer of load and automatic shutdown. Prior to these tests, adjust transfer switch timers for proper system coordination.

B. Automatic transfer switch manufacturer’s startup technician shall be present during generator startup. Contractor shall coordinate this requirement with both equipment suppliers.

C. Upon completion of installation and after circuitry has been energized, demonstrate capability and compliance of transfer switches with requirements. Where possible, correct malfunctioning units at site then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting. Initial testing and retesting, where necessary, shall be at no cost to Owner.

3.4 PERSONNEL TRAINING

A. Building Operating Personnel Training: Train Owner's building personnel in procedures for starting up, testing, and operating transfer switches and auxiliary equipment.

END OF SECTION 26 3600

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 4100

LIGHTNING PROTECTION SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and material necessary to install a lightning protection system in accordance with the Plans and as specified herein.

B. Work of this Section includes, but is not limited to:
   1. Lightning protection system.

1.3 QUALITY ASSURANCE

A. General
   1. Provide a complete lightning protection system including all items required for protection against damage by lightning.
   2. Provide a lightning protection system to cover all areas designated on the Drawings.

B. Codes and Standards
   1. The lightning protection system shall comply with the provisions of the latest "Lightning Protection Code" as adopted by the National Fire Protection Association and Underwriters' Laboratories, Inc.
   2. Underwriters' Laboratories Master Label shall be furnished as evidence that the installation has met with U.L. requirements. The installer shall have the Owner sign an application for a UL "Master Label". The 4 inch by 2-1/2 inch brass "Master Label" plate shall be received by the Owner in the mail directly from UL through the Manufacturer of the equipment.

C. Installers Qualifications: The Installer of Work of this Section shall be a firm regularly engaged in this kind of work for the past 5 years and a member of the Lightning Protection Institute.

1.4 DEFINITIONS

A. Air Terminal: Pointed solid rods provided with a proper conductor connection and mounting bracket.

B. Bonding: A connection between a metal object and an element of a lightning protection system to accomplish electrical continuity between the two.

C. Cable: A conductor formed of a number of wires stranded together.

D. Class II Materials: All conductors, fittings and fixtures necessary to protect ordinary buildings and structures exceeding 75 feet in height.

E. Conductors: The portion of a lightning protection system designed to carry the lightning discharge between air terminals and ground.
   1. Main conductors interconnect air terminals and serve as downleads to ground.
   2. Secondary conductors are used to accomplish various bonding and other connections.

F. Copper-clad Steel: Steel with a coating of copper bonded to it. Copperweld.

G. Fastener: An attachment to secure the conductor to the structure.

H. Ground Terminal: That portion of a lightning protection system extending into the earth, such as a ground rod, ground plate or the conductor itself, serving to bring the system into electrical contact with the earth.

I. Labeled: Equipment or materials with an attached label or identifying mark indicating the organization concerned with product evaluation and periodic evaluation of listed equipment and materials used in the lightning protection system.

J. Metal Clad Building: A building or structure with either sides or roof made of or covered with sheet metal.

K. Metal Framed Building: A building with electrically continuous framing of sufficient size and conductivity to be utilized as part of the lightning protection system.

L. Zone of Protection: The zone of protection provided by a grounded air terminal or mast is that adjacent space which is substantially immune to direct strokes of lightning.

1.5 SUBMITTALS

A. General: Submit the following according to the Conditions of the Contract and Division 01 Specification Sections.
   1. Product data for each component. Include electrical ratings, dimensions, mounting position, mounting method, vertical supports, materials, fire stops, and weather stops.
   2. Shop drawings detailing fabrication and installation of busways, including plans, elevations, sections, details of components, and attachments to other construction elements. Detail connections to switchgear, switchboards, and transformers. Detail supports and connections to building.
   3. Design data indicating zone of protection, showing elevations and plans and other factors that influence location of air terminals and down leads.

B. Reference Submittals
   1. Special Guarantees and Warrantees.
   2. Installers Certification.
   3. Material Certification.

PART 2 - PRODUCTS

2.1 LIGHTNING PROTECTION SYSTEM

A. General

1. All materials shall comply in weight, size and composition with the requirements of the Underwriters' Laboratories, Inc., the National Fire Protection Association Code and OSHA relating to the height of the structure.
2. All rods, cables, ground rods, and connectors used in the system shall carry an UL Label "A" & "B" and all lightning air terminals shall carry the Manufacturer's name.

B. Air terminals: Standard 12 inch Government point air terminals, solid copper bronze, nickel plated, with 5/8 inch inside thread with appropriate bronze base mounting bracket and cable clamps.

C. Conductors: Conductors shall consist of commercially pure copper cable, sized in accordance with NFPA Code.

D. Conductor Fasteners: Conductor fasteners shall be an approved type of noncorrosive metal having ample strength to support conductor.

E. Ground Connection: Ground connection shall be of 3/4-inch x 20’- 0" "Copperweld" rod.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General
1. All ungrounded sizable metallic objects within 6 feet of the system or metal connected to the system shall be bonded to the system with approved fittings and conductor.
2. Copper materials connecting to steel shall be lead-coated.
3. Connection between other dissimilar metals shall be made with approved bimetallic connectors.
4. Bonding of all metal Work and ventilators on roof shall be included in the above.
5. Where conductors or air terminals pass through roof, they shall be properly flashed to conform with the roofing requirements.
6. All materials shall be fastened to eliminate any possibility of displacement and subsequent maintenance.
7. Anchor bolts shall be stainless steel expansion type anchor bolts for anchoring to concrete and masonry surfaces.
8. All bolts, nuts and washers furnished with the accessories of the system shall be of a noncorrosive metal compatible with the metals of the accessory and fabricated for the accessory.
9. Clamps, connectors, support brackets and other miscellaneous accessories shall be as recommended by the protection system manufacturer.
10. Secure all points to structure by approved methods. Lightning protection system shall be adhered directly to the roof surface with the adhesive recommended by roofing supplier. Coordinate methods with roofing contractor and provide all wear pads, stripping, battens, heat weld strips or pavers in order to maintain roof warranty.

B. Air Terminals
1. The required number of air terminals shall be provided on parapet walls, perimeter, smoke stacks, chimneys, television antennas, penthouses, etc.
2. Air terminals shall be approved type extending not less than 10 inches above the roof and shall have proper base support for surface on which used and shall be securely anchored to this surface.

3. Air terminals shall not extend higher than 24 inches except with individual approval or as required by OSHA. Terminals 23 inches and less shall be spaced 20 feet apart.
4. Terminals 24 inches and higher shall be spaced 25 feet apart or as required by codes.

C. Conductors:
1. The main conductor routing shall primarily be around and on top of the parapet walls.
2. The down conductors (main conductors down the faces of the structures to the ground rods) shall be surface mounted on the exterior faces of the structures in protected locations (beside pilasters, down spouts or exposed pipes) where possible or otherwise in locations least subject to ground level damage.

D. Conductor Fasteners: Space 3'-0" O.C. max.

E. Ground Connection
1. Drive to the required depth to reach permanent moisture but in no case less than 11'-6". In case of rock ledge or other conditions making compliance impossible, trench or other grounding will be permitted, providing it will pass UL requirements.
2. A minimum of two grounds shall have connection to the water system and structural steel framing of the building.

END OF SECTION 26 4100

SECTION 26 4300

SURGE PROTECTIVE DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. Summary: These specifications describe the electrical and mechanical requirements for a modular, high-energy surge protective devices (SPDs) to be located where shown on the drawings.

B. Related Sections include the following:
   1. Division 26 Section “Wiring Devices”.
   2. Division 26 Section “Switchboards”.
   3. Division 26 Section “Panelboards”.
   4. Division 26 Section “Motor Control Centers”.

C. Standards: The specified system shall be designed, manufactured, tested and installed in compliance with the following codes and standards:
   1. Underwriters Laboratories; UL 1449 3rd Edition 2009 Revision (effective 9/29/2009)
   2. Institute of Electrical and Electronic Engineers (ANSI/IEEE C62.34, C62.41, C62.45)
   3. Institute of Electrical and Electronic Engineers 1100 Emerald Book
   4. Federal Information Processing Standards Publication 94 (FIPS PUB 94)
   5. National Fire Protection Association (NFPA 20, 70, 75 and 780)

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Manufacturers shall submit independent test data from a nationally recognized testing laboratory verifying the following: life cycle testing, overcurrent protection, UL1449 3rd Edition, noise attenuation and surge current capacity. Failure to do so will result in product disapproval.

B. Equipment Manual: The manufacturer shall furnish an installation manual with installation, startup, and operating instructions for the specified system.

C. Drawings: Electrical and mechanical drawings shall be provided by the manufacturer that show unit dimensions, weights, component and connection locations, mounting provisions, connection details and wiring diagram.

1.4 QUALITY ASSURANCE

A. Codes: Perform all work in compliance with NFPA 70, National Electrical Code (NEC) and all applicable federal, state, and local codes and regulatory requirements.

B. Manufacturer: The specified interconnect assembly shall be designed and manufactured in the USA by a qualified manufacturer of SPD products. The manufacturer shall have at least 5 years experience in the design, testing, and manufacturing of surge protective devices.

C. Installer: Minimum of 3 years successful installation experience on projects utilizing equipment similar to that required for this project.

D. Source Limitations: Obtain suppression devices and accessories through one source from a single manufacturer.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.5 PROJECT CONDITIONS

A. Service Conditions: Rate surge protective devices for continuous operation under the following conditions, unless otherwise indicated:
   1. Operating Frequency: 50 or 60 Hz.
   2. Operating Temperature: -40 to 140 deg F.
   3. Humidity: 0 to 95 percent, non-condensing.
   4. Operating Altitude: 0 to 18,000 feet above sea level.

B. Warranty: The manufacturer shall provide a (5) (10)-year full parts replacement warranty

1.6 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Replaceable Protection Modules: One of each size and type installed.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include the following:
   1. Liebert Corp.
   2. Thor Systems, Inc.
   3. Phoenix Contact.
   4. Current Technology.
   5. DEHN.
   6. Protection Technology.

B. The SPD terminals shall accommodate the wire sizes as shown on the drawings.

2.2 REQUIREMENTS

A. Performance Ratings:
   1. Surge Current Capacity – Service Entrance and main distribution panels shall be UL Listed Type 1 SPD with a 200 kA Surge Rating per Mode.

2. Surge Current Capacity –Branch panels shall be UL Listed Type 2 SPDs with a 100 kA Surge Rating per Mode.
3. UL 1449 Nominal Discharge Current: The UL 1449 Nominal Discharge Current Rating shall be 20kA.
4. Protection Modes: The SPD shall provide protection in all modes: L-N or L-L, L-G and N-G (where applicable). Note: L = Line, G = Ground, N = Neutral
5. UL 1449 Voltage Protection Ratings: The maximum UL 1449 listed surge ratings for each and/or all of the specified protection modes shall not exceed the following:

System Voltage	UL 1449 Second Edition SVR				UL 1449 3rd Edition VPR			
	L-N	N-G	L-G	L-L	L-N	N-G	L-G	L-L
120/240	400V	400 v	400 v	800 v	800 v	700 v	900 v	1200 v
120/208	400 v	400 v	400 v	800 v	800 v	700 v	900 v	1200 v
240			800 v	800 v			1200 v	2000 v
277/480	700 v	700 v	700 v	1500 v	1200 v	1200 v	1200 v	2000 v
480			1500 v	1500 v			2000 v	2000 v

B. Life Cycle Testing: The SPD shall be life cycle tested to withstand 10kA (8x20µs), 20kV (1.2x50µs), IEEE C62.41 Category C surge current with less than 5% degradation of clamping voltage. The service entrance and main distribution panel SPDs shall withstand a minimum of 15,000 Category C 10kA Surges per Mode. Branch panel SPDs shall withstand a minimum of 6,000 Category C 10kA Surges per mode.

C. Overcurrent Protection: Fusing: All surge suppression components shall be individually fused and rated to allow maximum specified surge current capacity with an interrupting rating greater than the available short circuit current. Devices that utilize a single fuse to protect two or more suppression paths are not excepted. Replaceable fusing is unacceptable. Overcurrent protection that limits specified surge currents is not acceptable. Where the avialable short circuit current is not shown, the fusing shall be rated for 200kAIC.

2.3 SERVICE ENTRANCE SUPPRESSORS

A. Surge Protective Device Description: Modular design with field-replaceable modules and the following features and accessories:
1. Fuses, rated at 200-kA interrupting capacity.
2. Fabrication using bolted compression lugs for internal wiring.
3. Integral disconnect switch.
4. Redundant suppression circuits.
5. Redundant replaceable modules.
6. LED indicator lights for power and protection status.
7. Audible alarm, with silencing switch, to indicate when protection has failed.
8. One set of Form C contacts, for remote monitoring of protection status.
9. Surge-event operations counter.
10. NEMA 4X Enclosure.

2.4 PANELBOARD SUPPRESSORS

A. Surge Protective Device Description: Modular design with field-replaceable modules and the following features and accessories:
1. Fuses, rated at 200-kA interrupting capacity.
2. Fabrication using bolted compression lugs for internal wiring.
3. Integral disconnect switch.

4. Redundant suppression circuits.
5. Redundant replaceable modules.
6. Arrangement with wire connections to phase buses, neutral bus, and ground bus.
7. LED indicator lights for power and protection status.
8. Audible alarm, with silencing switch, to indicate when protection has failed.
9. One set of Form C contacts for remote monitoring of protection status. Coordinate with building management system.
10. Surge-event operations counter.
11. NEMA 4X Enclosure.

PART 3 - EXECUTION

3.1 INSTALLATION OF SURGE PROTECTIVE DEVICES

A. The installing contractor shall install the SPD with as short of conductors as practically possible and twist the SPD input conductors together to reduce conductor inductance. The contractor shall follow the SPD manufacturer's recommended installation practices as found in the installation, operation and maintenance manual and comply with all applicable codes. Type 2 SPDs shall be connected to circuit breakers or fuses as required by the SPD's UL Listing.

3.2 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A/486B.

3.3 FIELD QUALITY CONTROL

A. Testing: Perform the following field quality-control testing:
   1. After installing surge protective devices, but before electrical circuitry has been energized, test for compliance with requirements.
   2. Complete startup checks according to manufacturer's written instructions.
   3. Perform each visual and mechanical inspection and electrical test stated in NETA ATS, Section 7.19. Certify compliance with test parameters.

B. Repair or replace malfunctioning units. Retest after repairs or replacements are made.

END OF SECTION 26 4300

SECTION 26 5000

LIGHTING FIXTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to work of this Section.

B. Division 26, Section “Basic Electrical Materials and Methods” applies to work specified in this section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to furnish and install lighting fixtures in accordance with the plans and as specified herein.

B. Types of lighting fixtures in this section include the following:
1. Fluorescent.
2. HID.
3. Incandescent.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all to work furnish and install lighting fixtures in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
1. Electrical Code Compliance: Comply with applicable local code requirements of the authority having jurisdiction and National Electrical Code (NEC) as applicable to installation and construction of lighting fixtures.
2. National Electrical Manufacturers Association (NEMA) Compliance: Comply with applicable requirements of NEMA Standard Publication Nos. LE 1 and LE 2 pertaining to lighting equipment.
3. Underwriters' Laboratories, Inc. (UL) Compliance: Comply with UL standards, including UL 486A and B, pertaining to lighting fixtures. Provide lighting fixtures and components which are UL listed and labeled.
4. Certified Ballast Manufacturers (CBM) Labels: Provide fluorescent lamp ballasts which comply with CBM Association standards and carry the CBM label.
5. National Fire Protection Association (NFPA) Compliance: Comply with applicable requirements of NFPA 780, "Lightning Protection Code," pertaining to installation of exterior lighting fixtures.
6. Special Listing and Labeling: For use in damp or wet locations, and combustible construction, provide fixtures specifically listed and labeled for such use.

B. Qualifications
1. Manufacturer's Qualifications: Firms regularly engaged in manufacture of lighting fixtures of sizes, types and ratings required, whose products have been in satisfactory use in similar service for not less than 5 years.

2. Installer's Qualifications: Firms with at least 3 years of successful installation experience on projects with lighting fixture work similar to that required for this project.

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and materials certifications as required.

B. Submit the following in accordance with Conditions of Contract and Division 01 specification sections:
   1. Product Data: Submit manufacturer's product data and installation instructions on each type lighting fixture and component including lamp data.
   2. Shop Drawings: Submit fixture shop drawings in booklet form with separate sheet for each fixture, assembled in "luminaire type" alphabetical or numerical order, with proposed fixture and accessories clearly indicated on each sheet. Clearly indicate all accessories and quantities. Provide dimensioned layout drawings, showing dimensional relationship to structure, for continuous row type fixtures.

1.5 DELIVERY, HANDLING, AND STORAGE

A. Deliver lighting fixtures in factory fabricated containers or wrappings, which properly protect fixtures from damage.

B. Handle lighting fixtures carefully to prevent damage, breaking, and scoring of finishes. Do not install damaged units or components; replace with new.

C. Store lighting fixtures in original wrappings in a clean dry space. Protect from weather, dirt, fumes, water, construction debris, and damage.

1.6 SEQUENCING AND SCHEDULING

A. Coordinate with other work including wires/cables, electrical boxes and fittings, and raceways, to properly interface installation of lighting fixtures with other work.

B. Sequence lighting installation with other work to minimize possibility of damage and soiling during remainder of construction.

PART 2 - PRODUCTS

2.1 GENERAL

A. Provide lighting fixtures, of sizes, types and ratings indicated; complete with, but not limited to, housings, energy efficient lamps, lamp holders, reflectors, energy efficient ballasts, starters, and wiring. Ship fixtures factory assembled, with those components required for a complete installation.
   1. All lighting fixtures shall be in accordance with the Fixture Schedule.
      a. The fixture schedule provides the Manufacturer's fixture catalog series.
      b. The fixture provided shall conform to the description in fixture schedule, the Manufacturer's catalog number, and all provisions of the contract documents.

2. All fluorescent fixtures shall have a code gauge steel housing having a white baked enamel or polyester powder coated finish which shall have a minimum reflectance of 87%, unless otherwise noted.
3. All fluorescent fixtures noted to have 0.125 inch thick pattern 12 lens shall have a maximum prism penetration in the lens of 0.080 inches and shall have a minimum lens weight of 8 ounces per square foot.
4. The Contractor shall provide the fluorescent fixture with the mounting method required for the ceiling system set forth on the architectural Drawings, (such as, the reflected ceiling plans, and room finish schedule) and in Division 09 of the project manual.
5. All surface mounted fluorescent fixtures to be furnished and installed on low density ceilings shall be UL listed for that application.
6. The actual aperture dimension of all incandescent and fluorescent fixtures provided shall be plus or minus 1/2 inch on the nominal value indicated.

2.2 WIRING

A. Provide electrical wiring within fixture as required for UL listing suitable for connecting to branch circuit wiring.

B. Refer to applicable Division 26 sections.

2.3 BALLASTS

A. General: Ballasts shall not have PCB type ballast fill or compound or PCB type capacitors.

B. Fluorescent Ballast
1. All fluorescent fixtures shall have solid state electronic ballasts. Ballasts shall meet the provisions of FCC part 18 for EMI/RFI limits and shall withstand transients as specified by IEEE Publication 587, Category A, ANSI C62.41, Category A.
2. Ballasts shall be UL listed, Class P, sound rated A.
3. Ballasts shall meet the following electrical characteristics:
   a. Input voltage: 277 volt, unless otherwise noted.
   b. Minimum power factor of 0.95.
   c. Maximum total harmonic distortion (THD) of 15%.
   d. Lamp current crest factor of 1.5 or less.
   e. Minimum ballast factor of 0.87.

C. HID Ballasts
1. HID ballasts shall conform to UL 1029 and ANSI C82.4.
2. Provide HID ballasts with the following features:
   a. Constant Wattage Autotransformer (CWA) or regulating high power factor type, unless otherwise indicated.
   b. Operating Voltage: Refer to fixture schedule on plans.
   c. Minimum Starting Temperature: -30 deg C.
   d. Rated Ambient Operating Temperature: 40 deg C.
   e. Equip with a solid-state igniter/starter having an average life in pulsing mode of 10,000 hours at 90 deg C.

2.4 LAMPS

A. Incandescent Lamps: 125 V, inside frosted type except where otherwise noted.

B. Fluorescent Lamps
   1. T8 Rapid Start: T8 rapid start lamps shall be 32 watt and rated 2900 lumens minimum. Lamps shall have a color temperature of 3500 deg K and a minimum color rendering index (CRI) of 70.
   2. Compact Fluorescent
      a. Compact lamps shall be wattage and type as indicated on the fixture schedule.
      b. Biax lamps used in 2-foot x 2-foot fixtures shall have a color temperature of 3500 deg K and a minimum CRI of 80.
      c. Lamps used in downlights shall have a color temperature of 2700 deg K and a minimum CRI of 82.

C. HID Lamps
   1. Provide HID lamps in types and wattage as indicated on the lighting fixture schedule on plans.
   2. HID lamps shall be by the same manufacturer, provide high color-rendering, and high efficiency.
   3. Lamp bases shall mate and match lamp socket configuration.

2.5 EXTRA MATERIALS

A. General: Furnish extra materials matching products installed, as described below, packaged with protective covering for storage, and identified with labels describing contents. Deliver extra materials to the Owner.

B. Lamps: Provide a quantity equal to 10 percent of installed units but no fewer than six of each type.

C. Diffusers and Lenses: Furnish 2 of each type.

D. Ballasts: Furnish 2 of each type.

2.6 ACCEPTABLE MANUFACTURERS

A. Manufacturer: Subject to compliance with requirements, provide products of one of the following:
   1. Fixtures
      a. As indicated on the fixture schedule.
      b. Or equivalent.
   2. Lamps
      a. GE Lighting.
      b. Osram Sylvania.
      c. Philips Lighting Co.
      d. Or approved equal.
   3. Ballasts
      a. Advance Transformer Co.
      b. GE Lighting.
      c. MagneTek, Inc.
      d. Motorola Lighting Inc.
      e. Valmont Electric.
      f. Prescolite.
      g. Robertson.

h. Or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General: Examine areas and conditions under which lighting fixtures are to be installed. Examine substrate/substrata for supporting lighting fixtures. Notify the Owner in writing of conditions detrimental to proper completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to the Owner.

B. Installation
1. Install lighting fixtures at locations and heights as indicated, in accordance with fixture manufacturer's written instructions, applicable requirements of NEC, National Electrical Contractors Association's (NECA) "Standard of Installation," NEMA standards, and with recognized industry practices to ensure that lighting fixtures fulfill requirements.
2. Provide fixtures and/or fixture outlet boxes with hangers to properly support fixture weight. Submit design of hangers, method of fastening, other than indicated or specified herein, for review by the A/E.
3. Support fixtures in/on lay-in type grid ceilings by hangers or wire anchors from the structural ceiling, not from the lay-in grid.
    a. Exception: For recessed cans the cans shall be equipped with bar hangers with integral slots for mounting directly to the T-BAR Grid. In addition, all four corners of the T-BAR Grid shall be supported from the structural ceiling by hangers or wire anchors.
4. Install flush mounted fixtures properly to eliminate light leakage between fixture frame and finished surface.
5. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Standards 486A and B, and the NEC.
6. Structurally support surface-mounted fixtures greater than 2 feet in length at a point in addition to the outlet box fixtures stud.
7. Box-mounted fixtures shall be mounted directly to the mounting ears of the outlet box.
8. Connections to each recessed fixture shall be made with 1/2 inch minimum flexible conduit more than 4 feet and less than 6 feet in length from fixture to outlet box.
9. All splices shall be carefully placed in outlet boxes or wiring gutters with no crowding.
10. Plaster frames shall be supplied by the Contractor where necessary.
11. No circuit other than the one feeding the fixture shall be pulled through a fluorescent fixture.

3.2 GROUNDING

A. Provide ground to all lighting fixtures. Provide equipment grounding connections for exterior lighting fixtures as indicated. Tighten connections to comply with tightening torques specified in UL Standard 486A to assure permanent and effective grounds.

3.3 ADJUSTING AND CLEANING

A. Aim adjustable lighting fixtures and lamps. Verify aiming requirements as indicated in the lighting fixture schedule.

B. Clean lighting fixtures of dirt and debris upon completion of installation.

C. Protect installed fixtures from damage during construction period.

3.4 FIELD QUALITY CONTROL

A. Replacement: At Date of Substantial Completion, replace lamps in lighting fixtures which are observed to be noticeably dimmed after Contractor's use and testing, as judged by the Owner.
   1. Refer to Division 01 sections for the replacement/restoration of lamps in lighting fixtures, where used for temporary lighting prior to Date of Substantial Completion.

3.5 DEMONSTRATION

A. Upon completion of installation of lighting fixtures, and associated electrical supply circuitry, apply electrical energy to demonstrate capability and compliance with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting. Give the Owner advance notice of dates and times for all field tests.

END OF SECTION 26 5000

SECTION 28 3100

FIRE ALARM SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to work of this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to furnish and install a complete fire alarm systems in accordance with the plans and as specified herein.

B. Work of this Section includes, but is not limited to, the following:
   1. Manual stations.
   2. Smoke detectors.
   3. Heat detectors.
   4. Duct detectors.
   5. Horns/speakers.
   6. Visual alarm signals.
   7. Control/monitor address modules.
   8. Magnetic door holders.
   9. Silent alarm pushbuttons.
   10. Remote annunciator panels.
   11. Remote device location indicating lights.
   12. Fire alarm control panel (FACP).
   13. Emergency power supplies.
   14. Printers.

C. System Description
   1. General: Zoned, noncoded, addressable, microprocessor-based system with automatic alarm initiation, analog addressable smoke detectors, and automatic alarm verification for alarms initiated by smoke detectors.
   2. Signal Transmission: Multiplex signal transmission dedicated to fire alarm service only.
   3. Audible Alarm Indicators: By voice alarm messages and tone signals on horns and ceiling speakers.
   4. Visual Alarm Indication: By xenon-strobe-type units.
   5. Systems Connections for Alarm-Indicating and Alarm-Initiating Circuits: Class B wiring.

1.3 QUALITY ASSURANCE

A. Installer Qualifications:
   1. Engage an experienced factory-authorized installer to perform work of this Section.
   2. Submit the names and locations of at least two installations where the Contractor or the subcontractor has installed such systems.

3. The Contractor shall indicate the type and design of these systems and certify that these systems have performed satisfactorily for at least 18 months.

B. Single-Source Responsibility: Obtain fire alarm components from a single source who assumes responsibility for compatibility of system components.

C. Compliance with Local Requirements: Comply with the applicable building code, local ordinances, and regulations, and the requirements of the authorities having jurisdiction.

D. Comply with NFPA 70 and NFPA 72.

E. Comply with the "Americans with Disabilities Act" (ADA).

F. Listing and Labeling: Provide fire alarm systems and components specified in this Section that are listed and labeled by Underwriters' Laboratories, Inc. (UL).
1. The Terms "Listed" and "Labeled": As defined in the National Electrical Code, Article 100.
2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.

G. Factory Mutual (FM) Compliance: Provide fire alarm system and components that are FM approved.

1.4 SUBMITTALS

A. General: Submittals required by this Section shall be made according to the Conditions of the Contract and Division 01 Specification Sections.

B. Submit product data for each type of proposed system component specified, including dimensioned drawings showing minimum clearances and installed features and devices. Include list of materials and NRTL-listing data.

C. Submit Shop Drawings showing detailed drawings of control panel(s), command centers, expander panels, multiplexers, fire fighter telephone cabinets and remote annunciator panels.

D. Submit wiring diagrams from manufacturer differentiating clearly between factory and field-installed wiring. Include diagrams for each component of the system with all terminals and interconnections identified. Make all diagrams specific to this Project.

E. Submit floor plans that indicate device locations, interconnecting wiring, and routings of raceways.

F. Submit a device address list to coordinate the final system programming.

G. Submit a system operation description covering this specific Project, including method of operation and supervision of each type of circuit and sequence of operations for all manual and automatically initiated system inputs and outputs. Manufacturer's standard descriptions for generic systems are unacceptable.

H. Submit calculations for battery capacity for both alarm and supervisory modes.

I. Submit voltage drop calculations for each indicating circuit.

J. Submit product certificates signed by the manufacturer of fire alarm system components certifying that their products comply with specified requirements.

K. Submit agenda for training class and copies of all handouts for the class.

L. Maintenance data for fire alarm systems shall be included in the operation and maintenance manual specified in Division 01. Include data for each type of product, including all features and operating sequences, both automatic and manual. Provide the names, addresses, and telephone numbers of service organizations that carry stock of repair parts for the system to be furnished.

M. Record of field tests of the fire alarm system shall be included in the operation and maintenance manuals.

N. Submission to Authorities Having Jurisdiction: In addition to routine submission of the above material, make an identical submission to the Authorities Having Jurisdiction (AHJ). Include copies of annotated Contract Drawings as needed to depict component locations to facilitate review. Upon receipt of comments from the authorities having jurisdiction, submit them for review. Resubmit if required to make clarifications or revisions to obtain approval.
   1. Certification: The fire alarm system supplier shall provide the AHJ with shop drawings and a certificate indicating that the system is designed and installed in compliance with the binding State code, and the appropriate acceptance tests have been conducted and approved. Shop drawings shall be sealed and signed by a certified Fire Alarm System Designer, registered in the State where the system will be installed.
   2. Submit evidence that the fire alarm system supplier and the certified Fire Alarm System Designer have reviewed the approved shop drawings for all HVAC and fire alarm systems required on the project. This review shall ensure that all required components to interface these systems to the fire alarm system have been checked for compatibility and are shown on the shop drawings submitted herein.

1.5 JOB CONDITIONS

A. Examine areas and conditions under which fire alarm system components are to be installed, and substrate which will support equipment. Notify Engineer in writing of conditions detrimental to proper completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer.

1.6 DELIVERY, HANDLING, AND STORAGE

A. Deliver fire alarm system components in factory fabricated containers or wrappings, which properly protect products from damage.

B. Handle fire alarm system components carefully to prevent breakage, denting and scoring finish. Wrap finished cabinets individually, in heavy containers for protection in transit. Do not install damaged units or components; replace with new.

C. Store fire alarm system components in original cartons in well ventilated space protected from moisture, construction traffic and debris.

1.7 WARRANTY

A. Manufacturer's Warranty
   1. Period: 1 year
   2. The Manufacturer shall warrant to repair or replace, without cost or undue hardship to the Owner, all of the Manufacturer's Work that is found to be defective, that is not in accordance with the Contract Documents, that fails to performs as represented by the Manufacturer's published product information, or that does not meet generally recognized standards of quality or performance for such Work, whichever is greater. Such warranty shall include the removal and replacement, without cost or undue hardship to the Owner, all other Work which is damaged as a result of removal or replacement of the Manufacturer's Work which is defective or nonconforming or nonperforming, as set forth above. Any labor or parts required during warranty shall be at no charge to the Owner.

1.8 SEQUENCING AND SCHEDULING

A. Coordinate with other electrical work including wires/cables, electrical boxes and fittings, and raceways, to properly interface installation of fire alarm system work with other work.

B. Sequence fire alarm installation work with other work to minimize possibility of damage and soiling during remainder of construction period.

1.9 MAINTENANCE SERVICE

A. Maintenance Service Contract: Provide maintenance of fire alarm systems and equipment for a period of 12 months following the Manufacturer's warranty using factory authorized service representatives.
   1. Basic Services: Systematic, routine maintenance visits on a biannual basis at times coordinated with the Owner. In addition, respond to service calls within 24 hours of notification of system trouble. Adjust and replace defective parts and components with original manufacturer's replacement parts, components, and supplies.
   2. Additional Services: Perform services within the above 12 month period not classified as routine maintenance or as warranty work when authorized in writing. Compensation for additional services must be agreed upon in writing prior to performing services.
   3. Renewal of Maintenance Service Contract: No later than 60 days prior to the expiration of the maintenance services contract, deliver to the Owner a proposal to provide contract maintenance and repair services for an additional 1 year term. Owner will be under no obligation to accept maintenance service contract renewal proposal.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements, provide products by one of the following:
   1. Siemens Fire Safety.
   2. Simplex/Grinnell.
   3. Notifier by Honeywell.
   4. Thorn Security by Tyco International.
   5. GE Fire & Life Safety.

2.2 FUNCTIONAL DESCRIPTION OF SYSTEM

A. Include the following system functions and operating features plus those additional functions and features required by the authorities having jurisdiction:
   1. Priority of Signals: Accomplish automatic response functions by the first zone initiated. Alarm functions resulting from initiation by the first zone shall not be altered by subsequent alarms. The highest priority shall be an alarm signal. Supervisory and trouble signals shall have second- and third-level priority. Higher-priority signals shall take precedence over signals of lower priority, even though the lower-priority condition occurred first. Annunciate all alarm signals regardless of priority or order received.
   2. Non-interfering: Zone, power, wire, and supervise the system so a signal on one zone does not prevent the receipt of signals from any other zone. All zones shall be manually resettable from the FACP after the initiating device or devices are restored to normal. Systems that require batteries or battery back-up for the programming function are unacceptable.
   3. Fire Alarm Control Panel (FACP) Response: The manual or automatic operation of an alarm-initiating or supervisory-operating device shall cause the FACP to transmit an appropriate signal including the following:
      a. General alarm.
      b. Fire-suppression system operation alarm.
      c. Smoke or heat detector alarm.
      d. Valve tamper supervisory.
      e. Fire pump power supervisory.
      f. Elevator recall.
      g. Elevator shutdown.
      h. System trouble.
      i. Fan shutdown.
   4. Silencing at the FACP: Switches shall provide capability for acknowledgment of alarm, supervisory, trouble, and other specified signals at the FACP; and capability to silence the local audible signal and light a light-emitting diode (LED). Subsequent zone alarms shall cause the audible signal to sound again until silenced by switch operation. Restoring alarm, supervisory, and trouble conditions to normal shall extinguish the associated LED and cause the audible signal to sound again until restoration is acknowledged by switch operation.
   5. Loss of primary power at any fire alarm panel (FACP, FAXP, FMUX, FFTC, etc.) shall sound a trouble signal at the FACP and each annunciator. An "emergency power" light shall illuminate at all panel locations when the system is operating on an alternate power supply.
   6. Annunciation: Manual and automatic operation of alarm and supervisory initiating devices shall be annunciated on the FACP and on each remote annunciator, indicating location and type of device.
   7. FACP Alphanumeric Display: Shall display plain-English-language descriptions and addresses of initiating devices, alarms, trouble signals, supervisory signals, monitoring actions, system and component status, and system commands.
   8. General Alarm: The fire alarm system general alarm shall include the following:
      a. Indicate the general alarm condition at the FACP and each annunciator.
      b. Identify the device that is the source of the alarm (or its zone) at the FACP and each annunciator.
      c. Initiate audible and visible alarm signals throughout the building.
      d. Release specific door security electric latches and magnetic door locks via the door security system control panels.
      e. Stopping supply and return fans serving zone where alarm is initiated.
      f. Closing smoke dampers on system serving zone where alarm is initiated.

g. Record the event on the system printer.
h. Provide 120VAC Form C contact output at Fire Alarm Control Panel to annunciate a General Alarm condition.

9. Manual station alarm operation shall initiate a general alarm.
10. Water-flow alarm switch operation shall cause the following:
    a. Initiate a general alarm.
    b. Activate the location-indicating light causing it to flash for the device that has operated.
    c. Print a record of the event on the system printer.
11. Smoke detection activation shall cause the following:
    a. Audible and visible indication of an "alarm verification" signal at the FACP.
    b. Activate a listed and approved "alarm verification" sequence at the FACP and the detector.
    c. Closure of associated smoke dampers for specific smoke detectors indicated should alarm be verified.
    d. Upon activation of a smoke detector in the elevator lobby, shaft, or equipment room, initiate a signal to capture the elevators. Also provide alternate floor capture signal to re-direct the elevators to a secondary level should the detector at the primary floor level be an alarm.
        1) Verify assignment of primary and alternate floor with local Fire Marshall prior to programming system.
    e. Record the event on the system printer.
    f. Initiate a general alarm if the alarm is verified.
    g. FACP indication cancellation and system reset if the alarm is not verified.
12. Duct smoke detection activation shall cause the following:
    a. Audible and visible indication of an "alarm verification" signal at the FACP.
    b. Activate a listed and approved "alarm verification" sequence at the FACP and the detector.
    c. Shut-down of associated air handler/VAV fan motor should alarm be verified.
    d. Record the event on the system printer.
    e. Initiate a general alarm if the alarm is verified.
    f. FACP indication cancellation and system reset if the alarm is not verified.
13. Sprinkler valve tamper switch operation shall cause the following:
    a. A supervisory, audible, and visible "valve tamper" signal indication at the FACP and each annunciator.
    b. Activate the location-indicating light causing it to flash for the device that has operated.
    c. Print a record of the event on the system printer.
14. Fire pump running, power failure, phase-reversal, supervisory power available, and alarm silence condition, shall cause the following:
    a. A supervisory, audible, and visible indication at the FACP and each annunciator.
    b. Print a record of the event on the system printer.
15. Low-air-pressure switch operation on a dry pipe or preaction sprinkler system shall cause the following:
    a. A supervisory, audible, and visible indication at the FACP and each annunciator.
    b. Print a record of the event on the system printer.
16. Remote Detector Sensitivity Adjustment: Manipulation of controls at the FACP shall cause the selection of specific addressable smoke detectors for adjustment, display their current status and sensitivity settings, and control changes in those settings. The same controls shall be capable to program repetitive, scheduled, automated changes in

sensitivity of specific detectors. Sensitivity adjustments and sensitivity adjustment schedule changes shall be recorded on the system printer.

B. Recording of Events: The system printer shall print a record of all alarm, supervisory, and trouble events. Printouts shall be by zone, device, and function. When the FACP receives a signal, the alarm, supervisory, and trouble conditions shall be printed. The printouts shall include the type of signal (alarm, supervisory, or trouble) the zone identification, date, and the time of the occurrence. The printouts shall differentiate alarm signals from all other printed indications. When the system is reset, this event shall also be printed, including the same information for device, location, date, and time. A command shall initiate the printout of a list of existing alarm, supervisory, and trouble conditions in the system.

C. Permissible Signal Time Elapse: The maximum permissible elapsed time between the actuation of any fire alarm or fire-detection system alarm-initiating device and its indication at the FACP shall be 3 seconds.

D. Circuit Supervision: Circuit faults shall be indicated by a trouble signal at the FACP utilizing a distinctive indicating audible tone and LED-indicating light. The maximum permissible elapsed time between the occurrence of the trouble condition and its indication at the FACP shall be 200 seconds.

2.3 ADDRESSABLE DEVICES

A. Alarm-Initiating Devices: Classified as addressable devices according to NFPA 72.
   1. Communication Transmitter and Receiver: The communication transmitter and receiver shall be integral to the device, providing each device with a unique identification capable of status reporting to the FACP.
   2. External Addressable Interface Unit: External units shall be used where specified devices are not manufactured and labeled with integral multiplex transmitter and receiver. Program to monitor status of each device individually.

2.4 ADDRESSABLE MANUAL PULL STATIONS

A. Description: Double-action type, fabricated of metal or plastic, and finished in red with molded, raised-letter operating instructions of contrasting color.
   1. Break-Glass Feature: Stations requiring the breaking of a glass panel are unacceptable. Stations requiring the breaking of a concealed glass rod are acceptable.
   2. Station Reset: Key operated, double pole, double throw, switch rated for the voltage and current at which it operates. Stations shall have screw terminals for connections.

2.5 ADDRESSABLE SMOKE DETECTORS

A. General: Comply with UL 268. Include the following features:
   1. Factory Nameplate: Serial number and type identification.
   2. Operating Voltage: 24-V dc, nominal.
   3. Self-Restoring: Detectors shall not require resetting or readjustment after actuation to restore them to normal operation.
   4. Plug-in Arrangement: Detector and associated encapsulated electronic components shall be mounted in a module that connects to a fixed base with a twist-locking plug connection. The plug connection shall not require springs for secure mounting and contact maintenance. Terminals in the fixed base shall accept building wiring.

5. Integral Visual Indicating Light: Indicates detector has operated.
6. Remote Controllability: Individually monitored at the FACP for calibration, sensitivity, and alarm condition, and individually adjustable at the FACP for sensitivity.

B. Photoelectric Smoke Detectors: Include the following features:
1. Detector Sensitivity: Between smoke obscuration when tested according to UL 268.
2. Sensor: Infrared detector light source with matching silicon-cell receiver.

C. Duct Smoke Detector: Include the following features:
1. Detector: Photoelectric type with adjustable sensitivity.
2. Sampling Tube: Design and dimensions as recommended by the manufacturer for the specific duct size and installation conditions where applied.
3. Fan Shutdown Relay: Rated to interrupt fan motor-control circuit. Where fan's shut-down circuitry requirements exceeds rating of relay contacts, provide an interposing relay at the smoke detector to accomplish shut-down.

2.6 ADDRESSABLE HEAT DETECTORS

A. Addressable Thermal Detector: Combination fixed-temperature and rate-of-rise unit with mounting plate arranged for outlet box mounting; 135 deg F fixed-temperature setting, except as indicated. The device shall be capable of transmitting an up-to-date temperature reading at the fire alarm control panel.

2.7 ALARM-INDICATING DEVICES

A. General: Equip alarm-indicating devices for mounting as indicated. Provide terminal blocks for system connections. All devices shall comply with ADA.

B. Visual Alarm Devices: Xenon strobe lights with clear polycarbonate lens. Lenses shall be mounted on a metallic faceplate. The word "FIRE" shall be engraved in minimum 1-inch high letters on the device.
1. Strobe light candle rating shall be selected and installed in accordance with NFPA/ANSI Standards and shall provide Equivalent Facilitation outlined under ADA Accessibility Guidelines by meeting or exceeding the effective illumination of 75 candela at 50 feet.
2. Candela ratings and area served shall be as follows:
   a. 15 candela units: Spaces up to 20-foot x 20-foot.
   b. 30 candela units: Spaces up to 30-foot x 30-foot.
   c. 60 candela units: Spaces up to 40-foot x 40-foot.
   d. 95 candela units: Spaces up to 50-foot x 50-foot and larger

   NOTE: Where manufacturer's standard product does not match those ratings listed above, the manufacturer's next higher rated unit shall be utilized.

3. Strobe Leads: Factory connected to screw terminals.
4. Combination devices shall consist of a factory-combined, audible and visual alarm unit in a single mounting assembly.
5. All strobe lights in each building shall be provided with a synchronized flash feature.

C. Voice/Tone Speakers: Comply with UL 1480.
1. Matching Transformer: 25 and 70 VRMS inputs
2. Taps: 1/4, 1/2, 1, and 2 watts

3. Speaker: 4-inch cone type with 4.8 oz. ceramic magnet
4. Mounting: Flush, ceiling mount with backbox and tile bridge.
5. Mounting: Semi-recessed wall mount in combination A/V units.
6. Baffle: Metal baffle painted white, 6-inch diameter.

2.8 REMOTE DEVICE LOCATION-INDICATING LIGHTS AND IDENTIFICATION PLATES

A. Description: Provide an LED-indicating light in the vicinity of each sprinkler water-flow switch, valve tamper switch, and duct mounted smoke detector to denote the associated device is in an abnormal or trouble mode. Lamp shall be flush mounted on a single gang wall plate. Provide a red, laminated, phenolic-resin identification plate at the indicating light identifying, in engraved white letters, the room where the valve is located or the protected spaces downstream from the water-flow switch.

2.9 MAGNETIC DOOR HOLDER

A. Provide a two-piece electromagnetic door holder designed to secure a door in the open position. Provide device with the following features:
1. Flush wall mount, low-profile magnet.
2. Operating voltage compatible with power supply of FACP.
   a. Three position wiring terminal block (common, low voltage, high voltage) with ground.
3. Door mounted strike with self-adjusting swivel catch plate.
   a. Two-point pivot.
   b. Surface mounted back-plate for strike (hollow doors only).
4. Holding force of 25 pounds minimum.
5. Low residual magnetism.
6. Cast metallic housing for magnet and strike assemblies.
   a. Finish: chrome.

2.10 SILENT ALARM PUSHBUTTONS

A. Provide a surface mounted silent alarm pushbutton assembly with the following features:
1. Two large levers on either side of the switch.
2. Both levers must be depressed simultaneously to activate the switch.
3. Lock-in mechanism with key reset.
4. Indicator to show switch has activated.
5. Metallic housing with screw holes for surface installation.
6. SPDT contacts.

2.11 FIRE ALARM CONTROL PANEL (FACP)

A. General: Comply with UL 864.

B. Cabinet: Lockable steel semi-recessed enclosure. Panel shall be arranged so all operations required for testing or for normal care and maintenance of the system are performed from the front of the enclosure. If more than a single unit is required to form a complete control panel, exactly matching modular unit enclosures shall be provided. Accommodate all components and allow ample gutter space for interconnection of panels and field wiring. Identify each enclosure with an engraved, red, laminated, phenolic-resin nameplate. Lettering on the enclosure's

nameplate shall not be less than 1 inch high. Identify individual components and modules within the cabinets with permanent labels.

C. Systems: Alarm and supervisory systems shall be separate and independent in the FACP. The alarm-initiating zone boards in the FACP shall consist of plug-in cards. Construction requiring removal of field wiring for module replacement is unacceptable.

D. Control Modules: Types and capacities required to perform all functions of the fire alarm systems. Local, visible, and audible signals shall announce alarm, supervisory, and trouble conditions. Each type of audible alarm shall have a different sound.

E. Zones: Provide for all alarm and supervisory zones indicated.

F. Indicating Lights: A single LED test switch for each FACP section shall be provided to illuminate all LED indicators on that section of the control panel. Alarm and supervisory signal lights shall utilize red LEDs. Trouble signal lights shall utilize amber LEDs.

G. Resetting: Provide the necessary controls to prevent the resetting of any alarm, supervisory, or trouble signal while the alarm or trouble condition still exists.

H. Alphanumeric Display and System Controls: Arranged to provide the basic interface between human operator at the FACP and the addressable system components, including annunciation, supervision, and control. Provide a display with a minimum of 32 characters to indicate alarm, supervisory, component status messages, and control commands entered into the system for control of smoke detector sensitivity and other parameters. Provide a keypad for use in entering and executing control commands.

I. Voice Alarm: Provide an emergency communication system, integral with the FACP, including central voice alarm system components complete with microphones, preamplifiers, amplifiers, and tone generators. Features shall include the following:
   1. Amplifiers shall comply with UL 1711.
   2. The system shall be capable of broadcasting a general alarm prerecorded voice message and simultaneously broadcasting a live voice evacuation message to selected zones via the fire fighter's zone selected switches and the central control microphone.
   3. All announcements shall be made over dedicated, supervised communication lines.
   4. Provide status annunciators to indicate the status of the various voice alarm speaker zones and the status of firefighter telephone 2-way communication zones.

J. Instructions: Printed or typewritten instruction cards shall be mounted behind a lexan plastic or glass cover in a stainless-steel or aluminum frame. Install the frame in a location observable from the FACP. The instruction card(s) shall include interpretation and appropriate response for displays and signals, and briefly describe the functional operation of the system under normal, alarm, and trouble conditions.

2.12 FIRE ALARM MULTIPLEXER PANEL (FMUX)

A. General: Comply with UL 864.

B. Cabinet: Lockable steel surface mounted enclosure. Panel shall be arranged so all operations required for testing or for normal care and maintenance of the system are performed from the front of the enclosure. If more than a single unit is required to form a complete control panel,

exactly matching modular unit enclosures shall be provided. Accommodate all components and allow ample gutter space for interconnection of panels and field wiring. Identify each enclosure with an engraved, red, laminated, phenolic-resin nameplate. Lettering on the enclosure's nameplate shall not be less than 1 inch high. Identify individual components and modules within the cabinets with permanent labels.

C. Systems: Alarm and supervisory systems shall be separate and independent in the FMUX. The alarm-initiating zone boards in the FMUX shall consist of plug-in cards. Construction requiring removal of field wiring for module replacement is unacceptable.

D. Control Modules: Types and capacities required to perform all functions of the fire alarm systems. Local, visible, and audible signals shall announce alarm, supervisory, and trouble conditions. Each type of audible alarm shall have a different sound.

E. Communication: Provide a communication bus between the fire alarm control panel (FACP) and multiple multiplexer panels (FMUX). All alarm, supervisory and trouble conditions originating at the FMUX shall be annunciated locally at the FMUX, the FACP, and each annunciator. Arrange so that system programming is performed at the FACP only.

F. Zones: Provide for all alarm and supervisory zones indicated.

G. Indicating Lights: A single LED test switch for each FMUX section shall be provided to illuminate all LED indicators on that section of the control panel. Alarm and supervisory signal lights a red LED. Trouble signal lights shall utilize an amber LED.

H. Resetting: Provide the necessary controls to prevent the resetting of any alarm, supervisory, or trouble signal while the alarm or trouble condition still exists.

2.13 GRAPHIC ANNUNCIATOR

A. Annunciator Panel: Provide a schematic building section that indicates each alarm and supervisory initiating device (see detail on Plans). Provide an LED-indicating light for each device. Provide lights that indicate the floor on which a signal was actuated. Engrave floor designations on the face of the annunciator.

B. Indicating lights include individual LED indicators for each type of alarm and supervisory device and an LED to indicate system trouble. The actuation of any alarm or supervisory signal shall cause the illumination of a floor light and device light. System trouble causes the illumination of the system trouble light. Additional LEDs shall be provided to indicate normal and emergency power modes for the system. A single LED test switch shall be provided to illuminate all LED indicators on the annunciator.

C. Faceplate: Satin-finished stainless steel or brushed aluminum. Floor plan lines shall be engraved in the faceplate and filled with colored paint. Engraved legends for the panel LEDs and switches shall be 1/4 inch high minimum, in letters filled with red paint. Device LEDs shall utilize a machine written legend plate, removable, and capable of being updated.

D. Cabinet: Flush mounted, lockable, stainless steel frame with clear flexiglass cover. Cover shall have full length, stainless steel piano hinge. Unit shall be provided with sufficient backbox to house all components with ample wire gutter space to terminate field wiring. All field wiring shall terminate on screw type terminal strips.

2.14 SYSTEM PRINTER

A. General: Provide a system printer that is listed and labeled as an integral part of the fire alarm system.
   1. Should the system printer be a separate component from the fire alarm control panel and require an individual power circuit, a 20 amp duplex receptacle shall be provided to serve the printer. The receptacle shall be flush mounted in the security control room (at a location as directed by the Engineer) and circuited to a dedicated 20 amp, 1 pole, circuit breaker to the nearest 120/208 volt, 3 phase, 4 wire, emergency power panelboard.
   2. Printer shall be dot matrix and capable of using wide, track-fed, fan fold paper.

2.15 EMERGENCY POWER SUPPLY

A. General: Components shall include a nickel-cadmium-type battery, charger, and an automatic transfer switch. Battery nominal life expectancy shall be 20 years, minimum.

B. Battery capacity shall be adequate to operate the complete alarm system in normal or supervisory (nonalarm) mode for a period of 24 hours. At the end of this period, the battery shall have sufficient capacity to operate the system, including alarm-indicating devices in either alarm or supervisory mode, for a period of 15 minutes.

C. Battery Charger: Solid-state, fully automatic, variable-charging-rate type. Provide capacity for 150 percent of the connected system load while maintaining the batteries at full charge. In the event batteries are fully discharged, the charger shall recharge them completely within 4 hours. Charger output shall be supervised as part of system power supply supervision.

D. Integral Automatic Transfer Switch: The transfer switch shall transfer the load to the battery without loss of signals or status indications when normal power fails.

2.16 WIRE

A. General: All power, signal and control wiring shall meet the requirements of NEC Article No. 760 "Fire Alarm Systems", and other articles as applicable.

B. Wire: Provide solid-copper conductors with 600 volt rated, 75 deg C, color-coded insulation.
   1. Low-Voltage Circuits: No. 14 AWG, minimum.
   2. Line-Voltage Circuits: No. 12 AWG, minimum.

C. Signal Cables: Provide factory fabricated multiconductor signal cables with No. 18 AWG copper conductors (minimum). Individual conductors shall be bare, soft annealed copper, PVC insulated with nylon outer jacket. Cables shall include overall shield, drain wire, and PVC jacket.

D. Fire Fighter Telephone Cables: Provide factory fabricated multiconductor signal cables with No. 18 AWG copper conductors (minimum). Individual conductors shall be bare, soft annealed copper, PVC insulated with nylon outer jacket. Cables shall include overall shield, drain wire, and PVC jacket.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Install system according to NFPA standards referenced to Parts 1 and 2 of this Section.

B. Fire Alarm Power Supply Disconnect: Paint red and label “FIRE ALARM”. Provide with lockable handle or cover.

C. System installer must be certified by the State Fire Marshal to install fire detection systems. Contractor to furnish evidence of certification to the Engineer.

3.2 EQUIPMENT INSTALLATION

A. Manual Pull Stations: Mount semiflush in recessed back boxes with operating handles 48 inchesabove the finished floor.

B. Water-Flow Detectors, Valve Supervisory Switches, and Pressure Sensors: Connect for each sprinkler valve station required to be supervised. Provide each component with an external addressable interface unit.

C. Smoke Detectors: install ceiling-mounted detectors at locations as indicated on Plans.

D. Duct-Mounted Smoke Detectors: Install duct-mounted smoke detectors where indicated on Plans. The Plans indicate installation locations and do not reflect actual quantity. The E.C. shall coordinate with the Mechanical Contractor to determine quantity and physical arrangement of detectors. The E.C. shall provide the necessary quantity and arrangement for compliance with NFPA 72.

E. Alarm-Indicating Devices: Install wall-mounted visual and combination audio/visual appliances 80 inchesabove the finished floor or 6 inches below ceiling, whichever is lower. Install ceiling mounted audio appliances on flush-mounted back boxes with the device-operating mechanism concealed behind a grille.

F. Remote Device location-Indicating Lights: Install device location indicators on wall 80 inches above finished floor or 6 inches below ceiling, whichever is lower, unless noted otherwise.

G. Control Panels and Equipment Cabinets: Surface/semi-surface mount with tops of cabinets 72 inchesabove the finished floor.

H. Graphic Annunciator: Flush mount with the top of the panel 72 inchesabove the finished floor.

3.3 WIRING INSTALLATION

A. Wiring Method: Install wiring in metal raceway according to Division 26 Section “Raceways”. Conceal raceway except in unfinished spaces and as indicated.

B. Wiring within Enclosures: Conductors shall be installed parallel with or at right angles to the sides and back of the enclosure. Bundle, lace, and train the conductors to terminal points with no excess. Connect conductors that are terminated, spliced, or interrupted in any enclosure associated with the fire alarm system to terminal blocks. Mark each terminal according to the system’s wiring diagrams. Make all connections with approved crimp-on terminal spade lugs, pressure-type terminal blocks, or plug connectors.

C. Cable Taps: Use numbered terminal strips in junction, pull or outlet boxes, cabinets, or equipment enclosures where circuit connections are made.

D. Color Coding: Color-code fire alarm conductors differently from the normal building power wiring. Use one color code for alarm circuit wiring and a different color code for supervisory circuits. Color-code audible alarm-indicating circuits differently from alarm-initiating circuits. Use different colors for visual alarm-indicating devices. Paint fire alarm system junction boxes and covers red.

3.4 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals according to Division 26 Section "Electrical Identification."

3.5 GROUNDING

A. Ground cable shields and equipment according to system manufacturer's instructions to eliminate shock hazard and to minimize, to the greatest extent possible, ground loops, common mode returns, noise pickup, cross talk, and other impairments.

B. Signal Ground Terminal: Locate at fire alarm control panel (FACP). Isolate from power system and equipment grounding. Extend #4 insulated ground conductor in 3/4-inch Schedule 80 PVC conduit under the raised access floor to ground bus in nearest telecommunication closet. Label ground conductor "Fire Alarm System Ground".

C. Ground equipment and conductor and cable shields. For audio circuits, minimize, to the greatest extent possible, ground loops, common mode returns, noise pickup, cross talk, and other impairments. Provide 5-ohm isolated ground at FACP location. Measure, record, and report ground resistance.

3.6 EXTRA MATERIALS

A. Furnish extra materials described below, before installation begins, that match products installed, that are packaged with protective covering for storage, and that are identified with labels clearly describing contents.
   1. Glass Rods for Manual Stations: Furnish 24 rods.
   2. Ceiling Speakers: Furnish 8 complete assemblies.
   3. Wall Mounted A/V Units: Furnish 4 complete assemblies.
   4. Smoke Detectors: Furnish 12 detectors.
   5. Detector Bases: Furnish 4 bases.
   6. Printer Ribbons: Furnish 6 ribbons.
   7. Printer Paper: Furnish 12 rolls (2 boxes) of premium paper.

3.7 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Provide services of a factory-authorized service representative to supervise the field assembly and connection of components and the pretesting, testing, and adjustment of the system.

B. Pretesting: After installation, align, adjust, and balance the system and perform complete pretesting. Determine, through pretesting, the conformance of the system to the requirements of

the Drawings and Specifications. Correct deficiencies observed in pretesting. Replace malfunctioning or damaged items with new ones and retest until satisfactory performance and conditions are achieved. Prepare forms for systematic recording of acceptance test results.

C. Report of Pretesting: After pretesting is complete, provide a letter certifying the installation is complete and fully operable, including the names and titles of the witnesses to the preliminary tests.

D. Final Test Notice: Provide a 10-day minimum notice in writing when the system is ready for final acceptance testing.

E. Minimum System Tests: Test the system according to the procedures outlined in NFPA 72. Minimum required tests are as follows:
   1. Verify the absence of unwanted voltages between circuit conductors and ground.
   2. Test all conductors for short circuits using an insulation-testing device.
   3. With each circuit pair, short circuit at the far end of the circuit and measure the circuit resistance with an ohmmeter. Record the circuit resistance of each circuit on the record drawings.
   4. Verify that the control unit is in the normal condition as detailed in the manufacturer's operation and maintenance manual.
   5. Test initiating and indicating circuits for proper signal transmission under open circuit conditions. One connection each should be opened at not less than 10 percent of the initiating and indicating devices. Observe proper signal transmission according to class of wiring used.
   6. Test each initiating and indicating device for alarm operation and proper response at the control unit. Test smoke detectors with actual products of combustion.
   7. Test the system for all specified functions according to the approved operation and maintenance manual. Systematically initiate specified functional performance items at each station, including making all possible alarm and monitoring initiations and using all communication options. For each item, observe related performance at all devices required to be affected by the item under all system sequences. Observe indicating lights, displays, signal tones, and annunciator indications. Observe all voice audio for routing, clarity, quality, freedom from noise and distortion, and proper volume level.
   8. Test Both Primary and Secondary Power: Verify by test that the secondary power system is capable of operating the system for the period and in the manner specified.

F. Retesting: Correct deficiencies indicated by tests and completely retest work affected by such deficiencies. Verify by the system test that the total system meets the Specifications and complies with applicable standards.

3.8 CLEANING AND ADJUSTING

A. Cleaning: Remove paint splatters and other spots, dirt, and debris. Touch up scratches and marred finish to match original finish. Clean unit internally using methods and materials recommended by manufacturer.

B. Report of Tests and Inspections: Provide a written record of inspections, tests, and detailed test results in the form of a test log. Submit log upon the satisfactory completion of tests. A copy of the test reports shall be included in the Owner's O&M Manual.

C. Tag all equipment, stations, and other components at which tests have been satisfactorily completed.

3.9 DEMONSTRATION

A. Startup Services: Engage a factory-authorized service representative to provide startup service and to demonstrate and train Owner's maintenance personnel as specified below.
   1. Train Owner's maintenance personnel on procedures and schedules related to startup and shutdown, troubleshooting, servicing, adjusting, and preventive maintenance. Provide a minimum of 16 hours' training,
   2. Train security room operators on procedures and schedules related to start-up, operation, and shut-down of the fire alarm system. Provide a minimum of four 4-hour training sessions.
   3. Training Aid: Use the approved final version of the operation and maintenance manual as a training aid.
   4. Schedule training with Owner with at least 7 days' advance notice.

3.10 ON-SITE ASSISTANCE

A. Occupancy Adjustments: When requested within one year of date of Substantial Completion, provide on-site assistance in adjusting sound levels, controls, and sensitivities to suit actual occupied conditions. Provide up to 3 requested adjustment visits to the site for this purpose.

END OF SECTION 28 3100

SECTION 31 0519.13

GEOTEXTILES FOR EARTHWORK

PART 1 - GENERAL

1.1 SCOPE

A. Contractor shall provide all labor, materials, equipment, and services required to provide and place geosynthetics as shown and specified.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American Society for Testing and Materials, (ASTM).
      a. ASTM D4355, Standard Test Method for Deterioration of Geotextiles by Exposure to Light, Moisture and Heat in a Xenon Arc-Type Apparatus
      b. ASTM D4491, Standard Test Methods for Water Permeability of Geotextiles by Permittivity
      c. ASTM D4533, Standard Test Method for Trapezoid Tearing Strength of Geotextiles
      d. ASTM D4632, Standard Test Method for Grab Breaking Load and Elongation of Geotextiles
      e. ASTM D4751, Standard Test Methods for Determining Apparent Opening Size of a Geotextile
      f. ASTM D6241, Standard Test Method for Static Puncture Strength of Geotextiles and Geotextile-Related Products Using a 50-mm Probe

1.3 QUALITY ASSURANCE

A. Manufacturer’s Qualifications:s
   1. Geotextile manufacturer shall be listed on the Ohio Department of Transportation Office of Materials Management Approved List.
   2. Geotextile manufacturer shall be a specialist in the manufacture of geotextile filter fabric, and have produced and successfully installed a minimum of five million square feet.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Product Data:
   2. Submit geotextile manufacturer's data, specifications, installation instructions and dimensions.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING:

A. Each roll of geotextile delivered to the Site shall be labeled by the manufacturer identifying the manufacturer's name, product identification, lot number, roll number and roll dimensions.

B. All rolls and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer if any loss or damage exists to geotextile filter fabric. Replace loss and repair damage to new condition, in accordance with manufacturer’s instructions.

C. Geotextile shall be protected from ultraviolet light exposure, precipitation or other inundation, mud, dirt, dust, puncture, cutting or any other damaging or deleterious conditions. Geotextile rolls shall be shipped and stored in relatively opaque and watertight wrappings.

PART 2 - PRODUCTS

2.1 GEOTEXTILE FILTER FABRIC

A. Provide woven or non-woven fabric composed of polymeric fibers which are formed into a stable network such that the filaments retain their relative position. The fabric shall be inert to biological degradation and naturally encountered chemicals, alkalizes, and acids.

B. All minimum strengths for geotextile filter fabrics are in the weakest principal direction.

C. Type A: Underdrains and Slope Drains
1. Product and Manufacturer: Provide the following:
   a. Mirafi 140 NL by TenCate Geosynthetics,
   b. 0311T by ADS Geosynthetics,
   c. FX-30HS by Carthage Mills,
   d. Or Equal.
2. Geotextile filter fabric shall conform to the following:

Property	Value	Test Method
Minimum tensile strength	80 lb	ASTM D4632
Minimum puncture strength	140 lb	ASTM D6241
Minimum tear strength	25 lb	ASTM D4533
Apparent opening size	≤ 0.3 mm	ASTM D4751
Minimum permittivity	2.0/sec	ASTM D4491
Minimum water flow rate	140 gpm/ft²	ASTM D4491

D. Type B: Filter Blankets for Rock Channel Protection
1. Product and Manufacturer: Provide the following:
   a. Mirafi 180 N by TenCate Geosynthetics,
   b. 0801T by ADS Geosynthetics,
   c. FX-80HS by Carthage Mills,
   d. Or Equal.
2. Geotextile filter fabric shall conform to the following:

Property	Value	Test Method
Minimum tensile strength	200 lb	ASTM D4632
Minimum elongation	15%	ASTM D4632
Minimum puncture strength	440 lb	ASTM D6241
Minimum tear strength	50 lb	ASTM D4533
Apparent opening size	≤ 0.6 mm	ASTM D4751
Minimum permittivity	0.2/sec	ASTM D4491

E. Type C: Sediment Fences
   1. Geotextile filter fabric shall conform to the following:

Property	Value	Test Method
Minimum tensile strength	120 lb	ASTM D4632
Maximum elongation	50%	ASTM D4632
Minimum puncture strength	275 lb	ASTM D6241
Minimum tear strength	40 lb	ASTM D4533
Apparent opening size	≤ 0.84 mm	ASTM D4751
Minimum permittivity	0.01/sec	ASTM D4491
Ultraviolet exposure strength retention	70%	ASTM D4355

PART 3 - EXECUTION

3.1 INSPECTION:

A. Contractor shall examine the conditions under which the Work is to be installed and notify the Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General
   1. All geotextiles shall be weighted with sandbags or the equivalent when required. Such sandbags shall be installed during placement and shall remain until replaced with cover material or geomembrane.
   2. Contractor shall take any necessary precautions to prevent damage to underlying layers during placement of the geotextile.
   3. During placement of geotextiles, care shall be taken not to entrap in the geotextile stone, excessive dust, or moisture that could damage the geomembrane, generate clogging, or hamper subsequent seaming.
   4. Geotextiles shall not be exposed to precipitation prior to being installed, and shall not be exposed to direct sunlight for more than 15 days.

B. Type A: Underdrains and Slope Drains
   1. Place the Geotextile Fabric to completely surround the granular material. Overlap the Geotextile Fabric at the top of the trench. Match the overlap to the trench width. At other seams, overlap Geotextile Fabric a minimum of 12 inches.

C. Type B: Filter Blankets for Rock Channel Protection
   1. Prepare the surface to receive the fabric to a relatively smooth surface, free of obstruction and debris. With the long dimension parallel to the flow direction, loosely place the fabric without wrinkles and creases. Where joints are necessary, provide a 12-inch minimum overlap, with the upstream strip overlapping the downstream strip. Place securing pins with washers at a minimum distance apart of 2 feet along the joints and at a minimum distance apart of 5 feet everywhere else.

3.3 GEOTEXTILE REPAIR:

A. Any holes or tears in the fabric shall be repaired as follows:

1. On slopes: A fabric patch shall be sewn into place using a double sewn lock stitch (1/4-inch to 3/4-inch apart and no closer than 1-inch from any edge). Should any tear exceed ten percent of the width of the roll, that roll shall be removed from the slope and replaced.
2. Non-slopes: A fabric patch shall be spot-seamed in place with a minimum of 24-inches of overlap in all directions.

3.4 PLACEMENT OF COVER MATERIALS:

A. Contractor shall place all cover materials in such a manner to ensure the geotextile is not damaged; minimal slippage of the geotextile on underlying layers; and no excess tensile stresses in the geotextile.

END OF SECTION 31 0519.13

SECTION 31 0519.33

TIED CONCRETE BLOCK MATS

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Contractor shall provide all labor, materials, equipment, and services required to provide tied concrete block mats as shown and specified.

1.2 REFERENCES:

A. American Society for Testing and Materials, (ASTM).
   1. ASTM C150, Standard Specification for Portland Cement.
   2. ASTM C33, Standard Specification for Concrete Aggregates.
   3. ASTM D792, Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.
   4. ASTM D4355, Standard Test Method for Deterioration of Geotextiles by Exposure to Light, Moisture and Heat in a Xenon Arc-Type Apparatus
   5. ASTM D6475, Standard Test Method for Measuring Mass per Unit Area of Erosion Control Blankets
   6. ASTM D6524, Standard Test Method for Measuring the Resiliency of Turf Reinforcement Mats (TRMs)
   7. ASTM D6525, Standard Test Method for Measuring Nominal Thickness of Rolled Erosion Control Products
   8. ASTM D6566, Standard Test Method for Measuring Mass Per Unit Area of Turf Reinforcement Mats
   9. ASTM D6567, Standard Test Method for Measuring the Light Penetration of a Rolled Erosion Control Product (RECP)
   10. ASTM D6818, Standard Test Method for Ultimate Tensile Properties of Rolled Erosion Control Products

B. Erosion Control Technology Council (ECTC).
   1. Current Standards.

1.3 QUALITY ASSURANCE:

A. Product shall be listed on the Ohio Department of Transportation Qualified Products List.

1.4 SUBMITTALS:

A. Action Submittals: Submit the following:
   1. Product Data:
      a. Submit manufacturer's data, specifications, manufacturer approved mat layout design including location and type of joints, installation instructions and dimensions.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING:

A. Each roll of geotextile delivered to the Site shall be labeled by the manufacturer identifying the manufacturer's name, product identification, lot number, roll number and roll dimensions.

B. All rolls and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer if any loss or damage exists to geotextile filter fabric. Replace loss and repair damage to new condition, in accordance with manufacturer’s instructions.

C. Chipping or missing concrete resulting in a weight loss exceeding 15% of the average weight of a concrete unit is grounds for rejection by the Engineer. Replace, repair, or patch the damaged areas per the manufacturer’s recommendations.

D. Cover the mat or otherwise protect it during long periods of storage to protect against degradation of the backing material as recommended by the manufacturer.

PART 2 - PRODUCTS

2.1 GENERAL:

A, Tied concrete block mats shall be manufactured from individual concrete blocks tied together with high strength polypropylene bi-axial geogrid. Each block is tapered, beveled and interlocked, and includes connections that prevent lateral displacement of the blocks within the mats when they are lifted for placement.

B. Tied concrete block mats shall be Flexamat, manufactured by Motz Enterprises, Inc. or approved equal.

2.2 BLOCKS:

A. Furnish blocks manufactured with concrete conforming to the cement requirements of ASTM C150 and to the aggregate requirements of ASTM C33. Meet a minimum compressive strength of 5,000 psi at 28 days. Furnish blocks that have a minimum weight of 3 lb. per block. Blocks shall be placed no further than 2 in. apart.

2.3 POLYPROPYLENE BI-AXIAL GEOGRID:

A. Provide revetment mat that is constructed of a high tenacity, low elongating, and continuous filament polypropylene fibers that is securely cast into and embedded within the base of the concrete blocks and obtains connection strength greater than that of the geogrid. The geogrid shall meet the following requirements:
   1. UV Stabilization: 2% Carbon Black
   2. Ultimate Tensile Strength: 2055 lb/ft

2.4 UNDERLAYMENT:

A. Degradable erosion control blanket
   1. Provide a degradable erosion control blanket in accordance with the following requirements:
      a. Thickness: 0.418 in, ASTM D6525
      b. Light Penetration: 34.6 %, ASTM D6567

c. Resiliency: 64%, ASTM D6524
d. Mass per Unit Area: 0.57 lb/yd², ASTM D6475
e. MD-Tensile Strength, Max: 127.0 lb/ft, ASTM D6818
f. TD-Tensile Strength, Max: 50.9 lb/ft, ASTM D6818
g. Swell: 89%, ECTC Procedure
h. Bench-Scale Rain Splash: Soil Loss Ratio = 6.84 @ 2 in/hr, ECTC Method 2
i. Bench-Scale Rain Splash: Soil Loss Ratio = 7.19 @ 4 in/hr, ECTC Method 2
j. Bench-Scale Rain Splash: Soil Loss Ratio = 7.56 @ 6 in/hr, ECTC Method 2
k. Bench-Scale Shear: 2.6 lb/ft2 @ 0.5 in soil loss, ECTC Method 3
l. Germination Improvement: 645% ECTC Method 4

B. Non-degradable erosion control blanket
1. Provide a degradable erosion control blanket in accordance with the following requirements:
a. Thickness: 0.294 in, ASTM D6525
b. Light Penetration: 57%, ASTM D6567
c. Resiliency: 86%, ASTM D6524
d. Mass per Unit Area: 0.50 lb/yd², ASTM D6566
e. MD-Tensile Strength Max: 295.2 lb/ft, ASTM D6818
f. TD-Tensile Strength Max: 194.4 lb/ft, ASTM D6818
g. MD-Elongation: 32.2%, ASTM D6818
h. TD-Elongation: 40.8%, ASTM D6818
i. Swell: 8%, ECTC Procedure
j. Specific Gravity: 1.21, ASTM D792
k. UV Stability: 80% minimum, ASTM D4355 (1,000 hr)
l. Bench-Scale Rain Splash: SLR = 5.86 @ 2 in/hr, ECTC Method 2
m. Bench-Scale Rain Splash: E SLR = 5.00 @ 4 in/hr, CTC Method 2
n. Bench-Scale Rain Splash: SLR = 6.33 @ 6 in/hr, ECTC Method 2
o. Bench-Scale Shear: 2.41 lb/ft2 @ 0.5 in soil loss, ECTC Method 3
p. Germination Improvement: 432%, ECTC Method 4

PART 3 - EXECUTION

3.1 INSPECTION:

A. Contractor shall examine the conditions under which the Work is to be installed and notify the Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION – GENERAL:

A. Install tied concrete block mats in accordance with manufacturer's installation instructions.

B. Prior to installing tied concrete block mats, prepare the subgrade as detailed in the plans. All subgrade surfaces to be smooth and free of all rocks, stones, sticks, roots, and other protrusions or debris of any kind that would result in an individual block being raised more than 3/4 in. above the adjoining blocks. When seeding is shown on the plans, provide subgrade material that can sustain growth.

C. Ensure the prepared subgrade provides a smooth, firm, and unyielding foundation for the mats. The subgrade shall be graded into a parabolic or trapezoidal shape to concentrate flow to middle of mat or mats.

D. When vegetation is required, distribute seed on the prepared topsoil subgrade before installation of the concrete mats in accordance with the specifications.

E. Install mats to the line and grade shown on the plans and per the manufacturer's guidelines. The manufacturer or authorized representative will provide technical assistance during the slope preparation and installation of the concrete block mats as needed.

F. Provide a minimum 18 in. deep concrete mat embedment toe trench at all edges exposed to concentrated flows. Recess exterior edges subject to sheet flow a minimum of 3 in.

G. When needed, provide fastening or anchoring as recommended by the manufacturer or engineer for the site conditions.

H. All geotextiles shall be weighted with sandbags or the equivalent when required. Such sandbags shall be installed during placement and shall remain until replaced with cover material or geomembrane.

I. For seams parallel to the flow line in ditch or channel applications, center a minimum 3 ft. wide strip of soil retention blanket under the seam. Fasten along the seam at 5 ft. maximum spacing. Parallel seams in the center of the ditch shall be avoided when possible.

J. Shingle seams perpendicular to the flow line with the downstream mat recessed a minimum of 2 blocks or 12 inches of extended underlayment under the upstream mat and fastened together along the seam at 2 ft. maximum spacing if required by manufacturer or engineer.

END OF SECTION 31 0519.33

SECTION 31 1100

CLEARING AND GRUBBING

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, equipment, and incidentals required to perform clearing and grubbing as shown and specified in the Contract Documents.
2. The Work includes removing from the Site and disposing of trees, stumps, brush, roots, shrubs, vegetation, logs, rubbish, and other objectionable material.
3. Pay all costs associated with transporting and disposing of debris resulting from clearing.
4. Limits of Clearing and Grubbing Work: Clear and grub all areas within the Work areas unless otherwise shown or indicated in the Contract Documents.

B. Related Sections:
1. Section 01 5705, Temporary Controls.
2. Section 02 4100, Demolition.
3. Section 32 0191, Tree Protection and Trimming.

1.2 QUALITY ASSURANCE:

A. Professional Arborist Qualifications:
1. Engage an accredited professional arborist, acceptable to Engineer, skilled, trained and with successful and documented experience in the protection and restorative care of trees, certified by the International Society of Arboriculture or American Society of Consulting Arborists; who agrees to employ only tradesmen with specific skill and successful experience in this type of Work.

B. Regulatory Requirements:
1. Laws and Regulations applying to the Work under this Section include, but are not necessarily limited to, the following:
a. Perform tree clearing only between October 15 and March 31

1.3 SUBMITTALS:

A. Action Submittals: Submit the following
1. Shop Drawings:
a. Plan for removing trees and other large vegetation not explicitly shown or indicated for removal in the Contract Documents.
b. Plan showing proposed limits of clearing and grubbing, if different from clearing and grubbing limits shown or indicated in the Contract Documents.

B. Informational Submittals: Submit the following
1. Qualification Statements:
a. Arborist.

1.4 WARRANTY

A. Contractor shall warrant that Work performed under this Section will not permanently damage trees, shrubs, turf, and plants designated to remain, or other adjacent work, facilities, or property. If damage resulting from Contractor's operations becomes evident during the correction period, Contractor shall replace damaged items and property at no additional cost to Owner.

PART 2 – PRODUCTS (NOT USED)

PART 3 – EXECUTION

3.1 PREPARATION:

A. Protection:
   1. Throughout the Project, protect existing site improvements, including streets, drives, and Underground Facilities to remain (if any), and adjacent property and structures. Repair damage caused by Contractor to original condition or replace in kind, to satisfaction of Engineer, at no additional cost to Owner.
   2. Protect trees, shrubs, vegetation, and grassed areas to remain by providing temporary fencing, barricades, wrapping, or other methods shown, specified, or accepted by Engineer. Correct at Contractor's expense damage caused by Contractor outside the limits of clearing Work.
   3. Do not remove trees without approval of Engineer, unless shown or indicated for removal.
   4. Do not locate construction equipment, stored materials, or stockpiles within drip line of trees and vegetation to remain.

B. Site Preparation:
   1. Obtain, pay costs associated with, and comply with applicable permits required for clearing and grubbing Work.
   2. Delineation of Clearing and Grubbing Limits:
      a. Locate and clearly flag trees and vegetation to remain, and other materials to remain in the clearing and grubbing limits. Locate and clearly flag salvable vegetation to be relocated.
      b. Provide flagging to delineate limits of areas to be cleared or grubbed. Review at Site with Engineer before commencing removal of trees, vegetation, and other materials to be removed.
      c. Replace flagging that is lost, removed, or destroyed, until clearing and grubbing Work is complete and Engineer allows removal of flagging.
   3. Erosion and Sediment Controls:
      a. Provide applicable erosion and sediment controls before commencing clearing and grubbing Work.
      b. Comply with Section 01 4126, Stormwater Pollution Prevention Plan and Permit
      c. Comply with erosion and sediment control requirements of Section 01 5705, Temporary Controls.
      d. Continue providing erosion and sediment controls as clearing and grubbing Work progresses to previously uncleared, ungrubbed areas of the Site.

3.2 CLEARING AND GRUBBING:

A. Remove and dispose of all trees, shrubs, stumps, roots, brush, logs, rubbish, and debris within limits of clearing and grubbing shown or indicated in the Contract Documents, unless otherwise shown or indicated.

B. Trees and Shrubs Improperly Destroyed or Damaged:
   1. For each tree or shrub to remain that is destroyed or damaged beyond repair by Contractor, provide two replacements of the same species at locations to be designated by Engineer.

C. Trees and shrubs to remain that have been damaged or require trimming shall be treated and repaired under the direction of a qualified arborist, or other professional with qualifications acceptable to Engineer. Trees and shrubs intended to remain, that are damaged beyond repair or that are removed, shall be replaced by Contractor at no additional cost to Owner.

D. Salvable Vegetation:
   1. Trees, shrubs, and other vegetation requiring removal to facilitate the Work, and that will be transplanted elsewhere at the Site, shall be carefully balled and burlapped or placed in temporary pots, and stored at the Site in an acceptable area. Work involving removing and relocating trees, shrubs, and other vegetation shall be under the direction of qualified arborist acceptable to Engineer, or other professional acceptable to Engineer, hired by Contractor.

E. Disposal of Cleared and Grubbed Materials:
   1. Dispose at appropriate off-Site location trees, stumps, rubbish, debris, and other cleared and grubbed material. Cleared or grubbed materials may remain at the Site only when allowed in the Contract Documents or when approved by Engineer in writing. Do not use cleared or grubbed material as fill, backfill, or in embankments.
   2. Dispose of cleared and grubbed material in accordance with Laws and Regulations.
   3. Do not burn clearing debris at the Site, unless approved by Owner and authorities having jurisdiction. If burning is permitted, comply with requirements of authorities having jurisdiction and Laws and Regulations. If burning is permitted at the Site, also comply with Owner's requirements.

3.3 TOPSOIL REMOVAL:

A. Existing topsoil to be removed is defined as friable, clay loam, surface soil present in depth of at least four inches. Topsoil shall be free of subsoil, clay lumps, stones, and other objects over two-inch diameter and other objectionable material.

B. Stripping:
   1. Strip topsoil to depths encoun¬tered, in manner that prevents intermingling of topsoil with underlying subsoil or other objectionable material. Remove heavy growths of grass and vegetation from areas before stripping.
   2. Do not strip topsoil from within drip line of each tree to remain as part of the completed Project.

C. Stockpile topsoil in storage stockpiles in areas shown, or where otherwise accepted by Engineer. Construct storage piles so that surface water drains freely. Stabilize large topsoil piles with a cover crop and mulch, and provide silt fencing around perimeter of pile to prevent topsoil erosion and sedimentation; silt fencing shall be in accordance with Section 01 5705, Temporary Controls.

Cover smaller topsoil stockpiles, when used, with reinforced fabric to prevent windblown dust. Topsoil in excess of the quantity required for the finished Project shall remain property of Owner.

END OF SECTION 31 1100

SECTION 31 2305

EXCAVATION AND FILL

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, equipment, and incidentals required to perform all excavating, filling, and grading, and disposing of earth materials as shown, specified, and required for construction of structures, Underground Facilities, roads, and other facilities required to complete the Work.
2. Preparation of subgrade for slabs and pavements is included under this Section.
3. No classification of excavated materials will be made. Excavation includes all materials regardless of type, character, composition, moisture, or condition thereof.

1.2 REFERENCES:

A. Standards referenced in this Section are:
1. ACI 522R, Pervious Concrete.
2. ANSI/AISC 360, Specification for Structural Steel for Buildings.
3. ASTM C29/C29M, Test Method for Bulk Density ("Unit Weight") and Voids in Aggregate.
4. ASTM C33/C33M, Specification for Concrete Aggregates.
5. ASTM C94/C94M, Specification for Ready-Mixed Concrete.
6. ASTM C138/C138M, Test Method for Density (Unit Weight), Yield, and Air Content (Gravimetric) of Concrete.
7. ASTM C172, Practice for Sampling Freshly Mixed Concrete.
8. ASTM C150/C150M, Specification for Portland Cement.
9. ASTM C595/C595M, Specification for Blended Hydraulic Cements.
10. ASTM C618, Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete.
11. ASTM C989, Specification for Slag Cement for Use in Concrete and Mortars.
12. ASTM D422, Test Method for Particle-Size Analysis of Soils.
13. ASTM D448, Classification for Sizes of Aggregate for Road and Bridge Construction.
14. ASTM D698, Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12 400 ft-lbf/ft3 (600 kN-m/m3)).
15. ASTM D1556, Test Method for Density and Unit Weight of Soil in Place by the Sand-Cone Method.
16. ASTM D1557, Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft3 (2,700 kN-m/m3)).
17. ASTM D2216, Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass.
18. ASTM D4253, Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table.
19. ASTM D4254, Test Methods for Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density.
20. ASTM D4318, Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils.

21. ASTM D4832, Test Method for Preparation and Testing of Controlled Low Strength Material (CLSM) Test Cylinders.
22. ASTM D6023, Test Method for Density (Unit Weight), Yield, Cement Content, and Air Content (Gravimetric) of Controlled Low-Strength Material (CLSM).
23. ASTM D6103, Test Method for Flow Consistency of Controlled Low Strength Material (CLSM).
24. ASTM D6938, Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).
25. ASTM E329, Specification for Agencies Engaged in Construction Inspection and/or Testing.

1.3 TERMINOLOGY:

A. The following words or terms are not defined but, when used in this Section, have the following meaning:
   1. "Subgrade" is the uppermost surface of native soil material unmoved from cuts; the bottom of excavation.

1.4 QUALITY ASSURANCE:

A. Qualifications:
   1. Professional Engineer:
      a. Engage a registered professional engineer legally qualified to practice in the same jurisdiction as the Site and experienced in providing engineering services of the kind indicated.
      b. Responsibilities include but are not necessarily limited to:
         1) Reviewing system performance and requirements shown or indicated in the Contract Documents.
         2) Preparing written requests for clarifications or interpretations of performance and requirements for submittal to Engineer by Contractor.
         3) Preparing or supervising the preparation of design calculations and related submittals verifying compliance of the system with the requirements of the Contract Documents.
         4) Signing and sealing all calculations, drawings, and submittals prepared by professional engineer.
         5) Certifying that:
            (a) it has performed the design of the system in accordance with the performance requirements stated in the Contract Documents, and
            (b) the said design conforms to Laws and Regulations, and to the prevailing standards of practice.

B. Quality Assurance Testing:
   1. Quality assurance testing is in addition to field quality control testing required under Part 3 of this Section.
   2. Materials used in the Work may require testing and retesting, as directed by Engineer, during the Project. Allow free access to material stockpiles and facilities at all times. Tests not specifically indicated to be performed at Owner's expense, including retesting of rejected materials and installed Work, shall be performed at Contractor's expense.
   3. Contractor's Testing Laboratory Scope:
      a. Collect samples and perform testing of proposed fill materials in the laboratory and in the field to demonstrate compliance of the Work with the Contract Documents.

b. Testing laboratory shall perform testing required to obtain data for selecting moisture content for placing and compacting fill materials.
c. Design controlled low-strength material (CLSM) mixes in accordance with requirements of CLSM Article in Part 2 of this Section. Perform concrete materials evaluation tests and testing of CLSM mixes.
d. Submit to Engineer and Contractor written report results of each test.

4. Required Quality Assurance Material Testing by Contractor's Testing Laboratory:
   a. Gradation in accordance with ASTM D422. Perform one test for every 1,000 cubic yards of each of the following types of material incorporated into the Work: select fill, general fill, subbase material, drainage fill, and pipe bedding material.
   b. Atterberg limits in accordance with ASTM D4318. Perform one test for every 1,000 cubic yards of the following types of materials incorporated into the Work: general fill, and pipe bedding material.
   c. Moisture/density relations in accordance with ASTM D698, ASTM D1557, ASTM D4253, or ASTM D4254, as applicable. Perform one test for every 5,000 cubic yards of the following types of materials incorporated into the Work: select fill, general fill, subbase material, drainage fill, and pipe bedding material.
   d. Moisture content of stockpiled or borrow material in accordance with ASTM D2216. Perform one test for every 1,000 cubic yards of the following types of material incorporated into the Work: select fill, general fill, subbase material, drainage fill, and pipe bedding material.
   e. CLSM Mix: Verify CLSM mix design by laboratory trial batch, unless indicated otherwise. Perform the following testing on each concrete mix trial batch:
      1) Aggregate gradation.
      2) Flowability, in accordance with ASTM D6103.
      3) Air content, in accordance with ASTM D6023.
      4) Unconfined compressive strength of CLSM mixes at 90 days, in accordance with ASTM D4832.
      5) Submit for each concrete mix trial batch the following information:
         (a) Project identification name and number (if applicable).
         (b) Date of test report.
         (c) Complete identification of aggregate source of supply.
         (d) Tests of aggregates for compliance with the Contract Documents.
         (e) Brand, type, and composition of cementitious materials.
         (f) Brand, type, and quantity of each admixture.
         (g) Quantity of water used in trial mixes.
         (h) Proportions of each material per cubic yard.
         (i) Gross weight and yield per cubic yard of trial mixtures.
         (j) Measured flowability.
         (k) Measured air content.
         (l) Unconfined compressive strength.
   f. Requirement for trial batch may be waived by Engineer if sufficient field test data documenting compliance with specified material properties and performance properties is submitted to and accepted by Engineer. Tests shall have been made on concrete with identical mix design to mix design proposed for the Work, including sources of aggregate and manufacturers of cementitious materials and admixtures.

C. Regulatory Requirements:
   1. Perform excavation work in compliance with require¬ments of authorities having jurisdiction and Laws and Regulations, including:
      a. OSHA, 29 CFR Part 1926, Section .650 (Subpart P – Excavations).

2. Obtain required permits and approvals for excavation and fill Work, including work permits from right-of-way owners and permits from environmental authorities having jurisdiction over discharge of water from excavations.

1.5 SUBMITTALS:

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. List of pervious concrete and CLSM materials and mix designs proposed for use. Include results of quality assurance testing performed to qualify the materials and to establish the mix designs.
      b. Laboratory Trial Batch Reports: Submit laboratory quality assurance test reports for materials and mix design tests.
      c. Modifications to the Work proposed due to design of sheeting, shoring, bracing, cofferdams, and similar excavation supports.
   2. Product Data:
      a. Manufacturer's specifications with application and installation instructions for proprietary materials and items, including admixtures to be used in pervious concrete mixes and CLSM mixes.

B. Informational Submittals: Submit the following:
   1. Procedure Submittals:
      a. Excavation Plan: Prior to starting excavation operations, submit written plan to demonstrate compliance with OSHA 29 CFR Part 1926.650. As a minimum, excavation plan shall include:
         1) Name of Contractor's "competent person" in responsible charge of excavation and fill Work.
         2) Copies of "manufacturer's data" or other tabulated data if protective system(s) are designed on the basis of such data.
         3) Copies of required permits and approvals, from authorities having jurisdiction and affected utility owners, for excavation methods proposed.
      b. Proposed compaction procedure and compaction equipment proposed for use. Where different procedures or equipment will be used for compacting different types of material or at different locations at the Site, indicate where each procedure and equipment item will be used.
   2. Quality Assurance Test Results Submittals:
      a. Submit results of quality assurance testing performed by in accordance with Paragraph 1.4.B of this Section, unless included as part of another submittal under this Section. Submit results for the following quality assurance testing:
         1) Tests on borrow fill material.
         2) Optimum moisture – maximum dry density curve for each type of fill material.
   3. Field Quality Control Submittals:
      a. Submit results of testing and inspection performed in accordance with the field quality control Article in Part 3 of this Section, including:
         1) Field density testing.
         2) Tests of actual unconfined compressive strength or bearing tests of each stratum.
   4. Qualifications Statements:
      a. Professional engineer.

b. Quality Assurance Testing laboratory. Submit name and qualifications of testing laboratory to be employed, and qualifications of testing laboratory's personnel that will perform quality assurance testing required in this Section.

c. Field Quality Control Testing Laboratory: Names and qualifications of testing laboratory employed, and qualifications of testing laboratory's personnel that will perform field quality control testing as required under this Section.

1.6 SITE CONDITIONS:

A. Subsurface Information: The Supplementary Conditions indicate information available relative to subsurface conditions at the Site. Such information and data is not intended as a representation or warranty of continuity of conditions between soil borings or test pits, nor of groundwater levels at dates and times other than date and time when measured, nor that purpose of obtaining the information and data were appropriate for use by Contractor. Owner will not be responsible for interpretations or conclusions drawn therefrom by Contractor.

B. Soil borings and other exploratory operations may be made by Contractor, at no additional cost to Owner. Coordinate Contractor-performed test borings and other exploratory operations with Owner and utility owners as appropriate. Perform such explorations without disrupting or otherwise adversely affecting operations of Owner or utility owners. Comply with Laws and Regulations relative to required notifications.

C. Existing Structures:

1. The Contract Documents show or indicate certain structures and Underground Facilities adjacent to the Work. Such information was obtained from existing records and is not guaranteed to be correct or complete. Contractor shall explore ahead of the excavation to determine the exact location of all existing structures and Underground Facilities. Existing structures and Underground Facilities shall be supported and protected from damage by Contractor. Immediately repair and restore existing structures and Underground Facilities damaged by Contractor without additional cost to Owner.
2. Movement or operation of construction equipment over Underground Facilities shall be at Contractor's sole risk and only after Contractor has prepared and submitted to Engineer and utility owners (as applicable), and received acceptance therefrom, a plan describing Contractor's analysis of the loads to be imparted and Contractor's proposed measures to protect structures and Underground Facilities during the Project.
3. Coordinate with utility owners for shut off of services in active piping and conduits. When required by utility owner, Owner will assist Contractor with utility owner notifications. Completely remove buried piping and conduits indicated for removal and not otherwise indicated as being abandoned or to remain in place.
4. In general, service lines and laterals to individual houses and businesses are not shown; however, Contractor shall assume that a service exists for each utility owner to each house, business, and property.
5. Do not interrupt existing utilities serving facilities occupied and used by Owner or others, except when such interruption is indicated in the Contract Documents or when allowed in writing by Engineer after acceptable temporary utility services are provided by Contractor for the affected structure or property.

PART 2 – PRODUCTS

2.1 MATERIALS:

A. Select Fill:
   1. Material shall be well-graded, crushed aggregate, free of organic material. Material shall be Item 304 in accordance with State of Ohio Department of Transportation Construction and Material Specifications.

B. General Fill:
   1. Material shall be free of: rock and gravel larger than three inches in any dimension, debris, waste, frozen materials, organic material, and other deleterious matter.
   2. Fill shall have a liquid limit not greater than 45, and plasticity index not greater than 25.
   3. Previously-excavated materials complying with the Contract Documents requirements for general fill may be used for general fill.
   4. When on-Site materials are found unsuitable for use as general fill, provide select fill or approved off-Site general fill materials. Prior to using off-Site material as general fill, furnish submittal for and obtain Engineer's approval of the material proposed for use.

C. Subbase Material:
   1. Material shall be naturally- or artificially-graded mixture of natural or crushed gravel, crushed stone, or natural or crushed sand. Crushed slag is unacceptable. Material shall be No. 57 or Item 304 in accordance with State of Ohio Department of Transportation Construction and Material Specifications.

D. Aggregate Base:
   1. Material shall be naturally- or artificially-graded mixture of natural or crushed gravel, crushed stone, or natural or crushed sand. Crushed slag is unacceptable. Material shall be Item 304 in accordance with State of Ohio Department of Transportation Construction and Material Specifications.

E. Drainage Fill:
   1. Material shall be washed, uniformly-graded mixture of crushed stone, or crushed or uncrushed gravel, with 100 percent passing 1.5-inch sieve and not more than five percent passing a No. 4 sieve.

F. Granular Back Fill
   1. Material shall be Item 304 or 411 in accordance with State of Ohio Department of Transportation Construction and Material Specifications.

G. Pipe Bedding Material:
   1. Aggregate material shall be crushed stone and gravel, free of debris, waste, frozen materials, organic material and other deleterious matter.
   2. For nominal pipe sizes less than 15" provide:
      a. AASHTO M43, No. 8 crushed stone.
   3. For nominal pipe sizes greater than or equal to 15" and less than or equal to 30" provide:
      a. AASHTO M43, No. 57 crushed stone, or
      b. AASHTO M43, No. 67 crushed stone, or
      c. Item 304 in accordance with State of Ohio Department of Transportation Construction and Material Specifications.

4. For nominal pipe sizes greater than 30" provide:
    a. AASHTO M43, No. 57 crushed stone, or
    b. Item 304 in accordance with State of Ohio Department of Transportation Construction and Material Specifications.

H. Mudmat shall be in accordance with Section 03 3000, Cast-in-Place Concrete.

I. Controlled Low Strength Material (CLSM):
1. CLSM shall be self-leveling and self-compacting cementitious material.
    a. Cement: Type I or Type II portland cement complying with ASTM C150/C150M.
    b. Fly Ash Mineral Admixture: Comply with ASTM C618, Class F.
    c. Water: Clean, potable.
    d. Admixtures: Provide admixtures in accordance with product manufacturer's published instructions. Admixtures shall be compatible with each other. Do not use calcium chloride or admixtures containing chloride ions. Use only admixtures that have been tested and approved in the mix designs.
    e. Fine Aggregates: ASTM C33/C33M.
2. CLSM Mix:
    a. Cement Content: 50 pounds per cubic yard.
    b. Fly Ash Mineral Admixture: 250 pounds per cubic yard.
    c. Fine Aggregate Content: 2910 pounds per cubic yard.
    d. Water Content: 500 pounds per cubic yard.
    e. Admixtures shall comply with manufacturer's recommendations for use with CLSM.
    f. Unconfined compressive strength shall be not more than 100 psi.
    g. Adjustment of Mixes.
        1) Mix design adjustments may be requested by Contractor when warranted by characteristics of materials, Site conditions, weather, test results, or other, similar circumstances.
        2) Submit for Engineer's approval laboratory test data for adjusted mix designs, including compressive strength test results.
        3) Implement adjusted mix designs only after Engineer's approval.
        4) Adjustments to mix designs shall not result in additional costs to Owner.

2.2 SOURCE QUALITY CONTROL:

A. Perform quality assurance testing, and submit results to Engineer, in accordance with the 'Quality Assurance" Article in Part 1 of this Section.

PART 3 – EXECUTION

3.1 INSPECTION:

A. Provide Engineer with sufficient notice and with means to examine areas and conditions under which excavating, filling, and grading will be performed. Engineer will advise Contractor in writing when Engineer is aware of conditions that may be detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 TEST PITS:

A. General:
1. In advance of the construction, excavate, make observations and measurements, and fill test pits to determine conditions or location of the existing Underground Facilities and structures. Perform all work required in connection with excavating, stockpiling, maintaining, sheeting, shoring, filling, and replacing pavement for test pits. Contractor shall be responsible for the definite location of each existing Underground Facility involved within the area of excavation for the Work. Exercise care during such location work to avoid damaging and disrupting the affected Underground Facility or structure. Contractor shall be responsible for repairing, at his expense, damage to Underground Facility or structure caused during the Work.

3.3 PREPARATION:

A. Use of Explosives:
1. Use of explosives is not allowed.

B. Dust Control:
1. Control objectionable dust caused by Contractor's operation of vehicles and equipment, clearing, and other actions. To minimize airborne dust, apply water or use other methods subject to Engineer’s acceptance and approval of authorities having jurisdiction.

C. Maintenance and Protection of Traffic:
1. Keep all streets and traffic ways open for passage of traffic and pedestrians during the Project, unless otherwise approved by owner of the street, traffic way, or right-of-way, as applicable.
2. When required to cross, obstruct, or temporarily close a street or traffic way, provide and maintain suitable bridges, detours, and other acceptable temporary expedients to accommodate traffic. Closings of street or traffic way shall be for shortest time practical, and passage shall be restored immediately after completion of fill and temporary paving or bridging.
3. Give required advance notice to fire department, police department, and other emergency services as applicable of proposed construction operations.
4. Give reasonable notice to owners or tenants of private property who may be affected by construction operations. Give such notice not less than 7 days prior to construction that will affect the property.
5. Hydrants, valves, fire alarm boxes, postal boxes and delivery service boxes, and other facilities that may require access during construction shall be kept accessible for use.
6. Provide temporary signage, signals, barricades, flares, lights and other equipment, service, and personnel required to regulate and protect traffic and warn of hazards. Such Work shall comply with requirements of owner of right-of-way and authorities having jurisdiction at the Site. Remove temporary equipment and facilities when no longer required, and restore grounds to original or to specified condi¬tions, as applicable.

3.4 DEWATERING:

A. Dewatering – General:
1. Provide and maintain adequate drainage and dewatering equipment to remove and dispose of all surface water and ground water entering excavations, or other parts of the Work and work areas. Keep each excavation dry during excavation, subgrade preparation, and

continually thereafter until the structure to be built therein is acceptable to Engineer and backfilling operations are completed and acceptable to Engineer.

2. Keep all working areas at the Site free of surface water at all times. Provide temporary drainage ditches and temporary dikes, and provide required temporary pumping and other work necessary for diverting or removing rainfall and all other accumulations of surface water from excavations and fill areas. Perform diversion and removal of surface water in manner that prevents accumulation of water behind permanent or temporary structures and at any other locations in the construction area where such accumulations may be detrimental.
3. Water used for working or processing, resulting from dewatering operations, or containing oils or sediments that will reduce the quality of the surface water or groundwater downstream of the point of discharge, shall not be directly discharged. Divert such waters through temporary settling basin or filter before discharging to surface water, groundwater, or drainage routes.
4. Contractor shall be responsible for condition of piping, conduits, and channels used for drainage and such piping, conduits, and channels shall be clean and free of sediment.
5. Remove water from excavations as fast as water collects.

B. Temporary Dewatering System:

1. Contractor shall design, provide, and operate dewatering system to include sufficient trenches, sumps, pumps, hose, piping, well points, deep wells, and similar facilities, necessary to depress and maintain groundwater level 3 ft below the base of each excavation during all stages of construction operations.
2. Design and operate dewatering system to avoid settlement and damage to existing structures and Underground Facilities.
3. Groundwater table shall be lowered in advance of excavation for a sufficient period of time to allow dewatering of fine grain soils.
4. Maintain groundwater level at excavations two feet below lowest subgrade excavation until the structure has sufficient strength and weight to withstand horizontal and vertical soil and water pressures from natural groundwater.
5. Operate dewatering system continuously, 24 hours per day, seven days per week. Provide standby pumping facilities and personnel to maintain the continued effectiveness of the system. Do not discontinue dewatering operations without first obtaining Engineer's acceptance for such discontinuation.
6. If, in Engineer's opinion, the water levels are not being lowered or maintained as required, provide additional or alternate temporary dewatering devices as necessary, at no additional cost to Owner.
7. Locate elements of temporary dewatering system to allow continuous dewatering operation without interfering with the Work to the extent practicable.
8. Where portions of dewatering system are located in the area of permanent construction, submit to and obtain Engineer's acceptance of details of proposed methods of constructing the Work at such location. Control of ground water shall continue until the permanent construction provides sufficient dead load to withstand hydrostatic uplift of the normal groundwater, until concrete has attained sufficient strength to withstand earth and hydrostatic loads, and until waterproofing Work is completed.
9. Perform pumping of water from excavations in a manner that prevents carrying away of unsolidified concrete materials, and that avoids damaging the subgrade.
10. Before discontinuing dewatering operations or permanently allowing rise of groundwater level, prepare computations to demonstrate that structures affected by the water level rise are protected by fill or other means to sustain uplift. Use a safety factor of 1.25 when preparing such calculations.

C. Disposal of Water Removed by Dewatering System:
   1. Contractor's dewatering system shall discharge to a suitable location acceptable to the Owner, in accordance with Laws and Regulations.
   2. Convey water from excavations in closed conduits. Do not use trench excavations as temporary drainage ditches.
   3. Dispose of water removed from excavations in a manner that does not endanger health and safety, property, the Work, and other portions of the Project.
   4. Dispose of water in manner that causes no inconvenience to Owner, others involved in the Project, and adjacent and downstream properties.

3.5 EXCAVATION:

A. Perform all excavation required to complete the Work as shown, specified, and required. Excavations shall include removing and handling of earth, sand, clay, gravel, hardpan, soft, weathered or decomposed rock, pavements, rubbish, and other materials within the excavation limits.

B. Excavation Protection:
   1. Provide excavation protection system(s) in accordance with Laws and Regulations to prevent injury to persons and property, including Underground Facilities.
   2. Excavation Less Than Five Feet Deep: Excavations in stable rock or in soil conditions where there is no potential for a cave-in may be made with vertical sides. Under all other conditions, excavations shall be sloped and benched, shielded, or shored and braced.
   3. Excavations Greater Than Five Feet Deep: Excavations in stable rock may be made with vertical sides. Under all other conditions, excavations shall be sloped and benched, shielded, or shored and braced.
   4. Provide and maintain excavation protection system(s) in accordance with submittals accepted by Engineer and required under Paragraph 1.5.B of this Section.

C. Maintain excavations in dry condition in accordance with "Dewatering" Article in Part 3 of this Section.

D. Elevation of bottom of footings shown is approximate. Engineer may direct such minor changes in dimensions and elevations as may be required to secure a satisfactory footing.

E. When excavations are made below required grades without written order of Engineer, fill such excavations with compacted select fill material, as directed by Engineer, at Contractor's expense.

F. Extend excavations sufficiently on each side of struc¬tures, footings, and similar construction to allow setting of forms, installation of shoring and bracing, and the safe sloping of banks, as necessary.

G. Subgrades – General:
   1. Subgrades shall be firm, dense, and thoroughly compacted and consolidated; shall be free from mud, muck, and other soft or unsuitable materials; and shall remain firm and intact under all construction operations. Subgrades that are otherwise solid but become soft or mucky on top due to construction operations shall be reinforced with crushed stone or gravel. Finished elevation of stabilized subgrades shall not be above subgrade elevations shown.
   2. If, in Engineer's opinion, subgrade becomes softened or mucky because of construction delays, failure to dewater properly, or other cause within Contractor's control, subgrade

shall be excavated to firm material, trimmed, and backfilled with select fill material at Contractor's expense.

H. Proofrolling Subgrades:
1. Prior to placing fill or constructing pavements or slabs, proofroll the subgrade surface with sufficient proofrolling apparatus. Before starting proofrolling, submit to and obtain acceptance from Engineer of proofrolling apparatus and procedure to be used.
2. Proofrolling operations shall be made in the presence of Engineer. Notify Engineer at least 24 hours in advance of start of proofrolling operations.
3. Subgrades displaying pronounced elasticity or deformation, deflection, cracking, or rutting shall be stabilized as directed by Engineer. Unsuitable materials shall be undercut to the depth directed by Engineer and replaced with select fill material. Other suitable stabilization methods may be directed by Engineer.

I. Pipe Trench Preparation:
1. Not more than 150 feet of trench may be opened in advance of installing pipe in trench.
2. Trench width shall be minimized to greatest extent practical, and shall comply with the following:
   a. Trench width shall be sufficient to provide space for installing, jointing and inspecting piping. Refer to Drawings for trench requirements. In no case should trench be wider at top of pipe than pipe barrel OD plus two feet, unless otherwise shown or indicated.
   b. Enlargement of trench width at pipe joints may be made when required and approved by Engineer.
   c. Trench width shall be sufficient for shoring and bracing, or shielding and dewatering.
   d. Trench width shall be sufficient to allow thorough compaction of fill adjacent to bottom half of pipe.
   e. Do not use excavating equipment that requires the trench to be excavated to excessive width.
3. Depth of trench shall be as shown or indicated. If required and approved by Engineer in writing, depths may be revised.
4. Where Engineer considers existing material beneath bedding material unsuitable, remove and replace such unsuitable material with select fill material.

J. Excavated Materials to be Used as Fill:
1. Stockpile excavated materials that are acceptable for use as fill.
2. As excavation proceeds, keep stockpiles of excavated materials suitable for use as fill separate from unsuitable materials and waste materials.
3. Place, grade, and shape stockpiles for proper drainage.
4. Locate and retain soil materials away from edge of excavations.
5. Dispose of excess soil material and waste materials as specified in this Section.
6. Stockpiled excavated soils for use as select fill or general fill shall be tested and classified by laboratory as on-Site select fill or on-Site general fill. Perform required quality assurance testing for material verification on stockpiled materials as soon as possible to demonstrate compliance of excavated materials with the Contract Documents.

3.6 UNAUTHORIZED EXCAVATION:

A. All excavations outside lines and grades shown or indicated and that are not approved by Engineer, together with removing and disposing of the associated material, shall be at Contractor's

expense. Fill unautho¬rized excavations with properly-compacted select fill material at Contractor's expense.

3.7 EROSION AND SEDIMENT CONTROLS:

A. Provide temporary erosion and sediment controls in accordance with Section 01 5705, Temporary Controls. When applicable, also comply with requirements of the erosion and sediment control plan approved by authorities having jurisdiction.

3.8 SHEETING, SHORING, AND BRACING:

A. General:
1. Design and provide sheeting, shoring, bracing, cofferdams, and similar excavation supports as shown, specified, and required for the Work.
2. Clearances and types of temporary sheeting, shoring, bracing, and similar excavation supports, insofar as they may affect the finished character of the Work and the design of sheeting to be left in place, will be subject to the Engineer's approval; but Contractor is responsible for adequacy of all sheeting, shoring, bracing, cofferdams, and similar excavation supports.
3. Materials:
   a. Previously-used materials shall be in good condition, and shall not be damaged or excessively pitted. All steel or wood sheeting designated to remain in place shall be new. New or used sheeting may be used for temporary sheeting, shoring, and bracing.
   b. All steel work for sheeting, shoring, bracing, cofferdams and other excavation supports, shall be in accordance with ANSI/AISC 360, except that field welding will be allowed.
4. As excavation progresses, carry down shoring, bracing, cofferdams, and similar excavation supports to required elevation at bottom of excavation.
5. Comply with Laws and Regulations regarding sheeting, shoring, bracing, cofferdams, and similar excavation supports.
6. Maintain sheeting, shoring, bracing, bracing, and other excavation supports in excavations regardless of time period excavations will be open.
7. Unless otherwise shown, specified, or directed, remove materials used for temporary construction when the Work is completed. Perform such removal in manner not injurious to the structures and Underground Facility, their appearance, and adjacent construction.

B. Sheeting Left in Place:
1. Materials: Steel sheeting shown or indicated to be left in place shall consist of rolled sections of continuous interlocking type. Steel sheeting material designated to be left in place shall be new. Type and design of the sheeting and bracing shall comply with the above requirements for steel work for all sheeting and bracing.
2. Installation:
   a. Steel sheeting to be left in place shall be driven straight to lines and grades as shown, indicated, or directed. Piles shall penetrate into firm materials with secure interlocking through¬out pile's entire length. Damaged piling having faulty alignment shall be pulled and replaced by new piling.
   b. Type of guide structure used and method of driving steel sheeting to be left in place shall be determined by Contractor's professional engineer. Jetting is not allowed.
3. Cut off at elevations shown, indicated, or directed by Engineer sheeting left in place and remove cut off pilings from the Site.

4. Clean wales, braces, and all other items to be embedded in the permanent structure, and ensure that concrete surrounding the embedded element is sound and free of air pockets and harmful inclusions. Provisions shall include the cutting of holes in the webs and flanges of wale and bracing members, and welding of steel diaphragm waterstops perpendicular to the centerline of brace ends that are to be embedded.
5. Subsequent to removing the inside face forms, and when removal of bracing is allowed, cut back steel at least two inches inside the wall face and patch opening with concrete repair mortar in accordance with Section 03 3000, Cast-in-Place Concrete. Concrete shall be thoroughly worked beneath wales and braces, around stiffeners, and at other place where voids may be formed.
6. Portions of sheeting or soldier piles and breast boards that are in contact with structure foundation concrete shall be left in place, together with wales and bracing members that are cast into foundation or superstructure concrete.

C. Removal of Sheeting and Bracing:
1. Remove sheeting and bracing from excavations, unless otherwise directed by Engineer in writing. Perform removal to avoid damaging the Work and adjacent construction. Removal shall be equal on both sides of excavation to ensure no unequal loads on structures and Underground Facilities.
2. Defer removal of sheeting and bracing, where removal may cause soil to come into contact with concrete, until the following conditions are satisfied:
   a. Concrete has cured for not less than seven days.
   b. Wall and floor framing, up to and including grade level floors, is in place.

3.9 TRENCH SHIELDS:

A. Excavation of earth material below bottom of trench shield shall not exceed the limits established in Laws and Regulations.

B. When using a shield for installing piping:
1. Portions of trench shield extending below the mid-diameter of an installed, rigid pipe, such as prestressed concrete pipe and other types of rigid pipe, shall be raised above the pipe's mid-diameter elevation prior to moving the shield along the trench for further construction.
2. Bottom of shield shall not at any time extend below mid-diameter of installed pipe that is flexible or has flexing capability, such as steel, ductile iron, PVC, CPVC, polyethylene, and other pipe that has flexing capability.

C. When using a shield for installing structures, bottom of the shield shall not extend below the top of the bedding for the structures.

D. When removing the shield or moving the shield ahead, exercise extreme care to prevent moving piping, structures, and other Underground Facilities, and prevent disturbance of bedding material for piping, structures, and other Underground Facilities. When piping, structures, or Underground Facilities are disturbed, remove and reinstall the disturbed items in accordance with the Contract Documents.

3.10 FILL AND COMPACTION – GENERAL PROVISIONS:

A. Provide and compact all fill required for the finished grades as shown and as specified in this Section.

B. Place fill in excavations as promptly as progress of the Work allows, but not until completing the following:
   1. Engineer's authorization after observation of construction below finish grade, including dampproofing, waterproofing, perimeter insulation, and similar Work.
   2. Inspection, testing, approval, and recording of locations of Underground Facilities.
   3. Removal of concrete formwork.
   4. Removal of shoring and bracing, and filling of voids with satisfactory materials.
   5. Removal of trash and debris.
   6. Permanent or temporary horizontal bracing is in place on horizontally-supported walls.
   7. Field testing of tanks, Underground Facilities including piping and conduits, and water-retaining structures.
   8. Placing of settlement plates.

C. Fill that includes organic materials or other unacceptable material shall be removed and replaced with approved fill material in accordance with the Contract Documents.

D. Placement – General:
   1. Place fill to the grades shown or indicated. Bring up evenly on all sides fill around structures and Underground Facilities.
   2. Fill areas shall be undercut and proof-rolled as directed by Engineer.
   3. Place fill materials at moisture content and density as specified in Table 31 2305-A of this Section and this Article's requirements on compaction density. Furnish and use equipment capable of adding measured amounts of water to the fill materials to bring fill materials to a condition within required moisture content range. Furnish and use equipment capable of discing, aerating, and mixing the fill materials to ensure reasonable uniformity of moisture content throughout the fill materials, and to reduce moisture content of borrow materials by air drying, when necessary. When subgrade or lift of fill materials requires moisture-conditioning before compaction, fill material shall be sufficiently mixed or worked on the subgrade to ensure uniform moisture content throughout the lift of material to be compacted. Materials at moisture content in excess of specified limit shall be dried by aeration or stockpiled for drying.
   4. Perform compaction with equipment suitable for the type of fill material placed. Select and use equipment capable of providing the minimum density required in the Contract Documents. Use light compaction equipment, with equipment gross weight not exceeding 7,000 pounds within horizontal distance of ten feet from the wall of completed, below-grade structures. Furnish and use equipment capable of compacting in restricted areas next to structures and around piping and Underground Facilities. Effectiveness of the equipment selected by Contractor shall be tested at start of compacted fill Work by constructing a small section of fill within the area where fill will be placed. If tests on the test section of fill indicate that required compaction is not obtained, do one or more of the following: increase the amount of coverages, decrease the lift thicknesses, or use different compactor equipment.
   5. Place fill materials in horizontal, loose lifts, not exceeding specified uncompacted thickness. Place fill in a manner ensuring uniform lift thickness after placing. Mechanically compact each lift, by not less than two complete coverages of the compactor. One coverage is defined as the conditions reached when all portions of the fill lift have been subjected to the direct contact of compactor's compacting surface. Compaction of fill materials by inundation with water is unacceptable.
   6. Do not place fill materials when standing water is present on surface of the area where fill will be placed. Do not compact fill when standing water is present on the fill to be compacted. Do not place or compact fill in a frozen condition or on top of frozen material.

Fill containing organic materials or other unacceptable material previously described shall be removed and replaced prior to compaction.

7. If required densities are not obtained because of improper control of placement or compaction procedures, or because of inadequate or improperly-functioning compaction equipment, Contractor shall perform all work required to provide the required densities. Such work shall include, at no additional cost to Owner, complete removal of unacceptable fill areas and replacement and re-compaction until acceptable fill is provided.
8. Repair, at Contractor's expense, observed or measured settlement. Make repairs and replacements as required within 30 days after being so advised by Engineer.

E. Fill Against Concrete:
1. Placing fill against concrete below finished grade is not allowed until the concrete has attained its specified strength, as determined by duration of concrete curing and testing of field-cured concrete cylinders. Requirements for strength and curing time are in Section 03 3000, Cast-in-Place Concrete.
2. Elevation of fill placed against concrete walls shall not differ by more than two feet on each side of walls, unless walls are adequately braced or all floor framing is in place up to and including grade level slabs.
3. Backfill structural foundation units as soon as practicable, in accordance with this Section, after concrete has gained sufficient strength to avoid damage, to avoid ponding of surface water and accumulation of debris.
4. Where fill is placed against waterproofed surface, exercise care that waterproofing material is not damaged.

F. Fill in Electrical Ductbank Trenches:
1. Provide general fill for full depth of electrical ductbank trench, below and above electrical ductbank. Where one ductbank passes beneath another pipe or ductbank, provide select fill to the elevation of the bottom of upper ductbank or pipe, as applicable.
2. Placing and compacting fill in electrical ductbank trenches shall comply with requirements of Paragraph "G. Fill in Pipe Trenches", of this Article.

G. Fill in Pipe Trenches:
1. Place pipe bedding material in pipe trenches in horizontal layers, and thoroughly compact each layer before the next layer is placed.
2. Piping Installed in Fills Above Pre-construction Grade:
   a. Prior to installing piping, place the fill in accordance with the Contract Documents until the fill reaches a minimum elevation two feet higher than the top of piping to be installed. Excavate the trench; install the piping, and backfill. Subsequently provide the remainder of the fill required for the Work.
3. Piping trenches may be backfilled prior to testing of piping, unless nature of the test requires observation of pipe during testing. Do not construct building or structure over piping until piping has been successfully tested and passed.
4. Placing and Compacting Pipe Trench Fill: Unless otherwise shown, placement and compaction of pipe trench fill materials shall comply with the following:
   a. Pipe bedding material shall be spread and the surface graded to provide a uniform and continuous support beneath piping at all points between bell holes or pipe joints. Slight disturbance of installed pipe bedding material surface during withdrawal of pipe slings or other lifting tackle is acceptable.
   b. After each pipe's bedding material has been graded, and the piping has been aligned, joined in accordance with the Contract Documents, and placed in final position on bedding material, provide and compact sufficient pipe trench fill material under and

around each side of the pipe and back of the bell or end thereof to hold piping in proper position and maintain alignment during subsequent pipe jointing and embedment operations. Deposit and compact pipe trench fill material uniformly and simultaneously on each side of piping to prevent lateral displacement of piping. Place and compact pipe trench fill material to an elevation 12 inches above top of pipe, unless otherwise shown or specified.

c. Each layer of pipe trench fill material shall be compacted by at least two complete coverages of all portions of surface of each lift using appropriate compaction equipment.

d. Method of compaction and compaction equipment used shall be appropriate for material to be compacted and shall not transmit damaging shocks to the piping.

H. Temporary Pavement:

1. Place 1.5 inches of temporary asphalt concrete pavement immediately after filling excavations in paved roadways and other paved areas that will remain for permanent use.
2. Maintain surface of paved area over the fill in good and safe condition during progress of the Work, and promptly fill depressions over and adjacent to the fill area caused by settlement of fill.

   Permanent replacement pavement shall be equal to that of the existing roadways, unless otherwise shown or specified.

I. Subbase Placement:

1. Provide subbase material where shown to the limits shown or indicated.
2. Place subbase material in compacted lifts not exceeding depth of six inches each.

J. Drainage Fill Placement:

1. Provide drainage fill material where shown to the limits shown or indicated.
2. Place drainage fill material in compacted layers of uniform thickness not exceeding depth of six inches each. Compact lifts of drainage fill using suitable compaction equipment.

K. Compaction Density Requirements:

1. Compaction required for all types of fills shall be in accordance with Table 31 2305-A of this Section. Moisten material or aerate the material as necessary to provide the moisture content that will facilitate obtaining the required compaction.

TABLE 31 2305-A
REQUIRED MINIMUM DENSITY

Material	Percent Compaction (ASTM D698)	Uncompacted Lift (inches)
General Fill		
More than five feet below final grade	100	8
Less than five feet below final grade	95	8
Select Fill		
Below concrete slabs or mats	100	8
Below pavement and sidewalks	100	12
Behind concrete walls	95	8
Subbase Material		
Below pavement and sidewalks	100	12
All other locations	100	8
Pipe Bedding Material		
Below structures or pavement	100	8
All other locations	95	6
Drainage Fill	N/A	6

2. Fill shall be wetted and thoroughly mixed to achieve optimum moisture content plus-or-minus three percent, with the following exceptions:
   a. On-site clayey soils: Optimum to plus three percent.
3. Replace natural, undisturbed soils or compacted soil subsequently disturbed or removed by construction operations with materials compacted as indicated in Table 31 2305-A of this Section.
4. Field quality control testing for density; to verify that specified density was obtained, will be performed during each day of compaction Work. Responsibility for field quality control testing is specified in the "Field Quality Control" Article in Part 3 of this Section.
5. When field quality control testing indicates unsatisfactory compaction, provide additional compaction necessary to obtain the specified compaction. Perform additional compaction Work at no additional cost to Owner until specified compaction is obtained. Such work includes complete removal of unacceptable (as determined by Engineer) fill areas and replacement and re-compaction until acceptable fill is provided in accordance with the Contract Documents.

L. Replacement of Unacceptable Excavated Materials: In cases where over-excavation to replace unacceptable soil materials is required, backfill the excavation to required subgrade with select fill material and thoroughly compact in accordance with Table 31 23 05-A and the associated "Compaction Density Requirements" in this Article. Slope the sides of excavation in accordance with the maximum inclinations specified for each structure location.

3.11 GRADING:

A. General:
   1. Uniformly grade areas within limits of grading under this Section, including adjacent transition areas.

2. Smooth subgrade surfaces within specified tolerances, compact with uniform levels or slopes between points where elevations are shown, or between such points and existing grades.

B. Grading Outside Building Lines: Grade areas adjacent to building lines to drain away from structures and to prevent ponding. Finish surfaces free of irregular surface changes, and shall comply with the following:
1. Grassed Areas or Areas Covered with Gravel, Stone, Wood Chips, or Other Special Cover: Finish areas to receive topsoil or special cover to within not more than one inch above or below the required subgrade elevations.
2. Sidewalks: Shape surface of areas under sidewalks to line, grade, and cross section, with finish surface not more than one inch above or below the required subgrade elevation.
3. Pavements: Shape surface of areas under pavement to line, grade, and cross section, with finish surface not more than 1/2-inch above or below the required subgrade elevation.

C. Grading Surface of Fill Under Concrete Slabs: Grade smooth and even, free of voids, compacted as specified, and to required elevation. Provide final grades within a tolerance of 1/2-inch when tested with a ten foot straight edge.

D. Compaction:
1. After grading, compact subgrade surfaces to the depth and percentage of maximum density for each area classification.

3.12 CONTROLLED LOW STRENGTH MATERIAL (CLSM):

A. Controlled Low Strength Materials Placement:
1. Discharge CLSM from the mixer by reasonable means into the space to be filled.
2. Bring the fill material uniformly up to the fill line shown or indicated in the Contract Documents.
3. Placement of fill over the CLSM may proceed after a curing period of not less than three days.

3.13 PAVEMENT SUBBASE COURSE:

A. General:
1. Place subbase material, in layers of specified thickness, over ground surface to support pavement base course.
2. After completing filling and grading, shape and compact pavement subgrade to an even, firm foundation in accordance with this Section. Remove unsuitable subgrade materials, including soft materials, boulders, vegetation, and loose stones, and replace with compacted fill material as directed by Engineer.

B. Grade Control:
1. During construction, maintain lines and grades including crown and cross-slope of subbase course.

C. Placing of Pavement Subbase Course:
1. Place subbase course material on prepared subgrade in layers of uniform thickness, in accordance with indicated cross-section and thickness. Maintain optimum moisture content for compacting subbase material during placing operations.

2. Compaction and Grade Control: Comply with compaction requirements for excavation and fill in this Section, and the following requirements:
    a. Compaction with roller shall begin at the sides of the area to be paved and continue toward the center. Continue compaction until there is no movement of the course ahead of the roller.
    b. After compaction of top lift of pavement subbase, provide and uniformly spread pipe bedding material and screenings compacted, on the surface, and sweep using gang-dragged broom, followed by compaction.
    c. After rolling, check for grade with a line not less than 40 feet in length; depression over 1/2-inch deep shall be filled to satisfaction of Engineer.
3. After completing compaction, other than that necessary for bringing material for the next course, do not haul or drive over the compacted subbase.
4. Do not install pavement subbase in excess of 500 feet in length without compacting to prevent softening of the subgrade.
5. If subgrade material becomes churned up into or mixed with the subbase material, remove the mixed material and replace with clean, compacted subbase material.

D. Shoulders:
1. Place shoulders along edges of subbase course to prevent lateral movement. Construct shoulders of acceptable soil materials, placed in such quantity to compact to thickness of each lift of subbase material.
2. Compact and roll not less than 12-inch width of shoulder simultaneously with compacting and rolling of each lift of subbase material.

3.14 DISPOSAL OF EXCAVATED MATERIALS:

A. General:
1. Contractor shall haul away material removed from excavations that does not comply with requirements for fill, or is in excess of the quantity required for fill.
2. Disposal of materials shall be in compliance with Laws and Regulations, at no additional cost to Owner.

3.15 TEMPORARY BARRIERS:

A. Provide temporary barrier surrounding excavations and excavation work areas to provide temporary protection to persons and property. Barrier shall have openings only at vehicular, equipment, and worker access points.

B. Minimum Material Requirements for Temporary Barriers:
1. Temporary barrier shall not be less snow fence-type fencing, four feet high.
2. Fence shall be constructed of vertical hardwood slats measuring not less than 1.5 inches by 1/4 inch interwoven with strands of horizontal wire, or shall be of equivalent plastic construction.
3. Posts:
    a. Posts shall be steel, either “U”-, “Y”-, “T”-shaped, or channel section.
    b. Posts shall have a nominal weight of not less than 1/3-pound per linear foot, exclusive of the anchor.
    c. Posts shall have tapered anchors weighing not less than 0.67 pounds, each firmly attached by means of welding, riveting or clamping.
    d. Posts shall have corrugations, knobs, notches, or studs placed and constructed to engage a substantial number of fence line wire in the proper position.

e. Provide each post with sufficient quantity of galvanized wire fasteners or clamps, of not less than 0.120 inch diameter, for attaching fence wire to post.

3.16 FIELD QUALITY CONTROL:

A. Site Tests: Owner will employ a testing laboratory to perform field quality control testing. Payment for testing laboratory will be through the Materials Testing Allowance.
   1. Testing Laboratory Scope:
      a. Perform field moisture content and density tests to ensure that the specified compaction of fill materials has been obtained.
      b. Tests of actual unconfined compressive strength or bearing tests on each stratum.
      c. Report results of each test to Engineer and Contractor.
   2. Required Material Tests:
      a. Compaction: Comply with ASTM D1556 and ASTM D6938, as applicable.
   3. Authority and Duties of Testing Laboratory:
      a. Technicians representing the testing laboratory shall inspect the materials in the field, perform testing, and report findings to Engineer and Contractor. When materials furnished or the Work performed does not comply with the Contract Documents, technician will direct attention of Engineer and Contractor to such failure.
      b. Technician will not act as foreman or perform other duties for Contractor. Work will be checked as it progresses, but failure to detect defective Work or non-complying materials shall not in any way prevent later rejection when defect is discovered, nor shall it obligate Engineer for Substantial Completion or final acceptance. Technicians are not authorized to revoke, alter, relax, enlarge, or release requirements of the Contract Documents, or to approve or accept any portion of the Work.
   4. Responsibilities and Duties of Contractor:
      a. Use of testing laboratory shall in no way relieve Contractor of the responsibility to provide materials and Work in full compliance with the Contract Documents.
      b. To facilitate testing laboratory, Contractor shall advise testing laboratory at least two days in advance of filling operations to allow for completion of field quality control testing and for assignment of personnel.
      c. It shall be Contractor's responsibility to accomplish the specified compaction for fill and other earthwork. Contractor shall control construction operations by confirmation tests to verify and confirm that Contractor has complied, and is complying at all times, with the Contract Documents relative to compaction, control.
      d. Contractor shall demonstrate adequacy of compaction equipment and procedures before exceeding one or more of the following quantities of earthwork. Each test location shall include tests for each layer, type, or class of fill to finish grade.
         1) 200 linear feet of trench fill.
         2) 10 cubic yards of select fill.
         3) 100 cubic yards of general fill.
         4) 50 cubic yards of subbase material.
   5. Testing laboratory will inspect and indicate acceptable subgrades and fill layers before construction work is performed thereon. Testing of subgrades and fill layers shall be taken as follows:
      a. Trenches for Structures, and Underground Facilities (including buried ductbanks):
         1) In Open Fields: Two locations every 1,000 linear feet.
         2) Along Dirt or Gravel Roads or Off Traveled Right-of-Way: Two locations every 500 linear feet.

3) Crossing Paved Roads: Two locations along each crossing.
4) Under Pavement Cuts or Within Two Feet of Pavement Edges: One location every 400 linear feet.

b. Footing Subgrade: For each stratum of soil on which footings will be placed, perform not less than one test to verify required design bearing capacities. Subsequent verification and approval of each footing subgrade may be based on a visual comparison of each subgrade with related tested strata, when acceptable to Engineer.

c. For Select Fill: On 30-foot intervals on all sides of the structure for every compacted lift, but not less than one per lift on each side of the structure for structures less than 60 feet long on a side.

d. For General Fill: One per 1,000 square feet on every compacted lift.

e. Subbase Material: One per 1,000 square feet on every compacted lift.

6. Periodic compliance tests will be made by Engineer to verify that compaction is complying with the requirements specified, at no cost to Contractor. Contractor shall remove the overburden above the level at which Engineer wishes to test and shall fill and re-compact the excavation after testing is complete.

7. If testing laboratory reports or inspections indicate subgrade, fills, or bedding compaction below specified density, Contractor shall remove unacceptable materials as necessary and replace with specified materials and provide additional compaction at Contractor's expense until subgrades, bedding, and fill are acceptable. Costs for retesting of subgrade, fills, or bedding materials that did not originally comply with specified density shall be paid by Contractor.

END OF SECTION 31 2305

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 31 3700

RIPRAP

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, equipment, and incidentals required to furnish and install riprap at locations shown or indicated in the Contract Documents.

B. Coordination:
1. Review procedures under this and other Sections and coordinate the Work that must be performed with or before riprap.

1.2 SUBMITTALS:

A. Acton Submittals: Submit the following:
1. Product Data:
a. Source or quarry name, gradation, and other information required by Engineer. Submit for each source of material proposed.

B. Informational Submittals: Submit the following:
1. Certificates:
a. Where material is specified according to reference specification item number, submit copy of Supplier's valid certification from entity issuing the reference specification, and associated certification of material conformance with the reference specifications.

PART 2 – PRODUCTS

2.1 MATERIAL:

A. Riprap Type A: Material shall conform to Item 601.09 Type A, in accordance with the Ohio Department of Transportation Construction and Material Specifications.

B. Riprap Type B: Material shall conform to Item 601.09 Type B, in accordance with the Ohio Department of Transportation Construction and Material Specifications.

C. Riprap Type C: Material shall conform to Item 601.09 Type C, in accordance with the Ohio Department of Transportation Construction and Material Specifications.

PART 3 – EXECUTION

3.1 PREPARATION:

A. Clear ground surface of brush, trees, stumps, and other objectionable material, and dress to a smooth surface. Clearing and grubbing, where required, shall comply with Section 31 1100, Clearing and Grubbing.

B. Placing of geosynthetics, where required, shall comply with Section 31 0519.13, Geotextiles for Earthwork.

3.2 INSTALLATION:

A. Riprap Placing:
   1. Minimum total thickness of riprap shall be as shown on the Drawings.
   2. Exercise reasonable care to ensure that the finished surface of the protected channel conforms to the channel cross-section shown on the plans.
   3. Place riprap stones so that weight of stone is carried by underlying material and not by adjacent stones. Carefully place the stones on geosynthetics, where required, to produce an even distribution of pieces, with minimum of voids and without damaging the geosynthetic. Place the full-course thickness in one operation while preventing segregation and avoiding displacing of underlying material. Do not place stones in layers, by dumping into chutes, or by other methods that cause segregation or damage to geosynthetic, if any. When necessary, rearrange individual stones for uniform distribution.
   4. Riprap may be placed using equipment, and placing shall produce an installation of firm and solid riprap. Level the top surface of riprap to required alignment and slope by hand-placing stones to fill large voids and to make surface even.
   5. On slopes, place the largest stones at the bottom. Riprap shall be properly sized to form compact, solid blanket to protect the slope or channel, as applicable. On slopes steeper than one foot vertical to 1.5 feet horizontal, do not use rounded boulders or cobbles without grouting stones in place.
   6. When existing riprap is in proximity to riprap provided under this Section, place riprap to conform as closely as practicable in size and character to existing riprap.

END OF SECTION 31 3700

SECTION 32 0191

TREE PROTECTION AND TRIMMING

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and perform tree protection and trimming.
2. Extent of plantings to remain are shown. Extent of tree protection and trimming may include, but is not limited to, crown cleaning, crown thinning, crown raising, crown reduction, vista pruning and crown restoration; in addition to soil aeration, trench cut supervision and hand tunneling; drip line, root zone and tree trunk protection, and temporary barriers.
3. Types of products required include the following:
   a. Temporary protection barriers.
   b. Tree wound dressing.
   c. Drainage fill.
   d. Topsoil.
   e. Drain tile.
   f. Straw.
   g. Stone.
   h. Burlap.
   i. Accessories.

B. Coordination:
1. Review installation procedures under other Sections and coordinate construction activities and the installation of items that pass within the drip line, or that affect existing grade, in areas where existing plantings are to remain.

C. Related Sections:
1. Section 33 11 00, Clearing and Grubbing.
2. Section 31 23 05, Excavation and Fill.

1.2 REFERENCES:

A. Standards referenced in this Section are listed below:
1. American National Standards Institute, (ANSI).
   a. ANSI 300, Tree Care Operations - Tree, Shrub, and Other Woody Plant Maintenance - Standard Practices.
2. American Society for Testing and Materials, (ASTM).
   a. ASTM C 700, Specification for Vitrified Clay Pipe, Extra Strength, Standard Strength, and Perforated.
   b. ASTM D 448, Classification for Sizes of Aggregate for Road and Bridge Construction.
3. International Society of Arboriculture, (ISA).
   a. Trees and Building Sites.
   b. Tree-Pruning Guidelines.

1.3 QUALITY ASSURANCE:

A. Professional Arborist Qualifications:
   1. Engage an accredited professional arborist, acceptable to Engineer, skilled, trained and with successful and documented experience in the protection and restorative care of trees, certified by the International Society of Arboriculture or American Society of Consulting Arborists; who agrees to employ only tradesmen with specific skill and successful experience in this type of Work.
   2. Submit names and qualifications to Engineer along with the following information on a minimum of three successful projects.
      a. Names and telephone numbers of owner, architects or engineers responsible for projects.
      b. Approximate contract cost of the tree protection and trimming.
      c. Amount and kinds of tree protection and trimming performed.

B. Tree Pruning Standards: Comply with ANSI A300 and ISA standards, unless more stringent requirements are specified, or required by Site conditions.

C. Pre-installation Conference:
   1. Prior to commencement of Site construction Work, Contractor shall schedule and meet at the Site with professional arborist, installers of other Site construction Work in and around areas of existing plantings to remain, the Engineer and other representatives directly concerned with performance of the Work. Review foreseeable methods and procedures related to protection of existing plantings to remain, including the following:
      a. Review Project requirements and the Contract Documents.
      b. Review required submittals, both completed and yet to be completed.
      c. Review availability of materials and methods of delivery.
      d. Review location and types of below-grade work, required access during construction and methods of protection existing plantings.
      e. Review Project Schedule and availability of materials, tradesmen, equipment and facilities needed to make progress and avoid delays.
      f. Review environmental conditions, other Project conditions, and procedures for coping with unfavorable conditions.
      g. Review procedures needed for protection of plantings during the remainder of the construction period.
      h. Review required inspection, testing, and certifying procedures.
   2. Record the discussions of the conference and the decisions and agreements or disagreements reached, and furnish a copy of the record to each party attending.
   3. Record all revisions or changes agreed upon, reasons therefor, and parties agreeing or disagreeing with them.
   4. Reconvene the meeting at the earliest opportunity if additional information must be developed in order to conclude the subjects under consideration.

1.4 SUBMITTALS:

A. Action Submittals: Submit the following:
   1. Product Data:
      a. Submit product data for each material specified.

B. Informational Submittals: Submit the following:
   1. Certificates:

a. Certification by professional arborist that trees shown to remain were protected during the course of construction in accordance with recognized standards of the industry, as specified.
b. Certification that where damage did occur, trees were promptly and properly treated, or replaced.

2. Qualifications Data:
   a. Professional arborist.

C. Closeout Submittals: Submit the following:
1. Care and Maintenance Data:
   a. Submit typewritten instructions recommending procedures to be established by Owner for seasonal care and maintenance of trees affected by construction activities, after Substantial Completion.

1.5 PROJECT CONDITIONS:

A. Protection and Precautions:
1. Protect existing trees to remain during the course of construction in accordance with recognized standards of the industry, as specified.
2. Where damage occurs, professional arborist shall promptly and properly treat trees in accordance with recognized standards, as specified.
3. Replace damaged trees, as specified, at no additional cost to the Owner where, in the opinion of the professional arborist or Engineer, damaged trees are incapable of retaining full growth potential, or have been damaged to the extent that they can no longer perform their intended function in the landscape.

1.6 EXTENDED SERVICE:

A. Extended Landscape Service for Tree Repair and Replacement and Trees Affected by Grade Lowering:
1. Begin extended service immediately after each tree is acceptably planted or area regraded. Provide extended service for 90 days after tree plantings are acceptably completed and grade modifications performed.
2. Prune, cultivate, water, weed, fertilize, shade, mist, restore planting saucers, tighten and repair stakes and guy supports, and reset tree plantings to proper grades or vertical position, as required to establish healthy, viable plantings.
   a. Do not allow trees to wilt or show other signs of environmental stress. Visit the Site twice a week during the extended service periods, to inspect the condition of the plantings and immediately provide required care.
   b. Contractor shall provide landscape installer who shall be available on-call if notified between regular visits that plants require critical care or maintenance, throughout the time of extended service period.
3. Check and observe tree plantings for signs of insect and disease attack. Take corrective measures immediately upon notice of such attack. Control damaging insects and diseases, as specified.
4. Restore or replace damaged tree wrappings.
5. Remove dead trees immediately. Replace immediately unless required to plant in the succeeding planting season.

B. Provide sufficient water to ensure that tree root zone remains moist at all times.
1. Apply water using a 1-inch diameter hose with an attached metering gauge.

2. Apply water at a sufficiently slow rate to prevent water run-off from the soil surface but great enough to provide 0.2-inches of water per square foot of canopy area per hour for five hours each week.

C. Any decline in the condition of trees shall require Contractor to take immediate action to identify potential problems and undertake corrective measures. If required, engage professional arborist or horticulturist to inspect trees, identify problems and recommend corrective procedures. Advise Engineer of all such actions and submit inspection and recommendation reports.

PART 2 - PRODUCTS

2.1 MATERIALS:

A. Tree Wound Dressing: Provide tree wound dressing which is waterproof, adhesive and elastic with an antiseptic, free from kerosene, coal tar, creosote or any other material injurious to the life of the plant.

B. Drainage Fill: Selected crushed stone, or crushed or uncrushed gravel, washed, ASTM D 448, Size 24, with 90 to 100 percent passing a 2-1/2-inch sieve and not more than ten percent passing a 3/4-inch sieve.

C. Topsoil: Provide topsoil, as required, that is fertile, friable, natural loam, surface soil, capable of sustaining vigorous plant growth, free of any admixture of subsoil, clods of hard earth, plants or roots, sticks or other extraneous material harmful to the growth of plants. Obtain topsoil only from well-drained sites where soil occurs in depth of 4-inches or more; do not obtain from bogs or marshes. Supply topsoil with the following analysis:
1. 3/4-inch Mesh: 100 percent passing.
2. No. 4 Sieve: 90 to 100 percent passing.
3. No. 200 Sieve: 0 to 10 percent passing.
4. Clay content of material passing No. 200 sieve not greater than 60 percent, as determined by hydrometer tests.
5. pH 5.0 to pH 6.5. If approved by Engineer, natural topsoil not having the hydrogen-ion value specified may be amended by Contractor at his own expense.
6. Organic content not less than five percent, as determined by ignition loss.
7. Free of pests or pest larvae.

D. Drain Tile: Provide 4-inch standard strength, perforated bell-and- spigot clay pipe, in compliance with ASTM C 700.

E. Stone: Naturally occurring at the Site, as selected by Contractor.

F. Burlap: Jute not less than 7.2 ounces per square yard.

PART 3 - EXECUTION

3.1 PERFORMANCE:

A. General:
1. Install temporary fencing, barricades or guards, located as recommended by professional arborist, outside the drip line of trees.

2. Protect tree root systems from damage caused by noxious materials from run-off or spillage during mixing, placing, or storing of construction materials. Protect root systems from flooding, erosion or excessive wetting resulting from dewatering operations or other construction activities.
3. Do not allow fires under or adjacent to trees or other plants to remain.
4. Do not store materials, debris, topsoil or excavated subsoil within the drip line of trees to remain. Do not permit vehicles within drip line. Restrict foot, vehicle and equipment traffic to prevent compaction of soil over root systems. Where such activities are unavoidable, and only as acceptable to Engineer, provide continuous heavy wood planking, effectively fastened together and capable of distributing all loads from such activities, above a filter fabric layer covered with 2-inches of gravel.
5. Cut branches and roots, if required, with sharp pruning instruments; do not break or chop. Paint cuts over 1/2-inch in size with tree wound dressing.

B. Excavation:
1. Excavate within drip line of trees only where shown.
2. Where trenching for utilities is required within drip line, tunnel under or around main lateral feeder roots by drilling, auger boring, pipe jacking, or digging by hand under supervision of professional arborist. Do not cut main lateral roots or tap roots; cut smaller roots, which interfere with installation of the Work.
3. Where excavation for construction is required within drip line of trees, hand excavate to minimize damage to root systems. Perform excavation under supervision of professional arborist. Install shoring or other protective support systems at excavations, to minimize sloping or benching of excavations. Use narrow tine spading forks and comb soil to expose roots.
4. Relocate roots in backfill areas wherever possible. If large, main lateral roots are encountered, expose beyond excavation limits as required to bend and relocate without breaking. If encountered immediately adjacent to location of construction and relocation is not practical, cut roots approximately 3-inches back from construction.
5. Do not allow exposed roots to dry out before permanent backfill is placed; provide temporary earth cover. Water and maintain in moist condition and temporarily support and protect from damage until permanently relocated and covered with earth.

C. Regrading:
1. Maintain existing grade within drip line of trees, unless otherwise shown or specified.
2. Grade Lowering:
    a. Where new finish grade is shown below existing grade around trees, slope grade beyond drip line. Maintain existing grade within the drip line of trees.
    b. Prune tree roots exposed during grade lowering, or provide permanent protections as recommended by professional arborist. Do not cut main or lateral roots or taproots; cut only smaller roots.
    c. Compensate for loss of roots and prune branches to stimulate root growth.
    d. Provide extended service during the Contract period as recommended by professional arborist.
3. Minor Fills:
    a. Where existing grade is 6-inches or less below elevation of finish grade shown, fill with topsoil.
    b. Place in single layer and do not compact.
    c. Hand grade to required finish elevations.

E. Tree Repair and Replacement:

1. Cavity Repair:
    a. Remove decayed areas to depth, which exposes healthy tissue.
    b. Shape cavities to provide drainage.
    c. Paint inside of cavity with accepted antiseptic tree wound paint.
    d. Do not fill cavities.
    e. When cavity cross section exceeds 60 percent of cross section of tree, remove tree upon authorization of Engineer.
    f. Remove tree stumps to 12-inches below finished grade.
2. Promptly repair trees damaged by construction operations within 24 hours of the occurrence of such damage. Treat damaged trunks, limbs, and roots according to written instructions of professional arborist.
3. Remove and replace dead trees, and damaged trees determined by professional arborist to be incapable of restoration to normal growth pattern.
4. If trees over 6-inches in caliper measurement, taken 12-inches above grade, are required to be replaced, provide new trees of 6-inch caliper size, and of the species selected by Engineer.

3.2 CLEAN-UP:

A. Burning of removed trees, chips and branches is not permitted on the Site.

B. Remove excess excavated material, displaced trees, excess chips and trimmings. Legally dispose off-Site.

C. Remove protection barriers and load distributing layers when no longer needed and restore areas beneath trees.

END OF SECTION 32 0191

SECTION 32 1200

FLEXIBLE PAVING

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install flexible, hot-mix, hot-laid, asphalt concrete pavement.
2. The Work includes:
a. Preparation such as sawcutting, milling where shown or indicated, cleaning, and other preparation for installing flexible pavements.
b. Providing asphalt concrete paving materials.
c. Providing tack coat material.
d. Providing pavement markings where shown or indicated.
e. Providing quality controls and testing.

B. Coordination:
1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before flexible paving Work.

C. Related Sections:
1. Section 31 2305, Excavation and Fill.
2. Section 32 1613, Concrete Curbs Gutters and Sidewalks.

1.2 REFERENCES:

A. Standards referenced in this Section are:
1. Construction and Materials Specifications of the State of Ohio Department of Transportation (ODOT), Latest Edition.

1.3 QUALITY ASSURANCE:

A. Standard Specifications and Details:
1. Contractor shall conform to all applicable requirements and testing of the State of Ohio Department of Transportation.

B. Qualifications:
1. Asphalt Concrete Production Facility:
a. Production facility for asphalt concrete, tack coat materials, and other bitumastic materials shall be certified by the Ohio Department of Transportationfor furnishing such materials for highways.
2. Contractor’s Testing Laboratory:
a. Retain the services of independent testing laboratory to perform testing and determine compliance with the Contract Documents of the materials provided under this Section.
b. Testing laboratory shall comply with ASTM E329.

c. Testing laboratory shall be experienced in the types of testing required.
d. Selection of testing laboratory is subject to Engineer's acceptance.

C. Regulatory Requirements:
1. Reference Specifications and Details:
a. Comply with applicable requirements of the Ohio Department of Transportation Construction and Material Specifications.
2. Obtain required highway and street rights-of-way work permits.

D. Quality Assurance Testing:
1. Quality assurance testing is in addition to source quality control testing, when required, and field quality control testing required under Article 3.4 of this Section.
2. Materials used in the Work may require testing and retesting, as directed by Engineer, during the Project. Allow free access to material stockpiles and facilities at all times. Tests not specifically indicated to be performed at Owner's expense, including retesting of rejected materials and installed Work, shall be performed at Contractor's expense.
3. Contractor's Quality Assurance Testing Laboratory Scope:
a. Use of testing laboratory shall not relieve Contractor of responsibility for providing materials and the Work in compliance with the Contract Documents.
b. Quality assurance testing laboratory shall perform the following, unless evidence of material compliance with reference specifications indicated in Paragraph 1.3.B of this Section , is submitted to Engineer by Contractor and asphalt concrete production facility:
1) Test in accordance with reference specifications indicated in Article 1.3 of this Section. In lieu of quality assurance testing, submit evidence and certification of material compliance with reference specifications. When evidence of conformance submitted is not acceptable to Engineer, perform quality assurance testing.
c. To facilitate testing services, Contractor shall:
1) Secure and deliver to testing laboratory and Engineer (when requested by Engineer) representative Samples of materials that Contractor proposes to furnish and that are required to be tested.
2) Furnish such labor as is necessary to obtain and handle Samples at the Site or at asphalt concrete production facility and other material sources.
3) Advise testing laboratory and Engineer sufficiently in advance of operations to allow for completion of quality assurance tests and for the assignment of personnel.

1.4 SUBMITTALS:

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Submit the proposed asphalt concrete mix design for each asphalt concrete material, and other bituminous materials, required under this Section, providing complete data on materials, including location in the Work, source, material content and percentages, temperatures and all other pertinent data. Indicate proportion of bituminous material from reclaimed asphalt pavement.
b. Proposed gradation for each aggregate to be used in flexible paving. Submit gradation test results for the same material furnished on a previous project. Indicate the proportion of reclaimed asphalt pavement.

c. In lieu of the information required under Paragraphs 1.4.A.1.a and 1.4.A.1.b, above, submit certificates of compliance with the reference specifications indicated in Article 1.3 of this Section, for each for the following:
1) Each mix design required.
2) Bituminous materials required.
3) Aggregates to be used in flexible paving, from each material source and each required gradation.
4) Density of uncompacted asphalt concrete material.
5) Density of previously-compacted, previously-tested asphalt concrete material.
6) Density and voids analysis for each asphalt concrete material test specimen.
7) Evidence of asphalt concrete plant inspection and compliance with the reference specifications indicated in Article 1.3 of this Section.
8) Proportion of reclaimed asphalt pavement in bituminous materials and aggregate.

2. Product Data:
a. Manufacturer's complete product data on all pavement marking materials proposed for use, including product literature, specifications, and recommended application techniques and other installation data.

B. Informational Submittals: Submit the following:
1. Quality Assurance Test Data Submittals and Source Quality Control Submittals:
a. Submit for quality assurance tests and source quality control tests required.
2. Field Quality Control Submittals:
a. Submit results of required field quality control testing.
3. Qualifications:
a. Asphalt concrete production facility, when required by Engineer.
b. Contractor's testing laboratory, when required by Engineer.

1.5 SITE CONDITIONS:

A. Weather Limitations:
1. Temperature:
a. For base course and binder course paving lifts equal to or greater than two inches thickness, atmospheric temperature shall be 40 degrees F and rising.
b. For surface course paving or other pavement courses in lifts less than two inches thick, temperature of surface on which pavement is to be placed shall be 50 degrees F or greater.
2. Prohibitions:
a. Do not place flexible paving materials when weather is foggy or during precipitation.
b. Do not place flexible paving materials when the base on which the material will be placed contains moisture in excess of optimum.
c. Place flexible paving materials only when Engineer concurs that weather conditions are suitable.

PART 2 – PRODUCTS

2.1 SYSTEM PERFORMANCE:

A. System Description: as shown on the Drawings

2.2 ASPHALT CONCRETE MIXES:

A. Asphalt Concrete Mixtures: As shown on the Drawings

2.3 MATERIALS:

A. Materials for Asphalt Concrete: As shown on the Drawings

2.4 PAVEMENT MARKING MATERIALS:

A. Traffic and parking marking materials shall conform to ODOT Item 642.

B. Colors:
1. Roadway Center Markings Between Opposing Traffic Lanes: Yellow.
2. Roadway Side Striping: White, unless otherwise shown or specified. On roads with divided median, right-side striping of each direction shall be white, and left-side striping shall be yellow.
3. Roadway Miscellaneous Lane Markings (turn lane arrows and text): White.
4. Parking Spaces: White.
5. No-Parking Areas: White.
6. Handicap Parking Spaces: Unless otherwise indicated with signs, provide handicap symbol on pavement with blue paint.

PART 3 – EXECUTION

3.1 INSPECTION:

A. Examine the subbase and base on which flexible paving will be installed. Notify Engineer in writing of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

B. Do not place materials on subgrades, or subbase that is muddy or has water thereon.

3.2 PREPARATION:

A. Preparation: Before starting installation of flexible paving, perform the following:
1. Grade Control: Establish and maintain throughout flexible paving installation the required lines and grades, including crown and cross slope for each asphalt concrete course during construction operations.
2. Prepare subgrade and provide subbase for flexible pavement in accordance with Section 31 2305, Excavation and Fill. Before installing flexible pavement, obtain Engineer's concurrence that subgrade and subbase are suitable for installing flexible pavement.
3. Coordinate placement of flexible pavement with the Work included under Section 32 1613, Concrete Curbs and Sidewalks, and Work including drainage structures, manholes, valve boxes, and similar items.
4. Provide appropriate maintenance and protection of traffic measures during placement of pavement.

B. Milling:
1. Perform milling of existing pavement where shown or indicated.

2. "Milling" consists of the milling, shaping, and removing portions of existing surfaces by cold milling process and subsequent cleaning.
3. Milling Equipment:
    a. Milling machines shall be power-operated, self-propelled machines capable of removing the desired thickness of existing surfaces. Machines shall have sufficient power, traction, and stability to accurately maintain depth of cut and slope. Machines shall produce a finished profile and cross slope to within 1/4 inch of that required and shall produce uniform surface texture free of gouges and ridges greater than 3/8-inch deep.
    b. Machines shall be equipped with a means to control dust and other particulate matter created by the cutting action.
    c. Provide equipment that removes milled material as quickly as the rate of milling.
    d. Use vacuum trucks, street sweepers or power brooms to clean milled surfaces.
4. Milling Operations:
    a. Perform milling to so that, when final course of pavement is placed, required elevations and grades are provided. Where required, establish a taut reference string line to control line and grade of milling.
    b. Minimize the time between milling and placement of pavement over milled surface.
    c. Areas not accessible to the milling machine, such as around or adjacent to drainage structures, manholes, curbs, and transverse joints on structures, may be removed by a small milling machine, handwork or other method acceptable to Engineer.
    d. Remove milled material as soon as it is milled. Remove fines and other material prior to opening milled area to traffic. Control objectionable dust emissions. When traffic has been allowed into milled area or when more than 48 hours have elapsed since milling, clean the milled area again prior to applying tack coat.
    e. Maintain drainage to drainage inlets and other drainage structures in a manner acceptable to Engineer.
    f. Properly dispose of milled material at a location away from the Site.

C. Surface Preparation:
1. Repair surface defects in existing pavement to provide uniform surface to receive new pavement.
2. Provide crack sealant to completely fill cracks more than 1/16-inch wide in areas shown or indicated on the Drawings.
3. Clean existing surfaces over which asphalt concrete pavement will be installed, by removing from the surface foreign material, excess asphalt concrete, excess joint sealant, and crack filler, and other undesirable matter.
4. Provide tack coat as indicated in Article 3.3 of this Section.

3.3 INSTALLATION OF FLEXIBLE PAVING:

A. General:
1. Provide final pavement surfaces of uniform texture, at required grades and cross-sections.
2. Construct roadways to the lines, grades, and typical sections shown or indicated.

B. Installation of Asphalt Concrete:
1. Asphalt concrete mixture shall be transported to the site of paving and placed as soon as possible after mixing.
2. Placement of each asphalt concrete course shall be completed over the full width of the section under construction during each day's paving operations.

3. Spread and finish asphalt concrete courses by means of self-propelled mechanical spreading and finishing equipment. Compacted thickness of layers placed shall not exceed 150 percent of specified thickness unless approved in writing by Engineer.
4. Compaction:
    a. Rollers:
        1) Use sufficient rolling equipment to satisfactorily compact and finish the quantity of asphalt concrete placed. There shall be not less than two rollers on the Project at all times. When acceptable to Engineer, one of the rollers may be a pneumatic-tire roller.
        2) During rolling operations, roller speed shall not exceed three miles per hour. When sufficient number of rollers is not available, reduce the quantity of asphalt concrete placed to accommodate the available rollers' speed.
        3) Required rollers shall be at the Site, in acceptable operating condition, prior to placing of asphalt concrete.
        4) Use of vibratory rollers in lieu of steel-wheeled rollers is acceptable, however when thickness of asphalt concrete is one-inch or less, rolling shall be in the static mode.
    b. Rolling of initially-placed asphalt concrete material, or breakdown rolling, shall begin as soon as the asphalt concrete mixture will bear the roller without undue displacement.
    c. Rolling shall be longitudinal, overlapping on successive trips by not less than one-half roller rear wheel width, and not more than three-quarters of roller rear wheel width. Alternate trips of the roller shall be of slightly different lengths.
    d. At all times, roller motion shall be slow enough to avoid displacing the asphalt concrete.
    e. Operate rollers continuously from breakdown of laid asphalt concrete through finish rolling.
    f. Perform finish rolling using a steel-wheeled roller or a vibratory steel-wheel roller operating in the static mode.
    g. Perform rolling with consecutive passes to achieve even and smooth finish without roller marks.
    h. At each location not accessible to roller, thoroughly compact asphalt concrete with tampers and finish, where necessary, with a hot smoothing iron to provide uniform, smooth layer over the entire area so compacted.
5. Each compacted asphalt concrete course shall be within plus or minus 1/4-inch of the indicated thickness.
6. Placement of Adjacent Strips of New Asphalt Concrete:
    a. When more than one width of asphalt concrete material will be placed, a six-inch wide strip of asphalt concrete adjacent to the area on which the future material is to be placed shall not be rolled until such future material is placed.
    b. Do not leave the unrolled strip unrolled for more than two hours after placement, unless the six-inch unrolled strip is first heated with a joint heater.
    c. After the first strip or width of asphalt concrete is compacted, place, finish, and compact the second width or strip as required for the first width, except that rolling shall be extended to include the six-inch strip of the first width not previously compacted.

C. Construction Joints:
1. Construction joints shall be made in such a manner as to ensure a neat junction, thorough compaction, and bond throughout.

2. Provide a transverse joint extending over the full width of the strip being laid and at right angles to its centerline at end of each workday and at other times when the placement of hot-mix asphalt concrete will be suspended for a period of time that will allow asphalt concrete mixture to chill.
3. Thoroughly compact by rolling the forward end of a freshly laid strip of asphalt concrete before the asphalt concrete mixture becomes chilled. When the Work is resumed, the end shall be cut vertically for the full depth of the layer.

D. Joining of Pavements:
1. When pavement is to join existing or previously-laid pavement, the existing or previously-laid pavement shall be neatly and carefully edged to allow for overlapping and feathering of the subsequent course of asphalt concrete material.
2. Where new pavement is to meet existing pavement, the existing pavement shall be sawcut and notched.
3. Where new pavement will meet existing asphalt pavement, remove existing pavement 12 inches onto undisturbed existing pavement course at edges where new pavement will meet existing pavement.
4. Tack Coat:
   a. Provide tack coat material at the following locations:
      1) At edges where new pavement will connect to existing or previously-installed pavement.
      2) On surface of existing or previously-installed pavement course over which new pavement will be installed, prior to placement of the subsequent pavement course. Tack coat may be deleted when a succeeding layer of asphalt pavement is being applied over a freshly-placed asphalt pavement course that has been subjected to very little or no traffic, with approval of Engineer
      3) Where new pavement will abut curbing, concrete gutters, drainage structures and frames, manhole cover frames, valve boxes, and similar items.
   b. Tack Coat Installation: Install tack coat immediately prior to installing pavement. Place pavement while tack coat is wet. Apply tack coat in accordance with reference specification indicated in Article 1.3 of this Section.

E. Curing:
1. Do not allow traffic onto pavement until directed by Engineer. Traffic will not be allowed on new asphalt concrete pavement until surface temperature is less than 140 degrees F.
2. Hold construction traffic on new pavement to a minimum as acceptable to Engineer.

F. Asphalt Concrete Curbs: Provide extruded asphalt curbs of the height and profile indicated on the Drawings.

G. Defective Pavement Work:
1. When directed by Engineer, remove and replace defective flexible paving Work. Cut out such areas of defective pavement and fill with fresh asphalt concrete materials, compacted to required density.

3.4 FIELD QUALITY CONTROL:

A. Site Tests:
1. Responsibility:
   a. Owner's field quality control testing laboratory will:

1) Perform field density tests to verify that required compaction of asphalt materials has been obtained.
2) Test the proposed materials for compliance with the Contract Documents, as directed by Engineer.
3) Submit reports of all test results to Engineer and Contractor.

b. Authority Field Quality Control Testing Laboratory:
1) Technicians representing the testing laboratory will inspect materials at the Site and perform required testing. When the materials furnished or Work performed do not comply with the Contract Documents, field quality control testing laboratory technician shall direct the attention of Engineer and Contractor to such non-compliance.
2) Testing laboratory personnel shall not act as foreman or perform other duties for Contractor. The Work will be checked as it progresses, but failure to detect defective Work shall not in any way prevent the later rejection of such defective Work when defect is discovered. Failure to detect defective Work as it occurs does not obligate Engineer to final acceptance. Testing laboratory personnel are not authorized to revoke, alter, relax, enlarge, or release requirements of the Contract Documents, nor to approve or accept any portion of the Work.

2. Asphalt Concrete Mix Temperature: Measure temperature at time of placement, record, and submit to Engineer.
3. Surface Smoothness:
a. Test finished surface of each flexible paving course for smoothness, using a ten-foot straightedge applied parallel to and at right angles to centerline of paved areas.
b. Check surfaced areas at intervals as directed by Engineer.
c. Surfaces will be acceptable relative to smoothness when measurements are equal to or less than the following:
1) Base Course: 3/8-inch vertical in ten feet horizontal.
2) Binder Course: 3/8-inch vertical in ten feet horizontal.
3) Surface Course (Wearing Course): 1/4-inch vertical in ten feet horizontal.
4) Crowned Surfaces:
5) Test crowned surfaces with a crown template, centered and at right angles to the crown.
6) Surfaces will be acceptable when variance is equal to or less than 1/4-inch from the template.
d. Elevation: Finished surface of pavement shall be within plus or minus 1/2-inch of elevations shown or indicated.
4. Density:
a. Test Method: ASTM D2950 nuclear method ; test one sample every 1,000 square yards of pavement. Test for each asphalt concrete course installed.
b. In addition, when directed by Engineer, compare density of in place flexible paving materials against laboratory specimen or certificates on same asphalt pavement mixture, using nuclear density device.
c. Criteria for Acceptance: Density of in place asphalt pavement material shall be not less than 90 percent of the recorded laboratory specimen or certificate density. Density shall be not greater than 98 percent.
5. Repair holes from test specimens in accordance with this Section’s requirements for repairing defective Work.

3.5 ADJUSTING:

A. Frames and Covers:
   1. Set frames of drainage structures, manholes, valve boxes, and similar items to final grade. Adjust frames of existing structures and frames furnished under other Sections. Frames shall be substantially similar elevation to finished surface course of pavement.
   2. Replace covers and gratings of existing structures immediately following adjusting associated frames. Install covers and gratings of structures provided under the Project as quickly as possible.
   3. Where there is a delay between adjusting of frames and installation of surface course, provide temporary bituminous material around perimeter of each frame to smooth vehicle access over the frame. Maintain and repair temporary bituminous material as required until placement of surface course. Remove temporary bituminous material before installing surface course.

B. Pavement Adjustment:
   1. Repair or replace in manner acceptable to Engineer areas of pavement that are observed to pond or collect water.

3.6 CLEANING:

A. Cleaning: After completing the paving operations, clean surfaces of excess or spilled bituminous materials, excess asphalt concrete, and foreign matter.

3.7 PROTECTION:

A. Protect finished pavement until pavement has become properly hardened and cool.

B. Cover openings of drainage structures, manholes, valve boxes, and similar items in the paved area until permanent coverings are provided.

3.8 PAVEMENT MARKINGS:

A. Provide pavement markings at the locations shown or indicated, in accordance with ODOT Item 642.

END OF SECTION 32 1200

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 32 1613

CONCRETE CURBS AND SIDEWALKS

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install concrete curbs and sidewalks.
2. Types of Work required under this Section include:
a. Conventionally-formed or machine-formed curb and sidewalk.
3. Width, thickness, geometry, and extent of curb and sidewalk shall be as shown or indicated on the Drawings.
4. Requirements for concrete sidewalks apply to concrete driveways, unless otherwise shown or specified, or unless concrete pavement requirements are included in the Contract Documents.

B. Related Sections:
1. Section 03 1100, Concrete Forming.
2. Section 03 1500, Concrete Accessories.
3. Section 03 2000, Concrete Reinforcing.
4. Section 03 3000, Cast-In-Place Concrete.
5. Section 07 9200, Joint Sealants.

1.2 QUALITY ASSURANCE:

A. Qualifications:
1. Installer:
a. Installer shall have not less than two years experience installing concrete curbs and sidewalks similar to those required for the Work.
b. When required by Engineer, submit record of experience documenting not less than three successful, completed projects. For each project, submit name the following information: project name, location of project, approximate quantity of concrete curb and sidewalk constructed by installer, contract price of concrete curb and sidewalk construction, and name and contact information for project owner and the project's construction-phase engineer.

1.3 SUBMITTALS:

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Submit concrete mix design when mix design is different from that submitted under Division 03 Sections on concrete. Submit in accordance with Division 03 Sections on concrete.
b. Proposed reinforcing materials.
c. Schedule of proposed underdrain piping sizes and materials by location in the Project.
2. Product Data:

a. Concrete Materials: Submit Supplier's technical information for materials proposed for use, when concrete materials are different from those submitted under Division 03 Sections on concrete.
b. Reinforcing Steel: Submit fabricator's technical information, including catalog information and specifications, for materials proposed for use, sufficient for Engineer to verify compliance with the Contract Documents.
c. Expansion Joint Filler: Submit Supplier's technical information, including manufacturer's product data, brochure, and specifications, for materials proposed for use, when materials are different from those submitted under Division 03 Sections on concrete.
d. Underdrain Piping: Manufacturer's product data, brochure, and specifications for underdrain piping proposed for use.

B. Informational Submittals: Submit the following:
1. Certifications:
a. When concrete materials are different from those approved under Division 03 Sections on concrete, submit certifications as required in concrete Specifications Sections referred to in this Section.
2. Site Quality Control Submittals:
a. Concrete test results for the Work included under this Section.
3. Qualifications Statements:
a. Installer, when requested by Engineer.

1.4 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Comply with Division 03 Sections on concrete referenced in this Section.

1.5 SITE CONDITIONS:

A. Weather and Temperature Limitations:
1. When temperature and environmental conditions warrant, comply with requirements for cold weather placing and hot weather placing under Division 03 Sections referenced in this Section, unless otherwise required under this Section.
2. Temperature of aggregate base material under concrete shall be 39 degrees F or higher. Aggregate base material shall not have snow, ice, frost, or standing water on its surface at the time of concrete placing. Use of insulating materials and heating equipment may be required before concrete placing begins.
3. Discontinue concrete placing when the air temperature falls below 39 degrees F. Do not place concrete in the rain.

PART 2 – PRODUCTS

2.1 MATERIALS:

A. Aggregate Bedding Material for Curbs and Sidewalks: compacted Subbase Material in accordance with Section 31 2305, Excavation and Fill, unless otherwise shown or indicated.

B. Concrete Materials:
1. Comply with applicable requirements of: Section 03 1100, Concrete Forming; Section 03 1500, Concrete Accessories; Section 03 2000, Concrete Reinforcing; and Section 03 3000, Cast-in-Place Concrete; including requirements for formwork, concrete materials, admixtures, bonding materials, curing materials, and others as required.

2. Concrete Mix, Design, and Testing:
    a. Comply with applicable requirements of Section 03 3000, Cast-in-Place Concrete, for concrete mix design, sampling, and testing, and quality control.
    b. Design the mix to produce concrete of properties of compressive strength, slump range, and air content as specified in Section 03 3000, Cast-in-Place Concrete.
    c. When machine-formed equipment is used for constructing concrete curbs or sidewalks, concrete so placed shall have properties in accordance with Section 03 3000, Cast-in-Place Concrete, except that maximum slump shall be 2.5 inches and air content shall be two percent of design.

C. Reinforcing Materials:
1. Provide deformed steel bars and smooth wire fabric complying with Section 03 2000, Concrete Reinforcing.

D. Expansion Joint Material:
1. Preformed Expansion Joint Filler: Comply with Section 03 1500, Concrete Accessories, for preformed expansion joint fillers.
2. Joint Sealant: For joint sealants and accessories used on expansion joints, comply with Section 07 9200, Joint Sealants.

2.2 DETECTABLE WARNING PLATE:

A. Detectable warning plates shall consist of a surface of truncated domes and shall comply with the following:
1. Dome Size. Truncated domes in a detectable warning surface shall have a base diameter of 0.9 inch (23 mm) minimum and 1.4 inches (36 mm) maximum, a top diameter of 50 percent of the base diameter minimum to 65 percent of the base diameter maximum, and a height of 0.2 inch (5.1 mm).
2. Dome Spacing. Truncated domes in a detectable warning surface shall have a center-to center spacing of 1.6 inches (41 mm) minimum and 2.4 inches (61 mm) maximum, and a base-to base spacing of 0.65 inch (17 mm) minimum, measured between the most adjacent domes on a square grid.
3. Contrast. Detectable warning surfaces shall contrast visually with adjacent walking surfaces either light-on-dark, or dark-on-light.
4. Platform Edges. Detectable warning surfaces at platform boarding edges shall be 24 inches (610 mm) wide and shall extend the full length of the public use areas of the platform.

PART 3 – EXECUTION

3.1 INSPECTION:

A. Examine subgrade, subbase, and conditions under which the Work is will be performed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions are been corrected.

B. Subgrade:
1. Verify that earthwork is completed to correct line and grade.
2. Verify that subgrade is smooth, properly compacted, and free of frost and excessive moisture in accordance with Division 31 Section on excavation and fill.
3. Do not commence the Work under this Section until conditions are satisfactory.

3.2 AGGREGATE BASE FOR CURBS AND SIDEWALKS:

A. Aggregate Base under Curb or Sidewalk:
   1. Install aggregate fill in accordance with Section 31 2305, Excavation and Fill. Properly compact aggregate fill to thickness shown or indicated in the Contract Documents.
   2. When thickness of aggregate base is not shown or indicated, provide six-inch thick aggregate base under curbs and sidewalks.

3.3 PERFORATED UNDERDRAIN PIPING:

A. Preparation for Underdrain Piping:
   1. Provide leveled and compacted bed of the required underdrain bedding material just prior to installing the underdrain piping. Slope bedding as shown and as required for drainage of underdrain piping.

B. Installation of Underdrain Piping:
   1. Install underdrain piping in accordance with pipe manufacturer's recommended installation procedures.
   2. Upgrade end of corrugated polyethylene underdrain pipe shall be closed with a solid plastic cap.
   3. Unless otherwise shown or required by Engineer, install underdrain pipe with perforations down.
   4. Install piping to drain to suitable discharge location.
   5. When polyethylene underdrains are daylighted through the side slope protect end of pipe from sunlight by providing section of corrugated steel or aluminum pipe, not less than three feet long, at the outlet. Extend the metal pipe not less than six inches into the ground and shall overlap the perforated underdrain piping by not less than the diameter of the underdrain pipe.

C. Acceptability of Underdrain Piping:
   1. With Engineer, visually inspect installed underdrain piping after installation and prior to filling and placing additional construction over underdrain piping. Piping will be acceptable when it is verified as installed on acceptable grade for drainage, is installed in accordance with the Contract Documents, and is free of damage and defects.

3.4 CONSTRUCTION OF FORMS:

A. Conventional Forms:
   1. Set forms to line and grade. Forms shall be free from warp.
   2. Install forms along full length of curb and sidewalk.
   3. Forms shall extend to the full depth of the curb and sidewalk (as applicable) and be secured so no displacement occurs during concrete placing.

B. At Contractor's option, machine-formed concrete curbs and sidewalks are acceptable.

3.5 REINFORCING:

A. General:
   1. Locate, place, and support reinforcing in accordance with Section 03 2000, Concrete Reinforcing, unless otherwise shown on the Drawings.
   2. Size of reinforcing shall be as shown or indicated in the Contract Documents.

3. Unless otherwise shown or indicated, locate reinforcing for sidewalks at the mid-depth point in the concrete slab.

B. When machine-formed concrete curbs and sidewalks are provided, reinforcing shall be suitable for the forming/placing method, at no additional cost to Owner. Obtain Engineer's approval of alternate reinforcing prior to placing concrete.

3.6 CONCRETE PLACING:

A. General:
1. Comply with Section 03 3000, Cast-in-Place Concrete, and this Section relative to mixing and placing concrete.

B. Placing:
1. Curbs: Place concrete using methods that prevent segregation of the mix. Consolidate concrete along face of forms with an internal vibrator.
2. Sidewalks: Place concrete in one-course, monolithic construction, for full width and depth of sidewalk.
3. Machine-Formed:
   a. At Contractor's option, automatic curb and sidewalk machine may be used for installing concrete.
   b. Machine forming shall produce curbs and sidewalks of required cross-section, lines, grades, finish, and jointing, as specified for conventionally-formed concrete.
   c. At curb cuts and driveway entrances, cut-out concrete and hand-finish the curbing to provide the required curb cut or driveway entrance, as applicable.
   d. If results do not comply with the Contract Documents, remove and replace at no additional cost to Owner.

C. Curbs:
1. Provide curb-cuts and driveway entrances for vehicle passage and pedestrian passage where shown, and when not shown but where existing sidewalks and curbs are being replaced, provide curb-cut or driveway entrance (as applicable) at location of existing driveways and pedestrian access ramps in sidewalks.
2. Neatly form transitions from curb to curb-cut or driveway entrance.
3. Unless otherwise shown or indicated, top of curb at curb-cut or driveway entrance shall be not greater than 1/4-inch above elevation of finished pavement surface.

3.7 JOINTS:

A. General:
1. Provide expansion joints, contraction joints, and construction joints in concrete curbs and sidewalks.
2. Provide expansion, contraction, and construction joints perpendicular to formed faces of curb or sidewalk.
3. Construct transverse joints at right angles to the Work centerline and as shown.

B. Contraction Joints: Provide joints as indicated below:
1. Curbs: Provide at intervals of ten feet on centers. Joint shall be not less than 1/8- inch and not more than 1/4-inch in width, and have a depth of 1.5 inches.
2. Sidewalks: Provide at intervals of five feet on centers. Joint shall be not less than 1/8- inch and not more than 1/4-inch in width, and have a depth of not less than one-third the total thickness of concrete sidewalk.

3. Joints may be formed or sawcut.

C. Construction Joints: Place construction joints at locations where concrete placing operations are stopped for more than 30 minutes, except where such pours terminate at expansion joints.

D. Expansion Joints:
1. General: Provide preformed expansion joint filler at locations indicated. When curb or sidewalk is not poured monolithically, provide expansion joints where each abuts the other.
2. Curbs: Provide 11/16-inch wide preformed expansion joint filter at the intervals of 30 feet along curb; at expansion joints in pavement; at movable structures (such as bridges); and between curb and: structures, returns, and at 30-foot intervals along length of curb.
3. Sidewalks: Provide 1/2-inch wide preformed expansion joint filler at 30-foot intervals along length of sidewalk and at all joints between sidewalk and: curb pavement, buildings, drainage structures, utility metal appurtenances such as manhole cover frames and valve boxes, and similar construction.
4. Place top of expansion joint material not less than 1/2-inch or more than one-inch below concrete surface. Apply joint sealer on top of expansion joint material flush with concrete surface, and in accordance with sealant manufacturer's instructions and Section 07 9200, Joint Sealants.

3.8 CONCRETE FINISHING:

A. Smooth exposed surface by screeding and floating. Perform hand-screeding when conventionally-formed concrete is provided.

B. Work edges of sidewalks, back top edge of curb, and transverse joints; and round to 1/4-inch radius.

C. Complete surface finishing by drawing a fine-hair broom across surface, perpendicular to line of traffic.

3.9 CURING:

A. General:
1. Protect and cure finished concrete curbs and sidewalks, in accordance with Section 03 3000, Cast-in-Place Concrete.
2. Cure driveways and sidewalks at driveways for not less than three days prior to opening to vehicle traffic. In colder weather, as indicated in Article 1.6 of this Section, curing period shall be not less than six days prior to opening to vehicle traffic unless other provisions to determine strength are provided and approved by Engineer.

3.10 REPAIR AND CLEANING:

A. Repair or replace broken or defective curbs and sidewalk as directed by Engineer.

B. Sweep the concrete curb and sidewalk Work and wash free of stains, discolorations, dirt, and other foreign material.

END OF SECTION 32 1613

SECTION 32 3100

FENCES

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified, and required to furnish and install fencing.
2. Extent of fencing is shown or indicated.
3. Types of materials required under this Section include:
a. Aluminum-coated, steel chain link fabric.
b. Galvanized steel framework.
c. Polyvinylchloride fusion-bonded finish.
d. Gate operators and associated control systems.
e. Barbed wire.
f. Auxiliary system components, gates, accessories, fasteners, and fittings.
4. Substitutions: Structural shapes of satisfactory sections and equal strengths may be substituted upon Engineer's approval of Contractor's substitution request.

B. Related Sections:
1. Section 03 3000, Cast-In-Place Concrete.
2. Section 03 6000, Grouting.
3. Section 09 9100, Painting.

1.2 REFERENCES:

A. Standards referenced in this Section are:
1. ASTM A53, Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
2. ASTM A90/A90M, Test Method for Weight [Mass] of Coating on Iron and Steel Articles with Zinc or Zinc-Alloy Coatings.
3. ASTM A123, Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
4. ASTM A153/A153M, Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
5. ASTM A428/A428M, Test Method for Weight [Mass] of Coating on Aluminum-Coated Iron or Steel Articles.
6. ASTM A491, Specification for Aluminum-Coated Steel Chain-Link Fence Fabric.
7. ASTM A780, Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
8. ASTM A817, Specification for Metallic-Coated Steel Wire for Chain-Link Fence Fabric.
9. ASTM A1011/A1011M, Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
10. ASTM B6, Specification for Zinc.
11. ASTM D412, Test Methods for Vulcanized Rubber and Thermoplastic Rubbers and Thermoplastic Elastomers—Tension.

12. ASTM D746, Test Method for Brittleness Temperature of Plastics and Elastomers by Impact.
13. ASTM D792, Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.
14. ASTM D1499, Practice for Filtered Open-Flame Carbon-Arc Exposures of Plastics.
15. ASTM D2240, Test Method for Rubber Property—Durometer Hardness.
16. ASTM F552, Terminology Relating to Chain Link Fencing.
17. ASTM F567, Practice for Installation of Chain-Link Fence.
18. ASTM F626, Specification for Fence Fittings.
19. ASTM A653, Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
20. ASTM F668, Specification for Polyvinyl Chloride (PVC) and Other Organic Polymer-Coated Steel Chain-Link Fence Fabric.
21. ASTM F900, Specification for Industrial and Commercial Swing Gates.
22. ASTM F1043, Specification for Strength and Protective Coatings on Metal Industrial Chain Link Fence Framework.

1.3 TERMINOLOGY:

A. The following words or terms are not defined but, when used in this Section, have the following meaning.
   1. “Knuckling” describes the type of selvage obtained by interlocking adjacent pairs of wire ends and then bending the wire ends back into a closed loop.
   2. “Gate operating cycle” is one gate opening plus one gate closing.
   3. “Fencing” describes an assembly of metal components, including wire chain-link fabric fastened to top, bottom and intermediate horizontal rails and to vertical line posts, corner posts and terminal posts. This assembly includes all auxiliary components, gates, fittings, fasteners, and other accessories, all with specified protective coatings.

B. Terminology used in this Section and not defined in this Article will be construed in accordance with the terminology used in CLF 2445 and ASTM F552.

1.4 QUALITY ASSURANCE:

A. Qualifications:
   1. Erector/Installer:
      a. Engage a single erector that is skilled and trained, and possesses successful and documented experience installing fencing, and employs only workers with specific skill and successful experience in the type of Work required.
      b. Erector shall be acceptable to fencing manufacturer,
      c. ubmit name and qualifications of erector with the following information for a minimum of three successful projects:
         1) Names and telephone numbers of owner and architect or engineer responsible for project.
         2) Approximate fencing contract amount.
         3) Quantity of fencing installed.

B. Component Supply and Compatibility:
   1. Provide fencing as complete system with all gates, hardware, appurtenances and other components produced by a single manufacturer, including custom erection accessories, fittings, clamps, and fastenings as required for complete system.
   2. Provide electrical components, devices and accessories from a single manufacturer regularly engaged in manufacturing such items, acceptable to, and coordinated by, fencing manufacturer.

C. Regulatory Requirements:
   1. Comply with Laws and Regulations, including:
      a. Americans with Disabilities Act of 1990 (Public Law 101-336), Appendix A of 28 CFR 36, Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG).
   2. Electrical Components, Devices, and Accessories:
      a. Shall be listed and labeled by testing agency acceptable to authority having jurisdiction at the Site, and marked for intended use.
      b. Comply with requirements of authorities having jurisdiction at the Site for automatic gate operators serving as required means of access.

D. Mock-Ups:
   1. Build at the Site a ten-foot long, full-height mock-up that incorporates all fencing materials specified for the Work.
   2. Demonstrate to Engineer the ability to comply with quality of workmanship, methods of detailing, and tolerances shown or indicated. Upon approval, mock-up will serve as a standard for the fencing Work.
   3. Full size mock-ups that, in opinion of Engineer, do not adequately demonstrate erector's ability to comply with the Contract Documents will not be approved.
   4. Each combination of manufacturer and erector proposed by Contractor shall be allowed to build two full-size mock-ups using approved components for Engineer's approval of mock-up. If Engineer's approval is not obtained after two mock-ups, provide another combination of manufacturer and erector capable of complying with the Contract Documents at no additional cost to Owner.
   5. Do not alter, move, or destroy approved full-size mock-up until obtaining Engineer's written permission. Rebuild at no additional cost to Owner mock-ups destroyed before Contractor receives written permission.

6. Work advanced without an approved mock-up will not be eligible for payment until an approved mock-up is provided and Engineer has confirmed that Work already installed matches the approved mock-up.

1.5 SUBMITTALS:

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Drawings at scale of 1/4-inch equal to one foot of typical fence assembly, identifying all materials, dimensions, sizes, weights, and finishes of rails, posts, braces, supports and other fencing components. Show fence heights, and locations of gates. Show gate swing, or other operation, hardware, and accessories. Include plans, elevations, and sections, with required installation and operating clearances, and details of post anchorage, attachments, and bracing.
      b. Gate Operator: Show locations and details for installing operator components, switches, and controls. Indicate motor size, electrical characteristics, drive arrangement, mounting, and grounding provisions.
      c. Wiring Diagrams: Power and control wiring, communication, and access control features. Differentiate between manufacturer installed and Site installed wiring, and between components furnished by gate operator manufacturer and those by others.
      d. List of all hardware, fasteners, and accessories.
   2. Product Data:
      a. Copies of manufacturer's technical product information, and specifications for all fencing components, including auxiliary system components such as gate operators and motors.
      b. Data substantiating that materials proposed comply with the following:
         1) Physical properties of PVC protective coating, in compliance with ASTM D1499.
         2) Weight of aluminum coating on wire fabrications, in compliance with ASTM A428.
         3) Weight of zinc coating on pipe fabrications, in compliance with ASTM A90.
   3. Samples: Engineer's review will be for color and texture only. Compliance with other requirements is Contractor's responsibility. Submit the following:
      a. Each fencing component, fastener, post, rail, support, chain-link fabric type, and other auxiliary and miscellaneous items labeled with identification of proposed use and location.
      b. Sample of each chain-link fabric material, six inches square; and framework members, and typical accessories, each approximately six inches long.
      c. Full range of manufacturer's standard and custom color Samples.

B. Informational Submittals: Submit the following:
   1. Certifications:
      a. Submit shipping list for materials used, endorsed with manufacturer's voucher, signed by authorized employee of manufacturer, certifying that material used in fencing complies with the Contract Documents and with the approved submittals.
      b. Certification that gate operators comply with requirements of authorities having jurisdiction at the Site for safety and emergency access.
      c. Certification that electrical components, devices, and accessories are listed and labeled by testing agency acceptable to authorities having jurisdiction at the Site, and are marked for intended use.
   2. Design Data: Submit with the Shop Drawings:

a. All structural calculations verifying that all system components comply with requirements of authorities having jurisdiction at the Site.
b. When proposing fencing framework or other structural components that varies from the Contract Documents, submit fabricator's structural calculations for design of proposed fencing. Structural analysis shall verify that all system components including supports, gates, fasteners, fittings, and connections comply with the Contract Documents and requirements of authorities having jurisdiction at the Site.

3. Manufacturer's Instructions:
   a. anufacturer's installation instructions.
4. Field Quality Control Submittals:
   a. Indicate and interpret test results for compliance of chain link fence and gate grounding and bonding with performance requirements specified in the Contract Documents.
5. Qualifications Statements:
   a. Erector.

C. Closeout Submittals: Submit the following:
1. Operation and Maintenance Data: Submit fencing system operations and maintenance manual in accordance with Section 01 7823, Operations and Maintenance Data, for the following:
   a. PVC finish.
   b. Motorized gate operators, including gate operating instructions and motor nameplate data, ratings, and other characteristics.
2. Warranty documentation.
3. Keys: Submit specified number of keys for locksets, padlocks, and control stations.

D. Maintenance Material Submittals: Submit the following:
1. Extra Stock Materials:
   a. Furnish extra stock materials from same manufactured lot as materials installed.
   b. Provide minimum of five percent excess over required amount of fencing components. Pack in cartons and store at the Site where directed by Owner.
   c. Do not provide partial containers or packages of materials. Round-up quantities to furnish only complete, unopened, and undamaged containers and packages.
   d. Submit quantities of each system component required for the Work, based on actual purchase order to manufacturer for materials to be used for this Project, with calculations substantiating quantity of extra stock materials furnished.

1.6 DELIVERY, STORAGE, AND HANDLING:

A. Delivery of Materials:
1. Packaging and Marking: Comply with CLFMI CLF 2445.
2. Deliver materials in manufacturer's original, unopened packaging with all factory-applied tags, labels and other identifying information intact, legible and accurately representing material on approved submittals.

B. Storage of Materials:
1. Store all materials under weatherproof cover, off the ground and away from other construction activities.
2. Do not store material in a manner that would create a humidity chamber. Provide for free movement of air under protective cover and between components of the fencing.

C. Handling of Materials:

1. Handle material in manner that is in compliance with manufacturer's recommendations and that avoids damaging coatings.

1.7 PROJECT CONDITIONS:

A. Existing Utilities: Do not interrupt utilities unless allowed:
   1. In Section 01 1416, Coordination with Owner's Operations; or
   2. Under the following conditions, only after providing temporary utility services according to requirements indicated.
      a. Notify Engineer and Owner not less than 7 days in advance of proposed utility interruptions.
      b. Do not proceed with utility interruptions without Engineer's written permission.

B. Obtain measurements at the Site to verify layout information and dimensions for fencing and gates in relation to reference points provided by Owner or indicated in the Contract Documents.

1.8 WARRANTY:

A. General Warranty: The special warranties specified in this Article shall not deprive Owner of other rights or remedies Owner may otherwise have under the Contract Documents and shall be in addition to and run concurrent with other warranties made by Contractor under the Contract Documents.

B. Special Warranties:
   1. Submit manufacturer's written ten-year warranty against cracking and peeling of PVC coating, and against rusting or corrosion of metal.

PART 2 – PRODUCTS

2.1 SYSTEM PERFORMANCE:

A. Design Considerations:
   1. Verify size of framing members shown or indicated in the Contract Documents. Where structural analysis indicates the need, provide additional members, or increased member size, thickness or weight.
   2. Modifications may be made only as necessary to meet Site conditions to ensure proper fitting and support of the Work and only upon submittal of Shop Drawings and receipt of approval by Engineer.

2.2 MATERIALS

A. General:
   1. Tube sizes specified are nominal outside dimension.
   2. Roll formed section sizes are nominal outside dimensions.
   3. Wire gages shall conform to American Steel and Wire Company gage.
   4. Heat-form arcs and chords before applying protective coatings to metal.
   5. Sizes specified are given for uncoated metal. Protective coatings are in addition to specified metal dimensions, gages, and sizes.
   6. Provide weights of zinc and aluminum coatings on wire and pipe fabrications in accordance with CLFMI CLF 2445.

B. Chain-Link Fence Fabric:
   1. One-piece fabric widths, for fencing 12 feet and less in height, complying with CLFMI CLF 2445.
   2. Wire mesh shall be woven throughout in form of approximately-uniform square mesh with parallel sides and horizontal and vertical diagonals of approximately-uniform dimensions, of size and gage specified and in compliance with ASTM A817, Type 1, cold-drawn carbon steel wire with minimum breaking strength of 2,170 pounds and coated with aluminized finish, as specified. Fabric shall be as recommended by CLFMI for heavy industrial usage.
   3. Provide fence fabric imprinted with manufacturer's trade name, country of origin, core wire gage, and finished outside diameter gage.
   4. Provide fabric knuckled to eliminate exposure of sharp edges.
   5. Fabric Gage: Provide the following:
      a. No. 6-gage wires.
   6. Mesh Size: Provide the following:
      a. Two inch mesh.

2.3 FRAMEWORK:

A. General: The following table presents actual OD and equivalent nominal NPS size and trade size of round members:

Actual OD (inches)	NPS Size (inches)	Trade Size (inches)
1.315	1.0	1-3/8
1.660	1.25	1-5/8
1.900	1.5	2
2.375	2.0	2.5
2.875	2.5	3
3.500	3.0	3.5
4.000	3.5	4
6.625	6.0	6-5/8
8.625	8.0	8-5/8

B. Pipe shall be commercial grade, plain-end steel pipe with standard-weight walls. Steel strip used for manufacture of pipe shall comply with ASTM F1083, Schedule 40 pipe with minimum yield strength of 25,000 psi and protected with zinc, as specified.

C. Fittings: Comply with ASTM F626.

D. End, Corner, and Pull Posts: Provide end, corner, and pull posts of following minimum sizes:
   1. Up to six feet fabric height:
      a. 2.375 inches OD pipe weighing 3.65 pounds per linear foot.

E. Line Posts: Provide line posts of following minimum sizes and weights:
   1. Up to six feet fabric height:
      a. 1.90 inches OD pipe weighing 2.72 pounds per linear foot.

F. Gate Posts: Provide gate posts for supporting single gate leaf, or one leaf of a double gate installation, for nominal gate widths as follows:
   1. Up to six feet wide:
      a. 2.875 inches OD pipe weighing 5.79 pounds per linear foot.
   2. Over six feet wide and up to 13 feet wide:

a. Four inches OD pipe weighing 9.11 pounds per linear foot.

3. Over 13 feet wide and up to 18 feet wide:
   a. 6.625 inches OD pipe weighing 18.97 pounds per linear foot.
4. Over 18 feet wide:
   a. 8.625 inches OD pipe weighing 28.55 pounds per linear foot.

G. Top Rail: Provide top rails, unless otherwise shown or indicated, conforming to the following:
1. 1.900 inch OD pipe weighing 2.72 pounds per linear foot.
2. Provide in manufacturer's longest lengths, with expansion-type coupling 0.051-inch thick rail sleeves, approximately seven inches long, for each joint.
3. Provide means for attaching top rail securely to each gate, corner, pull, and end post.

H. Center Rails Between Line Posts: Provide center rails between line posts, where shown, consisting of 1.660-inch OD pipe weighing 2.27 pounds per linear foot.

I. Roll-Formed Steel: Provide rolled steel shapes produced from structural-quality steel conforming to ASTM A1011, Grade 45, with minimum yield strength of 45,000 pounds psi. Protective coating system shall conform to ASTM F1043, as specified.

2.4 GATES:

A. Swing gates shall comply with ASTM F900.

B. Sliding gates shall comply with ASTM F1184.

C. Gate hinges shall be double clamping offset type. To hold gate in the open or closed positions, provide each gate frame with a keeper that automatically engages gate shoe set in concrete. Gates shall have drop latch with provision for padlock.
1. Gate Hinges: Pressed or forged steel or malleable iron to suit gate size, non-lift off type, 180-degree offset heavy-industrial hinges, 1.5 pair per leaf.
2. Latch: Forked-type or plunger bar type to permit operation from either side of gate, with padlock eye as integral part of latch.
3. Keeper: Provide a gate keeper for vehicle gates that automatically engages gate leaf and holds gate leaf in open position until manually released.

D. Padlocks: Provide each gate with heavy-duty bronze padlock and shackle chain as follows:
1. Product and Manufacturer: Provide one of the following:
   a. No. 160DHM with 11/32-inch marine brass shackle by Master Lock Company.
   b. Or equal.
2. Provide three keys for each padlock. Where more than one gate is required for same enclosure, padlocks shall be keyed identically.

E. Provide gate frames with intermediate horizontal rails. Gate frames shall be welded construction and shall be galvanized after fabrication. Provide single gates six feet or greater in width, and double gates 12 feet or greater in width, with diagonal bracing in one direction, extending from top to bottom rail.

F. Fabricate gate perimeter frames of tubular members. Provide additional horizontal and vertical members to ensure proper gate operation and for attachment of fabric, hardware, and accessories. Space so that frame members are not more than eight feet apart. Fabricate as follows:
1. Up to six feet high, or leaf width of eight feet or less:
   a. 1.660-inch OD pipe weighing 2.27 pounds per linear foot.

G. Assemble gate frames by welding or with special malleable or pressed steel fittings and rivets for rigid connections. Use same fabric as provided for fence. Install fabric with stretcher bars at vertical edges. Bars may also be used at top and bottom edges. Attach stretchers to gate frame at not more than 15 inches on centers. Attach hardware with rivets or by other means that will provide security against removal and breakage.

H. Install diagonal cross-bracing on gates consisting of 1/2 inch diameter adjustable length truss rods provided with turnbuckles to ensure frame rigidity without sag or twist.

I. Where barbed wire is shown or indicated above gates, extend end-members of gate frames one foot above top member and prepare to receive three strands of wire. Provide necessary clips for securing wire to extensions.

J. Sliding Gates: Provide manufacturer's heavy-duty track, ball bearing hanger sheaves, overhead framing and supports, guides, stays, bracing, and accessories as required.

2.5 GATE OPERATORS:

A. General: Provide factory-assembled automatic gate operation system designed for gate size, type, weight, construction, use, traffic flow patterns, and operation frequency. Provide operation system for gate specified and shown, of size and capacity and with features, characteristics, and accessories suitable for Project conditions, recommended and provided by gate manufacturer complete with electric motor and factory prewired motor controls, remote control stations, control devices, power disconnect switch, obstruction detection device, lockable weatherproof enclosures protecting controls and all operating parts, and accessories required for proper operation. Provide enclosures with corrosion resistant protective and decorative finish and two keys per lock. Include wiring from motor controls to motor. Coordinate operator wiring requirements and electrical characteristics with Project electrical system.
   1. Provide operator constructed so motor may be removed without disturbing limit switch adjustment and without affecting auxiliary emergency operator.
   2. Provide operator in compliance with Laws and Regulations and requirements of authorities having jurisdiction at the Site.
   3. Provide electronic components with built-in troubleshooting diagnostic feature.
   4. Provide units designed and wired for both right-hand/left-hand opening, allowing universal installation.

B. Control Equipment: Comply with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6.

C. Electromechanical Operation: Provide unit designed for concrete base/pad mounting; consisting of electric motor and factory prewired motor controls, starter, speed control device, brake, and clutch or torque limiter, with enclosed worm gear reducer, wheel and rail drive.

D. Operation Cycle Requirements: Provide gate operator designed to operate for not less than the following duty and cycles per hour.
   1. Heavy-Duty: 25 cycles per hour.

E. Gate Operation Speed:
   1. 60-feet per minute, minimum.

F. Electric Motors: High starting torque, reversible, continuous duty, insulated electric motors, complying with NEMA MG 1, sized to start and operate size and weight of gate in accordance

with Project's service conditions, without exceeding nameplate ratings or considering service factor.

1. Service Factor: In accordance with NEMA MG 1, unless otherwise indicated.
2. Enclosure: Totally enclosed, non-ventilated or fan-cooled motors, fitted with plugged drain.
3. Thermal Protection: Internal manual reset.
4. Motors 1/2 hp and Larger: single phase, 120 V, 60 Hertz.

G. Vehicle Presence Sensor: Provide complete system including automatic closing timer with adjustable time delay before closing and vehicle presence sensor designed to open and close gate and hold gate open until traffic clears. Vehicle presence sensor shall be model OVS-01GT, manufactured by Optex.

H. Obstruction Detection Devices: Provide each motorized gate with automatic safety sensor(s). Activation of sensor causes operator to immediately function as follows:

1. Action: Reverse gate in both opening and closing cycles and hold until clear of obstruction.
2. Internal Sensor: Built in torque or current monitor senses gate is obstructed.
3. Sensor Edge: Contact pressure sensitive safety edge, profile, and sensitivity designed for type of gate and component indicated, located on gate as follows. Connect to control circuit using gate edge transmitter and operator receiver system.
    a. Along entire gate leaf trailing edge.
    b. Along entire length of gate posts.
    c. Along entire length of gate guide posts.
4. Photoelectric/Infrared Sensor System: Provide complete system constructed to detect obstruction in gate leaf path by interrupting an infrared beam in the zone pattern without allowing obstruction to contact gate.

I. Limit Switches: Provide adjustable switches, interlocked with motor controls and set to automatically stop gate at fully retracted and fully extended positions.

J. Emergency Release Mechanism: Quick-disconnect release of operator drive system of the following type of mechanism, allowing manual operation if operator fails. Provide system configured such that control circuit power is disconnected during manual operation.

1. Type: Integral fail safe release, allowing gate to be pushed open without mechanical devices, keys, cranks, or special knowledge.

K. Operating Features: Include the following:

1. Digital Microprocessor Control: Electronic programmable means for setting, changing, and adjusting control features with capability of monitoring and auditing gate activity. Provide unit that is isolated from voltage spikes and surges.
2. Fully Systems Compatible: With controlling circuit board capable of accepting any type of input from external devices.
3. Automatic Closing Timer: Provide circuitry with adjustable time delay before closing and with timer cut off switch.
4. Open Override Circuit: Provide circuitry configured to override closing commands.
5. Reversal Time Delay: Provide time delay circuitry to protect gate system from shock load on reversal in both directions.
6. Maximum Run Timer: Configure circuitry to prevent damage to gate system by shutting down system if normal time to open gate is exceeded.
7. Clock Timer: Seven day programmable for regular events.

L. Accessories: Provide the following:
   1. Mounting kit, including pedestal.
   2. Audio Warning Module: Provide ADA compliant audible alarm sounding three to five seconds in advance of gate operation and continuing until gate stops moving.
   3. Visual Warning Module: Provide ADA compliant visible light alarm sounding three to five seconds in advance of gate operation and continuing until gate stops moving.
   4. Battery Backup System: Battery powered drive and access control system, independent of primary drive system, opening gate if power fails.
   5. External electric powered lock with delay timer allowing time for lock to release before gate operates.
   6. Fire box.
   7. Fire Siren sensor.
   8. Instructional, Safety, and Warning Labels and Signs: Manufacturer's standard for components and features specified in compliance with authorities having jurisdiction at the Site.

2.6 AUXILIARY FENCING MATERIALS AND ACCESSORIES:

A. Wire Ties:
   1. For tying fabric to line posts, use nine-gage, aluminum alloy 1100-H4, PVC-coated wire ties to match fence fabric, spaced 12 inches on centers.
   2. For tying fabric to rails and braces, use nine-gage, aluminum alloy 1100-H4, PVC-coated wire ties to match fence fabric, spaced two feet on centers.
   3. For tying fabric to tension wire, use 11-gage, aluminum alloy 1100-H4, PVC-coated wire hog ring ties to match fence fabric, spaced two feet on centers.

B. Tension Wire: Provide tension wire consisting of aluminized, seven-gage, coiled spring steel wire coated with 0.40-ounces of aluminum per square foot of wire surface, minimum, in compliance with ASTM F1664.

C. Barbed Wire Supporting Arms: Pressed steel for three rows of barbed wire attached to each arm, complete with provisions for anchorage to posts. Supporting arms shall be integral with post-top weather cap. Provide following type:
   1. Single 45-degree arm, one for each post.

D. Post Caps: Pressed steel, wrought iron, or cast aluminum alloy, designed as weather-tight closure cap, for tubular posts. Provide one cap for each post unless equal protection is afforded by combination post-top cap and barbed wire supporting arm, where barbed wire is required.
   1. Provide caps with openings to allow through-passage of top rail.
   2. Provide cone-type caps for terminal posts and loop-type caps for line posts.

E. Stretcher Bars: One-piece lengths equal to full height of fabric, with minimum cross section of 3/16-inch by 3/4-inch. Provide one stretcher bar for each gate and end-post, and two for each corner- and pull-post, except where fabric is integrally woven into the post.

F. Stretcher Bar Bands: Pressed steel, galvanized, 0.078-inch to 0.108-inch thick depending on post diameter, spaced not greater than 15 inches on centers to secure stretcher bars to end-, corner-, pull-, and gate-posts.
   1. Bands may also be used with special fittings for securing rails to end-, corner-, pull-, and gate-posts.

G. Truss Rods: Steel rods, 3/8-inch diameter, merchant quality with turnbuckle.

H. Concrete: In accordance with Section 03 3000, Cast-In-Place Concrete.

2.7 FINISHING:

A. Chain-Link Fence Fabric:
1. Aluminized finish with not less than 0.40 ounces aluminum per square foot, complying with ASTM A491, Class II.

B. Framework and Appurtenances: Provide the following finishes for steel framework, auxiliary system components, and miscellaneous accessories:
1. Galvanizing: Zinc for galvanizing shall be of High Grade or Special High Grade conforming to ASTM B6 with maximum aluminum content of 0.01 percent. Galvanize metal using hot-dip process in accordance with the following:
a. Structural Iron and Steel Shapes: ASTM A123
b. Rolled-Form Sheet Steel: ASTM A653
c. Hardware and Accessories: ASTM A153
d. Fittings: ASTM F626
e. Pipe: ASTM A53
2. Provide minimum weights of zinc as follows:
a. Pipe: 1.8-ounces of zinc per square foot. Apply Type A coating both inside and outside according to ASTM F1043, as determined by ASTM A90.
b. Rolled-Form Sheet Steel: 4.0-ounces of zinc per square foot of surface area.
c. Hardware and Accessories: Zinc weights in compliance with Table 1 of ASTM A153.

C. Welded Joints:
1. Repair zinc coatings at welded joints by applying zinc-rich paint, as specified in Section 09 9100, Painting, and ASTM A780.
2. Repair polymer-coated steel by applying an epoxy primer, intermediate coat and urethane topcoat, as specified in Section 09 9100, Painting, matching color and reflectivity of adjacent PVC finish.

2.8 SOURCE QUALITY CONTROL:

A. Fabrication Tolerances:
1. Fabric, posts, rails, and other supports shall be straight or uniformly curved to provide the profiles shown, to dimensional tolerance of 1/16-inch in 10 feet without warp or rack in the finished Work.

PART 3 – EXECUTION

3.1 INSPECTION:

A. Examine conditions under which the Work will be erected and notify Engineer in writing of conditions detrimental to proper and timely comple¬tion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 ERECTION:

A. Comply with CLFMI Step-by-Step Installation Guide and ASTM F567. Do not begin installation and erection of fencing until final grading is completed.

B. Excavation: Drill holes of diameters specified, for post footings in firm, undisturbed or compacted soil.
   1. For posts set in cast-in-place concrete, provide hole diameters dug or drilled a minimum of four times the largest cross section of post.
      a. Unless otherwise shown or indicated, excavate hole depths approximately three inches lower than bottom of post, with bottom of posts set not less than two feet below the surface of finished grade when in firm, undisturbed soil, plus an additional three inches for each foot increase in the fence height over four feet.
      b. Excavate holes for sliding cantilever gate-posts to not less than 3.5 feet below grade and minimum diameter of 12 inches.
   2. Spread soil from excavations uniformly adjacent to fence line, or on adjacent areas of the Site, as directed by Engineer.
   3. When solid rock is encountered at ground surface, drill into rock at least 12 inches for line-posts and at least 1.5 feet for end-, pull-, corner-, and gate-posts. Drill hole at least one inch greater diameter than largest dimension of post to be placed.
      a. If solid rock is below soil overburden, drill to full depth required, except penetration into rock need not exceed the minimum depths specified above for rock encountered at ground surface.

C. Setting Posts: Remove loose and foreign materials from sides and bottoms of holes, and moisten soil prior to placing concrete.
   1. Center and align posts in holes 3-inches above bottom of excavation.
   2. Posts shall be set in concrete footings, except as otherwise shown or specified. Place concrete around posts in continuous pour, and vibrate or tamp for consolidation. Check each post for vertical and top alignment, and hold in position during placement and finishing operations.
   3. Extend concrete to two inches above ground surface, or to two inches below ground surface if cover of sod, bituminous asphalt paving, or other material is shown or indicated to conceal concrete. Crown to shed water away from posts.
   4. Extend footings for gate posts to underside of bottom hinge. Set keeps, stops, sleeves, and other accessories into concrete as required.
   5. Keep exposed concrete surfaces moist for at least seven days after placement, or cure with membrane curing materials, or other acceptable curing method.
   6. Grout posts set in sleeved holes, concrete constructions, or rock with grout, as specified in Section 03 6000, Grouting, and as recommended in CLFMI CLF 2445.

D. Concrete Strength: Allow concrete to attain at least 75 percent of its minimum 28 day compressive strength, but in no case sooner than seven days after placement, before installing rails, tension wires, barbed wire, or chain-link fabric.
   1. Do not stretch and tension fabric and wires, and do not hang gates, until concrete has attained its full design strength.

E. Posts and Rails:
   1. Line Posts: Set posts in cast-in-place concrete footings as specified, spaced not more than ten feet on centers. Provide caps on top of each post to exclude moisture and to receive top rail, unless equal protection is afforded by combination post-top cap and barbed wire supporting arm, where barbed wire is required.
   2. Top Rails: Run rail continuously through post caps or extension arms, bending to radius for curved runs. Provide expansion couplings as recommended by fencing manufacturer to form continuous rail between terminal posts.

3. Center Rails: Provide center rails, where shown or specified, erected in one piece between posts and flush with post on fabric side, using special offset fittings where necessary.
4. Brace Assemblies: Install braces so posts are plumb when diagonal rod are under proper tension. Install brace assemblies at end-posts and at both sides of corner- and pull-post panels. Panels adjacent to gates shall have intermediate horizontal rails and diagonal bracing. Diagonal bracing shall run from center of first line-post to bottom of terminal-post.

F. Chain-Link Fabric:
1. Install fabric on security side of fence, and anchor to framework so that fabric remains in tension after pulling force is released. Fasten to terminal posts and gate posts with tension bars threaded through mesh and secured with tension bands at maximum intervals of 14 inches.
2. Tie to line-posts, gate frames and top and bottom rails with tie wires spaced at maximum 12 inches on posts and two feet on rails.
3. Connect tension bars to posts and frames by means of adjustable bolts and bands spaced not more than 14 inches apart.
4. Leave approximately two inches between finish ground surface and bottom selvage, except where bottom of fabric extends into concrete.
5. Join roll of chain-link fabric by weaving a single picket into the ends of roll to form continuous mesh.

G. Tension Wire:
1. Stretch tension wire taut and free of sag, from end to end of each stretch of fence and position at a height that will enable the wire to be fastened to chain-link fabric by securing within the top 12 inches of chain-link fabric.
2. Fasten bottom tension wire within bottom six inches of chain-link fabric.
3. Tie tension wire to each post with not less than six-gage galvanized wire.

H. Barbed Wire:
1. Install three parallel wires on each extension arm; on security side of fence, unless otherwise shown or indicated
2. Pull wire taut to remove sag and firmly install in slots of extension arms to prevent movement or displacement.
3. Secure wire to terminal posts utilizing terminal post band arms or brace bands.
4. Extend vertical members of gates to receive barbed wire.

I. Stretcher Bars: Thread through or clamp to fabric four inches on centers, and secure to posts with metal bands spaced 15 inches on centers.

J. Gates: Install gates plumb, level, and secure for full opening without interference. Install ground set items in concrete for anchorage, as shown on approved Shop Drawings. Adjust hardware for smooth operation and lubricate where necessary.

K. Gate Operators:
1. Mount and adjust operator on concrete pad.
2. Connect to gate and adjust for proper operation.
3. Refer to Division 26, Electrical, for electrical connections.

L. Tie Wires: Use U shaped wires conforming to diameter of pipe. Clasp pipe and fabric firmly with ends twisted at least two full turns. Bend ends of wire to minimize hazard to persons and clothing.

M. Fasteners: Install nuts for tension band and hardware bolts on side of fence opposite fabric side. Peen ends of bolts or score threads to prevent removal of nuts.

3.3 FIELD QUALITY CONTROL:

A. Site Tests:
1. Test and adjust automatic gate operators, controls, alarms, safety devices, hardware, limit switches, and other operable components. Replace damaged or malfunctioning operable components.
a. Energize circuits to electrical equipment and devices.
b. After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Test controls, alarms, and safeties.
2. Remove damaged and malfunctioning units, replace with new units, and retest.

B. Manufacturer's Services:
1. Engage a factory authorized service representative to train Owner's personnel to adjust, operate, and maintain gates.
2. Train Owner's personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.
3. Review data in maintenance manuals.
4. Provide minimum of two, 8-hour days of on-Site training during day shift normal working hours. Coordinate training schedule with Owner.

3.4 ADJUSTMENT AND CLEANING:

A. Repair coatings damaged in the shop or at the Site by recoating with manufacturer's recommended repair compound, applied in accordance with manufacturer's directions. Repair hot-dip galvanized coatings in accordance with ASTM A780.

B. Gate: Adjust gate to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, and malfunction throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

C. Lubricate operating equipment and clean exposed surfaces.

D. Repair and replace broken or bent components.

END OF SECTION 32 3100

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 32 9200

TURF AND GRASS

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install all lawns and meadows.
2. Extent of lawns and meadows is shown.
3. Types of products required include the following.
a. Topsoil.
b. Lawn grass seed.
c. Meadow grass seed mixture.
d. Fertilizers.
e. Mulches.
f. Erosion-control materials.
g. Accessories.

B. Coordination:
1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with, or before, lawns and meadows.

C. Related Sections
1. Section 31 1100, Clearing and Grubbing
2. Section 32 9300, Plants

1.2 REFERENCES:

A. Standards referenced in this Section are listed below:

a. Official Methods of Analysis of AOAC International.
2. Association of Official Seed Analysts, (AOSA).
a. Journal of Seed Technology; Rules for Testing Seeds.
3. American Society of Agronomy, (ASA).
a. Reference No. 1 - Methods of Soils Analysis, Soil Science Society of America, Incorporated.
4. American Society for Testing and Materials, (ASTM).
a. ASTM B 221, Specification for Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and Tubes.
b. ASTM C 602, Specification for Agricultural Liming Materials.
c. ASTM D 75, Practice for Sampling Aggregates.
d. ASTM D 422, Test Method for Particle Size Analysis of Soil.
e. ASTM D 977, Specification for Emulsified Asphalt.
f. fASTM D 2487, Practice for Classification of Soils for Engineering Purposes (United Soil Classification System).
g. ASTM D 5268, Specification for Topsoil Used for Landscape Purposes.

h. ASTM E 329, Specification for Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction.
i. ASTM E 548, Guide for General Criteria Used for Evaluating Laboratory Competence.

5. Turfgrass Producers International, (TPI).
   a. Guideline Specifications to Turfgrass Sodding.

1.3 DEFINITIONS

A. The term "finish grade" shall be used to describe the finished surface elevation of planting soil.

B. The term "manufactured topsoil" shall be used to describe soil produced off-Site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil acceptable as a component of loam.

C. The term "loam" shall be used to describe topsoil that has been mixed with additional organic and inorganic additives, as specified.

D. The term "percentage pure live seed" shall be defined as the percent (%) purity multiplied by percent (%) germination divided by 100 to equal the percent pure live seed (PLS) and shall be calculated for all seed lots using each seed lots own unique purity and germination test results. A PLS pound shall be defined as the bulk weight of seed required to equal one pound of 100 percent pure, germinated seed.

E. The term "subgrade" shall be used to describe the surface of subsoil remaining after completing excavation; or the top surface of a fill or backfill immediately beneath topsoil and which has not been tested for acceptable use as topsoil.

1.4 QUALITY ASSURANCE:

A. Installer Qualifications:
   1. Engage a single landscape installer skilled, trained and with successful and documented experience in the planting of lawns and meadows and with specific skill and successful experience in the installation of the types of materials required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of Work. Submit names and qualifications to Engineer along with the following information on a minimum of three successful projects:
      a. Names and telephone numbers of owner, architects or engineers responsible for projects.
      b. Approximate contract cost of the lawns and meadows.
      c. Amount of area installed.
   2. Installer's Site Supervisor: Require installer to maintain an experienced full-time landscape supervisor on-Site during the time of preparation for, and planting of, lawns and meadows. Supervisor shall have achieved landscape or horticultural certification acceptable to governing authorities having jurisdiction at the Site.
   3. Ratio of laborers to certified landscape supervisors shall not exceed 12 to one. Certified landscape supervisor shall be on-Site throughout the day-to-day performance of the Work of this Section.
   4. Application of herbicides, chemicals and insecticides shall be done by personnel licensed to perform such applications by governing authorities having jurisdiction at the Site and in accordance with each manufacturer's instructions provided on each product label.

B. Soil Testing Laboratory Qualifications:
   1. An independent laboratory, recognized by governing authorities having jurisdiction at the Site, with the experience and capability to conduct testing indicated and that specializes in types of soil tests to be performed.
   2. To qualify for approval, an independent testing agency shall demonstrate to Engineer's satisfaction, based on evaluation of criteria submitted by testing agency, that it has the experience and capability to satisfactorily conduct the testing indicated without delaying the Work, in accordance with ASTM E 329 and as documented according to ASTM E 548.

C. Soil Analysis: Furnish report of soil analysis to Engineer, prepared by a qualified soil testing laboratory, stating percentages of organic matter; mechanical gradation of sand, silt, and clay content in compliance with ASTM D 422; cation exchange capacity; sodium absorption ratio; deleterious materials content; pH; and mineral and plant nutrient content of soil. Chemical analysis shall include tests for percentages of nitrate nitrogen, ammonium nitrogen, phosphorus, potassium, calcium, iron, manganese, copper, zinc, extractable aluminum, and total soluble salts.
   1. Existing On-Site Soil:
      a. Separate soil stockpiled and proposed for use as topsoil for lawns and meadows into 1000 cubic yard piles and label with a numbering system used to reference all soil samples and test results.
      b. Obtain a one cubic foot representative sample for each 1000 cubic yards of soil stockpiled on-Site proposed for use as topsoil for lawns and meadows, in compliance with ASTM D 75 and Appendixes, for securing samples from stockpiles.
      c. Place samples taken from each stockpile, into separate clean, new and previously unused, containers and mix thoroughly. Maintain separation and legible labeling of each sample taken from each stockpile, throughout the process of mixing, drying and delivering to soil analysis laboratory. Label samples on outside of container.
      d. Take one cup of soil from each container and allow to dry at room temperature. Once dry, place each one-cup sample in a separate, accurately labeled, new and previously unused one-cup sized plastic container, seal tightly and deliver to soil testing laboratory.
      e. Report suitability of soil as a topsoil component for lawn and meadow plant growth. State recommended quantities of nitrogen, phosphorus, secondary and micronutrients, potash and soil amendments to be added to produce satisfactory topsoils. Include calculations, types of fertilizer and recommendations for application rates in either gallons or pounds per cubic foot of soil.
      f. In addition, all on-Site soil that will be used as topsoil shall be provided with additional compost and peat moss amendments specified, whether or not testing indicates positive need for such amendments, for such material to be used as loam.
   2. Manufactured Imported Topsoil:
      a. Test each 1000 cubic yards of manufactured topsoil at the proposed source. In addition, after Engineer's approval of manufactured topsoil based on results and recommendations of soil testing reports, test each 1000 cubic yards of manufactured topsoil that is delivered to the Site for conformance to results and recommended modifications of approved soil test reports. Manufactured topsoil that differs from proposed source material, after modification according to recommendations of soil test reports, shall be rejected for use in the Work.
      b. Obtain a one cubic foot representative sample for each 1000 cubic yards of manufactured topsoil proposed for lawn and meadow Work, in compliance with ASTM D 75 and Appendixes, for securing samples from stockpiles.
      c. Place samples taken from each stockpile into separate clean, new and previously unused, containers and mix thoroughly. Maintain separation and legible labeling of

each sample, taken from each stockpile, throughout the process of mixing, drying and delivering to soil analysis laboratory. Label samples on outside of container.

d. Take one cup of topsoil from each container and allow to dry at room temperature. Once dry, place each one-cup sample in a separate, accurately labeled, new and previously unused one-cup sized plastic container, seal tightly and deliver to soil testing laboratory.

e. Report suitability of manufactured topsoil as a component for lawn and meadow plant growth. State recommended quantities of nitrogen, phosphorus, secondary and micronutrients, potash and soil amendments to be added to produce satisfactory manufactured topsoil. Include calculations, types of fertilizer and recommendations for application rates in either gallons or pounds per cubic foot of manufactured topsoil.

f. Organic component of manufactured topsoil shall be obtained from compost and peat moss amendments specified, for such material to be used as loam.

D. Source Quality Control:

1. Analysis and Standards: Package all products with manufacturer's certified analysis performed in accordance with methods established by AOAC, wherever applicable, or as specified.
2. Provide manufactured imported topsoil from a commercial processing facility specializing in the manufacture of topsoil.
3. Seed that has been stored at temperatures, or under conditions not recommended by the seed supplier, or has become wet, moldy, or otherwise damaged, shall not be acceptable. The PLS for each seed lot shall be 75 percent, minimum.
4. Certify that all seed has been stored under conditions recommended by the seed supplier and has not been subjected to conditions damaging to PLS percentages.
5. Seed may be mixed by an approved method on-Site or at the seed supplier’s facilities. If the seed is mixed on-Site, each variety shall be delivered in the original containers and shall bear the supplier’s certified analysis. Where seed is mixed by the seed supplier, provide Engineer with the seed supplier’s certified statement as to the composition of the mixture.

1.5 SUBMITTALS:

A. Action Submittals: Submit the following:

1. Shop Drawings:
   a. Schedule for lawn and meadow-planting showing anticipated planting dates for each type of Work.
2. Product Data:
   a. Manufacturer's product data, specifications and installation instructions for all required materials.
   b. Composition and analysis of commercial fertilizers and all purchase receipts showing the total quantity actually purchased for this Project.
   c. Proportions of each component contained in hydro seed mixture. Identify number of pounds of each component required for each 100 gallons of water. Include the number of square feet of lawn, grass meadow or wildflower meadow mixture that can be installed with each full tank of hydro seed mixture.
   d. PLS for each type of seed and each seed lot. Include bulk weight of seed required to equal one pound of 100 percent pure, germinated seed.

B. Informational Submittals: Submit the following:

1. Certificates:
    a. Certification of Grass and Wildflower Seed: For each grass-seed monostand and seed mixture, furnish seed supplier's certification stating the botanical and common name, and percentage by weight of each species and variety, and percentage of purity, germination and weed seed. Include the year of production and date of packaging. Certify that seed has been stored in compliance with all recommendations of the seed supplier.
    b. Certificates of inspection as may be required by governmental authorities to accompany shipments, and manufacturer's certified analysis for soil amendments and fertilizer materials. For standard products submit other data substantiating that materials comply with specified requirements.
2. Test Reports: Submit the following:
    a. Soil analysis reports for existing soil and imported manufactured topsoil, as specified. Include recommendations for remediating existing soil into acceptable topsoil.
3. Qualifications Data: Submit qualifications data for the following:
    a. Landscape installer.
    b. Landscape supervisor.
    c. Testing agency.
4. Source Quality Control Submittals
    a. Written statement providing the location from which manufactured topsoil is to be obtained and the names and addresses of the suppliers.

C. Closeout Submittals: Submit the following:
1. Operations and Maintenance Data:
    a. Submit recommended procedures to be established by Owner for the maintenance of lawns and meadows for one full year. Submit prior to expiration of required maintenance period.
2. Warranty Documentation:
    a. Submit written warranty, signed by Contractor and landscape installer, as specified.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING:

A. Delivery of Materials:
1. Do not deliver seed until Site conditions are ready for installation.
2. Deliver packaged materials in containers showing weight, analysis and name of manufacturer. Protect materials from deterioration during delivery.
3. Deliver seed in undamaged, original containers, sealed by the supplier and indicating compliance with approved Shop Drawings.
4. Inspect lawn and meadow materials upon arrival at Site. Immediately and permanently remove unacceptable materials from Site.

B. Storage of Materials:
1. Store and cover materials to prevent deterioration. Remove packaged materials that become wet or show deterioration or water marks from the Site.
2. Seed that becomes wet, moldy or damaged during the time of storage on-Site or that has been damaged during transit is not acceptable.

1.7 PROJECT CONDITIONS:

A. Environmental Requirements:
   1. Proceed with and complete lawn and meadow planting as rapidly as portions of the Site become available, working within the seasonal limitations for each type of lawn, grass and wildflower planting required.
   2. Proceed with planting only when current and forecasted weather conditions are favorable to successful planting and establishment of lawns and meadows.
      a. Do not spread seed when wind velocity exceeds five miles per hour.
      b. Do not plant when drought, or excessive moisture, or other unsatisfactory conditions prevail.
   3. Herbicides, chemicals and insecticides shall not be used on areas bordering wetlands.

B. Scheduling:
   1. Coordinate planting with specified extended service periods to provide required service from date of Substantial Completion. Plant during one of the following periods:
      a. Spring Planting: March 15 to June 1.
      b. Fall Planting: September 1 to October 30.
   2. Do not begin lawn and meadow planting until water, acceptable for use and adequate in supply, is available on-Site and can be successfully transported to the areas of Work. Coordinate provision of adequate and acceptable water supply with Project Schedule.
   3. Do not proceed with installation of loam until all subgrade utility services have been installed, are operating successfully and have been approved by Engineer.

C. Pre-installation Conference:
   1. Prior to commencement of lawn and meadow planting and associated Work, Contractor shall schedule and meet at the Site with the landscape installer, the installers of other Work in and around lawn and meadow areas that follows the lawn and meadow Work, including fencing Work specified in Section 32 3100, Fences; and Engineer and other representatives directly concerned with performance of the Work. Review foreseeable methods and procedures related to the lawn and meadow Work, including the following:
      a. Review Project requirements and the Contract Documents.
      b. Review required submittals, both completed and yet to be com¬pleted.
      c. Review availability of water and methods of delivery.
      d. Review status of below-grade work and required access during lawn and meadow planting and establishment.
      e. Review Project Schedule and availability of materials, tradesmen, equipment and facilities needed to make progress and avoid delays.
      f. Review environmental conditions, other Project conditions, and proce-dures for coping with unfavorable conditions.
      g. Review procedures required for protection of lawns and meadows during the remainder of the construction period.
      h. Review required inspection, testing, and certifying procedures.
   2. Record the discussions of the Pre-installation Conference and the decisions and agreements or disagreements reached, and furnish a copy of the record to each party attending.
   3. Record all revisions or changes agreed upon, reasons therefor, and parties agreeing or disagreeing with them.
   4. Reconvene the meeting at the earliest opportunity if additional information must be developed in order to conclude the subjects under consideration.

1.8 WARRANTY:

A. General Warranty: The special warranties specified in this Article shall not deprive Owner of other rights or remedies Owner may otherwise have under the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under the Contract Documents.

B. Special Warranties: Warranty lawns and meadows through the specified extended service period.

1.9 EXTENDED SERVICE:

A. Extended Lawn Service:
   1. Begin extended service immediately after each lawn area is acceptably established. Provide extended service for not less than the following periods:
   2. Seeded Lawns: Sixty days from date after lawn areas are acceptably established.
      a. When full service period has not elapsed before end of planting season, or if lawn is not acceptably established, continue service during next planting season.
   3. Service lawn by watering, fertilizing, weeding, mowing, trimming, replanting, and other operations. Roll, regrade, and replant bare or eroded areas and remulch to produce a uniformly smooth lawn.
   4. Watering: Provide and maintain temporary piping, hoses, and lawn watering equipment to convey water from sources. Keep newly germinated plants uniformly moist to a depth of 4-inches, applied at a minimum rate of 1-inch per week, or greater as required to maintain minimum moisture depth specified. Provide and maintain watering gages and soil moisture probes until end of maintenance period.
      a. Schedule watering to prevent wilting, puddling, erosion, and displacement of seed or mulch. Lay out temporary watering system to avoid walking over muddy or newly planted areas.
      b. After plants have their first true leaves and grasses show mature blades, watering shall be performed to provide moisture to a depth of 6-inches, and not performed again until top 1-inch of loam has dried.
   5. Mow lawn as soon as top growth is tall enough to cut. Repeat mowing to maintain specified height without cutting more than 40 percent of grass-leaf height. Remove no more than 40 percent of grass leaf growth in initial or subsequent mowing. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet. Schedule initial and subsequent mowing to maintain the following grass height:
      a. Mow grass 1 1/2 to 2-inches high.
   6. Lawn Fertilization: Apply fertilizer after initial mowing and when grass is dry.
      a. Use fertilizer that will provide actual nitrogen of at least one pound for each 1000 square feet of lawn area.
   7. After seed has passed its expected germination period, reseed all areas and parts of areas that fail to show a uniform stand of grass. Reseed repeatedly until all areas are covered with grass.

B. Extended Meadow Service:
   1. Begin extended service immediately after each meadow area is satisfactorily established and continue for not less than 40 days.
   2. Service meadow by watering, weeding, replanting, and other operations. Roll, regrade, and replant bare or eroded areas and remulch.

PART 2 – PRODUCTS:

2.1 MATERIALS:

A. Topsoil:
1. All soil accepted as topsoil, whether obtained from on-Site or off-Site sources, shall comply with specified topsoil analysis.
2. Provide fertile, friable, natural loam, surface soil, capable of sustaining vigorous plant growth; free of any admixture of subsoil, clods of hard earth, plants or roots, sticks, stones larger than 1-inch in diameter, or other extraneous material harmful to plant growth, in compliance with ASTM D 5268. Provide topsoil with the following analysis:
   a. 3/4 inch mesh: 100 percent passing.
   b. No. 4-sieve: 90 to 100 percent passing.
   c. No. 200-sieve: 0 to 10 percent passing.
   d. Clay content of material passing No. 200-sieve not greater than 60 percent, as determined by hydrometer tests.
   e. pH-adjusted with ferrous sulphate or ground limestone to provide pH 5.5 to pH 7.0 at time of installation of lawns, grass and meadow areas, unless particular species of grass or wildflower stand requires a different pH to meet its growing needs.
   f. Electrical conductivity of a 1:2 soil-water suspension shall not exceed 1.0 milliohm per centimeter and with less than 200 parts per million of extractable aluminum.
   g. Cation Exchange Capacity: 5, minimum.
   h. Organic content not less than five percent, as determined by ignition loss of oven-dried samples passing No. 10-sieve (Muffle Furnace Temperature: 110 plus or minus five degrees C for eight hours).
   i. Free of pests and pest larvae.
3. Topsoil Source: Reuse surface soil stockpiled on Site, where possible. Verify suitability of stockpiled surface soil to produce topsoil, as specified. Clean surface soil of roots, plants, sod, stones, clay lumps, and other extraneous materials harmful to plant growth.
   a. Supplement acceptable on-Site soil with manufactured topsoil from off Site sources, when quantities available on-Site are insufficient to complete the Work.

B. Lawn Grass Seed:
1. Provide fresh, clean, new crop seed complying with the tolerance for purity and germination established by AOSA. Provide seed of the grass species, proportions and minimum percentages of purity, germination, and maximum percentage of weed seed, specified.
2. Seed Species: Seed of grass species as follows, with not less than 90 percent germination, not less than 80 percent pure seed, and not more than 0.25 percent weed seed by weight. Mixes shall be proportioned by weight as follows.
3. Type A
   a. 30% Kentucky Bluegrass (Poa pratensis).
   b. 30% Creeping Red Fescue (Festuca rubra).
   c. 20% Annual Ryegrass (Lolium multiflorum).
   d. 20% Perennial Ryegrass, turf type (Lolium perenne)
4. Type B
   a. 30% Kentucky Bluegrass (Poa pratensis)
   b. 40% Kentucky 31 Fescue (Festuca arundinacea var. KY 31 or Fawn Tall Fescue)
   c. 30% Perennial Ryegrass (Lolium perenne)

C. Ohio Flood Plain Seed:
   1. Provide a mixture of fresh, clean, new crop seed complying with the tolerance for purity and germination established by AOSA. Provide seed of each species, proportions and minimum percentages of purity, germination, and maximum percentage of weed seed specified.
   2. Provide Ohio Flood Plain Mix II by Ohio Prairie Nursery or equal.
   3. The seed shall be a mixture of grass, grasslike, and forb species. All species shall be native to Ohio and be suitable for periodic flooding and sun or partial shade.

D. Fertilizers:
   1. Bonemeal: Commercial, raw or steamed, finely ground; a minimum of four percent nitrogen and 20 percent phosphoric acid.
   2. Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 20 percent available phosphoric acid.
   3. Commercial Fertilizer: Commercial grade complete fertilizer of neutral character, consisting of fast and slow release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
      a. Composition: When applied, composition of fertilizer shall provide one pound of nitrogen per 1000 square feet; including four percent phosphorous, and two percent potassium, by weight.
   4. Slow Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water insoluble nitrogen, phosphorus, and potassium in the following composition:
      a. Composition: 20 percent nitrogen, 10 percent phosphorous, and 10 percent potassium, by weight.
      b. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil testing agency.

E. Mulches:
   1. Straw Mulch: Provide air dry, clean, mildew and certified seed free, salt hay or threshed straw of wheat, rye, oats, or barley.

F. Erosion-Control Materials:
   1. Erosion Control Blankets: 100 percent biodegradable wood excelsior, straw, or coconut fiber mat enclosed in a photodegradable plastic mesh. Include manufacturer's recommended 6-inches long steel wire staples.
   2. Erosion Control Fiber Mesh: Biodegradable twisted jute or spun coir mesh, a minimum of 0.92 pounds per cubic yard, with 50 to 65 percent open area. Include manufacturer's recommended 6-inches long steel wire staples.

G. Accessories:
   1. Provide herbicides, chemicals and insecticides as needed for disease, fungus or pest control. All herbicides, chemicals and insecticides shall be bear approval labels indicating they are approved by the United States Department of Agriculture for the intended uses and application rates.
   2. Post Emergent Crab Grass and Plantain Chemical: Provide recommended post emergent crab grass and plantain control throughout the maintenance period to ensure germinated and established lawns free of crab grass and other undesirable grasses and forbs.

2.2 LOAM MIXES:

A. Follow recommendations of soil-testing laboratory for modifying on-Site soil and manufactured soil, for use as topsoil.

B. On-Site soil and manufactured soil that has been provided with all inorganic soil amendments and fertilizers recommended by soil-testing laboratory, and acceptable for use as topsoil, shall be mixed with an additional organic soil amendment mix in a ratio of two parts topsoil to one part organic soil amendment mix, by volume.
   1. Prepare soil amendment mix by combining 40 percent compost, 40 percent peat moss, ten percent wood derivatives, five percent well-rotted manure and five percent grit aggregate, by volume.

C. Loam: Thoroughly blend topsoil with organic soil amendment mix and use as planting media for all lawn and meadow Work.

PART 3 – EXECUTION:

3.1 INSPECTION:

A. Contractor shall examine the areas and conditions under which lawn and meadow Work is to be performed, and notify Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 PREPARATION:

A. Thoroughly blend and mix loam before spreading. Incorporate fertilizers, and ground limestone or acidulant, after spreading, as specified, and at rates recommended by soil-testing laboratory.

B. Protect structures, utilities, sidewalks, pavements, and other facilities, trees, shrubs, and plantings from damage caused by planting operations.
   1. Protect adjacent and adjoining areas from hydroseeding overspray.

C. Provide erosion control measures to prevent erosion or displacement of soils and discharge of soil bearing water runoff or airborne dust to adjacent properties and walkways.

D. Perform percolation tests on existing subgrade and placed fills prior to fine grading.
   1. Perform percolation testing of subgrades and placed fills to determine whether or not the subgrade will drain properly. Perform percolation tests in accordance with the following procedure:
      a. Dig a hole in the subgrade that is 4-inches in diameter and 12-inches deep.
      b. Fill the hole with water and wait for the water to completely drain from the hole.
      c. Immediately refill the hole with water and measure the rate of fall in the water level.
   2. In the event that water drains at a rate less than 1-inch in one hour, excavate soil to a minimum depth of 24-inches, and deeper, as necessary to break the compaction. Backfill, recompact and retest each area so prepared to confirm drainage rates exceed one inch in one hour.
   3. Perform minimum of one soil percolation test for every 10,000 square feet of lawn and meadow area.

E. Excavate or fill subgrade, as required, to bring subgrade to elevations shown. Maintain all angles of repose. Confirm that subgrade is at proper elevations and that no further earthwork is required to bring the subgrade to proper elevations. Provide subgrade elevations that slope parallel to finished grade and towards subsurface drains shown.

F. Remove all construction debris, trash, rubble and all extraneous materials from subgrade. In the event that fuels, oils, concrete washout or other material harmful to plant growth or germination have been spilled into the subgrade, excavate the subgrade sufficiently to remove all such harmful materials and fill with approved fill, compacted to the required subgrade compaction level.

3.3 FINE GRADING:

A. Immediately prior to dumping and spreading loam, clean subgrade of all stones greater than 2-inches and all other extraneous matter. Remove all such material from Site. Notify Engineer that subgrade has been cleaned, and obtain approval prior to spreading loam.

B. Do not attempt to spread excessively wet, muddy or frozen loam. Do not spread loam more than five days before seeding or planting.

C. Spread loam to a depth of 8 inches but not less than required to meet finish grades after light rolling and natural settlement.
   1. Spread approximately one-half the thickness of required loam depth. After spreading loam, rototill, disk or harrow loam and subgrade to bring top 2-inches of subgrade upward into loam layer, so that there is a transitional layer between loam and subgrade.
   2. Spread remainder of loam to required finish grades.
   3. Compact each lift sufficiently to reduce settling, but not enough to prevent the movement of water and feeder roots through loam. After compaction spread loam should offer firm, even resistance when a soil sampling tube is inserted.
   4. Phase the placement of the final lift so that wheeled vehicles do not have to travel over areas where final lifts are already in-place.
   5. Spread and compact to a smooth, uniform surface plane, to within plus or minus 1/2-inch of finish elevations. Roll and rake and remove all ridges, and fill depressions, as required. Remove all stones larger than 1-inch in any dimension and all sticks, roots, trash and other extraneous matter.
   6. Perform percolation tests as for subgrades, except limit depth of holes to 2/3 the depth of loam layer.

D. Spread ground limestone or acidulant and fertilizer, as specified. Mix ground limestone with dry loam before spreading fertilizer and work lightly into the top 4-inches of loam by harrowing or tilling at least three days before applying commercial fertilizers.

E. Grade planting areas to smooth, even surface with loose, uniformly fine texture. Remove all stones and extraneous material in excess of 1 inch diameter. Roll, rake and remove ridges and fill depressions, as required to meet finish grades.

F. Moisten prepared areas before seeding, sodding, sprigging or plugging. Water thoroughly and allow surface moisture to dry before planting. Do not create a muddy loam condition.

G. Prior to seeding or planting, restore loam to specified condition, if eroded or otherwise disturbed.

3.4 CONVENTIONAL SEEDING:

A. General: Maintain grade stakes until removal is mutually agreed upon by all parties concerned.

B. Rake or harrow all seedbeds immediately prior to seeding to produce a rough, grooved surface, no deeper than 1-inch. Seed only when seedbed is in a friable condition and not muddy or hard.

C. Sow seed using a spreader or seeding machine.

D. Distribute seed evenly over entire area by sowing equal quantity in two directions at right angles to each other.

E. Sow lawn grass seed mixture at the rate of not less than eight-pounds for every 1000 square feet.

F. Sow meadow grass with minor forbs seed mixture at the rate of not less than 38-pounds per acre.

G. Cultipacker, or approved similar equipment, may be used to cover the seed and to firm the seedbed in one operation. In areas inaccessible to cultipacker:
   1. Rake the seed lightly into top 1/8-inch of loam, roll in two directions with a water ballast roller, weighing not less than 100 pounds per linear foot.
   2. Take care during raking that seed is not raked from one spot to another.
   3. Protect seeded areas against erosion by spreading specified mulch after completion of seeding operations.
      a. Protect seeded areas against hot, dry weather or drying winds by applying peat moss mulch not more than 24 hours after completion of seeding operations. Presoak and scatter evenly to a depth of from 1/8 inch to 3/16 inches thick and roll to a smooth surface. Do not mound.
      b. Spread straw mulch to form a continuous loose blanket not less than 1 1/2 inch deep over seeded areas at the approximately rate of two tons-per acre.
         1) Anchor mulch by spraying with asphalt emulsion at the rate of ten to 13-gallons per 1000 square feet.
         2) Place mulch with equipment that will blow or eject, by means of a constant air stream, controlled quantities of the mulch and asphalt in a uniform pattern over the specified area. If the mulch is excessively cut or broken, take measures to reduce the cutting or breakage. Introduce the asphalt into the air stream by means of a spray arranged so that it will partially coat the mulch with a spotty asphalt tack prior to the depositing of the mulch covering. Rate of application not less than 75-gallons per ton of mulch.
      c. Protect seeded areas, with slopes exceeding one on six, by providing erosion-control fiber mesh and where slopes exceed one on four, by providing erosion-control blankets. Install erosion-control materials according to manufacturer's written instructions and as follows:
         1) Vertically down slope without stretching fabric.
         2) Install hold down staples three per square yard minimum in center of fabric or as required to hold and shape the fabric to the contours of the slope. Install hold down staples along edges and overlaps of fabric at 9 inches on centers minimum, or as required to hold and shape the fabric to the contours of the slope.
         3) Lap fabric 4-inches minimum and turn edges of fabric into 8-inch deep by 16-inch wide earth trench and fill trench with earth.

H. Using a uniform fine spray, thoroughly and evenly water seeded areas. Provide adequate water to moisten seedbed to a depth of 2-inches.
   1. Repeat this process when peat mulch color lightens. Maintain all seedbeds in a uniformly moist condition, conducive to seed germination and plant establishment, as specified.

I. Reseed areas that remain without mulch for longer than three days.

J. Take precautions to prevent damage or staining of construction or other plantings adjacent to mulched areas. Immediately clean damaged or stained areas.

K. Prevent foot or vehicular traffic, or the movement of equipment, over the mulched areas. Reseed areas damaged as a result of such activity.

3.5 HYDROSEEDING:

A. Hydroseeding: Mix specified seed, fertilizer, and fiber mulch in water, using equipment specifically designed for hydroseed application. Continue mixing until uniformly blended into homogeneous slurry suitable for hydraulic application.

B. Mix slurry with asphalt emulsion tackifier.

C. Apply slurry uniformly to all areas to be seeded in a two step process. Apply first slurry application at a minimum rate of 500 pounds per acre dry weight, but not less than the rate required to obtain specified seed sowing rate so that the seed comes into direct contact with loam.

D. Apply slurry cover coat of fiber mulch at a rate of 1000-pounds per acre.

3.6 RECONDITIONING EXISTING LAWNS AND MEADOWS:

A. Recondition existing lawn and meadow damaged by Contractor's operations, including areas used for storage of materials or equipment and areas damaged by movement of vehicles. Recondition existing lawns and meadow areas where minor regrading is required.

B. Recondition other existing lawn and meadow areas shown.

C. Provide fertilizer, seed or sod and soil amendments, as specified for new lawn and meadow, and as required to provide satisfactorily reconditioned lawns and meadows. Provide new loam as required to fill low spots and meet new finish grades.

D. Till stripped, bare, and compacted areas thoroughly to a depth of 12-inches.

E. Remove diseased or unsatisfactory lawn and meadow areas; do not bury into soil. Remove topsoil containing extraneous materials resulting from Contractor's operations including oil drippings, stone, gravel and other construction materials.

F. In areas approved by Engineer, where substantial lawns and meadows remain (but are thin), mow, dethatch, core aerate and rake. Fill low spots, remove humps, cultivate soil, fertilize, and seed. Remove weeds before seeding or if extensive, apply selective chemical weed killers, as required. Apply a seedbed mulch, if required, to maintain moist condition.

G. Water newly planted areas and keep moist until new lawns and meadows are established, as specified.

3.7 ACCEPTANCE CRITERIA FOR LAWNS AND MEADOWS:

A. Lawn and meadow Work will be considered acceptable when:
   1. Seeded Lawn: When a healthy, uniform, close stand of grass has been established, free of weeds and surface irregularities, with coverage exceeding 90 percent over any 10 square feet and bare spots not exceeding 5-inches by 5-inches.
   2. Seeded Meadow: When a healthy, uniform, close stand of meadow grass and forbs has been established, free of weeds and surface irregularities, with coverage exceeding 90 percent over any 20 square feet and bare spots not exceeding 12-inches by 12-inches.

3.8 CLEANUP AND PROTECTION:

A. Promptly remove soil and debris, created by lawn and meadow Work, from paved areas. Clean wheels of vehicles before leaving Site to avoid tracking soil and loam onto roads, walks, or other paved areas.

B. Erect barricades and warning signs as required to protect newly planted areas from traffic. Maintain barricades throughout extended service period and remove when service period ends. Treat, repair or replace damaged lawns and meadows.

C. Remove erosion control measures after lawn and meadow extended service period ends.

D. Take all precautions to ensure that hydroseed slurry is only placed on the areas designated. Completely clean any overspray, on areas not designated to receive slurry.

3.9 INSPECTION AND ACCEPTANCE:

A. Where lawns and meadows do not comply with specified acceptance criteria, reestablish lawns and meadows and continue extended service period until lawns and meadows comply with criteria for acceptance.

3.10 DEMONSTRATION:

A. Engage installer’s Site supervisor to train and instruct Owner’s personnel in the proper maintenance of lawns and meadows and procedures to be performed throughout the year for proper care and maintenance of lawn and meadows.
   1. Include instructions and training on reconditioning established lawns and meadow and sources of lawn and meadow materials.
   2. Schedule training with Owner, through Engineer, with at least seven days' advance notice.

B. Review Operation and Maintenance information and be sure all instructions are clearly understood by Owner’s personnel and are supplemented with additional information, clarifications and instructions, as required.

C. Provide minimum of two, nonconsecutive, full days on-Site training time during day shift normal working hours.

END OF SECTION 32 9200

SECTION 32 9300

PLANTS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install plants.
   2. Extent of plants is shown.
   3. Types of products required include the following.
      a. Shade and flowering trees.
      b. Deciduous shrubs.
      c. Organic topsoil amendments.
      d. Topsoil
      e. Fertilizers.
      f. Mulches and weed-control barriers.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with, or before, the plants.

C. Related Sections:
   1. Section 33 1100, Clearing and Grubbing.
   2. Section 32 9200, Turf and Grass.
   3. Section 32 0191, Tree Protection and Trimming.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American National Standards Institute, (ANSI).
      a. ANSI Z60.1, American Standard for Nursery Stock.
   2. Association of Official Analytic Chemists, (AOAC).
      a. Official Methods of Analysis of AOAC International.
   3. American Society of Agronomy, (ASA).
      a. Reference No. 1 - Methods of Soils Analysis, Soil Science Society of America, Incorporated.
   4. American Society for Testing and Materials, (ASTM).
      a. ASTM A 36, Specification for Carbon Structural Steel.
      b. ASTM A 641, Specification for Zinc-Coated (Galvanized) Carbon Steel Wire.
      c. ASTM D 75, Practice for Sampling Aggregates.
      d. ASTM D 422, Test Method for Particle Size Analysis of Soil.
      e. ASTM D 977, Specification for Emulsified Asphalt.
      f. ASTM D 2487, Practice for Classification of Soils for Engineering Purposes (United Soil Classification System).
      g. ASTM D 4397, Specification for Polyethylene Sheeting for Construction, Industrial and Agricultural Applications.
      h. ASTM D 5268, Specification for Topsoil Used for Landscape Purposes.

i. ASTM E 329, Specification for Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction.
j. ASTM E 548, Guide for General Criteria Used for Evaluating Laboratory Competence.

5. Hortus III, Liberty Hyde Bailey Hortorium.
6. The Rainforest Alliance, SmartWood Certified Forestry Program.
7. United States Department of Agriculture, (USDA).
   a. Description of the Eco-regions of the United States.
   b. Plant Hardiness Zone Maps.

1.3 DEFINITIONS

A. The term “balled and burlapped stock” describes plants dug with firm, natural balls of earth in which they are grown, with ball size not less than diameter and depth recommended by ANSI Z60.1 for type and size of tree or shrub required; wrapped, tied, rigidly supported, and drum-laced as recommended by ANSI Z60.1.

B. The term “balled and potted stock” describes plants dug with firm, natural balls of earth in which they are grown and placed, unbroken, in a container. Ball size is not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required.

C. The term “bare-root stock” describes plants with a well-branched, fibrous-root system developed by transplanting or root pruning, with soil or growing medium removed, and with not less than minimum root spread according to ANSI Z60.1 for kind and size of plant required.

D. The term “container-grown stock” describes healthy, vigorous, well-rooted plants, grown in a container with well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during shipping and be sized according to ANSI Z60.1 for kind, type, and size of plant required.

E. The term “fabric bag-grown stock” describes healthy, vigorous, well-rooted plants established and grown in-ground in a porous fabric bag with well-established root system reaching sides of fabric bag. Fabric bag size is not less than diameter, depth, and volume required by ANSI Z60.1 for type and size of plant.

F. The term “finish grade” describes elevation of finished surface of planting soil mix.

G. The term “manufactured topsoil” describes soil produced off-Site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil for planting soil mix.

H. The term “planting soil mix” describes native or imported topsoil, manufactured topsoil, or surface soil modified to become topsoil; mixed with topsoil amendments.

I. The term “subgrade” describes surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill, before placing planting soil mix.

1.4 QUALITY ASSURANCE

A. Installer Qualifications:

1. Engage a single landscape installer skilled, trained and with successful and documented experience in the planting of plants and in the installation of the types of materials required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of Work. Submit names and qualifications to Engineer along with the following information on a minimum of three successful projects:
    a. Names and telephone numbers of owner, architects or engineers responsible for projects.
    b. Approximate contract cost of the plants.
    c. Amount and kinds of plants installed.
2. Installer's Site Supervisor: Require installer to maintain an experienced full-time landscape supervisor on-Site during the time of preparation for, and planting of, plants. Supervisor shall have achieved landscape or horticultural certification acceptable to governing authorities having jurisdiction at the Site.
3. Ratio of laborers to certified landscape supervisors shall not exceed 12 to one. Certified landscape supervisor shall be on-Site throughout the day-to-day performance of the Work of this Section.
4. Application of herbicides, chemicals and insecticides shall be done by personnel licensed to perform such applications by governing authorities having jurisdiction at the Site and in accordance with each manufacturer's instructions provided on each product label.

B. Soil-Testing Laboratory Qualifications:
1. An independent laboratory, recognized by governing authorities having jurisdiction at the Site, with the experience and capability to conduct testing indicated and that specializes in types of soil tests to be performed.
2. To qualify for approval, an independent testing agency shall demonstrate to Engineer's satisfaction, based on evaluation of criteria submitted by testing agency, that it has the experience and capability to satisfactorily conduct the testing indicated, in accordance with ASTM E 329 and as documented according to ASTM E 548, without delaying the Work.

C. Source Quality Control:
1. General:
    a. Provide quality, size, genus, species, and variety of plants indicated, complying with applicable requirements of ANSI Z60.1.
    b. Ship plants with certificates of inspection as required by governing authorities having jurisdiction at the Site.
2. Analysis and Standards: Package standard products with manufacturer's certified analysis. For other materials, provide analysis by recognized laboratory made in accordance with methods established by the AOAC, wherever applicable or specified.
3. Provide plants grown in a recognized nursery in accordance with good horticultural practice, with healthy root systems developed by transplanting or root pruning. Provide healthy, vigorous plants grown for at least two years under climatic conditions similar to conditions in the locality of the Project and free of disease, insects, eggs, larvae, and defects such as knots, sun-scald, injuries, abrasions or disfigurement.
    a. Provide plants of the sizes shown. Plants of larger size may be used if acceptable to Engineer, and if sizes of roots or balls are increased proportionately.
    b. Measure according to ANSI Z60.1 with branches and trunks or canes in their normal position. Do not prune to obtain required sizes. Take caliper measurements 6-inches above ground for trees up to 4-inch caliper size, and 12-inches above ground for larger sizes.
    c. Measure main body of tree or shrub for height and spread; do not measure branches, or roots, tip-to-tip.

4. Plants showing signs of graft incompatibility shall be removed from the Site. Visual indication of graft incompatibility shall include:
    a. Development of over-growths by rootstock or scion resulting in the development of shoulders or inverted shoulders.
    b. Suckering of the rootstock combined with poor growth or dieback of the scion.
    c. Any mechanical weakness between scion and rootstock.
    d. Any marked difference in bark pattern and structure between scion and rootstock.
5. Inspection: Engineer may inspect plants either at place of growth or at Site, before planting, for compliance with requirements for genus, species, variety, size, and quality. Engineer retains right to inspect plants further for size and condition of ball and root systems, insects, injuries, and latent defects and to reject unsatisfactory or defective material at any time during progress of Work. Immediately remove rejected plants from Site.
    a. Notify Engineer of sources of planting materials, minimum of 14 days in advance of delivery to Site.
6. Do not prune plants before delivery, except as approved by Engineer, in writing. Protect bark, branches, and root systems from sun scald, drying, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape.
7. Requirements for Balled and Burlapped Plants:
    a. Where shown to be balled and burlapped, provide plants dug with a firm, natural ball of earth in which they are grown.
    b. Provide ball size of not less than the diameter and depth recommended by ANSI Z60.1 for the type and size of plants required. Increase ball size or modify ratio of depth to diameter as required to encompass the fibrous and feeding root system necessary for full recovery of plants subject to unusual or atypical conditions of growth, soil conditions or horticultural practice.
    c. Wrap and tie earth ball as recommended by ANSI Z60.1 for the size of balls required. Drum-lace balls with a diameter of 30-inches or greater.
8. Requirements for Container Grown Plants:
    a. Where shown as acceptable, provide healthy, vigorous, well-rooted plants established in the container in which they are sold. Provide balled and burlapped stock, when required plants exceed maximum size recommended by ANSI Z60.1 for container grown plants.
    b. Containers: Use rigid containers that will hold ball shape and protect root mass during shipping. Provide plants established in containers of not less than the minimum sizes recommended by ANSI Z60.1 for the kind, type and size of plant required.
9. Requirements for Bare-Root Plants:
    a. Where shown to be bare root, provide plants with a heavy fibrous root system developed by transplanting or root pruning and with not less than the minimum root spread recommended by ANSI Z60.1 for the kind and size of plant required.
    b. Provide freshly dug bare-root plants.
    c. Immediately after digging up bare-root plants, pack root system in wet straw, hay, or other suitable material to keep root system moist until planting.

D. Pre-installation Conference:
1. Prior to commencement of planting and associated Work, Contractor shall schedule and meet at the Site with the landscape installer, the installers of other work in and around planting areas that follows the planting Work, including fencing Work specified in Section 32 31 00, Fences, and Engineer and other representatives directly concerned with performance of the Work. Review foreseeable methods and procedures related to the planting Work, including the following:

a. Review Project requirements and the Contract Documents.
b. Review required submittals, both completed and yet to be completed.
c. Review availability of water and methods of delivery.
d. Review status of below-grade work and required access during planting and extended service periods.
e. Review Project Schedule and availability of materials, tradesmen, equipment and facilities needed to make progress and avoid delays.
f. Review environmental conditions, other Project conditions, and procedures for coping with unfavorable conditions.
g. Review procedures needed for protection of plantings during the remainder of the construction period.
h. Review required inspection, testing, and certifying procedures.

2. Record the discussions of the conference and the decisions and agreements or disagreements reached, and furnish a copy of the record to each party attending.
3. Record all revisions or changes agreed upon, reasons therefor, and parties agreeing or disagreeing with them.
4. Reconvene the meeting at the earliest opportunity if additional information must be developed in order to conclude the subjects under consideration.

1.5 SUBMITTALS

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Planting schedule showing scheduled start and finish dates for each type of planting in each area of Site.
2. Product Data:
a. Manufacturer's specifications and installation instructions for all materials required.
b. Composition and analysis of commercial fertilizers and all purchase receipts showing the total quantity actually purchased for this Project.

B. Informational Submittals: Submit the following:
1. Certificates:
a. Certificates of inspection as may be required by governing authorities having jurisdiction at the Site to accompany shipments, and manufacturer's certified analysis for soil amendments and fertilizer materials.
b. For standard products, submit other data certifying that materials comply with specified requirements.
2. Test and Evaluation Reports:
a. An analysis made by an approved laboratory stating the mechanical and chemical analysis of the peat humus proposed for use.
b. Soil analysis reports for existing soil and imported manufactured topsoil, as specified. Include recommendations for remediating existing soil into acceptable topsoil as a component of planting soil mix.
3. Qualifications Data:
a. Landscape installer.
b. Landscape supervisor.
c. Testing agency.
4. Source Quality Control Submittals:
a. Written statement providing the location from which manufactured topsoil is to be obtained and the names and addresses of the suppliers.

C. Closeout Submittals: Submit the following:
   1. Care and Maintenance Data:
      a. Report with instructions recommending procedures to be established by Owner for full care, vigorous growth and maintenance of each type of plant specified, with specific recommendations for type of care, insect and disease prevention and special winter protection measures to be performed for each type of plant, for each month of the year. Include color pictures of each type of plant used in the Project, showing full plant form and close-ups of leaf and flower forms, along with botanical and common names adjacent to written full care and maintenance recommendations.
      b. Submit report prepared in Microsoft Word or Adobe portable document format, with scanned pictures as specified, and provide Owner with two copies on compact disc.
      c. Submit prior to expiration of specified extended service periods.
   2. Warranty Documentation:
      a. Submit written warranty, signed by Contractor and landscape installer, as specified.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery of Materials:
   1. Deliver each type of plant as the Work progresses, after preparations for planting that specific type of plant is completed, and when plants will be planted immediately upon arrival at the Site. Do not stockpile plants on-Site.
   2. Deliver packaged materials in original, unopened containers, legibly showing weight, analysis and name of manufacturer. Protect materials from deterioration during delivery. Provide protective covering.
   3. Do not drop plants during delivery.
   4. Immediately remove unacceptable material from Site.

B. Storage of Materials:
   1. If planting is delayed more than six hours after delivery, set plants in shade, protect from weather and mechanical damage, and keep roots moist.
   2. Set balled stock on ground and cover ball with soil, moistened peat moss or other acceptable material.
   3. Heel-in bare root plants in a bed containing adequate peat moss to keep roots in a moist condition. Soak roots in water for two hours before planting.
   4. Store and cover materials to prevent deterioration. Remove packaged materials that have become wet, or show deterioration or water marks, from Site.

C. Handling of Materials:
   1. Handle balled and burlapped plants so that the ball will not be loosened or broken. Immediately remove split, broken or loosened balled and burlapped material from Site and replace with new material.
   2. Do not remove container-grown plants from containers until planting time.
   3. Do not lift or drag plants by stems or trunks. Handle plants by lifting root ball or container.
   4. Water as necessary to maintain plant root systems in a moist condition.

1.7 PROJECT CONDITIONS

A. Existing Conditions:
   1. Obstructions Below Ground and Utilities: Exercise extreme caution in all planting operations, as there are underground electric and telephone cables, sewer lines and water lines throughout the entire Site. Study and be familiar with the location of these obstructions

and underground utilities. Place plantings, where shown in the proximity of these obstructions and underground utilities, clear of any interference. Repair all damages to obstructions and underground utilities caused by the Work of this Section.

B. Environmental Requirements:
   1. Proceed with and complete the Work as rapidly as portions of the Site become available, working within the seasonal limitations for each kind of plant shown.
   2. Herbicides, chemicals and insecticides shall not be used on areas bordering wetlands.
   3. Do not resort to chemical control measures at the first sign of insect or disease attack. Make an attempt to determine the environmental cause of the attack and take corrective measures.
   4. Apply chemical insect and disease measures locally and specifically to the area and type of planting in need of such insect and disease control, so as not to damage plantings, or endanger the environment. Select natural chemical controls specific to the type of insect or disease encountered, or provide naturally controlling insect predators and bacterial controls for release at the Site.
   5. Plantings exhibiting a broad and heavy infestation of insects or diseases, or where insects or diseases have disfigured plantings such that they no longer provide their intended aesthetic effect, shall be replaced with new plantings.

C. Scheduling:
   1. Coordinate planting with specified extended service periods to provide required service from date of acceptable completion of each type of planting. Planting periods shall be per supplier recommendations.
   2. Do not begin planting until water, acceptable for use and adequate in supply, is available on-Site and can be successfully transported to the areas of Work. Coordinate provision of adequate and acceptable water supply with Project schedule.
   3. Do not proceed with installation of plants until all subgrade utility services have been installed, are operating successfully and have been approved by Engineer.
   4. Plant only after final grades are established and prior to planting of lawns and meadows, unless otherwise acceptable to Engineer. If planting occurs after lawn and meadow Work, protect lawn and meadow areas and promptly repair damage to lawns and meadows resulting from planting operations.
   5. Apply anti-desiccant to trees and shrubs using power spray to provide an adequate film over trunks, branches, stems, twigs and foliage to protect during digging, handling, and transportation.
      a. One week before evergreen trees and deciduous trees and shrubs in full leaf are to be dug, spray with anti-desiccant at nursery before moving and again two weeks after planting.
      b. Apply anti-desiccant to evergreens, again, immediately after the first frost.

1.8 ALTERNATIVES

A. Do not select plant material differing from that shown, without consulting Engineer for approval.

B. Plant material differing from that shown may be allowed by Engineer, at the varietal level only. Submit proof of non-availability and proposal for types of equivalent material.
   1. Where custom propagation is indicated, current non-availability shall not be cause for recommending alternatives to plants shown.

C. Bring to the attention of Engineer plant selections believed to be unsuitable for the microclimate or ecoregion of the Project, based on USDA information specified, or other authoritative sources.

1.9 WARRANTY

A. General Warranty: The special warranties specified in this Article shall not deprive Owner of other rights or remedies Owner may otherwise have under the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under the Contract Documents.

B. Special Warranty: Warrant the following plants, for the warranty period indicated, against defects including death and unsatisfactory growth, except for defects resulting from lack of adequate care and maintenance, or abuse by Owner, or incidents that are beyond Contractor's control.
   1. Warranty Period for Trees and Shrubs: One year from date of end of extended service period.
   2. Replace plants that are more than 25 percent dead or in an unhealthy condition at end of warranty period.
   3. A limit of one replacement of each plant will be required, except where losses or replacement failures are due to Contractor's failure to comply with specified requirements.

1.10 EXTENDED SERVICE

A. Extended Landscape Service:
   1. Begin extended service immediately after each planted area is acceptably completed. Provide extended service for not less than the following periods:
      a. Trees and Shrubs: 90 days after trees and shrub plantings are acceptably completed.
   2. Prune, cultivate, water, weed, fertilize, shade, mist, restore planting saucers, tighten and repair stakes and guy supports, and reset plantings to proper grades or vertical position, as required to establish healthy, viable plantings.
      a. Do not allow plantings to wilt or show other signs of environmental stress. Visit the Site twice a week during the extended service periods, to inspect the condition of the plantings and immediately provide required care.
      b. Contractor shall provide landscape installer who shall be available on-call if notified between regular visits that plants require critical care or maintenance, throughout the time of extended service periods.
   3. Check and observe plantings for signs of insect and disease attack. Take corrective measures immediately upon notice of such attack. Control damaging insects and diseases, as specified.
   4. Restore or replace damaged tree wrappings.
   5. Remove dead plants immediately. Replace immediately, unless required to plant in the succeeding planting season.

B. Provide sufficient water to ensure that the top six inches of the planting bed mix remains moist at all times.
   1. Apply water using a 1-inch diameter hose with an attached metering gauge.
   2. For trees in seeded areas or mulched beds, apply water to the ground surface directly under the canopy. Apply water at a sufficiently slow rate to prevent water run-off from the soil surface but great enough to provide 0.2-inches of water per square foot of canopy area per hour for five hours each week.

C. Any decline in the condition of plants shall require Contractor to take immediate action to identify potential problems and undertake corrective measures. If required, engage professional arborists or horticulturists to inspect plants, identify problems and recommend correctives procedures. Advise Engineer of all such actions and submit inspection and recommendation reports.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General Landscape Design Criteria:
   1. Provide plant materials true to name and variety, established in Hortus III.
   2. Provide nursery-grown plants complying with ANSI Z60.1, typical of their species or variety and with a normal habit of growth for type of plant required, with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous plants free of disease, insects, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.
   3. Label each tree and shrub and all bundles or flats of plants with securely attached, waterproof tag bearing legible designation of botanical and common name.

2.2 SHADE AND FLOWERING TREES

A. Single-stem trees with straight trunk, well-balanced crown, and intact leader, of height and caliper indicated, complying with ANSI Z60.1 for type of trees required.

2.3 DECIDUOUS SHRUBS

A. Form and Size: Deciduous shrubs with not less than the minimum number of canes required by and measured according to ANSI Z60.1 for type, shape, and height of shrub.

2.4 TOPSOIL

A. Topsoil shall be in accordance with Section 32 9200, Turf and Grass

2.5 ORGANIC SOIL AMENDMENTS

A. Compost: Well-composted, stable, weed-free organic matter, produced by the aerobic decomposition of organic residues; pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through a 1-inch screen; soluble salt content of 5 to 10 decisiemens/meter; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:
   1. Organic Matter Content: 50 to 60 percent of dry weight.
   2. Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.

B. Peat: Partially decomposed stems and leaves of several species of sphagnum moss; finely divided or granular texture. Supply shredded material, free from lumps, wood, roots, stones, decomposed collodial residue and other extraneous foreign matter, capable of passing through a 1/2-inch screen, which can easily be incorporated with the soil. Supply material that has been conditioned in storage piles after excavation for at least six months, including one freezing and thawing period. Supply peat humus with the following analysis:
   1. Not less than 90 percent organic matter by weight on an ovendry basis.
   2. pH range of 3.4 to 4.8.
   3. Moisture content 35 percent at time of incorporation into soil.
   4. Water absorbing ability 150 percent to 350 percent by weight.

C. Wood Derivatives: Decomposed, nitrogen-treated sawdust, ground bark, or wood waste; of uniform texture, free of chips, stones, sticks, soil, or toxic materials.

1. In lieu of decomposed wood derivatives, mix partially decomposed wood derivatives with at least 0.15 pounds of ammonium nitrate or 0.25 pounds of ammonium sulfate per cubic foot of loose sawdust or ground bark.

D. Manure: Well-rotted, unleached, stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, and material harmful to plant growth.

2.6 FERTILIZERS

A. Bonemeal: Commercial, raw or steamed, finely ground; a minimum of four percent nitrogen and 20 percent phosphoric acid.

B. Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 20 percent available phosphoric acid.

C. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral char-acter, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
   1. Composition: When applied, composition of fertilizer shall provide one pound of nitrogen per 1000 square feet; including four percent phosphorous, and two percent potassium, by weight.

D. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following compo-sition:
   1. Composition: Twenty percent nitrogen, ten percent phosphorous, and ten percent potassium, by weight.

2.7 MULCHES

A. Compost Mulch: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1-inch screen; soluble salt content of 5 to 10 decisiemens/meter; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:
   1. Organic Matter Content: 50 to 60 percent of dry weight.
   2. Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.

B. Wood Chip Mulch: Provide either hardwood or softwood chips as produced by any standard chipping machine containing no wood shavings, sawdust or foreign material such as stones. Chip sizes larger than 3-inches in greatest dimension are not acceptable.

2.8 STAKES AND GUYS

A. Upright and Guy Stakes: Rough-sawn, sound, hardwood or softwood obtained from certified sustainable managed forests, free of knots, holes, cross grain, and other defects, 2-inches by 2-inches by length indicated, pointed at one end.

B. Guy and Tie Wire: ASTM A 641, Class 1, galvanized-steel wire, 2-strand, twisted, 0.106-inch in diameter.

C. Guy Cable: Five-strand, 3/16-inch diameter, galvanized-steel cable, with zinc-coated turnbuckles, a minimum of 3-inches long, with two 3/8-inch galvanized eyebolts.

D. Hose Chafing Guard: Reinforced rubber or plastic hose at least 1/2-inch in diameter, black, cut to lengths required to protect tree trunks from damage.

E. Flags: Standard surveyor's plastic flagging tape, white, 6-inches long.

2.9 MISCELLANEOUS PRODUCTS

A. Antidesiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's written instructions.

B. Trunk-Wrap Tape: Two layers of crinkled paper cemented together with bituminous material, 4-inch wide minimum, with stretch factor of 33 percent.

C. Provide herbicides, chemicals and insecticides as needed for disease, fungus or pest control. All herbicides, chemicals and insecticides shall be bear approval labels indicating they are approved by the USDA for the intended uses and application rates.

2.10 PLANTING SOIL MIXES

A. Follow recommendations of soil-testing laboratory for modifying on-Site soil and manufactured soil, for use as topsoil.

B. Preparation of Planting Soil Mix:
   1. Before mixing, clean topsoil of roots, plants, sods, stones, clay lumps, and other extraneous materials harmful or toxic to plant growth.
   2. Mix specified soil amendments and fertilizers with topsoil at the rates required to produce the pH needed for that particular planting and as specified. Delay mixing of fertilizer if planting will not follow placing of planting soil within a few days.
   3. Provide planting soil mix proportions as follows:

Percent by Volume	Material
40 percent	Screened topsoil
25 percent	Peat Humus
25 percent	Compost
10 percent	Coarse Sand

   4. Add five pounds 5-10-5 commercial fertilizer and three pounds of bonemeal per cubic yard of planting soil mix.
   5. For pit and trench type backfill, mix planting soil prior to backfilling, and stockpile at the Site.

6. Mix lime with dry soil prior to mixing of fertilizer. Prevent lime from contacting roots of acid-loving plants.
7. Apply phosphoric acid fertilizer (other than that constituting a portion of complete fertilizers) directly to subgrade before applying planting soil mix and tilling.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine the subgrade, verify the elevations, observe the conditions under which planting Work is to be performed, and notify Engineer, in writing, of unsatisfactory conditions. Do no proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Inspect plants for injury, insect infestation, and improper pruning.

C. Do not begin planting or wrapping of trees until deficiencies are corrected, or plants, replaced.

3.2 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities, and lawns and existing plants from damage caused by planting operations.

B. Provide erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

C. Lay out plants at locations directed by Engineer. Stake locations of individual trees and shrubs and outline areas for multiple plantings.

3.3 PLANTING BED ESTABLISHMENT

A. Remove all existing soil from planting beds to the depth shown, but not less than 12-inches, so that finished plantings are level with adjacent final lines, grades and elevations after addition of planting soil mix and after light rolling and natural settlement.

B. Loosen subgrade of planting beds to a minimum depth of 6-inches. Remove stones larger than 2-inches in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off-Site.
   1. Apply superphosphate fertilizer directly to subgrade before loosening.

C. Spread planting soil mix to a depth required meeting finish grades after natural settlement. Do not spread if planting soil mix or subgrade is frozen, muddy, or excessively wet.
   1. Spread approximately one-half the thickness of planting soil mix over loosened subgrade. Mix thoroughly into top 4-inches of subgrade. Spread remainder of planting soil mix.

D. Finish Grading: Grade planting beds to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades.

E. Restore planting beds if eroded or otherwise disturbed after finish grading and before planting.

3.4 TREE AND SHRUB EXCAVATION

A. Pits and Trenches: Excavate circular pits with sides sloped inward. Trim base leaving center area raised slightly to support root ball and assist in drainage. Do not further disturb base. Scarify sides of plant pit smeared or smoothed during excavation. Dispose of subsoil removed from pits and trenches in a legal manner, off-Site.
   1. Excavate approximately three times as wide as ball diameter for balled and burlapped stock.
   2. Excavate at least 12-inches wider than root spread and deep enough to accommodate vertical roots for bare-root stock.

B. Obstructions: Notify Engineer if unexpected rock or obstructions detrimental to trees or shrubs are encountered in excavations.

C. Drainage: Notify Engineer if subsoil conditions evidence unexpected water seepage or retention in tree or shrub pits.

3.5 TREE AND SHRUB PLANTING

A. Set plants plumb and in center of pit or trench with top of root ball set such that it will be 1-inch above adjacent finish grades, at plant stem, after planting soil mix has settled.
   1. Remove burlap and wire baskets from tops of root balls and partially from sides, but do not remove from under root balls. Remove pallets, if any, before setting. Do not use plant if root ball is cracked or broken before or during planting operation.
   2. Place planting soil mix around root ball in layers. Each layer shall not be more than 6-inch deep. Tamp to settle mix and eliminate voids and air pockets. When pit is approximately one-half backfilled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed. Water again after placing and tamping final layer of planting soil mix.
   3. Remove all soil from around the root flare of the stem of each plant and from the top of the root ball to determine the true depth of the root flare. Plant with root flare at surface of finish planting soil mix.

B. Carefully remove root ball from container without damaging root ball or plant.
   1. After removal of plant from container, or sides from box, tease out feeder roots to assure positive contact and embedment into planting soil.

C. Set fabric bag-grown plants plumb and in center of pit or trench with top of root ball 1-inch above adjacent finish grades.
   1. Carefully remove root ball from fabric bag without damaging root ball or plant. Do not use plant if root ball is cracked or broken before or during planting operation.

D. Set and support bare-root plants in center of pit or trench with root collar or trunk flare 1-inch below adjacent finish grade. Spread roots without tangling or turning toward surface, and carefully work backfill around roots by hand. Puddle with water until backfill layers are completely saturated. Plumb before backfilling, and maintain plumb while working backfill around roots and placing layers above roots. Tamp final layer of backfill. Remove injured roots by cutting cleanly; do not break.

E. Organic Mulching: Apply 2-inch average thickness of organic mulch extending 12-inches beyond edge of planting pit or trench. Do not place mulch within 3-inches of trunks or stems.

F. Wrap trees of 2-inch caliper and larger with trunk-wrap tape. Start at base of trunk and spiral cover trunk to height of first branches. Overlap wrap, exposing half the width, and securely attach without

causing girdling. Inspect tree trunks for injury, improper pruning, and insect infestation; take corrective measures required before wrapping.

G. Perform complete sequence of planting steps for each plant within the same day.

H. Dish top of backfill to allow for mulching. Provide dish four feet in diameter approximately 4-inches deep around each tree, with planting soil berm around edge of excavations to form shallow saucer to collect water.

I. After watering, any settlement within basins shall be refilled to required grade with planting soil mix.

3.6 TREE AND SHRUB PRUNING

A. Prune, thin out and shape trees in accordance with standard horticultural practice. Prune trees to retain required height and spread. Unless otherwise directed by the Engineer, do not cut tree leaders. Remove only injured or dead branches from ornamental flowering trees, if any. Prune to retain natural character and accomplish their use in the landscape design. Required tree sizes are the size after pruning.
   1. Remove all dead wood and suckers, and all broken and badly bruised branches.

B. Remove and replace excessively pruned or misformed stock resulting from improper pruning.

C. Paint cuts over 1/2-inch in size with standard tree wound compound, covering exposed, living tissue.

D. All pruning wounds shall show vigorous bark on all edges at the time of harvest.

3.7 GUYING AND STAKING

A. Guy and stake trees immediately after planting.

B. Upright Staking and Tying: Stake trees of 2-inches through 5-inch caliper. Stake trees of less than 2-inch caliper only as required to prevent wind tip-out. Use a minimum of two stakes of length required to penetrate at least 18-inches below bottom of backfilled excavation and to extend at least 72-inches above grade. Set vertical stakes and space to avoid penetrating root balls or root masses. Support trees with two strands of tie wire encased in hose sections at contact points with tree trunk. Allow enough slack to avoid rigid restraint of tree. Use the number of stakes as follows:
   1. Use two stakes for trees up to 12 feet high and 2-1/2-inches or less in caliper.
   2. Use three stakes for trees greater than 12 feet, but less than 14 feet high, and up to 4-inches in caliper. Space stakes equally around trees.

3.8 ACCEPTANCE CRITERIA FOR PLANTS

A. Planting Work will be considered acceptable when:
   1. Shade and Flowering Trees: When firmly planted, properly located and vertically upright with all securement devices and accessories, mulches, and saucers formed and in-place; with plant showing no signs of environmental stress, disease, insect infestations, mechanical damage or disfigurements such as suckers or watersprouts. Twigs and branches shall have a

full bud set for their full length including terminal buds. Buds shall be swelling or provide other indications of becoming vigorous, healthy growth.

2. Deciduous Shrubs: When firmly planted, properly located and vertically upright, with all mulches and saucers formed and in-place; with plant showing no signs of environmental stress, disease, insect infestations, damage or other disfigurement. Twigs and branches shall have a full bud set for their full length including terminal buds. Buds shall be swelling or provide other indications of becoming vigorous, healthy growth.

3.9 CLEANUP AND PROTECTION

A. Protect plants from damage due to landscape operations, operations by other contractors and trades, and others. Maintain protection during installation and extended service periods. Treat, repair, or replace damaged planting.

B. Protection includes all temporary fences, barriers and signs and other Work incidental to proper maintenance.

3.10 INSPECTION AND ACCEPTANCE

A. Where plants do not comply with specified acceptance criteria, replace plants and continue extended service period until plants comply with criteria for acceptance.

END OF SECTION 32 9300

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 33 0505

BURIED PIPING INSTALLATION

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to install and test all buried piping, fittings, and specials. The Work includes the following:
a. All types and sizes of buried piping, except where buried piping installations are specified under other Sections or other contracts.
b. Unless otherwise shown or specified, this Section includes all buried piping Work required, beginning at the outside face of structures or structure foundations, including piping beneath structures, and extending away from structures.
c. Work on or affecting existing buried piping.
d. Installation of all jointing and gasket materials, specials, flexible couplings, mechanical couplings, harnessed and flanged adapters, sleeves, tie rods, cathodic protection, and other Work required for a complete, buried piping installation.
e. Supports, restraints, and thrust blocks.
f. Field quality control, including testing.
g. Cleaning and disinfecting.
h. Incorporation of valves, meters, and special items shown or specified into piping systems in accordance with the Contract Documents and as required.

B. Coordination:
1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before buried piping Work.
2. Coordinate with appropriate piping Sections of Division 40, Process Integration.

C. Related Sections:
1. Section 31 2305 Excavation and Fill.
2. Section 03 3000, Cast-In-Place Concrete.
3. Section 09 9100, Painting.
4. Section 40 0513, Process Piping

1.2 REFERENCES:

A. Standards referenced in this Section are:
1. ASME Boiler and Pressure Vessel Code.
2. ASME B31.3, Process Piping.
3. American Society for Non-Destructive Testing (ASNT), ASNT-TC-1A, Recommended Practice, Personnel Qualification, and Certification in Non-destructive Testing.
4. ASTM D2321, Practice for Underground Installation of Thermoplastic Pipe for Sewers and other Gravity-Flow Applications.
5. ASTM D2774, Practice for Underground Installation of Thermoplastic Pressure Piping.
6. ASTM F1417, Test Method for Installation Acceptance of Plastic Gravity Sewer Lines using Low-Pressure Air.

7. ASTM F2164, Standard Practice for Field Leak Testing of Polyethylene (PE) Pressure Piping Systems Using Hydrostatic Pressure.
8. ANSI/AWWA C105, Polyethylene Encasement for Ductile-Iron Pipe Systems.
9. ANSI/AWWA C111, Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
10. ANSI/AWWA C600, Installation of Ductile-Iron Water Mains and Their Appurtenances.
11. ANSI/AWWA C605, Underground Installation of Polyvinyl Chloride (PVC) Pressure Pipe and Fittings for Water.
12. ANSI/AWWA C651, Disinfecting Water Mains.
13. AWWA M23, PVC Pipe - Design and Installation.
14. AWWA M41, Ductile-Iron Pipe and Fittings.
15. AWWA M55, PE Pipe - Design and Installation.
16. ASCE 37, Design and Construction of Sanitary and Storm Sewers.
17. NFPA 24, Standard for the Installation of Private Fire Service Mains and Their Appurtenances.

1.3 QUALITY ASSURANCE:

A. Regulatory Requirements:
1. Comply with requirements and recommendations of authorities having jurisdiction over the Work, including.
a. Warren County.
2. Obtain required permits for Work in roads, rights of way, railroads, and other areas of the Work.

1.4 SUBMITTALS:

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Details of piping, specials, joints, harnessing and thrust blocks, and connections to piping, structures, equipment, and appurtenances.
2. Product Data:
a. Manufacturer's literature and specifications, as applicable, for products specified in this Section.
3. Testing Procedures:
a. Submit proposed testing procedures, methods, apparatus, and sequencing. Obtain Engineer's approval prior to commencing testing.

B. Informational Submittals: Submit the following:
1. Certificates:
a. Certificate signed by manufacturer of each product certifying that product conforms to applicable referenced standards.
2. Field Quality Control Submittals:
a. Results of each specified field quality control test.

C. Closeout Submittals: Submit the following:
1. Record Documentation:
a. Maintain accurate and up-to-date record documents showing modifications made in the field, in accordance with approved submittals, and other Contract modifications relative to buried piping Work. Submittal shall show actual location of all piping Work and appurtenances at same scale as the Drawings.

b. Show piping with elevations referenced to Project datum and dimensions from permanent structures. For each horizontal bend in piping, include dimensions to at least three permanent structures, when possible. For straight runs of piping provide offset dimensions as required to document piping location.
c. Include profile drawings with buried piping record documents when the Contract Documents include piping profile drawings.

1.5 DELIVERY, STORAGE, AND HANDLING:

A. Delivery:
1. Deliver materials to the Site to ensure uninterrupted progress of the Work.
2. Upon delivery inspect pipe and appurtenances for cracking, gouging, chipping, denting, and other damage and immediately remove from Site and replace with acceptable material.

B. Storage:
1. Store materials to allow convenient access for inspection and identification. Store material off ground using pallets, platforms, or other supports. Protect packaged materials from corrosion and deterioration.
2. Pipe and fittings other than PVC and CPVC may be stored outdoors without cover. Cover PVC and CPVC pipe and fittings stored outdoors.

C. Handling:
1. Handle pipe, fittings, specials, and accessories carefully in accordance with pipe manufacturer's recommendations. Do not drop or roll material off trucks. Do not drop, roll or skid piping.
2. Avoid unnecessary handling of pipe.
3. Keep pipe interiors free from dirt and foreign matter.
4. Protect interior linings and exterior coatings of pipe and fittings from damage. Replace pipe and fittings with damaged lining regardless of cause of damage.

PART 2 – PRODUCTS

2.1 MATERIALS:

A. Piping materials are specified in the Buried Piping Schedule on the project drawings. Piping materials shall conform to Section 40 0513 Process Piping.

B. General:
1. Pipe Markings:
a. Manufacturer shall cast or paint on each length of pipe and each fitting pipe material, diameter, and pressure or thickness class.

C. Polyethylene Encasement:
1. Polyethylene may be supplied in tubes or sheets.
2. Polyethylene encasement materials shall be in accordance with ANSI/AWWA C105.

2.2 BURIED PIPING IDENTIFICATION:

A. Polyethylene Underground Warning Tape for Metallic Pipelines:

1. Tracer tape shall be of inert, acid- and alkali-resistant, polyethylene, four mils thick, six inches wide, suitable for direct burial. Tape shall be capable of stretching to twice its original length.
2. Message shall read, "CAUTION [insert customized name of pipe service, i.e., "POTABLE WATER", "SANITARY SEWER", "CHLORINE GAS", or other service as appropriate, as indicated in the Buried Pipe Schedule on the Drawings] PIPE BURIED BELOW", with bold letters approximately two inches high. Messages shall be printed at maximum intervals of two feet. Tape shall be custom colored the same as pipeline colors specified for associated pipe service in Section 09 9100, Painting.
3. Manufacturer: Provide products of one of the following:
    a. Brady Corporation
    b. Seton Identification Products
    c. Marking Services, Inc.
    d. Or equal.

B. Detectable Underground Warning Tape for Non-Metallic Pipelines:
1. Tape shall be of inert, acid- and alkali-resistant, polyethylene, five mils thick, six inches wide, with aluminum backing, and have 15,000 psi tensile strength and 80 percent elongation capability. Tape shall be suitable for direct burial.
2. Message shall read, "CAUTION [insert customized name of pipe service, i.e., "POTABLE WATER", "SANITARY SEWER", "CHLORINE GAS", or other appropriate service, as indicated in the Buried Pipe Schedule on the Drawings] PIPE BURIED BELOW" with bold letters approximately two inches high. Messages shall be printed at maximum intervals of two feet. Tape shall be custom colored the same as the pipeline colors as specified for the associated pipe service in Section 09 9100, Painting.
3. Manufacturer: Provide products of one of the following:
    a. Brady Corporation
    b. Seton Identification Products
    c. Marking Services, Inc.
    d. Or equal.

PART 3 – EXECUTION

3.1 INSTALLATION:

A. General:
1. Install piping as shown, specified, and as recommended by pipe and fittings manufacturer.
2. In event of conflict between manufacturer's recommendations and the Contract Documents, request interpretation from Engineer before proceeding.
3. Engineer will observe excavations and bedding prior to laying pipe by Contractor. Notify Engineer in advance of excavating, bedding, pipe laying, and backfilling operations.
4. Minimum cover over buried piping shall be 4.5 feet, unless otherwise shown or approved by Engineer.
5. Earthwork is specified in Section 31 2305, Excavation and Fill.
6. Excavation in excess of that required or shown, and that is not authorized by Engineer shall be filled at Contractor's expense with granular material furnished, placed, and compacted.
7. Comply with NFPA 24 for "Outside Protection", where applicable to water piping systems used for fire protection.

B. Separation of Sewers and Potable Water Piping:
1. Horizontal Separation:

a. Where possible, existing and proposed potable water mains and service lines, and sanitary, combined, and storm sewers shall be separated horizontally by clear distance of at least ten feet.
b. If local conditions preclude the specified clear horizontal separation, installation will be allowed if potable water main is in separate trench or on undistributed earth shelf on one side of sewer and with bottom of potable water main at least 24 inches above top of sewer.
c. Exception:
1) Where it is not possible to provide minimum horizontal separation described above, construct potable water main of cement-lined ductile iron pipe with restrained push-on joint or restrained mechanical joint pipe complying with public water supply design standards of authority having jurisdiction. Hydrostatically test water main and sewer as specified in this Section prior to backfilling. Hydrostatic test pressure at crossing shall be at least 150 psi.

2. Vertical Separation:
a. Provide minimum vertical distance of 24 inches between outside of potable water main and outside of sewer when sewer crosses over potable water main.
b. Center a section of potable water main pipe at least 17.5 feet long over sewer so that sewer joints are equidistant from potable water main joints.
c. Provide adequate structural support where potable water main crosses under sewer. At minimum, provide compacted select backfill for ten feet on each side of crossing.
d. Exceptions:
1) Where it is not possible to provide minimum vertical separation described above, construct potable water main of cement-lined ductile iron pipe with restrained push-on joint or restrained mechanical joint pipe. Hydrostatically test water main and sewer as specified in this Section, prior to backfilling. Hydrostatic test pressure at crossing shall be at least 150 psi.
2) Encase either potable water main or sewer in watertight carrier pipe extending ten feet on each side of crossing, measured perpendicular to potable water main.

C. Plugs:
1. Temporarily plug installed pipe at end of each day of work or other interruption of pipe installation to prevent entry of animals, liquids, and persons into pipe, and entrance or insertion of deleterious materials into pipe.
2. Install standard plugs in bells at dead ends, tees, and crosses. Cap spigot and plain ends.
3. Fully secure and block plugs, caps, and bulkheads installed for testing to withstand specified test pressure.
4. Where plugging is required for phasing of the Work or subsequent connection of piping, install watertight, permanent type plugs, caps, or bulkhead acceptable to Engineer.

D. Bedding Pipe: Bed pipe as specified and in accordance with details on the Drawings.
1. Trench excavation and backfill, and bedding materials shall conform to Section 31 2305, Excavation and Fill , as applicable.
2. Where Engineer deems existing bedding material unsuitable, remove and replace existing bedding with approved granular material furnished, placed, and compacted in accordance with 31 2305, Excavation and Fill.
3. Where pipe is installed in rock excavation, provide minimum of three inches of granular bedding material underneath pipe smaller than four-inch nominal diameter, and minimum of six inches of granular bedding material underneath pipes four-inch nominal diameter and larger.

4. Excavate trenches below bottom of pipe by amount shown and indicated in the Contract Documents. Remove loose and unsuitable material from bottom of trench.
5. Carefully and thoroughly compact pipe bedding with hand held pneumatic compactors.
6. Do not lay pipe until Engineer approves bedding condition.
7. Do not bring pipe into position until preceding length of pipe has been bedded and secured in its final position.

E. Laying Pipe:
1. Conform to manufacturer's instructions and requirements of standards and manuals listed below, as applicable:
   a. Ductile Iron Pipe: ANSI/AWWA C600, ANSI/AWWA C105, AWWA M41.
   b. Concrete Pipe: AWWA M9.
   c. Thermoplastic Pipe: ASTM D2321, ASTM D2774, ANSI/AWWA C605, AWWA M23, AWWA M45, AWWA, M55.
   d. Sanitary and Storm Sewers: ASCE 37.
2. Install pipe accurately to line and grade shown and indicated in the Contract Documents, unless otherwise approved by Engineer. Remove and reinstall pipes that are not installed correctly.
3. Slope piping uniformly between elevations shown.
4. Keep groundwater level in trench at least 24 inches below bottom of pipe before laying pipe. Do not lay pipe in water. Maintain dry trench conditions until jointing and backfilling are complete. Keep clean and protect interiors of pipe, fittings, valves, and appurtenances.
5. Start laying pipe at lowest point and proceed towards higher elevations, unless otherwise approved by Engineer.
6. Place bell and spigot-type pipe so that bells face the direction of laying, unless otherwise approved by Engineer.
7. Place concrete pipe containing elliptical reinforcement with minor axis of reinforcement in vertical position.
8. Excavate around joints in bedding and lay pipe so that pipe barrel bears uniformly on trench bottom.
9. Deflections at joints shall not exceed 75 percent of amount allowed by pipe manufacturer, unless otherwise approved by Engineer.
10. For PVC and CPVC piping with solvent welded joints, 2.5-inch diameter and smaller, and copper tubing, snake piping in trench to compensate for thermal expansion and contraction.
11. Carefully examine pipe, fittings, valves, and specials for cracks, damage, and other defects while suspended above trench before installation. Immediately remove defective materials from the Site and replace with acceptable products.
12. Inspect interior of all pipe, fittings, valves, and specials and completely remove all dirt, gravel, sand, debris, and other foreign material from pipe interior and joint recesses before pipe and appurtenances are moved into excavation. Bell and spigot-type mating surfaces shall be thoroughly wire brushed, and wiped clean and dry immediately before pipe is laid.
13. Field cut pipe, where required, with machine specially designed for cutting the type of pipe being installed. Make cuts carefully, without damage to pipe, coating or lining, and with smooth end at right angles to axis of pipe. Cut ends on push-on joint type pipe shall be tapered and sharp edges filed off smooth. Do not flame-cut pipe.
14. Do not place blocking under pipe, unless specifically approved by Engineer for special conditions.
15. Touch up protective coatings in manner satisfactory to Engineer prior to backfilling.
16. Notify Engineer in advance of backfilling operations.
17. On steep slopes, take measures acceptable to Engineer to prevent movement of pipe during installation.

18. Thrust Restraint: Where required, provide thrust restraint conforming to Article 3.3 of this Section.
19. Exercise care to avoid flotation when installing pipe in cast in-place concrete, and in locations with high groundwater.

F. Polyethylene Encasement:
1. Provide polyethylene encasement for ductile iron piping to prevent contact between pipe and surrounding bedding material and backfill.
2. Polyethylene encasement installation shall be in accordance with ANSI/AWWA C105.

G. Geotextile Wrap:
1. Provide polyethylene wrap to prevent migration of fines into the drainage pipe.
2. Contractor shall take any necessary precautions to prevent damage to the geotextile wrap.

H. Jointing Pipe:
1. Ductile Iron Mechanical Joint Pipe:
   a. Immediately before making joint, wipe clean the socket, plain end, and adjacent areas. Taper cut ends and file off sharp edges to provide smooth surface.
   b. Lubricate plain ends and gasket with soapy water or manufacturer's recommended pipe lubricant, in accordance with ANSI/AWWA C111, just prior to slipping gasket onto plain end of the joint assembly.
   c. Place gland on plain end with lip extension toward the plain end, followed by gasket with narrow edge of gasket toward plain end.
   d. Insert plain end of pipe into socket and press gasket firmly and evenly into gasket recess. Keep joint straight during assembly.
   e. Push gland toward socket and center gland around pipe with gland lip against gasket.
   f. Insert bolts and hand-tighten nuts.
   g. If deflection is required, make deflection after joint assembly and prior to tightening bolts. Alternately tighten bolts approximately 180 degrees apart to seat gasket evenly. Bolt torque shall be as follows:

Pipe Diameter (inches)	**Bolt Diameter (inches)**	**Range of Torque (ft-lbs)**
3	5/8	45 to 60
4 to 24	3/4	75 to 90
30 to 36	1	100 to 120
42 to 48	1.25	120 to 150

   h. Bolts and nuts, except those of stainless steel, shall be coated with two coats, minimum dry film thickness of eight mils each, of high build solids epoxy or bituminous coating manufactured by Tnemec, or equal.
   i. restrained mechanical joints shall be in accordance with Section 40 0513 Process Piping.
2. Ductile Iron Push-On Joint Pipe:
   a. Prior to assembling joints, thoroughly clean with wire brush the last eight inches of exterior surface of spigot and interior surface of bell, except where joints are lined or coated with a protective lining or coating.
   b. Wipe clean rubber gaskets and flex gaskets until resilient. Conform to manufacturer's instructions for procedures to ensure gasket resiliency when assembling joints in cold weather.

c. Insert gasket into joint recess and smooth out entire circumference of gasket to remove bulges and to prevent interference with proper entry of spigot of entering pipe.
d. Immediately prior to joint assembly, apply thin film of pipe manufacturer's recommended lubricant to surface of gasket that will come in contact with entering spigot end of pipe, or apply a thin film of lubricant to outside of spigot of entering pipe.
e. For assembly, center spigot in pipe bell and push pipe forward until spigot just makes contact with rubber gasket. After gasket is compressed and before pipe is pushed or pulled in the rest of the way, carefully check gasket for proper position around the full circumference of joint. Final assembly shall be made by forcing spigot end of entering pipe past gasket until spigot makes contact with base of the bell. When more than a reasonable amount of force is required to assemble the joint, remove spigot end of pipe to verify proper positioning of gasket. Do not use gaskets that have been scored or otherwise damaged.
f. Maintain an adequate supply of gaskets and joint lubricant at the Site when pipe jointing operations are in progress.

3. Prestressed Concrete Cylinder Pipe Joints:
a. Immediately before making the joint, completely clean bell and spigot surfaces to be jointed.
b. Apply lubricant supplied by pipe manufacturer to sealing surfaces of bell, spigot, and gasket. After lubrication, install gasket in spigot groove and ensure that stretch in the gasket is equalized.
c. After pipe is lowered into place, align spigot and bell so that spigot will squarely enter the bell.
d. Before joint is fully assembled, check position of gasket in bell using methods recommended by pipe manufacturer and accepted by Engineer.
e. If gasket is in correct position around entire circumference of the bell, remove temporary joint stoppers, if used, and insert pipe completely into bell. If gasket is not in proper location, open the joint and reinstall using a new gasket.
f. Where joint opening is required to make grade or alignment adjustment, joint shall first be installed completely closed, then opened as necessary on one side. Joint openings shall not be greater than 75 percent of maximum opening recommended by pipe manufacturer.
g. Strap diaper to outside of completed joint, straddling the external joint recess. Pour grout mix consisting of portland cement and sand in proportions recommended by pipe manufacturer to completely fill external joint recess. In lieu of joint diaper, Contractor may, with written approval of pipe manufacturer, use polyurethane foam joint protector with unhydrated portland cement dispersed throughout protector. Protector shall have the cross-sectional shape required for the type of joint being installed and shall be formed in loop to fit size of pipe on which it is to be used.
h. Coat exterior exposed steel portions of pipe, flanges, couplings, bolts and nuts with two coats each eight-mils minimum dry film thickness, of high-build epoxy or bituminous coating manufactured by Tnemec, or equal.
i. Maintain sufficient quantity of joint lubricant, gaskets, joint diapers, and joint fillers at the Site at all times.
j. Do not use gaskets that have been scored or otherwise damaged.
k. Where welded joints are required to handle thrust, steel spigot shall be cut at trailing edge of gasket groove to provide surface suitable for field-welding. Field-welded joints shall be full circumferential welds designed to take thrust at joint location. Provide minimum 3/16-inch weld. Exposed steel surface of pipe joints shall have

temporary protection system of rust and corrosion inhibitor applied that need not be removed prior to welding. After welding is complete, joint protection shall be completed with interior and exterior cement mortar grouting.

4. Thermoplastic Pipe Joints:
   a. Solvent Cement Welded Joints:
      1) Bevel pipe ends and remove all burrs before making joints. Clean pipe and fittings thoroughly. Do not attempt to make solvent cement joints if temperature is below 40 degrees F. Do not make solvent cement welded joints in wet conditions.
      2) Use solvent cement supplied or recommended by pipe manufacturer.
      3) Apply joint primer and solvent cement and assemble joints in accordance with recommendations and instructions of manufacturer of joint materials and pipe manufacturer.
      4) Take appropriate safety precautions when using joint primers and solvent cements. Allow air to circulate freely through pipelines to allow solvent vapors to escape. Slowly admit water when flushing or filling pipelines to prevent compression of gases within pipes.
   b. Bell and Spigot Joints:
      1) Bevel pipe ends, remove all burrs, and provide a reference mark at correct distance from pipe end before making joints.
      2) Clean spigot end and bell thoroughly before making the joint. Insert O-ring gasket while ensuring that gasket is properly oriented. Lubricate spigot with manufacturer's recommended lubricant. Do not lubricate bell and O-ring. Insert spigot end of pipe carefully into bell until reference mark on spigot is flush with bell.
5. Mechanical Coupling Joints:
   a. Mechanical couplings include: sleeve-type flexible couplings, split flexible couplings, ANSI/AWWA C606 grooved or shouldered end couplings, plasticized PVC couplings, and other mechanical couplings specified in Section 40 0513, Process Piping.
   b. Prior to installing and assembling mechanical couplings, thoroughly clean joint ends with wire brush to remove foreign matter.
   c. For mechanical couplings that incorporate gaskets, after cleaning apply lubricant to rubber gasket or inside of coupling housing and to joint ends. After lubrication, install gasket around joint end of previously installed piece and mate joint end of subsequent piece to installed piece. Position gasket and place coupling housing around gasket and over grooved or shouldered joint ends. Insert bolts and install nuts tightly by hand. Tighten bolts uniformly to produce an equal pressure on all parts of housing. When housing clamps meet metal to metal, joint is complete and further tightening is not required.
   d. For plasticized PVC couplings, loosen the stainless steel clamping bands and remove clamps from coupling. Slide coupling over plain ends of pipes to be joined without using lubricants. Place clamps over each end of coupling at grooved section and tighten with torque wrench to torque recommended by manufacturer.
6. HDPE Pipe Joints:
   a. Butt Fusion Welded Joints:
      1) Install joints in accordance with manufacturer's instructions using hydraulic butt fusion machine or manual machine equipped with torque wrench. Equipment shall be able to achieve and maintain heating tool temperature range of 400 to 450 degrees F and an interface pressure of 60 to 90 psi.

2) Clean interior and exterior of pipe and fitting ends with clean, dry, lint-free cloth.
3) Align ends to be joined in the fusion machine without forcing ends into alignment. Adjust alignment as necessary and tighten clamps to prevent slippage.
4) Place facing tool between ends to be joined and face them to provide clean, smooth, parallel mating surface. If stops are present, face ends down to the stops. Remove all shavings after facing without touching ends.
5) Re-check alignment of ends and check for slippage against fusion pressure. There shall be no detectable gaps between ends. Align outside diameters.
6) Heating tool shall maintain pipe manufacture's recommended temperature range. Place the tool between ends to be joined. Move ends against heating tool to achieve full contact. Hold ends against heating tool without force until the following melt bead size is formed:

Pipe Diameter (inches)	Required Melt Bead Size (inches)
2 to 4	1/8 to 3/16
4 to 12	3/16 to 1/4
12 to 24	1/4 to 7/16
24 to 54	7/16 to 9/16

7) Upon forming proper melt bead size, quickly separate ends and remove heating tool. Quickly inspect melted ends and bring ends together applying joining force recommended by manufacturer, using 60 to 90 psi interfacial pressure to form double bead rolled over surface of pipe on both ends.
8) Hold joining force against ends until joint is cool to the touch. Cooling period shall be 30 to 90 seconds per inch of pipe diameter. Heavier wall thicknesses may require longer cooling times as recommended by pipe manufacturer.
9) Upon completing joint, inspect to verify double bead has been formed on both sides, uniformly rounded and consistent in size all around joint. Remove faulty joints and re-joint.

7. HDPE Double Containment Pipe (Containment and Carrier Pipe):
   a. Install joints of double containment piping system in accordance with pipe manufacturer's instructions. Joints shall be butt fusion welded.

I. Backfilling:
1. Conform to applicable requirements of Section 31 2305, Excavation and Fill.
2. Place backfill as Work progresses. Backfill by hand and use power tampers until pipe is covered by at least one foot of backfill.

J. Connections to Valves and Hydrants:
1. Install valves and hydrants as shown and indicated in the Contract Documents.
2. Provide suitable adapters when valves or hydrants and piping have different joint types. Provide thrust restraint at all hydrants and at valves located at pipeline terminations.

K. Transitions from One Type of Pipe to Another:
1. Provide necessary adapters, specials, and connection pieces required when connecting different types and sizes of pipe or connecting pipe made by different manufacturers.

L. Closures:
1. Provide closure pieces shown or required to complete the Work.

3.2 TRACER TAPE INSTALLATION:

A. Polyethylene Underground Warning Tape for Metallic Pipelines:
   1. Provide polyethylene tracer tape for buried metallic piping, which includes pipe that is steel, ductile iron, cast iron, concrete, copper, and corrugated metal.
   2. Provide tracer tape 12 to 18 inches below finished grade, above and parallel to buried pipe.
   3. For pipelines buried eight feet or greater below finished grade, provide second line of magnetic tracer tape 2.5 feet above crown of buried pipe, aligned along pipe centerline.
   4. Tape shall be spread flat with message side up before backfilling.

B. Detectable Underground Warning Tape for Non-Metallic Pipelines:
   1. Provide polyethylene tracer tape with aluminum backing for buried, non-metallic piping, which includes pipe that is PVC, CPVC, polyethylene, HDPE, FRP, ABS, and vitrified clay.
   2. Provide magnetic tracer tape 12 to 18 inches below finished grade, above and parallel to buried pipe.
   3. For pipelines buried eight feet or greater below finished grade, provide second line of magnetic tracer tape 2.5 feet above crown of buried pipe, aligned along the pipe centerline.
   4. Tape shall be spread flat with message side up before backfilling.

3.3 THRUST RESTRAINT:

A. Provide thrust restraint on pressure piping systems where shown or indicated in the Contract Documents.

B. Thrust restraint may be accomplished by using restrained pipe joints, or concrete thrust blocks. Thrust restraints shall be designed for axial thrust exerted by test pressure specified in the Buried Piping Schedule on the drawings.

C. Place concrete thrust blocks against undisturbed soil. Where undisturbed soil does not exist, or for projects where the Site consists of backfill material, thrust restraint shall be provided by restrained pipe joints.

D. Restrained Pipe Joints:
   1. Pipe joints shall be restrained by means suitable for the type of pipe being installed.
      a. Ductile Iron, Push-on Joints and Mechanical Joints: Restrain with proprietary restrained joint system as specified in Section 40 0513 Process Piping ; lugs and tie rods; or other joint restraint systems approved by Engineer.
      b. Steel Pipe Joints: Provide butt welded joints, lap welded joints, flanged joints, or mechanical coupling connections as shown and specified in Buried Piping Schedule on the Drawings. Provide tie rods connected to lugs welded to the steel pipe for restraint at mechanical couplings.
      c. Thermoplastic and HDPE Joints: Where bell and spigot type or other non restrained joints are utilized, provide tie rods across joint or other suitable joint restraint system, subject to the approval of Engineer.
      d. Prestressed Concrete Cylinder Pipe Joints: Restrain utilizing clamp type restrained joint, snap ring-type restrained joint, or by welding. Concrete pipe requiring restraint shall have sufficient longitudinal steel reinforcement provided to handle thrust forces at maximum design stress of 12,500 psi. Thrust forces in longitudinales must be transmitted directly to steel joint bands using welded connections sufficient to carry stresses involved. No allowance for the concrete to handle tensile forces is allowed. Thrust restraint shall be in accordance with ANSI/AWWA Manual M9.

e. Joints for Concrete Pipe Other than Prestressed Concrete Cylinder Pipe: Restrain joints utilizing clamp type restrained joint or snap ring-type restrained joint.

E. Concrete Thrust Blocks:
1. Provide concrete thrust blocks on pressure piping at changes in alignment of 15 degrees or more, at tees, plugs and caps, and where shown or indicated in the Contract Documents. Construct thrust blocks of Class B concrete, conforming to Section 03 3000, Cast-In-Place Concrete.
2. Install thrust blocks against undisturbed soil. Place concrete so that pipe and fitting joints are accessible for repair.
3. Concrete thrust block size shall be as shown on the drawings or as approved by Engineer.

3.4 WORK AFFECTING EXISTING PIPING:

A. Location of Existing Underground Facilities:
1. Locations of existing Underground Facilities shown on the Drawings should be considered approximate.
2. Determine the true location of existing Underground Facilities to which connections are to be made, crossed, and that could be disturbed, and determine location of Underground Facilities that could be disturbed during excavation and backfilling operations, or that may be affected by the Work.

B. Taking Existing Pipelines and Underground Facilities Out of Service:
1. Conform to Section 01 3113, Coordination.
2. Do not take pipelines or Underground Facilities out of service unless specifically listed in Section 01 3113, Coordination, or approved by Engineer.
3. Notify Engineer in writing prior to taking pipeline or Underground Facilities out of service. Shutdown notification shall be provided in advance of the shutdown in accordance with the General Conditions and Section 01 3113, Coordination.

C. Work on Existing Pipelines or Underground Facilities:
1. Cut or tap piping or Underground Facilities as shown or required with machines specifically designed for cutting or tapping pipelines or Underground Facilities, as applicable.
2. Install temporary plugs to prevent entry of mud, dirt, water, and debris into pipe.
3. Provide necessary adapters, sleeves, fittings, pipe, and appurtenances required to complete the Work.
4. Conform to applicable requirements of Section 01 3113, Coordination, and Section 01 7324, Connections to Existing Facilities.

3.5 FIELD QUALITY CONTROL:

A. General:
1. Test all piping, except as exempted in the Buried Piping Schedule on the Drawings.
2. When authorities having jurisdiction are to witness tests, notify Engineer and authorities having jurisdiction in writing at least 48 hours in advance of testing.
3. Conduct all tests in presence of Engineer.
4. Remove or protect pipeline-mounted devices that could be damaged by testing.
5. Provide all apparatus and services required for testing, including:
a. Test pumps, compressors, hoses, calibrated gages, meters, test containers, valves, fittings, and temporary pumping systems required to maintain Owner's operations.
b. Temporary bulkheads, bracing, blocking, and thrust restraints.

6. Provide air if an air test is required, power if pumping is required, and gases if gases are required.
7. Unless otherwise specified, Owner will provide fluid required for hydrostatic testing. Contractor shall provide means to convey fluid for hydrostatic testing into piping being tested. Contractor shall provide fluid for other types of testing required.
8. Repair observed leaks and repair pipe that fails to meet acceptance criteria. Retest after repair.
9. Unless otherwise specified, testing shall include existing piping systems that connect with new piping system. Test existing pipe to nearest valve. Piping not installed by Contractor and that fails the test shall be repaired upon authorization of Owner. Unless otherwise included in the Work, repair of existing piping or Underground Facilities will be paid as extra Work.

B. Test Schedule:
1. Refer to the Buried Piping Schedule on the Drawings for type of test required and required test pressure.
2. Unless otherwise specified, required test pressures are at lowest elevation of pipeline segment being tested.
3. For piping not listed in Buried Piping Schedule on the Drawings:
   a. Hydrostatically test pipe that will convey liquid at a pressure greater than five psig. Provide process air pipe test for pipe that will convey air or gas under pressure or vacuum, except chlorine gas, which requires separate test.
   b. Use exfiltration testing, low-pressure air testing, or vacuum testing for other piping.
   c. Disinfect for bacteriological testing piping that conveys potable water.
4. Test Pressure:
   a. Use test pressures listed in Buried Piping Schedule on the Drawings.
   b. If test pressure is not listed in Buried Piping Schedule, or if test is required for piping not listed in the Buried Piping Schedule, test pressure will be determined by Engineer based on maximum anticipated sustained operating pressure and methods described in applicable ANSI/AWWA manual or standard that applies to the piping system.

C. Hydrostatic Testing:
1. Conform to Section 40 0513 Process Piping.

D. Sewer Testing with Low Pressure Air:
1. Plug and bulkhead ends and lateral connections of pipe segment to be tested.
2. Required test pressure shall be increased by an amount equal to the elevation of groundwater above invert of lowest point of pipe segment being tested.
3. Test in accordance with requirements of authority having jurisdiction.
4. If there are no Laws and Regulations covering the test, use test procedures described in the following standards:
   a. Thermoplastic and HDPE Pipe: ASTM F1417.
   b. Concrete Pipe: ASTM C924.
   c. Clay Pipe: ASTM C828.

E. Vacuum Testing:
1. Plug and bulkhead ends and lateral connections of pipe segment or manhole to be tested.
2. Following set-up of test apparatus, draw vacuum of ten inches of mercury on pipe segment or manhole being tested.
3. Start test upon reaching specified test vacuum. Test duration shall be 15 minutes.

4. Record vacuum drop at end of test. If vacuum drop is greater than one inch of mercury, pipe segment or manhole fails the test and shall be repaired and retested. If vacuum drop is less than one inch of mercury, pipe segment or manhole passes the test.

F. Vertical Deflection Test for Thermoplastic, FRP, and HDPE Pipe:
1. Conduct vertical deflection test at least thirty days after backfill has been placed.
2. Use rigid ball or mandrel for deflection test, which shall have diameter of at least 95 percent of base inside diameter or average inside diameter of piping, depending on which is specified in applicable ASTM standard, including appendix, to which pipe is manufactured. Perform test without mechanical pulling devices. Re-install and retest pipe segments that exceed deflection of five percent.

G. Televised Inspection:
1. Televise completed sewer and appurtenant structures, including manholes and chambers, and provide to Engineer copy of video on digital video disc (DVD).
2. A second televised inspection is required one year after installation.
3. Repair apparent leaks in pipe Work in manner satisfactory to Engineer without additional cost to Owner and re-televise the pipe.
4. Inspection shall be performed by Subcontractor certified in Pipeline Assessment Certification Program (PACP) by National Association of Sewer Service Companies (NASSCO). Provide copy of PACP certification prior to starting inspection. Televising shall conform to coding and reporting standards and guidelines specified in PACP. Use same standards for lateral inspections, regardless of whether conducted using cleanout-launched or mainline-launched lateral camera. Identify report annotations, pipe conditions, and pipe defects in accordance with PACP. Severity ratings shall be calculated in accordance with PACP.
5. Camera for main line shall be pan-and-tilt, radial viewing, pipe inspection camera that pans plus-or-minus 275 degrees and rotates 360 degrees. Use camera with an accurate footage counter that displays on television monitor exact distance of camera from centerline of starting manhole. Use camera with height adjustment so that lens is always centered at one-half inside diameter or higher, in pipe being televised. Provide lighting system that allows features and condition of pipe to be clearly seen. Camera shall operate in 100 percent humidity. Camera, television monitor, and other components of video system produce a minimum 450-line resolution colored video picture. Picture quality and definition shall be satisfactory to Engineer. Camera for lateral televising shall be fixed and capable of moving from main line 80 feet up lateral, and conform in other respects to requirements for main line camera.

H. Bacteriological Testing:
1. Bacteriological testing for potable water lines, finished water lines, and other piping in accordance with the Buried Piping Schedule shall conform to Section 40 0513 Process Piping.

3.6 CLEANING AND DISINFECTION:

A. Cleaning, disinfection and bacteriological testing shall conform to Section 40 0513 Process Piping.

END OF SECTION 33 0505

SECTION 33 0513

MANHOLES AND STRUCTURES

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all precast, cast-in-place and masonry manholes and structures.

B. General:
1. Manholes and structures shall conform in shape, size, dimensions, material, and other respects to the details shown or as directed by Engineer.
2. Cast-iron frames, grates and covers shall be the standard frame and grate or cover unless otherwise shown and shall be as specified in Section 05 5600, Metal Castings.
3. Concrete for cast-in-place manholes and structures and for inverts in precast and masonry manholes and structures shall be Class "A" and shall conform to the requirements specified under Section 03 3000, Cast-In-Place Concrete.

C. Related Sections:
1. Section 03 3000, Cast-In-Place Concrete.
2. Section 05 5013, Miscellaneous Metal Fabrications.
3. Section 05 5600, Metal Castings.

1.2 REFERENCES:

A. Standards referenced in this Section are listed below:
1. American Society for Testing and Materials, (ASTM).
a. ASTM C 478, Specification for Precast Reinforced Concrete Manhole Sections.
b. ASTM C 923, Standard Specification for Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes, and Laterals
2. American Water Works Association, (AWWA).
a. AWWA C302, Reinforced Concrete Pressure Pipe, Non-cylinder Type, for Water and Other Liquids.

1.3 SUBMITTALS:

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Submit drawings showing design and construction details of all precast concrete and cast-in-place manholes and structures, including details of joints between the manhole bases and riser sections and stubs or openings for the connections.

PART 2 – PRODUCTS

2.1 PRECAST CONCRETE MANHOLES AND STRUCTURES:

A. Precast manholes and structures shall conform to the details shown. Provide cast-in-place concrete bases where shown.

B. Except where otherwise specified precast manhole components shall consist of reinforced concrete pipe sections especially designed for manhole construction and manufactured in accor¬dance with ASTM C 478, except as modified herein.

C. Precast, reinforced concrete manhole bases, riser sections, flat slabs and other components shall be manufactured by wet cast methods only, using forms which will provide smooth surfaces free from irregularities, honeycombing or other imperfections.

D. Joints between manhole components shall be the tongue and groove type employing a single, continuous rubber O-ring gasket and shall conform to AWWA C 302. The circumferential and longitudinal steel reinforcement shall extend into the bell and spigot ends of the joint without breaking the continuity of the steel. Joints between the base sections, riser sections and top slabs of manholes 72-inches in diameter and less shall be rubber and concrete joints. Joints for manhole components greater than 72-inches in diameter shall be provided with steel bell and spigot rings.

E. All precast manhole components shall be of approved design and of sufficient strength to withstand the loads imposed upon them. They shall be designed for a minimum earth cover loading of 130 pounds per cubic foot, an H-20 wheel loading, and an allowance of 30 percent in roadways and 15 percent in rights-of-way for impact. Manhole bases shall have two cages of reinforcing steel in their walls, each of the area equal to that required in the riser sections. Wall thickness shall not be less than 5-inches. Concrete top slabs shall not be less than 8-inches thick.

F. Lifting holes, if used in manhole components, shall be tapered, and no more than two shall be cast in each section. Tapered, solid rubber plugs shall be furnished to seal the lifting holes. The lifting holes shall be made to be sealed by plugs driven from the outside face of the section only.

G. The point of intersection (P.I.) of the sewer pipe centerlines shall be marked with 1/4-inch diameter steel pin firmly enclosed in the floor of each manhole base and protruding approximately 1-inch above the finished floor of the base.

H. Mark date of manufacture and name or trademark of manufacturer on inside of barrel.

I. The barrel of the manhole shall be constructed of various lengths of riser pipe manufactured in increments of one foot to provide the correct height with the fewest joints. Openings in the barrel of the manholes for sewers or drop connections will not be permitted closer than one foot from the nearest joint. Special manhole base or riser sections shall be furnished as necessary to meet this requirement.

J. A precast or cast-in-place slab or precast eccentric cone, as shown or approved, shall be provided at the top of the manhole barrel to receive the cast iron frame and cover.

2.2 RESILIENT CONNECTOR:

A. Sewer pipe to manhole connections on all sanitary sewers shall be flexible and watertight. Sewer pipe shall be sealed in the manhole section pipe openings with a resilient connector meeting the requirements of ASTM C 923. The resilient connector shall be manufactured by:
   1. Trelleborg Pipe Seals
   2. Press-Seal Corporation
   3. A-Lok Producs Inc.
   4. Or equal

2.3 MISCELLANEOUS METALS

A. Metal frames and covers and similar required items shall be provided as shown and in accordance with Division 05, Metals.

2.4 DROP CONNECTIONS:

A. Drop connections for manholes and structures shall be constructed where shown or directed by the Engineer and shall conform to the design and details shown. Pipe and fittings shall be ductile iron, reinforced concrete, or vitrified clay as shown or otherwise approved. Concrete for pipe encasement shall be Class "B" as specified under Section 03 3000, Cast-In-Place Concrete. Concrete shall be bonded to manhole in the manner shown or otherwise approved by Engineer.

PART 3 – EXECUTION

3.1 LAYING MASONRY:

A. Brick shall be satisfactorily wet when being laid and each brick shall be laid in mortar so as to form full bed, end and side joints in one operation. The joints shall not be wider than 3/8-inch, except when the bricks are laid radially, in which case the narrowest part of the joint shall not exceed 1/4-inch. Masonry work shall be kept moist for a period of three days after completion, and precautions shall be taken to prevent freezing during cold weather.

B. For concrete block, the vertical keyways shall be completely filled with mortar.

C. Each grading ring shall be laid in a full bed of mortar and shall be thoroughly bonded.

3.2 PLASTERING:

A. The outside of brick manholes and structures, brick stacks and grading rings shall be neatly plastered with 1/2-inch of cement mortar as the Work progresses.

3.3 MANHOLE BASES:

A. Precast bases shall be set on a crushed stone or crushed gravel foundation as shown. Precast bases shall be set at the proper grade and carefully leveled and aligned.

3.4 PRECAST MANHOLE SECTIONS:

A. Set sections vertical with steps and sections in true align¬ment. The base of the bell or groove end at joints between components shall be buttered with 1:2 cement-sand mortar to provide a uniform bearing between components. All joints shall be sealed with cement mortar inside and

out and troweled smooth to the contour of the wall surface. Raised or rough joint finishes will not be accepted.

B. Install sections, joints and gaskets in accordance with manufactur¬ers recommendations.

C. Lifting holes shall be sealed tight with a solid rubber plug driven into the hole from the outside of the barrel and the remaining void filled with 1 to 2 cement-sand mortar.

3.5 MANHOLE CHANNELS:

A. All invert channels through manholes and structures shall be constructed of Class "A" concrete. Channels shall be properly formed to the sizes, cross sections, grades and shapes shown or as ordered. Benches shall be built up to the heights shown or as directed by the Engineer and given a uniform wood float finish. Care shall be taken to slope all benches for proper drainage to the invert channel.

3.6 GRADING RINGS:

A. Grading rings or brick stacks shall be used for all precast and masonry manholes and structures, where required. Stacks or grade rings shall be a maximum of 12-inches in height, constructed on the roof slab or cone section on which the manhole frame and cover shall be placed. The height of the stack or grade rings shall be such as required to bring the manhole frame to the proper grade.

B. Each grade ring shall be laid in a full bed of mortar and shall be thoroughly bonded.

C. Brick work shall be as specified in Article 2.2 and Article 3.1, above.

3.7 GRADING AT MANHOLES AND STRUCTURES:

A. All manholes and structures in unpaved areas shall be built so that the top of the casting is a minimum of 12-inches above finished grade or as otherwise shown or directed by the ENGINEER.. The ground surface shall be graded to drain away from the manhole. Fill shall be placed around manholes to the level of the upper rim of the manhole frame, and the surface evenly graded on a 1 to 5 slope to the existing surrounding ground, unless otherwise shown or directed by the Engineer. The slope shall be covered with 4-inches of topsoil, seeded and maintained until a satisfactory growth of grass is obtained.

B. Manholes and structures in paved areas shall be constructed to meet the final surface grade. In paved areas on State Highways, all manholes and structures shall be 1/2-inch below final wearing surfaces. Manholes and structures shall not project above finished roadway pavements to prevent damage from snowplows.

C. Contractor shall be solely responsible for the proper height of all manholes and structures necessary to reach the final grade at all locations. Contractor is cautioned that Engineer'S review of Shop Drawings for manhole components will be general in nature and Contractor shall provide an adequate supply of random length precast manhole riser sections to adjust any manhole to meet field conditions for final grading.

3.8 MANHOLE WATERTIGHTNESS:

A. All manholes and structures shall be free of visible leakage. Each manhole shall be tested for leaks and inspected, and all leaks shall be repaired in a manner subject to Engineer'S approval. Manhole testing shall conform to the requirements of Section 33 0505, Buried Piping Installation.

3.9 FLEXIBLE PIPE JOINT AT MANHOLE BASE:

A. An approved flexible joint shall be provided between each pipe entering and exiting the manhole. This may be accomplished by the installation in the manhole base of the bell end of a pipe or by other means subject to approval of Engineer. Joints shall be similar to the approved pipe joints. The joint into the manhole base shall be completely watertight.

END OF SECTION 33 0513

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 33 4413

DRAINAGE STRUCTURES

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all precast and masonry drainage structures, including drain inlets, catch basins, headwalls and similar structures.

B. General:
1. Structures shall conform in shape, size, dimensions, materials, and other respects to the details shown or as directed by the Engineer.
2. Cast iron frames, grates and covers shall be the standard frame and grate or cover, unless otherwise shown.
3. All concrete shall be Class "A" and shall conform to the require¬ments specified under Section 03 3000, Cast-In-Place Concrete.
4. Inverts shall be as shown and shall conform accurately to the size and elevation of the adjoining pipes.

C. Related Sections:
1. Division 31, Applicable Sections on Earthwork.
2. Section 03 3000, Cast-In-Place Concrete.
3. Section 05 5013, Miscellaneous Metal Fabrications.
4. Section 05 5600, Metal Castings.

1.2 QUALITY ASSURANCE:

A. Standards referenced in this Section are listed below:
1. American Society for Testing and Materials, (ASTM).
a. ASTM C 32, Specification for Sewer and Manhole Brick (Made from Clay or Shale).
b. ASTM C 139, Specification for Concrete Masonry Units for Construction of Catch Basins and Manholes.
c. ASTM C 140, Test Methods for Sampling and Testing Concrete Masonry Units and Related Units.
d. ASTM C 207, Specification for Hydrated Lime For Masonry Purposes.
e. ASTM C 478, Specification for Precast Reinforced Concrete Manhole Sections.

1.3 SUBMITTALS:

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Submit drawings showing design and construction of all precast concrete.
2. Samples:
a. Submit for approval samples of brick, block, gaskets and accessories, if any, for the structures.

PART 2 – PRODUCTS

2.1 PRECAST PRODUCTS:

A. Where shown or otherwise approved by Engineer, precast concrete shall be used for items such as area drains, catch basins, splash pads, etc. Layout and details shall be as shown and specified. Design shall be adequate to withstand all loads imposed, including earth pressure, vehicle loads and construction loading.

B. Precast concrete sections shall conform to ASTM C 478, where applicable.

C. Where precast structures are made up of various precast components such as base sections, riser sections and top sections, the joint between sections shall be the tongue and groove type.

2.2 MISCELLANEOUS METALS:

A. Metal frames, covers, grates, troughs and similar required items shall be provided as shown and in accordance with Section 05 5600, Metal Castings or Section 05 5013, Miscellaneous Metal Fabrications.

PART 3 – EXECUTION

3.1 GRADING RINGS:

A. Grading rings or brick stacks shall be used for all precast and masonry structures, where required. They shall be constructed on the top slab on which the frame will be placed. The height of the stack shall be such as is necessary to bring the frame to the proper grade, but in no case greater than 12-inches.

3.2 PRECAST ITEMS:

A. Precast products shall be placed on a concrete or crushed stone bed, set at the proper grade and carefully leveled and aligned.

B. Backfill shall be carried up evenly on all sides of the structures to prevent overturning forces.

3.3 PIPE JOINT IN STRUCTURE BASE:

A. An approved joint shall be provided between each pipe entering and exiting the structure. Joint may be accomplished by the installation in the structure base of the bell end of a short pipe or by other means subject to approval of Engineer.

B. Pipes shall not protrude inside the structure, but shall be cut in an approved manner to be flush with the inside wall of the structure.

END OF SECTION 33 4413

SECTION 40 0513

PROCESS PIPING

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the Work of this Section, including but not limited to Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. Exposed, buried, interior and exterior process piping.

B. Piping associated with the following processes:
   1. All Water Treatment Process Piping
   2. All Process Waste Piping
   3. Compressed and Low Pressure Air Piping
   4. Membrane Cleaning System (MCS) Piping
   5. All chemical feed piping
   6. Sample water piping

C. Process piping excludes the following:
   1. Piping associated with HVAC systems.
   2. Piping associated with plumbing and sanitary waste systems.
   3. Storm drainage piping.
   4. Gutters and downspouts.
   5. Water distribution system.

1.3 QUALITY ASSURANCE

A. General: All materials shall be free from defects impairing strength and durability and be of the best quality for the purposes specified or shown on the Drawings. It shall have structural properties sufficient to solely sustain or withstand strain and stresses to which it is normally subjected and be true to detail.

B. Manufacturer's Qualifications
   1. Provide piping and appurtenances that are the standard product in regular production by Manufacturers whose products have proven reliable in similar service for at least two years.
   2. Provide piping and appurtenances of the same type from a single manufacturer.
   3. All castings used for coupling housings, fittings, and valve bodies shall be date stamped for quality assurance and traceability.
   4. All grooved joint couplings, fittings, valves, and specialties shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components

C. The Contractor shall be responsible for making all field measurements prior to installation of his work. Any deviations in measurements between the field conditions and the Drawings shall be immediately reported to the Engineer.

D. Testing
   1. Manufacturer's certified test results as defined for the type of pipe shall be stamped approved by the Contractor and forwarded to the Engineer as a Reference Submittal. No pipe shall be installed which does not meet the requirements of these Specifications.
   2. All pipe, joints, and fittings shall be pressure tested as required by this Specification for the type of pipe. The Contractor shall notify the Engineer or Owner, in writing, at least 48 hours prior to performing the tests.

E. All materials furnished under this Section shall have NSF 61 approval.

1.4 SUBMITTALS

A. Provide technical submittals in accordance with Division 01 Section “Submittal Procedures”, demonstrating piping and accessories conform completely to the requirements of this Section.

B. Product Data
   1. Catalog cut sheets and description of all items.
   2. Construction materials.
   3. Standard diameters, wall thicknesses and other pertinent dimensions of all sizes of piping and accessories.
   4. Support and anchor details with manufacturer's maximum recommended loads.
   5. Design calculations indicating support spacing requirements for all size pipe.

C. Shop Drawings
   1. Complete piping layout indicating type of pipe, diameter and location. Show dimensions from adjacent structure, equipment and other piping.
   2. Location of all pipe joints, sleeves, valves, and couplings.
   3. Location of all pipe supports and anchors.
   4. Details of pipe anchors, supports, couplings, and joints.
   5. Grooved joint couplings and fittings may be shown on drawings and product submittals, and shall be specifically identified by the manufacturer’s style or series designation.

D. Testing: Copies of all field test reports.

E. Contractor shall verify chemical compatibility of piping, solvents, gaskets, seals, o-rings, etc. for each chemical feed system. Provide chemical compatibility charts and manufacturer’s written verification of compatibility for each chemical feed system.

1.5 HANDLING, DELIVERY, AND STORAGE

A. General
   1. Handling, delivery, and storage shall be in accordance with the manufacturer's recommendations.
   2. In no case shall the pipe or appurtenance be dumped, dropped, or thrown.
   3. Interiors of piping shall be completely free of dirt and foreign matter.

PART 2 - PRODUCTS

2.1 AMERICAN IRON AND STEEL REQUIREMENTS

A. This project is being funded in part with loan and loan forgiveness funds from the Ohio EPA WSRLA Program and is subject to American Iron and Steel (AIS) requirements. See Division 00, Section "OEPA WSRLA Program Requirements."

2.2 PIPING

A. General
1. The outside of all piping, valves, and fittings shall bear the Manufacturer's standard marking for type, pressure, etc.
2. All pipe and fittings shall be equal to or better than the grade specified.
3. Whenever Specifications call for close bending or coiling, use Grade B pipe.
4. All piping material shall be new and free from defects and shall be subject to standard mill test before being shipped. No salvaged or used pipe shall be used.
5. Pipe shall be labeled.
6. Fittings shall have the Manufacturer's name or trademark legibly raised or cut into each piece, and shall bear the Manufacturer's standard marking for type, pressure, etc.
7. All pipe shall be cut off even and reamed full bore. Threads shall be cut smooth, true and to full standard size. Piping shall be installed clean of chips, burrs or oil.
8. Victaulic grooved fittings and couplings and valves may be utilized in lieu of welded, threaded, or flanged joints as shown on the Drawings. Gasket selection and intended use shall be verified as suitable for the intended service as published in the manufacturer's latest literature. Installation shall be in accordance with the coupling manufacturer's latest published instructions.

B. Hardware
1. Unless indicated otherwise, provide hardware of the following materials for all piping/valve hardware (bolts, nuts, and washers).
   a. Exposed (painted): Zinc Plated.
   b. Exposed (unpainted): 304 SST.
   c. Buried: 316 SST or Cor-Blu.
   d. Submerged: 316 SST.
2. Provide a washer under each nut and under each bolthead. Washers shall be of the same material as the bolts.
3. Lubricant shall be TRX-Synlube by Ramco, Anti-Seize by Ramco, Husk-It Husky Lube O'Seal, or equal.

C. Ductile Iron Pipe (DIP or DI)
1. Pipe
   a. Standards
      1) Flanged: ANSI/AWWA C115/A21.15.
      2) Nonflanged: ANSI/AWWA C151/A21.51.
      3) Thickness Class: 53 (Unless noted otherwise on Drawings).
   b. Lining
      1) Cement-mortar lining (All piping, unless indicated otherwise in the piping schedule)
         a) ANSI/AWWA C104/A21.4.
      2) Glass Lining (where indicated in the piping schedule)
         a) Glass Lining: Vitreous material that is smooth, continuous and formulated to prevent the adherence of grease, scum and crystalline

metal salt deposits in sludge, scum and related process piping systems in wastewater and sewage treatment systems.

b) Provide lining consisting of two coats, separately applied and separately fired at a maturing temperature of approximately 1400 degrees F (760 degrees C) creating a molecular bond with the base metal and a total minimum lining thickness of 8-10 mils.

c) Lining minimum hardness: 5-6 on the MOHS scale.

d) Provide lining capable of withstanding an instantaneous thermal shock of 350 degrees F (195 degrees C) differential without crazing, blistering or spalling.

e) Provide lining capable of withstanding a strain of 0.001 inch/inch (0.025 mm/mm), the yield point of the base metal, without damage to the glass lining.

f) Provide lining resistant to corrosion of between pH of 3 to 10.

g) Fabricators: Custom-Fab or Engineer Approved Equal.

c. Grooved end pipe shall be Class 53 (min), with ends that comply with ANSI / AWWA C606.

d. Coating

1) Buried pipe: 1 mil asphalt coating, AWWA C151.

2) Exposed pipe to be painted: Factory prime coat compatible with finished coat system.

2. Joints

a. Types: As shown on the Drawings—grooved joints are acceptable at locations where flanged joints are shown on the drawings. If not designated, use grooved or flanged joints for exposed piping and mechanical joints for buried pipe. Use grooved joints upstream and downstream of flow meters.

b. Flanged

1) Ductile iron, ANSI A21.10.

2) Bolt Circles and Bolt Holes: Class 125.

3) Gaskets: 1/8 inch EPDM full faced.

c. Grooved

1) ANSI/AWWA C606

2) Grooved joint couplings shall consist of two or more ductile iron housings to ASTM A536.

3) Gaskets: FlushSeal pressure responsive gasket to ASTM D2000.

4) Housing: Ductile Iron with coal tar epoxy coating (min 3 mils).

5) Bolts and nuts: 316 SST.

6) Basis of Design: Victaulic Style 31.

d. Mechanical or Push-on

1) ANSI A21.11.

2) Gaskets: plain tipped.

e. Restrained

1) Provide restrained joints on all buried pipe joints.

2) Restraining wedges shall be made of ductile iron; conform to ASTM A536.

3) Restraint at pipe joints (≥ 24-inch):

a) TR Flex by US Pipe.

b) Super-Lock or Restrained Tyton Joint by Clow.

c) Flex-Ring or Lok-Ring by American Cast Iron Pipe Company.

4) Restraint at pipe joints (< 24-inch):

a) All products acceptable for pipe ≥ 24-inch

b) Flex-ring by US Pipe.

c) Lok-Ring by American Cast Iron Pipe Company.

3. Fittings
   a. Types: As shown on the Drawings—grooved fittings are acceptable at locations where flanged fittings are shown on the drawings. If not designated, use flanged fittings for exposed piping and mechanical fittings for buried pipe.
   b. Flanged: ANSI/AWWA C110/A21.10.
   c. Grooved
      1) Comply with ANSI A21.10 /AWWA C110 for center to end dimensions, and ANSI A21.10 /AWWA C110 or AWWA C153 for wall thickness, with ends to AWWA C606.
      2) Basis of Design: Victaulic AWWA Fittings.
   d. Mechanical joint
      1) Full body ANSI/AWWA C110/A21.10 or short body ANSI/AWWA C153/A21.53.
   e. Pressure rating: 250 psi minimum.
   f. Coating and lining: Identical to connecting piping.
   g. Base tees and bends: Drill and furnish with anchor bolts. Machine when used as pipe kicker.
   h. Restrained
      1) Provide restrained joints on all buried pipe fittings.
      2) Restraining wedges shall be made of ductile iron; conform to ASTM A536.
      3) Provide a full length of pipe on both sides of the fitting.
      4) Restraint at fittings and valves
         a) Megalug by EBAA Iron Sales.

D. Prestressed Concrete Cylinder Pipe (PCCP)
   1. Prestressed concrete cylinder pipe and fittings shall be manufactured by Thompson Pipe Group, Grand Prairie, TX or equal.
   2. Unless otherwise specified, the design materials and workmanship for pipe shall conform to the requirements of AWWA C301. Core and coating thickness for pipe shall be as specified in AWWA C301.
   3. Design Conditions
      a. Pipe shall be designed in accordance with the AWWA C304 Standard, using the following design conditions; these conditions shall also be used in designing fittings that include a Portland cement mortar interior and exterior coating of the steel cylinder:
      b. Pipe shall be designed for an external live loading, including impact, equal to AASHTO H-20 loading with earth cover as shown
      c. Service Conditions:
         1) Liquid Service: Water
         2) pH range of contents: 6.0 to 8.5
         3) Design working pressure: 40 psi.
         4) Design transient pressure: 56 psi.
         5) Field test pressure shall be 50 psi.
         6) Pipe overburden and trench bedding condition: as shown on Drawings.
   4. The pipe core shall be produced by the centrifugal method or the vertical casting method.
   5. Materials
      a. Cement shall be Type II and shall be in accordance with ASTM C150.
      b. Mortar coating shall consist of one part cement to a maximum of three parts fine aggregate by weight. Rebound not to exceed one fourth of the total mix weight may be used provided the rebound is treated as fine aggregate.

c. Wire shall be a minimum of No.6 gauge and shall meet the requirements of ASTM A648, Class III. Wire of a class strength greater than Class III will not be permitted.
d. Steel cylinders shall be No. 16 gauge minimum thickness and shall be hot rolled.

6. Fittings
   a. Steel thickness of all fittings shall be designed in accordance with Chapter 8 of the AWWA M9 Manual. Fittings shall be designed for the same conditions as the adjacent pipe.
   b. Fabrication of the fittings shall be as per AWWA M9 manual and C301.
   c. Interior and exterior concrete/mortar coating shall be as per AWWA C301.
7. Joints
   a. Bell and spigot joint rings shall be steel, self-centering type, and otherwise specified in AWWA C301. Surfaces of the joint rings that will be exposed after fabrication is complete shall receive a zinc metalized coating of 4 mils thickness (0.004").
   b. Provide restrained joints by field welding joints or by mechanically restrained joints.
   c. The rubber gaskets shall be in accordance with AWWA C301 and shall be designed and manufactured so that the completed joint will withstand an internal water pressure in excess of the highest pressure to which the pipe will be subjected without showing any leakage by the gasket or displacement of it.
   d. Bell and spigot wall fittings shall be the manufacturer's standard design. Wall fittings shall be supplied with adequate bracing to keep them round and true during transportation and installation.

E. PVC Pipe and Fittings
1. Pipe:
   a. Schedule 80.
   b. Provide standard lengths of pipe sizes 10-inch and larger, beveled at each end by the pipe manufacturer.
2. Material:
   a. Type I, Grade I (Class 12454) conforming to ASTM D 1784.
3. Nipples:
   a. Short nipples shall be the same as the PVC pipe.
4. Fittings:
   a. Fittings shall be schedule 80 and shall conform to ASTM D 2464 for threaded fittings 6-inches and smaller and ASTM D 2467 for socket-type fittings 8-inches and smaller. For threaded fittings larger than 6-inches and for solvent welded fittings larger than 8-inches the fittings shall be schedule 80 per the manufacturer's standards. All fittings shall successfully pass the required pressure test. All fittings shall be manufactured in the USA by an ISO 9002 manufacturer.
5. Flanges:
   a. PVC flanges shall be made of the same material as the pipe. Flanges shall match the bolt pattern of ANSI B16.5, Class 150. Flanges shall be flat face.
   b. Gaskets shall be full faced, low torque, molded EPDM with dual concentric, convex sealing rings (and PTFE bonded to the rubber). The dimensions shall comply with 150# ANSI B16.5 drilling.

6. Unions
    a. Unions shall have socket-type ends, EPDM o-rings (unless noted otherwise), and shall be schedule 80. Material shall be Type 1, Grade I (Class 12454) per ASTM D 1784.
    b. Provide Unions at connections to equipment, valves, and other accessories to facilitate equipment removal.
7. Joints
    a. Pipes less than 8-inch diameter:
        1) Pipe and fitting joints shall be socket welded.
        2) Screwed joints that are necessary to match up to threaded valves or fittings shall be made up with Teflon Tape only.
    b. Pipes 8-inch diameter and larger:
        1) Grooved Joints.
        2) Grooved joint couplings shall consist of two or more ductile iron housings to ASTM A536.
        3) Gaskets: EPDM (Grade E).
        4) Housing: Ductile Iron orange enamel coating.
        5) Bolts and nuts: 316 SST.
        6) Basis of Design: Victaulic Style 357 coupling with PGS-300 groove profile.
    c. Connections to valves, pumps, and equipment:
        1) Provide flanges. Flanged joints shall be made with solvent welded PVC flanges.
8. Solvent Cement:
    a. IPS Corporation Weld-On 724 without exception.
9. Threaded ends:
    a. Taper pipe threads. All threaded female fittings shall be 316 stainless steel reinforced.
10. Manufacturer
    a. Pipe: Harvel or equal.
    b. Fittings: Spears or equal.

F. Polyvinyl Chloride Pipe (PVC) C900
1. Pipe: Conform to AWWA C900.
2. Dimension Ratio: DR-14 (unless noted otherwise on Drawings).
3. Pressure Class: 300 psi (unless noted otherwise on Drawings).
4. Joints: Flexible elastomeric, conform to ASTM D3139.
5. Gaskets: Conform to ASTM F477.
6. Fittings: Fully restrained ductile iron.
7. PVC Resin: Meet or exceed cell class 12454 as defined in ASTM D1784.
8. Pipe shall be homogeneous throughout; free from voids, cracks, inclusions or other defects. Surfaces shall be free from nicks, scoring, scratches, and other blemishes.
9. Color: Green
10. Manufacturer/Product name: JM Eagle/Blue Brute or equal.

G. Polyvinyl Chloride Pipe (PVC) D3034/F679
1. Pipe: Conform to ASTM D3034/F679.
2. Dimension Ratio: DR-26 unless otherwise noted on Drawings.
3. Pressure Class: PS115 unless otherwise noted on Drawings.
4. Joints: Flexible elastomeric, conform to ASTM D3212.
5. Gaskets: Conform to ASTM F477.
6. PVC Resin: Meet or exceed cell class 12364 as defined in ASTM D1784.

7. Pipe shall be homogeneous throughout; free from voids, cracks, inclusions or other defects. Surfaces shall be free from nicks, scoring, scratches, and other blemishes.
8. Color: Green
9. Manufacturer/Product name: JM Eagle/Ring-Tite PVC Gravity Sewer or equal.

H. High Density Polyethylene (HDPE)
1. Pipe: Conform to AWWA C901/906.
2. Dimension Ratio: DR-17 (unless noted otherwise on Drawings).
3. Pressure Class: 125 psi (unless noted otherwise on Drawings).
4. Joints: Heat fusion per ASTM D2657.
5. Resin: PPI TR-4 PE 4710, per ASTM D3350 Cell Class 445574 C/E.
6. Color: Black with green stripes.
7. Manufacturer/Product name: JM Eagle or equal.

I. Dual Wall Corrugated High Density Polyethylene (DWC-HDPE)
1. Pipe: Conform to ASTM F2648.
2. Joints: Soil tight bell and spigot, conform to AASHTO M294, or ASTM F2306.
3. Gaskets: Conform to ASTM F477
4. Resin: Cell classification 435420C (ESCR Test Condition B), as defined in ASTM D3350 except carbon black content should not exceed 4%.
5. Manufacturer/Product name: Advanced Drainage Systems, Inc./N-12

J. Single Wall Corrugated High Density Polyethylene (SWC-HDPE)
1. Pipe: Conform to AASHTO M252.
2. Perforations: Conform to AASHTO M252 Class II.
3. Joints: Soil tight couplings, conform to AASHTO M252 or M294.
4. Fittings: Conform to AASHTO M252.
5. Gaskets: Conform to ASTM D1056 Grade 2A2.
6. Resin: Cell classification 424420C, as defined in ASTM D3350 except carbon black content should not exceed 4%.
7. Manufacturer/Product name: Advanced Drainage Systems, Inc./Single Wall Highway Pipe.

2.3 STAINLESS STEEL PIPE

A. All stainless steel pipe and fittings shall be fabricated from Type 304 stainless steel Schedule 10S sheet and plate.
1. Pipe
a. Pipe shall conform to ASTM A-312 and be die-formed or rolled true to dimension and round within the applicable ANSI Standard. The two edges of sheet shall be brought to line so as not to leave a shoulder on the inside of the pipe.
b. Fittings shall conform to ASTM A-403-WP in accordance with B16.9.
c. Longitudinal seams on pipe and fittings shall be welded by the GTAW, PAW, FCAW, SAW, or the SMAW methods. Filler metal, if utilized, shall be of same composition or superior to the pipe and fittings material.
d. Weld deposit at the seams shall have a slight crown on both sides of the weld and no cracks or crevices shall be allowed. Excessive weld deposits, slag, weld spatter and projections into interior of pipe shall be removed by grinding. The interior welds shall be smooth, even and shall not have an internal bead higher than 1/16 inch.

e. All pieces shall be marked indicating wall thickness/schedule, grade of stainless steel, and ASTM Standard.
f. All pieces shall be marked indicating wall thickness/schedule, grade of stainless steel, and ASTM Standard. Roll or Cut grooved as appropriate to the pipe material, wall thickness, pressure, size and method of joining.
g. For pipe sizes 2" and smaller, ASTM A312, Schedule 10S, stainless steel pipe with plain ends may be used in applicable piping systems with Vic-Press couplings and fittings.
h. Schedule 5S and 10S stainless steel pipe shall be roll grooved using a Victaulic grooving tool equipped with RX roll sets, specifically designed for stainless steel pipe.

2. Fittings
   a. Fittings shall be butt weld type per ASTM-A-403WP and manufactured in accordance with ANSI B16.9. All fittings shall be of the same pressure rating and grade material as the pipe.
   b. Fittings three inches and smaller shall be threaded conforming to ASTM-A-182 forged, Class 3000# and manufactured to ANSI B16.11.
   c. Fittings for buried or submerged pipe larger than three inches shall be butt-welded, conforming to ASTM-A-403WP, same pressure rating and material as the pipe and manufactured to ANSI B16.9.
   d. Fittings for above ground or exposed pipe larger than three inches shall be butt-welded or flanged, conforming to ASTM A 403 WP.
   e. Grooved End Fittings:
      1) Fittings shall be manufactured of stainless steel conforming to ASTM A-403, WPW, WPW/S9, or CR/S9, or shall be fabricated from stainless steel pipe conforming to ASTM A312, with factory grooved ends. Fittings shall be type 316.
      2) For NPS 2-inch and smaller, Schedule 10S stainless steel pipe may be used with precision, cold drawn, austenitic stainless steel fittings, complete with elastomer O-ring seals and suitable for working pressure of 500 psig. Basis of Design: Victaulic Vic-Press for Schedule 10S pipe.

3. Joints
   a. Joints for pipes three inches and smaller shall be threaded, grooved or socket welded, same material as the pipe, 3,000 pound WOG, conforming to ANSI B16.11.
   b. Joints for buried or submerged pipe larger than three inches shall be butt-welded.
   c. Joints for aboveground or exposed pipe larger than three inches shall be grooved or butt-welded except where flanges or grooved end joints are shown on the Drawings.
   d. Grooved
      1) Couplings shall consist of two ASTM A536 ductile iron housings or ASTM A351, Grade CF8M, stainless steel housings.
      2) Rigid Type: Housing key shall engage the bottom of the groove. Victaulic Style 89 (DI) and Style 489 (SS).
         a) AGS series two-segment couplings with lead-in chamfer on housing key and wide-width FlushSeal gasket. Victaulic Style W89.
      3) Flexible: Victaulic Style 77S.
   e. Split Sleeve Couplings
      1) Couplings shall consist of a double-arched rolled stainless steel housing, with closure plates and two elastomer O-ring seals. Couplings shall be Victaulic Style 230S Non-Restrained (Depend-O-Lok ExE); 231S

Expansion (Depend-O-Lok FxE); and Style 232S Restrained (Depend-O-Lock FxF).

4. Flanges
   a. Provide weld-neck flanges conforming to ANSI B16.5 for piping three inches and smaller to connect to flanged valves, fittings, or equipment. Provide slip-on flanges for piping larger than three inches. Provide blind flanges at dead end connections and where shown on the Drawings.
   b. Flanges shall be Class 150 per ANSI B16.5
   c. Provide full-face gaskets for flat faced flanges. Provide ring gaskets for raised face flanges. Gaskets shall be composed of asbestos with rubber binder, 1/8-inch thick, Johns-Manville No. 60, John Crane Co. "Granite", or equal for high temperature air service and shall be constructed of EPDM for ambient temperature water service.

2.4 CHEMICAL FEED TUBING

A. Braid Reinforced PVC Tubing
   1. Chemically resistant, flexible, high-dimensional stability and long-term strength.
   2. Working Pressure: 100 psi min. at 70 degree F
   3. Fittings: Barbed type, made of polypropylene, fastened with 316 SST hose clamps.
   4. Support: Tubing to be supported by schedule 80 PVC carrier piping. See details on the drawings. Carrier piping to be supported hardware and in accordance with Division 40, Section “Pipe Supports”.
   5. Manufacturer
      a. Tubing: New Age Industries Nylobrade or Engineer Approved Equal.
      b. Fittings: New Age Industries Thermobarb or Engineer Approved Equal.
   6. Spare Tubing:
      a. For each size diameter tubing provided, Contractor shall provide 1,000 LF of spare tubing.

2.5 PROCESS PIPE INSULATION

A. Process piping insulation is required at the following locations:
   1. All above grade exterior process piping.

B. Pipe Insulation, Non-flexible:
   1. Techlite 379 Series with PVC film jacket.
   2. Thermal conductivity (K value): Not greater than 0.23 at mean temperature of 75 deg F.
   3. Apply to the following piping in thickness indicated:
      a. Process piping (40 – 60 deg F):
         1) 1-1/4 inch and smaller 1/2 inch
         2) 1-1/2 inch and larger 1 inch
      b. Process piping (below 40 deg F):
         1) 3/4 inch and smaller 1/2 inch
         2) 1 inch to 6 inch 1 inch
         3) 8 inch and larger 1-1/2 inch

2.6 PROCESS PIPE HEAT TRACING

A. Process piping shall be heat traced where indicated on the drawings. Heat tracing shall be in accordance with Division 40, Section “Process Piping Heat Tracing”.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. General
1. Piping shall be installed in a manner to permit easy removal of valves and disconnection of equipment. Unions or flanged joints shall be installed for this purpose.
2. Piping shall be installed, supported, guided, and anchored to properly provide for movement due to expansion and contraction without undue strains on the joints and in such a manner that it will not sag, buckle or sway.
3. Piping shall not be supported from other pipes, conduits, ducts or similar installations.
4. No piping shall be supported by the equipment to which it is connected. Install base elbows, hangers or other approved independent method of support for the pipe.
5. Connections to equipment shall be arranged to facilitate ease of removal and service without dismantling of the runouts of main piping, and shall be installed by the use of multiple elbows or other similar methods to minimize strain on the equipment connections.
6. No field-fabricated welding fittings shall be permitted. All welding tees, elbows, reducers, and caps shall be commercially manufactured products.
7. All open ends of pipes, including equipment connections, shall be properly sealed at all times during installation to keep dirt and all foreign material out of the piping. Plugs used shall be commercially manufactured products.
8. Pipe size reductions shall be made with factory-fabricated eccentric reducers, concentric reducers, or reducing fittings and shall be installed not to cause pocketing or inhibit the flow of the material.
9. Install shut-off valves or cocks with unions on all connections to equipment and on each side of traps and control valves as required for ease of proper servicing and maintenance.
10. Unless otherwise indicated, the discharge from pressure-and temperature-relief valves and equipment drains shall be piped to the nearest floor or hub drain, installed with an approved air gap as required, and arranged for safe discharge.
11. No pipe shall penetrate any structural member without the written approval of the Engineer. Where such penetration is allowed, the structural member shall be reinforced subject to the approval of the Engineer.
12. Flanges and Gaskets
    a. Where forged steel flanges are to be bolted to cast iron flanges, a smooth or flat-face forged steel flange with a full-face gasket shall be used.
    b. All gaskets, other than teflon envelope or full-face, shall be of the flat ring type, with the outside diameter of the gasket extending to the edge of the bolts.
    c. Gaskets for all joints shall have an inside diameter equal to the outside diameter of the pipes on which they are to be used to ensure that no portion of the gasket will project into the ports of valves, pipe, or fittings.
    d. The dimensions of all gaskets shall conform to ANSI Standard B-16.21 for nonmetallic gaskets.
13. Provide flanged coupling adapters as necessary to accommodate ease of piping installation according to Contractor's layout plan.
14. Installation shall include all rough-in and final connections to equipment and services as provided in the Contract Documents, for the services and equipment to be functional.

B. Cross Connections and Interconnections: No devices, equipment or pipe connections shall be installed that will provide a cross-connection or interconnection between a potable water supply

and any source of nonpotable water such as a drainage system, a soil pipe, a waste pipe, or where the water may be chemically treated.

3.2 PIPE EXPANSION CONTROL: INSTALLATION

A. General
1. Install expansion loops or joints as required, to limit strain and movement of the piping.
2. All loops shall be cold sprung when installed.
3. Install conforming manufactured guides for each loop and joint to maintain the proper pipe alignment and minimize undue stresses on the piping and joints.
4. All mechanical joints and guides shall be installed in accordance with the Manufacturer's recommendations.
5. Install conforming manufactured pipe anchors at the midpoint between loops and joints. Installation and design shall be subject to the approval of the Engineer or Owner.
6. Manufacturer shall be held responsible for the proper capacity of the joints, with a minimum 25% allowance beyond the anticipated expansion and contraction in the piping.

B. Polyvinyl Chloride (PVC) Pipe: Provide expansion joints in straight piping runs over 50 feet and at least every 50 feet. Shall be Proco Series 261 or equal based on Chemical compatibility.

3.3 EXPOSED PIPING: INSTALLATION

A. General
1. Do not obstruct passageways, headroom, door and window operation, and similar areas with the installation of the piping and supports.
2. Painting of piping is specified elsewhere in the Contract Documents.
3. Install straight runs true to line and elevation.
4. Install vertical pipe plumb in all directions.
5. Install piping parallel or perpendicular to building walls. Piping at angles and 45 deg runs across corners shall not be accepted unless specifically shown.

B. Joints
1. General
   a. Make joints in accordance with the pipe Manufacturer's recommendations and the requirements below.
   b. Cut piping accurate and square. Assemble without forcing or springing.
   c. Ream all pipes and tubing to full inside diameter after cutting. Remove sharp edges on end cuts.
   d. Remove all cuttings and foreign matter from the inside of pipes and tubing before installation.
   e. Thoroughly clean all pipe, fittings, valves, specials, and accessories before installing.
   f. Thoroughly wire-brush, wipe clean and dry all spigot mating surfaces immediately before pipe is installed.
2. Threaded Joints
   a. Use standard righthand tapered full depth threads on steel piping.
   b. Apply before installation an approved joint compound to the male threads only.
   c. Leave three pipe threads maximum exposed at each connection.
3. Grooved Joints:
   a. Install in accordance with the manufacturer’s latest published installation instructions. Pipe ends shall be clean and free from indentations, projections and

roll marks in the area from pipe end to (and including) groove. Gasket shall be manufactured by the coupling manufacturer and verified as suitable for the intended service. A factory trained representative (direct employee) of the coupling manufacturer shall provide on-site training for Contractor's field personnel in the use of grooving tools, application of groove, and product installation. The representative shall periodically visit the job site and review installation to ensure best practices are being followed. Contractor shall correct any deficiencies found.

4. Solder Joints
   a. Ream or file pipe to remove burrs.
   b. Clean and polish contact surfaces of joints
   c. Apply flux to both male and female ends.
   d. Insert end of tube full depth into fitting socket.
   e. Heat joint evenly.
   f. Form continuous solder bead around entire joint circumference.
5. Flanged Joints: Use hexagon head nuts and bolts. Assemble flanged joints with gaskets and gasket compounds in compliance with the applicable material specifications. Tighten flange bolts evenly.
6. Plastic Pipe Joints: Comply with Manufacturer's recommendations.

C. Unions
1. Install dielectric unions where dissimilar metals are connected except at bronze or brass valves installed in ferrous piping.
2. Provide a union downstream of each screwed end valve.
3. Provide screwed or flanged unions at each piece of equipment, where shown, and where necessary to install or dismantle piping.

D. Eccentric Reducers: Use eccentric reducers where shown and where air or water pockets would occur in mains because of reduction in pipe size.

E. Transitions between Types of Pipe: Provide all necessary adapters, specials and connector pieces when connecting different types and sizes of pipe or connecting pipe furnished by different Manufacturers.

F. Restraints, Supports and Thrust Blocks
1. Install restrained joints as shown, specified, recommended by Manufacturer, or otherwise required.
2. Provide concrete and metal cradles, collars, kickers, and blocks as indicated.

G. Expansion Coupling
1. Install expansion couplings in tension to facilitate their removal.
2. Set stretcher bolts for maximum allowable elongation of expansion coupling as recommended by the Manufacturer.

H. Adjustment: Adjust all parts and components as required to provide correct operation.

I. Hangers, Supports and Attachments: Installation: Refer to Division 40 Section "Pipe Supports".

J. Identification of Piping: Paint, identify contents of piping and flow direction, and coordinate color coding of both insulated and non-insulated piping with Division 09 Section "High Performance Coatings".

3.4 BURIED PIPING: INSTALLATION

A. Conform to the applicable requirements set forth in Division 33 Section "Buried Piping Installation".

3.5 PVC AND CPVC PIPE INSTALLATION

A. General
1. Do not install pipe when the temperature is below 40 deg F or above 90 deg F. Store loose pipes on racks with a minimum support spacing of 3 feet. Provide shade from direct sunlight for pipe stored outdoors or installed outdoors until the pipe is filled with water.
2. Store fittings indoors in their original cartons.
3. Store solvent cement indoors or, if outdoors, shade from direct sunlight. Do not use solvent cements which have exceeded the shelf life marked on the storage container.
4. Before installation, check pipe and fittings for cuts, scratches, gouges, buckling, kinking, or splitting on pipe ends. Remove any pipe section containing defects by cutting out the damaged section as a complete cylinder.

B. Installation
1. Do not drag PVC pipe over the ground, drop it onto the ground, or drop objects on it.
2. Cut pipe ends square and remove all burrs, chips, and filings before joining pipe or fittings.
3. Bevel solvent welded pipe ends as recommended by the pipe manufacturer.

C. Solvent Welded Joints
1. Prior to solvent welding, remove fittings and couplings from their cartons and expose them to the air for at least one hour to the same temperature conditions as the pipe.
2. Wipe away loose dirt and moisture from the ID and OD of the pipe end and the ID of the fittings before applying solvent cement. Do not apply solvent cement to wet surfaces.
3. Make up solvent welded joints per ASTM D 2855.
4. Allow at least eight hours of drying time before moving solvent welded joints or subjecting the joints to any internal or external loads or pressures.

D. Flanged Joints
1. Lubricate stainless steel bolt threads with specified materials before installation.
2. Tighten bolts on flanges by tightening the nuts diametrically opposite each other using a torque wrench. Complete tightening shall be accomplished in stages and the final torque values shall be as shown in the following table:

Pipe Size (inches)	Final Torque (Ft-Lb)
1/2 – 1-1/2	10-15
2-4	20-30
6-8	33-50
10	53-75
12	80-110
14-24	100

E. Threaded Joints
   1. Cut threaded ends on pipe to the dimensions of ANSI B2.1. Ends shall be square cut. Follow the pipe manufacturer's recommendations regarding pipe holddown methods, saw cutting blade size, and saw cutting speed.
   2. Pipe or tubing cutters shall be specifically designed for use on plastic pipe.
   3. If the holddown vise is used when pipe is cut, insert a rubber sheet between the vise jaws and the pipe to protect from scratching the pipe.
   4. Thread cutting dies shall be clean and sharp and shall not be used to cut materials other than plastic.
   5. Not more than three threads shall remain exposed after installation.
   6. All joints shall be wrapped with Teflon tape.

3.6 SLEEVES: INSTALLATION

A. Provide and accurately locate all sleeves required under this Section. Set sleeves true to line, grade and position, plumb or level, and maintain as such during the work under other Divisions.

B. Sufficient advance notice shall be supplied to the proper trade to enable the installation to progress.

C. Whenever improper location or insufficient notice is provided for the installation of the sleeves, such work shall be done as Work of this Section, with no change in the Contract Sum or the Date of Substantial Completion.

D. Sleeves shall not penetrate any structural member except as shown on the Drawings.

E. Provide 8-inch clear space between sleeves unless otherwise indicated on the Drawings.

F. Sleeves shall be of the full thickness, with the exposed ends flush and smooth, with the structure in which they are installed.

G. Wherever water might get into the sleeve, the sleeves shall extend 1 inch above the finished surface and be made watertight. The exposed end shall be smooth and neatly finished.

H. On all piping passing through a sleeve, the piping insulation shall be continuous through the sleeve. The sleeve shall be sized to allow a 1 inch annular space between the sleeve and the bare pipe or insulation.

I. Sealing of Sleeves and Penetrations
   1. Where sleeves are embedded through cast-in-place concrete walls or slabs on or below grade, the joints between the concrete and the sleeve shall be sealed with a polyurethane sealer.
   2. Where sleeves pass through boxed out or cored openings in concrete walls or floor slabs on or below grade, a bonding agent shall be applied to the concrete surface and a nonshrink grout shall be installed between the concrete and the sleeves. After the grout has cured, the joints between the grout and the sleeves on both sides of the wall or floor shall be sealed with a polyurethane sealer.
   3. Where sleeves pass through exterior building walls above grade, the joints between the wall and sleeve on both sides of the wall shall be sealed with silicone sealer or the opening shall be sealed with silicone foam.

J. The 1 inch annular space around pipes passing through sleeves shall be filled with silicone foam having a minimum service temperature rating at least 15 deg F higher (8.3 deg C higher) than the temperature of the pipe service passing through it.

3.7 TESTING

A. General
1. All pipe lines shall be tested to prove tightness of the final assembly. The Engineer shall be given 24 hours notice before each test.
2. All tests required by governing authorities shall be satisfactorily made.
3. Provide all necessary testing apparatus, including gages, pumps, hoses, and fittings.
4. Repair and retest pipelines which fail to hold specified test pressure or which exceed the allowable leakage rate.
5. Test pressures specified apply at the lowest elevation of the pipeline section being tested unless otherwise noted.
6. The Contractor is responsible for all testing and shall pay all costs incurred during the specified testing.

B. Hydrostatic Pressure Testing
1. General
   a. Conduct hydrostatic pressure testing on all process piping in accordance with AWWA C600.
   b. Slowly fill section to be tested with water and expel all air. Install corporation cocks as necessary to remove air.
   c. Apply test pressure for two hours.
2. Exposed Piping
   a. Allow any concrete which may be affected by the testing to reach design strength before testing.
   b. Ensure that all supports and restraint protection are securely in place.
3. Buried Piping
   a. Place and compact backfill to at least the pipe centerline before testing, unless otherwise required or acceptable to the Engineer. Backfill and compact around all blocking before testing and as required to assure restraint by harnessed joints.
   b. Allow concrete for blocking to reach design strength before testing.
4. Test Pressure
   a. Piping connected to pump suction and discharge: 150% of specified maximum operating head of pump.
   b. Gravity flow ductile iron pipe: 150% of maximum static water head of pipe section being tested.
   c. Liquid chemical feed piping: 100 psi

C. Allowable Leakage: Leakage shall not exceed:

$$L = \frac{SD(P)^{0.5}}{133{,}200}$$

Where
L = Allowable leakage, gallons per hour.
S = Length of pipe tested, feet.
D = Nominal diameter of pipe, inches.
P = Average test pressure, psig.

3.8 CLEANING AND DISINFECTION

A. General
   1. All piping systems shall be cleaned and flushed out prior to operation. If it is necessary to place the system in operation by sections, then the cleaning shall be done by sections. Notify Owner prior to start of Work.
   2. Inspect inside of piping 24-inch diameter and larger and remove all debris, dirt and foreign matter.
   3. All piping, including equipment installed in connection with the piping, conveying liquids shall be filled and flushed several times to eliminate all debris and contaminants.
   4. Where pumps are installed, install temporary strainers ahead of pumps and circulate the medium through several cycles. The system shall be flushed out and the temporary strainers removed. Strainers shall have a free area of at least 3 times the cross sectional area of the attached pipe.
   5. Prior to turning over the Work, this Contractor shall remove and clean all strainers, traps, and dirt pockets.
   6. All process piping shall be pigged and flushed.

B. Disinfection
   1. Standard: AWWA C651 unless otherwise acceptable to the Engineer or Owner.
   2. Disinfect all potable water piping.
   3. Flush piping with water at 2-1/2 feet per second minimum velocity prior to disinfection.
   4. Water for flushing, testing and chlorination will be furnished by Owner at no cost to Contractor.
   5. Chlorine shall be supplied by Contractor.
   6. All other labor, material and equipment including chlorination taps and blow-off taps shall be furnished and paid for by the Contractor.
   7. Chlorine Concentration
      a. Maintain chlorine concentration between 50 and 100 parts per million for water entering the pipe.
      b. 25 parts per million minimum residual concentration shall remain after 24 hr retention period.
      c. Repeat the operation as necessary to provide complete disinfection.
      d. Provide two safe total coliform samples taken 24 hours apart prior to placing pipe in service. Provide results to Ohio EPA and the Engineer.

3.9 INSULATION INSTALLATION

A. Do not insulate piping until satisfactory completion of required pressure tests.

B. Apply insulation to clean, dry surfaces with pipe surfaces at room temperature.

C. Butt insulation firmly together with longitudinal and end joints sealed with compatible jackets, facings and adhesives as specified.

D. Apply adhesives, mastics and coatings per manufacturer's recommendations and as specified.

E. On cold surfaces where vapor barrier jackets are used, apply insulation with a continuous, unbroken vapor seal.
   1. Adequately insulate and vapor seal hangers, supports, and anchors that are secured directly to cold surfaces to prevent condensation.

F. Continue insulation through sleeves and wall and ceiling openings except insulation shall not continue through fire-rated (2-hour or greater) partitions, walls, floor-ceiling systems.

G. Insulate all fittings, valve bodies, flanges and other pipeline accessories.

H. At hangers and bracing, install in accord with Division 40 Section “Pipe Supports”.

I. Contractors shall consult manufacturer's Technical Bulletins for detailed information on safety precautions in using all insulation products, polyurethanes, polyisocyanurates, and related materials. The data shall describe fire and other risks, safety in handling, toxicity, threshold limit values, physiological effects of inhalation and eye and skin contact, incompatibilities and other essential information regarding use. Obtain 6 copies for distribution and use at jobsite and for submittal with shop drawing submittals.

J. On piping, install with lap joint attached using outward clinching staples, 3-inch centers, 1/4 inch from edge on hot piping.
   1. On cold piping, use self-sealing lap system or adhesive applied to both surfaces per manufacturer's recommendation.
   2. Do not staple cold piping.
   3. Butt adjoining sections of insulation tightly together and continue jacket by installing self-adhering butt strips over entire circumferential joint.

K. Installation of Insulation of Fittings
   1. For pipe sizes 2 inches and smaller, finish with mineral fiber cement to thickness of adjoining pipe insulation.
   2. Over 2 inches, insulate with mitered pipe insulation segments or preformed fiberglass fittings secured with vinyl faced insulation strapping tape or 20 ga galvanized annealed wire and finished with one coat of mineral fiber cement.
   3. After cement is dry, finish with Glass Fab and seal with Foster 30-36 adhesive.
   4. Prefabricated fitting covers approved for use at pipe fittings may be used instead of finishing method outlined above.
   5. Install in accordance with manufacturer's recommendations.

L. Cover all insulated piping exposed to weather with additional jacket of 0.016-inch smooth aluminum with moisture barrier.
   1. Apply aluminum jacket with 0.020-inch x 3/8-inch aluminum bands on 9-inch centers, minimum 2-inch lap joint.
   2. Protect fittings, valves, and specialties exposed to weather in like manner.
   3. Contractor option: Use Ceel-Co 300 Series plastic jacketing applied per manufacturer's recommendations.

M. Reinforce jackets on insulated piping in mechanical rooms and central plant less than 8 ft. above floor.
   1. Cover with 0.030 inch PVC jacket conforming to 25-50 fire requirements.

END OF SECTION 40 0513

SECTION 40 0523

PROCESS VALVES, GATES, AND ACCESSORIES

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the Work of this Section, including, but not limited to Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. Valves, Gates, Actuators and Accessory Process Equipment

1.3 RELATED WORK SPECIFIED ELSEWHERE

A. Valves and accessories for a specific system, as covered in other sections. Valves not included in other Sections shall conform to this Section.

B. Valves associated with plumbing, interior potable water systems and heating normally installed by a mechanical contractor.

C. Division 09 Sections.

D. Division 26 - Electrical.

1.4 QUALITY ASSURANCE

A. The equipment manufacturer shall have been engaged in the manufacture of the equipment being supplied for the past 5 years.

B. All equipment shall be rated for the specified test pressure of the piping where it is connected. Refer to Division 40 Section “Process Piping”, for test pressures.

C. Manufacturer's Representative
   1. A manufacturer-trained and certified representative shall check the installation, supervise the initial start-up and operation, and instruct the Owner's personnel in the proper operation and maintenance for the valves listed below.
      a. Pneumatic pinch valves.
      b. Electrically activated butterfly valves.
   2. The manufacturer's representative shall spend a minimum of 8 hours on site performing these services.
   3. Return visits shall be made as required to accommodate the construction schedule until each valve is started and demonstrated to be operating properly. Return visits shall be at no expense to the Owner.

1.5 SUBMITTALS

A. Provide technical submittals in accordance with Division 01 Section “Submittal Procedures”, demonstrating that all equipment provided conforms completely to the requirements of this Section.

B. Product Data
   1. Catalog cut sheets and description of all items.
   2. Specific location of each item in the Project identified with Engineer's valve schedule number.
   3. Construction materials.
   4. Electric and control data.

C. Shop Drawings
   1. Detailed dimensional drawings indicating overall dimensions and required clearances of each size item with actuators mounted.
   2. Orientation of actuator.
   3. Elevations, weights and sizes of all gates.
   4. Cross-section drawings labeling all interior parts, including bearings, seals, and other mechanical parts.
   5. Diagrams indicating lubrication compartments and anchoring and mounting details.

D. Operation and Maintenance Manuals: Provide Operation and Maintenance Manuals in accordance with Division 01 Section “Closeout Procedures”.

1.6 HANDLING, DELIVERY AND STORAGE

A. Handling and storage instructions shall accompany each pump delivered to the site. Store all equipment in accordance with the manufacturer's instructions.

B. Power actuators shall be stored indoors, protected from precipitation.

1.7 REFERENCED STANDARDS

A. American Society of Mechanical Engineers (ASME); American Society of Testing and Materials (ASTM); American Water Works Association (AWWA).

PART 2 - PRODUCTS

2.1 AMERICAN IRON AND STEEL REQUIREMENTS

A. This project is being funded in part with loan and loan forgiveness funds from the Ohio EPA WSRLA Program and is subject to American Iron and Steel (AIS) requirements. See Division 00, Section “OEPA WSRLA Program Requirements.”

B. Attempts made by suppliers and/or manufacturer’s to intentionally avoid having to comply with the AIS requirements by changing the material of valve components from those specified (or other similar measures) will result in the submittal being returned with the disposition of Does Not Conform.

2.2 GENERAL

A. Valve schedule is shown on the drawings.

B. Connections: As shown on the Drawings, grooved joints are acceptable at locations where flanged joints are shown on the drawings. If not designated, use flanged or grooved joints for exposed valves and mechanical joints for buried valves.
   1. Flanged: ANSI B16.1, Class 125
   2. Mechanical joint: ANSI 21.11
   3. Grooved: ANSI/AWWA C-606

C. Bolts and Studs
   1. Exposed (painted): Zinc Plated.
   2. Exposed (unpainted): 304 SST.
   3. Buried: 316 SST or Cor-Blu.
   4. Submerged: 316 SST.
   5. Head: Hexagon for flanged, T-head for mechanical joint.
   6. Provide a washer under each nut and under each bolthead. Washers shall be of the same material as the bolts.
   7. Lubricant shall be TRX-Synlube by Ramco, Anti-Seize by Ramco, Husk-It Husky Lube O'Seal, or equal.

D. Labeling
   1. Manufacturer's name and working pressure cost in raised letters on valve body.
   2. Valve Tags: Provide 316 SST valve tags on each valve after valve is installed, with the following information clearly labeled:
      a. Valve number
      b. Direction to open
      c. Number of turns to open
      d. Pressure rating
      e. Function

2.3 VALVES

A. Butterfly Valve (BFV-AWWA)
   1. Description:
      a. AWWA C-504 type butterfly valve.
   2. Manufacturer/Model:
      a. Dezurik/BAW.
      b. Crispin.
      c. Pratt.
      d. Val-Matic.
   3. End Connection:
      a. Flanged, ANSI Class 150.
   4. Materials of Construction:
      a. Body:
         1) Cast Iron, ASTM A126 Class B
      b. Discs
         1) Cast 316 SST, ASTM A749, Type CF8M
      c. Shaft, Seating Edge, and Pin:
         1) 316 SST, ASTM A276
      d. Packing and Seat:
         1) EPDM.
      e. Torque Screw:
         1) 316 SST, ASTM A276

f. Set Screws:
1) 18-8 SST.
g. Plug:
1) Malleable Iron, ASTM A47-52 Grade 35018
h. Lower Journal Bearing:
1) PTFE

5. Valve Orientation
a. Any butterfly valve located immediately downstream of the discharge of any centrifugal pump with a vertical drive shaft shall have its shaft in a horizontal position.
b. Any butterfly valve located immediately downstream of the discharge of any vertical lift type pump should have its shaft in a vertical position.
c. Any butterfly valve which is located immediately downstream of any elbow should have its shaft located in the same plane as the elbow.
d. The valve disc should be installed with the shaft axis oriented so nonsymmetric profiles caused by pump discharge, elbows, or other causes of irregular flow do not impinge upon the valve disc in a nonsymmetrical manner about the valve shaft axis.

B. Butterfly Valve (BFV-SST)
1. Description:
a. Double offset stem and disc, high performance butterfly valve with zero leakage bi-directional shutoff to full rated pressure.
2. Manufacturer/Model:
a. Bray/Series 40.
b. Dezurik/BHP.
c. Engineer Approved Equal.
3. End Connection:
a. Wafer or Lug, ANSI Class 150
4. Pressure Rating:
a. 275 psig at Temperatures up to 100 degrees F
5. Materials of Construction:
a. Body and Disc:
1) Cast 316 SST, ASTM A351 GR CF8M
b. Stem and Taper Pins:
1) 17-4 PH SST, ASTM A564-Type 630
c. Disc Spacers, Bearing Assembly, Gland Ring, and Stud:
1) 316 SST, ASTM 276 with TFE and glass fabric bearing assembly liner
d. Gland Retainer and Seat Retainer Plate:
1) Cast 316 SST, ASTM A351 GR CF8M
e. Lock Washers, Hex Nut, Cap Screws, and Mounting Plate:
1) 18-8 SST
f. Gasket (between bearing assembly and locator plug):
1) PTFE

C. Butterfly Valve (BFV-Coated)
1. Description:
a. Resilient seat, high strength, one piece butterfly valve with coated disc and bi-directional bubble-tight shutoff.
2. Manufacturer/Model:
a. Bray/Series 30.

b. Dezurik
c. Engineer Approved Equal.

3. End Connection:
   a. Wafer or Lug, ANSI Class 150
4. Pressure Rating:
   a. 175 psig at Temperatures up to 100 degrees F
5. Materials of Construction:
   a. Body:
      1) Cast Iron, ASTM A126 Class B with Nylon 11 Coating
   b. Seat:
      1) EPDM
   c. Stem:
      1) 416 SST, ASTM A582
   d. Disc:
      1) Nylon 11 Coated Ductile Iron

D. Swing Check Valve (CV-Cast Iron)
1. Description:
   a. AWWA C-508 type check valve.
2. General:
   a. The valve shall be tight seating when closed, and when open provide full flow area through the valve equal to the pipeline diameter.
   b. The seating shall be by a resilient field replaceable ring on the valve disc contacting a stainless seat ring in the valve body.
   c. Valve shall be capable of being installed in the vertical.
   d. Valve shall include an air cushion closure control device.
3. Manufacturer/Model:
   a. APCO/CVS.
   b. Bray.
   c. Pratt.
4. End Connection:
   a. Flanged, ANSI Class 150.
5. Materials of Construction:
   a. Body, cover, disc, and disc arm:
      1) Ductile Iron ASTM A536 or Cast Iron A126 C1B.
   b. Body Seat:
      1) 316 SST with EPDM retaining ring.
   c. Seat retaining ring:
      1) 304 SST.
   d. Disc Seat:
      1) EPDM.
   e. Pivot Shaft:
      1) Type 303 SST, ASTM 582.
   f. Studs, bolts, nuts:
      1) 304 or 316 SST.

E. Check Valve (CV-SST)
1. Description:
2. Manufacturer/Model:
   a. Bray(Rite)/210.
   b. Prince.

c. Engineer Approved Equal.

3. End Connection:
   a. Wafer or Lug, ANSI Class 150
4. Materials of Construction:
   a. Body:
      1) Cast 316 SST, ASTM A351 GR CF78M
   b. Seat:
      1) EPDM
   c. Spacers:
      1) 316 SST, ASTM A479

F. Globe Valve (GLOBE-Conc.)
1. Manufacturer:
   a. Warren Controls, 5840 Series.
2. Function:
   a. Flow Control.
3. End Connection:
   a. Flanged, ANSI Class 300.
4. Materials of Construction:
   a. Body and Bonnet:
      1) Cast 316 SST (ASTM A351 GR CF8M)
   b. Stem, cage, plug, trim, and seat ring:
      1) 316 SST
   c. Lip:
      1) EPDM with PEEK bearings
5. Enclosure Blanket:
   a. Provide an insulating blanket wrap for the valve
6. Actuator:
   a. Type:
      1) Modulating, linear, industrial electrically actuated.
   b. Fail in place.
   c. Power Supply:
      1) 24 VAC/DC.
   d. Control Signal and Feedback:
      1) 4-20 mA.
   e. Cover:
      1) Polycarbonate
   f. Gear case material:
      1) Aluminum die casting, powder-coated (60 micron thickness)
   g. Enclosure Rating:
      1) IP65

G. Globe Valve (GLOBE-Bypass)
1. Description: Motor operated flow control valve.
2. Manufacturer/Model:
   a. Ross Valve
   b. Cla-Valve
   c. GA Industries
3. End Connection:
   a. Flanged, ANSI Class 150.
4. Pressure Rating: 250 psi.

5. Materials of Construction:
    a. Body and cover:
        1) Ductile Iron, ASTM A536.
    b. Disc Retainer & Diaphragm Washer:
        1) Cast Iron
    c. Disc Guide, Seat, and Cover Bearing:
        1) Bronze, ASTM B62.
    d. Disc and Diaphragm:
        1) Buna-A (with nylon reinforcement in the diaphragm).
    e. Stem, Nut, and Spring:
        1) 304 SST.
6. Controls
    a. Provide a modulating motorized operator for control of the valve via a 4-20 mA signal.

H. V-notch Ball Valve (BA-V-Notch)
1. Manufacturer/Model
    a. Bray(Flow-tek)/V-Control
    b. Dezurik.
2. End Connection:
    a. Flanged, ANSI Class 150.
3. Materials of Construction:
    a. Body, Ball, and Stem:
        1) 316 Stainless Steel.
    b. Seals and Seats:
        1) Tek-Fil.
4. Actuator: As specified in the valve schedule.

I. Ball Valve (BA-SST)
1. Description:
    a. One piece body, quarter turn, bottom entry blowout proof stem, SST ball valve.
2. Manufacturer/Model:
    a. Bray(Flow-Tek)/S40
    b. Engineer Approved Equal
3. End Connection:
    a. NPT Threaded
4. Pressure Rating:
    a. 1,000 psi WOG
5. Materials of Construction:
    a. Body and Body Insert:
        1) Cast 316 SST, ASTM A351 GR CF8M
    b. Ball and Stem:
        1) 316 SST, ASTM A479
    c. Seat, Thrust Washer, Stem Packing
        1) RPTFE
    d. Spring Washer:
        1) 301 SST
    e. Handle, Handle Nut, Locking Device, and Gland
        1) 304 SST
    f. Handle Sleeve
        1) Vinyl

J. Check Valve (CV-Thermoplastic)
   1. Description: Solid, thermoplastic construction type wafer check valve incorporating a single disc design suitable for either horizontal or vertical installations.
   2. Manufacturer/Model
      a. Asahi/Wafer Check Valve.
      b. Engineer Approved Equal.
   3. End Connection:
      a. Wafer, ANSI Class 150.
   4. Pressure Rating:
      a. 150 psig (85 psi for valves larger than 8")
   5. Materials of Construction:
      a. Body, Disc, Stopper, Shaft, Shaft Plug, and AV Bolt:
         1) H707 PVC, ASTM D1784 1245
      b. I-bolt:
         1) SS400.
      c. Spring:
         1) SWP-B W/ETFE Coating.
      d. O-ring:
         1) EPDM

K. Butterfly Valve (BFV-Thermoplastic)
   1. Description: Thermoplastic construction type butterfly valve with full seat liner design fully molded around the body.
   2. Manufacturer/Model
      a. Asahi/Type 57P.
      b. Engineer Approved Equal.
   3. End Connection:
      a. Wafer, ANSI Class 150.
   4. Pressure Rating:
      a. 150 psig (100 psi for valves larger than 10")
   5. Materials of Construction:
      a. Body, Disc, Seat Bush:
         1) H707 PVC, ASTM D1784 1245A
      b. Seat, O-ring, and Gasket:
         1) EPDM.
      c. Stem:
         1) 316 SST.
      d. Screw and Bolt:
         1) 304 SST.

L. Ball Valve (BA-Thermoplastic)
   1. Description: Thermoplastic construction type, true union ball valve with two-way blocking capability.
   2. Manufacturer/Model
      a. Asahi/Type 21/21A.
      b. No Approved Equals.
   3. End Connection:
      a. True Union.
   4. Pressure Rating:
      a. 230 psig (150 psi for valves larger than 3") up to temperatures of 70 degrees F
   5. Vent Hole:

a. Provide valves equipped with 1/8-inch vent holes for all sodium hypochlorite (NaOCl) applications.

6. Materials of Construction:
   a. Body, Ball, Carrier, End Connector, union Nut, and Stem:
      1) H707 PVC, ASTM D1784 1245A
   b. Seat:
      1) PTFE.
   c. O-rings:
      1) EPDM (water service).
      2) PTFE (chemical service).
   d. Stop Ring:
      1) PVDF.
   e. Handle:
      1) ABS
   f. Ring:
      1) 304 SST

M. Diaphragm Valve (DV-Thermoplastic)
1. Description: Thermoplastic construction type, diaphragm valve.
2. Manufacturer/Model
   a. Asahi Type 14.
3. End Connection:
   a. True Union.
4. Pressure Rating:
   a. 150 psi up to temperatures of 105 degrees F
5. Materials of Construction:
   a. Body, Bonnet, Carrier, and Union Nut:
      1) PVC
   b. Diaphragm and Cushion:
      1) EPDM.
   c. O-rings:
      1) EPDM.
   d. Handwheel:
      1) Polypropylene
   e. Screw:
      1) 304 SST

N. Check Valve (CV-Thermoplastic)
1. Description: Thermoplastic construction type, ball check valve.
2. Manufacturer/Model
   a. Asahi Type 14.
3. End Connection:
   a. True Union.
4. Pressure Rating:
   a. 150 psi up to temperatures of 120 degrees F
5. Materials of Construction:
   a. Ball, Body, End Connector, Union Nut, and Stop Ring:
      1) PVC
   b. Diaphragm and Cushion:
      1) EPDM.
   c. Seat and O-rings:

1) EPDM (water service).
2) PTFE (chemical service).

O. Overflow Check (CV-Overflow)
1. Description: Wafer style, full face check valve.
2. Manufacturer/Model
a. Tideflex Waterflex.
3. End Connection:
a. Flanged.
4. Pressure Rating:
a. 50 psi.
5. Materials of Construction:
a. Disc:
1) 304 SST.
b. Waterflex Membrane:
1) EPDM.

2.4 AIR RELEASE VALVES

A. Combination Air Valve (CAV)
1. Description:
a. AWWA C-512 combination air/vacuum valve.
2. General:
a. The CAV shall be designed to allow large quantities of air to escape out the orifice when filling a pipeline and to close water tight when the liquid enters the valve. The Air/Vacuum Valve shall also permit large quantities of air to enter through the orifice when the pipeline is being drained to break the vacuum. The discharge orifice area shall be equal or greater than the inlet of the valve.
b. The valve shall consist of a body, cover, baffle, float and seat. The baffle will be designed to protect the float from direct contact of the rushing air and water to prevent the float from closing prematurely. The seat shall be fastened into the valve cover without distortion and shall be easily removed, if necessary. The float shall be stainless steel, and shall be center guided into the seat.
3. End Connection:
a. NPT Threaded.
4. Materials of Construction:
a. Body and Cover:
1) ASTM A126 Gr.B Cast iron or ASTM A536 Gr 65-45-12 Ductile Iron.
b. Float:
1) 304 SST.
c. Seat:
1) Buna-N.
5. Rated Pressure: 175 psi.
6. Manufacturer/Model:
a. DeZURIK (APCO)/AVV.
b. GA
c. Crispin
d. VAL-MATIC
7. All CAVs shall include a SST ball valve for isolation. Contractor shall field route drain piping for CAV to the nearest floor or trench drain. Piping from host pipe to CAV shall be SST, pipe from ARV to drain shall be SCH 80 PVC.

B. Air Release Valve (ARV)
   1. Description:
      a. AWWA C-512 combination air valve.
   2. General:
      a. Float operated and shall incorporate a simple lever mechanism to enable the valve to automatically release accumulated air from a fluid system while that system is pressurized and operating.
   3. End Connection:
      a. NPT Threaded.
   4. Materials of Construction:
      a. Body and Cover:
         1) ASTM A126 Gr.B Cast iron or ASTM A536 Gr 65-45-12 Ductile Iron.
      b. Float, seat, needle, linkage, all other internals, and hardware:
         1) 304 SST.
   5. Rated Pressure: 175 psi.
   6. Manufacturers:
      a. DeZURIK (APCO)/ARV.
      b. GA
      c. Crispin
      d. VAL-MATIC
   7. All ARVs shall include a SST ball valve for isolation. Contractor shall field route drain piping for ARV to the nearest floor or trench drain. Piping from host pipe to ARV shall be SST, pipe from ARV to drain shall be SCH 80 PVC.

2.5 ACTUATORS - MANUAL

A. Type: Hand-wheel, lever, chain-wheel, chainlever or operating nut.

B. Location
   1. Hand-wheel or Lever: Comply with Schedules
   2. Chain-wheel or Chainlever: All valves with centerline more than 6'-0" above the operating floor level.
   3. Operating Nut: 2 inch square, all buried valves unless otherwise specified in Schedules

C. Gearing
   1. Refer to individual valve specification.
   2. Location: All valves requiring operating torque in excess of that provided by maximum pull of 80 lb on hand-wheel or chain-wheel or maximum input of 150 ft lb on operating nuts.
   3. Design: Totally enclosed.

D. Chain-Wheel Operator Details
   1. Chain-Wheel: Manufacturer's standard design or sprocket wheel bolted directly to valve hand-wheel.
   2. Chain Length and Size: Provide aluminum alloy chain for all chain-wheel-operated valves. Length of chain shall be such that chain comes within 3'-6" of the floor.
   3. Chain-Hold Device: Equip each operator with 1/2-inch hook bolt located to hold chain from walking area.

E. Additional Butterfly Valve Operator Details
   1. Stop-limiting Devices: Provide for open and closed position.

2. Design: Adequate to avoid damage to all components from 200 lb pull on hand-wheel or chain-wheel operators, or 300 ft lb input torque on operating nuts.
3. Comply with all applicable AWWA standards.

2.6 ELECTRIC ACTUATORS - MODULATING

A. All electric actuators shall conform to the requirements of AWWA C-542.

B. All actuators shall be multi-turn type with gearbox, suitable for modulating service.

C. Refer to the valve schedule for service conditions.

D. Actuators shall contain motor, gearing, manual over-ride, limit switches, torque switches, drive coupling, integral motor controls, position feedback transmitter, and digital position indicator.

E. Motor
1. Designed for actuator service.
2. Induction type.
3. Insulation: Class H.
4. Protected by thermal switches imbedded in the motor windings.
5. Totally enclosed, non-ventilated.
6. Voltage: As indicated on the electrical drawings.

F. Actuator and Gearbox Enclosure:
1. Valves inside tanks, vaults, trenches, or other submersible locations: IPS 68.
2. All other locations: NEMA 4X.

G. External Fasteners
1. Stainless steel.
2. Fasteners on terminal compartments shall be captured to prevent loss while cover is removed.

H. Gearing
1. Oil-lubricated.
2. Designed to withstand full stall torque of the motor.

I. Manual Operation
1. Manual over-ride shall be by handwheel.
2. Manual operation shall be via power gearing.
3. Return from manual to electric mode of operation shall be automatic upon motor operation.
4. A seized or inoperable motor or power gearing shall not prevent manual operation.
5. Manual operation shall be possible with electric components removed.

J. Limit Switches
1. Limit switches shall be furnished at each end of travel.
2. Switch adjustment shall not be altered by manual operation.
3. Switches shall be capable of quick adjustment without removing covers.
4. Furnish two sets of normally open and two sets of normally closed contacts at each end of travel. Contacts shall be capable of reliably switching low voltage DC source from the control system.

K. Torque Switch
   1. Furnish torque switch at each end of travel.
   2. Switch shall trip when the valve load exceeds the switch setting.
   3. Switch adjustment device shall be calibrated directly in percent of torque.

L. Wiring: Wiring shall be terminated at a separately sealed terminal compartment.

M. Temperature Range: Actuator shall be capable of operating in an ambient temperature range of –20 to +160 deg F (with motor controls).

N. The required dynamic valve torque shall be no more than 60% of the electric actuator's maximum rated breakaway torque. Power gearing shall have zero backlash between the motor and actuator output.

O. All actuators shall be provided with the following:
   1. Feedback potentiometer.
   2. Reversing starter.
   3. Control transformer.
   4. Phase rotation correction.
   5. Monitor relay.
   6. Positioner capable of accepting a 4-20 mADC command signal and positioning the valve by comparing the command signal with the present valve position as indicated by the feedback potentiometer. The positioner shall be field adjustable to fail to the open, closed, or last position on loss of signal.
   7. "Open – Close" pushbuttons.
   8. "Local – Off – Remote" selector switch.
   9. Red and green indicating lights or LED's.

P. Manufacturer: AUMA.

2.7 ELECTRIC ACTUATORS – FOR ON/OFF SERVICE

A. All electric actuators shall conform to the requirements of AWWA C-542.

B. All actuators shall be multi-turn type with gearbox, suitable for modulating service.

C. Refer to the valve schedule for service conditions.

D. Actuators shall contain motor, gearing, manual over-ride, limit switches, torque switches, drive coupling, integral motor controls, and digital position indicator.

E. Motor
   1. Designed for actuator service.
   2. Induction type.
   3. Insulation: class H.
   4. Protected by thermal switches imbedded in the motor windings.
   5. Totally enclosed, non-ventilated.
   6. Voltage: As indicated on the electrical drawings.

F. Actuator and Gearbox Enclosure:
   1. Valves inside tanks, vaults, trenches, or other submersible locations: IPS 68.

2. All other locations: NEMA 4X.

G. External Fasteners
1. Stainless steel.
2. Fasteners on terminal compartments shall be captured to prevent loss while cover is removed.

H. Gearing
1. Oil-lubricated.
2. Designed to withstand full stall torque of the motor.

I. Manual Operation
1. Manual over-ride shall be by handwheel.
2. Manual operation shall be via power gearing.
3. Return from manual to electric mode of operation shall be automatic upon motor operation.
4. A seized or inoperable motor or power gearing shall not prevent manual operation.
5. Manual operation shall be possible with electric components removed.

J. Limit Switches
1. Limit switches shall be furnished at each end of travel.
2. Switch adjustment shall not be altered by manual operation.
3. Switches shall be capable of quick adjustment without removing covers.
4. Furnish two sets of normally open and two sets of normally closed contacts at each end of travel. Contacts shall be capable of reliably switching low voltage DC source from the control system.

K. Torque Switch
1. Furnish torque switch at each end of travel.
2. Switch shall trip when the valve load exceeds the switch setting.
3. Switch adjustment device shall be calibrated directly in percent of torque.

L. Wiring: Wiring shall be terminated at a separately sealed terminal compartment.

M. Temperature Range: Actuator shall be capable of operating in an ambient temperature range of –20 to +160 deg F (with motor controls).

N. The required dynamic valve torque shall be no more than 60% of the electric actuator's maximum rated breakaway torque. Power gearing shall have zero backlash between the motor and actuator output.

O. All actuators shall be provided with the following:
1. Reversing starter.
2. Control transformer.
3. Phase rotation correction.
4. Monitor relay.
5. "Open – Close" pushbuttons.
6. "Local – Off – Remote" selector switch.
7. Red and green indicating lights or LED's.

P. Manufacturer: AUMA.

2.8 PNEUMATIC ACTUATORS

A. General
1. Pneumatically operated spring return actuators of the rack and pinion design, totally enclosed in a single enclosure with no external moving parts.
2. Actuators shall travel a minimum of 95 degrees in each direction to allow for over travel adjustment.
3. Output torque shall be linear throughout travel.
4. Factory lubricated with no field lubrication required.
5. Capable of mounting in any position without loss of performance.
6. Suitable for both on/off and throttling applications.
7. Heavy duty mechanical limit switches with solid state analog position feedback.
8. Visual position indicator.
9. Dual travel stops.
10. Manual over-ride on solenoids.
11. Adjustable open/close speed control.
12. Output torque: 44,130 lb-in minimum.

B. Materials of Construction:
1. Body and Endcaps:
   a. Extruded, anodized aluminum alloy.
2. Pistons:
   a. Die cast aluminum alloy.
3. Output Shaft/Pinion:
   a. 304 SST.
4. Travel stops:
   a. Alloy steel.
5. Shaft bearings and piston guides:
   a. Acetal.
6. Fasteners:
   a. 304 SST.
7. Spring:
   a. Spring steel with protective coating.
8. O-ring seals:
   a. Buna-N.
9. Temperature Rating:
   a. -4 to 200 degrees F.
10. Pressure Rating:
   a. Up to 140 psig.

C. Manufacturer: Bray Series 93 or Engineer Approved Equal.

2.9 ACCESSORIES

A. Flow Straighteners (Inlet Flow Conditioners)
1. Provide where indicated on process drawings.
2. Provide a certified drawing including dimensions, weight, welding requirements, material designations, material thicknesses and flange details for review with pump submittal.
3. Provide flow conditioning grid design approved by a nationally recognized physical hydraulic modeling laboratory.

a. For pipe sizes larger than 18-inch provide a design based on physical hydraulic modeling by a nationally recognized physical hydraulic modeling laboratory

4. Design Criteria:
   a. Spool, Minimum Length: 1 x Pipe diameter
      1) Ends: Flanged: ANSI 150-lb standard
      2) Type: Van Stone flat face rings and back-up flanges
   b. Grid, Minimum Length: 1 x Pipe diameter
      1) Thickness: 0.125 inch (3 mm)
      2) Grid Spacing: 4 inch (100 mm) nominal
      3) Velocity: Maximum 7 ft/s (2.13 m/s).
5. Materials:
   a. Spool: Type 316L A778 welded stainless steel pipe, Schedule 10S
   b. Van Stone flat face rings and back up flanges: Type 316Lstainless steel
   c. Hardware: Type 316 stainless steel
6. Finish:
   a. Pickled and passivated
   b. Completely immerse for a minimum of 15 minutes in 10 percent nitric acid and 3 percent hydrofluoric acid at 125 degrees Fahrenheit, followed by a neutralizing rinse.
7. Manufacturers:
   a. Flow Optimizers, LLC.
   b. Or Engineer approved equal.

B. Fire Hydrants
1. Cast Iron, conform to AWWA C-502, dry-barrel type.
2. Bell Connection Size: 6-inch.
3. Pumper Connection: One 4-1/2-inch diameter NST connection.
4. Main Valve Opening: 5-inch diameter Storz fitting and cap.
5. Hydrants shall have a 5-1/4-inch bronze to bronze seat.
6. Depth of Bury:
   a. Watermain 12-inches and less in diameter: 5’-0”
   b. Watermains greater than 12-inches in diameter: 5’-6”
7. Threads on nozzles shall match those standard for local fire department.
8. All valve shall open left.
9. Manufacturers:
   a. Mueller A-423 Super Centurion
   b. Kennedy 81A
   c. Darling B62B
   d. Clow Medallion

C. Pressure Gauges and Compound Gauges
1. Dial Size:
   a. 4-inch minimum.
2. Accuracy:
   a. Not less than 1/2 of 1% of scale range.
3. Connection:
   a. 1/2-inch NPT male connection
4. Dampening:
   a. Provide dampener (Ashcroft No. 1106 or equal) for each high service discharge gage.
5. Manufacturers:

a. Ashcroft/Duragauge.
b. AMETEK/Solfront 1929.
c. McDaniels/MPB/SC.

6. Materials of Construction:
   a. Case:
      1) Phenolic, PET turret, or fiber reinforced thermoplastic.
   b. Internals and wetted parts:
      1) 316 SST.
   c. Dampening fluid:
      1) Glycerin.
7. Mounting and installation:
   a. Provide SST piping and isolation valve. Refer to detail on Drawings.
8. Gage Schedule:
   a. As shown on Drawings.

D. Y-strainer
1. Description: Sediment strainer to protect pipeline comments by removing suspended solids and impurities.
2. Manufacturer/Model
   a. Asahi/sediment strainer.
   b. Engineer approved equal.
3. End Connection:
   a. True Union.
4. Pressure Rating:
   a. 150 psig (85 psi for valves larger than 3").
5. Screen Size:
   a. 20 mesh.
6. Materials of Construction:
   a. Body, screen support, end connection, union nut, retaining ring, and split ring:
      1) PVC with transparent body
   b. Filter screen:
      1) PVC.
   c. O-rings:
      1) EPDM (water service).
      2) PTFE (chemical service).
   d. Stop Ring:
      1) PVDF.

E. Quick Connect Coupling
1. Material: Polypropylene.
2. Ends: 150 lb. Flat face flange x female.
3. Provide polypropylene lockable cap.
4. Manufacturer: Banjo Corporation.

F. Valve Appurtenances
1. Valve Extension Stems, Stem Guides, Wrenches and Keys
   a. Extension Stem: Size at least as large as stem of operated valve.
   b. Intermediate Stem Guide(s): Install for extensions more than 8 feet long or as shown on the Drawings.
   c. Stem brackets and guides
      1) Cast iron having fully adjustable bronze bushed guide block.

2) Mounting: Comply with Division 40, Section “Pipe Supports”.
3) Stem brackets and guides located within the pre-treatment basins shall be 304 stainless steel as indicated on the drawings.

d. Operating nuts
1) Provide 2-inch square nut with each extension stem.
2) Locate in floor box or grating recess as required.

e. Number: Provide operating key or wrench of suitable length and size for each valve that is not readily accessible to direct operation.

G. Valve Floor Boxes
1. Location: Provide at all valves operated from floor above.
2. Construction
a. Material: Cast iron.
b. Depth: Metal floor slab thickness.
c. Cover: Cast iron with bronze bushing.

H. Expansion Joints
1. Expansion joint shall allow axial compression or expansion, lateral movement, and axial deflection.
2. Expansion joints shall be installed at the following locations:
a. Straight piping runs over 50 ft. and at least every 50 ft. for all interior PVC and CPVC chemical piping systems.
b. All locations as shown on the drawings.
3. Materials of Construction:
a. All Materials shall be NSF approved.
b. Elastomer:
1) EPDM.
c. Retaining rings:
1) 304 SST.
d. Control units, nuts, and washers:
1) 304 SST.
4. Install expansion joints in tension to facilitate removal.
5. Manufacturer/Model:
a. Proco/Style 231.
b. Engineer Approved Equal.

PART 3 - EXECUTION

3.1 VALVES, GATES AND ACCESSORIES: INSTALLATION

A. General
1. Install in accordance with Manufacturer's recommendations.
2. Install valves for convenient operation of hand-wheels or wrenches from the operating floor without interfering with access as acceptable to the Engineer or Owner.
3. Orientation of Valves
a. Install valves plumb and level unless otherwise approved.
b. Install valves free from distortion and strain caused by misaligned piping, equipment or other causes.

B. Fire Hydrants and Extensions
1. Fire Hydrants

a. Locate approximately as shown on the Drawings with final location and setting determined in field by Engineer.
b. Individually valve all new fire hydrant leads.
c. Use mechanical joint anchoring fittings as shown.
d. Install hydrants with suitable concrete backing and gravel fill for drainage as shown on Drawings.
e. Do not obstruct drain openings.

2. Hydrant Extensions
a. Provide complete, including barrel and stem sections, where shown on Drawings or directed by Engineer.
b. The Engineer or Owner reserves right to order extensions installed before or after hydrant setting.

C. Tapping Sleeves and Valves
1. Install where shown on the Drawings.
2. Install under pressure in strict accordance with Manufacturer's recommendations.
3. Satisfactorily test under 150 psi pressure prior to cutting operations. If leaks appear, make repairs and re-test.

D. Corporation Stops: Install at all points shown and where required to avoid air binding of piping systems.

E. Valve Appurtenances
1. Valve Boxes
a. Install plumb with the bodies centered directly over the valves.
b. Carefully tamp earth fill around each box to a distance of 4 feet on all sides.
c. Tamp earth fill to the undisturbed trench face, if less than 4 feet.

3.2 WORK AFFECTING EXISTING PIPING

A. Location of Existing Piping
1. Locations of existing piping shown shall be considered approximate.
2. Contractor is responsible for determining exact location of existing piping to which he must make connections, may disturb during earth moving operations, or may affect in any way by his work.

B. Removing Existing Pipelines from Service
1. Pipelines shall not be removed from service unless approved by the Engineer or Owner.
2. Notify the Engineer and Owner at least 48 hrs prior to taking pipeline out of service.

C. Work on Existing Pipelines
1. Cut piping as shown or required using machines designed specifically for this work.
2. Install temporary plugs to keep out all mud, dirt, water and debris.

END OF SECTION 40 0523

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 40 2319.01

PIPE SUPPORTS

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Design, and provide a complete system of pipe supports with inserts, bolts, nuts, restraining and hanger rods, washers, miscellaneous steel, sliding Teflon plates, and accessories as indicated and specified. The term pipe support includes hangers, guides, restraints, anchors and saddles.

B. Provide all support systems and the design of all support systems for all piping as specified herein. The Contractor shall provide pipe support locations, configurations and details through accepted shop drawing submittals stamped by a Registered Professional Engineer as specified herein.

C. The Contractor shall be responsible for the proper design, fabrication, location, shop drawings and installation of all pipe supports in accordance with the specified requirements.

D. Pipe support locations and types for piping 1/2-inch (13 mm) and larger shall be determined by the Contractor using the guidelines for support spacing specified herein and other criteria contained in this pipe support specification. Guidelines for pipe supports may need to be adjusted based upon field coordination, field routing, or other considerations outlined herein such as structural load limits. The Contractor may revise the pipe support locations and details through accepted shop drawing submittals stamped by a Registered Professional Engineer as specified herein. The Contractor is responsible for the proper design, installation and fabrication of all pipe supports in accordance with the specified requirements. For pipe supports 1/2 inch (13 mm) and larger pipe support shop drawings together with a marked up piping drawing showing support number, location and typical type shall be submitted by the Contractor for acceptance.
   1. The Contractor shall be responsible for coordinating all pipe support designs for all trades to ensure compliance with all of the requirements of this specification, including but not limited to the total limitations specified herein.

E. Design and provide all temporary pipe supports required during installation and testing.

1.3 SUBMITTALS:

A. Submit the following in accordance with Division 01, Section “Submittal Procedures”:
   1. Pipe support drawings specified herein and including data for accessory items for acceptance prior to fabrication. The Contractor shall submit pipe support coordination drawings including all piping and pipe supports for all trades.
      a. Detailed drawing of the device with dimensions.
      b. A table of applied forces and moments.
      c. A complete bill of materials.
      d. A unique identification and revision level.
      e. Stamp of a Registered Professional Engineer, registered in the state where this project is being constructed, experienced in pipe support design and pipe stress analysis as specified herein.
      f. Detailed connections to existing structure.
      g. Indicate all welds, both shop and field, by Standard Units of Measurement as specified in AWS D1.1.
   2. Welding Procedure: Submit description required to illustrate each welding procedure to be performed in the specified work.
   3. Welding Equipment: Submit descriptive data for welding equipment, including type, voltage and amperage.
   4. Qualification for Welders: Provide certification that welders to be employed in work have satisfactorily passed AWS or ASME qualification tests. If recertification of welders is required, retesting is the Contractor's responsibility at no additional cost to the Owner.
   5. Pipe support manufacturers' qualifications as specified herein.
      a. List of at least five (5) successful pipe support projects and current addresses and telephone numbers of persons in charge of representing the owner or the owner of those construction projects during the time of pipe support design, fabrication and installation.
      b. Qualification of manufacturers' Registered Professional Engineer, registered in the state where this project is being constructed, who stamps and seals shop drawings and designs.
   6. Coordination drawings for pipe supports shall include as a minimum the following information.
      a. Coordination drawings shall include all pipe supports covered by specifications.
      b. These coordination drawings will be used by the Contractor to ensure that the pipe supports do not obstruct access, access for equipment operation or removal

including all mechanical and electrical equipment, panels, valves, gauges, and instrumentation.

c. The Contractor shall be responsible for including and coordinating the work of all subcontractors into the coordination drawings.

d. Prepare reproducible coordination drawings, indicating equipment, piping, valves, expansion joints, ductwork, conduit, cable trays, junction boxes, lighting fixtures, sleeves, inserts, embedments, supports, hangers and appurtenances at not less than 1/4-inch (5 mm) scale. Drawings shall show beams, columns, ceiling heights, wall, floors, partitions and structural features as indicated on the contract drawings. Individual pipes and conduit 2-inches (50 mm) or less in diameter that will be field routed need not be shown on coordination drawings.

e. Coordination drawings shall include large-scale details as well as cross and longitudinal sections required to fully delineate all conditions. Particular attention shall be given to the location, size, and clearance dimensions of equipment items, shafts, operators and necessary maintenance access.

f. Make all minor changes in duct, pipe or conduit routings that do not affect the intended function, but items may not be resized or exposed items relocated without the approval of the Engineer. No changes shall be made in any wall locations, ceiling heights, door swings or locations, window or other openings or other features affecting the function or aesthetic effect of the building. If conflicts or interferences cannot be resolved, the Engineer shall be notified. Any problems of coordination that require architectural or structural changes of design shall be submitted to the Engineer for resolution.

g. After the reproducible drawings have been coordinated and all changes have been made, the drawings shall be signed by the Contractor and all subcontractors indicating that all work on that drawing has been coordinated with all associated vendors and subcontractors and all conflicts have been resolved.

h. Relocation of any duct, pipe, conduit or other material that has been installed without proper coordination among all trades shall be performed at no additional cost to the Owner.

7. Written notification of any deviations from the requirements of this specification.
8. Support documentation and justification as specified.
9. Certificates of Design signed by a Registered Professional Engineer for all pipe supports.
10. Manufacturer's product data and specifications for shop painting.

B. Material Certification:

1. Provide certification from the manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
2. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
2. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
    a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.4 QUALITY ASSURANCE:

A. Provide in accordance with Division 01, Section “Quality Control”.

B. Provide manufacturer's certification in writing, that materials meet or exceed minimum requirements as specified.

C. Welder Qualifications:
1. Quality and certify welding procedures, welders, and operators in accordance with ANSI B31.1, paragraph 127.5 for shop and project site welding of piping work.

D. Pipe supports: All supports and parts shall conform to the latest requirements of the Code for Pressure Piping ASME/ANSI B31.1 and Manufactures Standardization Society (MSS) Standard Practice SP-58, SP-69, SP-89 and SP-90 except as supplemented or modified by the requirements of this specification.

E. Structural Concrete: Conform to the requirements of Section 03 30 00. Concrete strength: 4,000 PSI (28 MPa) unless noted otherwise.

F. Conform to the requirements of the latest edition of the AISC Manual of Steel Construction for miscellaneous and supplementary steel. Tube steels are ASTM A500 Grade B, structural shapes A36, plates A-572 or equal. Stainless steel structural members shall conform to ASTM requirement Type 316L.

G. Pipe Support Manufacturer Qualifications:
1. Must possess a written quality assurance program.
2. Have a minimum of 5 years experience in the design and fabrication of pipe supports.
3. Have completed the design and fabrication of at least 5 successful pipe support projects of equal size, complexity, and systems as this project within the past 10 years.
4. Retains the services of a Registered Professional Engineer, registered in the state where this project is being constructed, with a minimum of ten years experience in the design of piping systems and pipe supports.
5. Manufacturers' Standardization Society (MSS) Member.
6. Have a field service technician on staff with at least 5 years experience in resolving field installation, interference and interface problems associated with the design, installation and manufacture of pipe supporting components.

H. Hanger inspections shall be performed in accordance with MSS-SP-89 and ASME B31.1.

1.5 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in Division 01, Section "Product Requirements".

PART 2 - PRODUCTS

2.1 MATERIALS:

A. 316L Stainless Steel Supports: All submerged piping, piping within tanks/wet wells, and outdoor piping shall be supported with support, assemblies, including framing, hardware, and anchors, constructed of 316L SST, unless otherwise indicated.

B. FRP Supports: All piping with chemical feed rooms and all piping carrying chemicals shall be supported with assemblies including framing, hardware, and anchors constructed of FRP, unless otherwise indicated. 316L SST supports are an acceptable alternate.

C. Hot Dipped Galvanized Steel Supports: Unless otherwise indicated, all other pipe support assemblies, including framing, hardware, and anchors, shall be of hot dipped galvanized steel construction.

D. Provide only new material. Previously used and/or scrap material is not acceptable.

E. Provide tube steels that are ASTM A500 Grade B, Structural shapes A-36, plates A-572 or equal.

F. Provide sliding Teflon plates. The sliding surfaces shall be a nominal 3/8-inches (10 mm) glass filled Teflon bonded to stainless steel backup plate with a 10 gauge minimum thickness. The bearing pad upper and lower units shall be as follows: Conslide Type CSA elements as manufactured by Con-Serv. Inc., Balco TFE Slide Bearing Plates 10N-cs as manufactured by Balco Inc., or Dynalon Slide Bearings as manufactured by JVI, Inc. or acceptable equivalent product.
   1. The blended TFE material used for this bearing shall be composed of virgin (unreprocessed) TFE resin tested per ASTM D1457 and reinforcing agents milled glass fibers. This structural material shall have the following representative mechanical and physical properties:
   2. Tensile strength -2,000 psi (14 MPa).
   3. Elongation -225 percent
   4. Specific Gravity -2.17 to 2.22
   5. The coefficient of friction shall average 0.06 under compressive load of 2,000 psi (14 MPa).
   6. The compressive creep shall be a minimum of 2 percent at 2,000 psi (14 MPa) and 70 degrees F (21 degrees C).
   7. The elements shall be flat, clean and prepared for installation in the structure. Slots and holes shall be fabricated in the bearing manufacturer's plant.

G. Concrete anchor bolts - Hilti Kwik-Bolt II Stud Anchors, Rawl Bolt, Phillips Wedge Anchors, or equal.

2.2 DESIGN, LOCATION, AND TYPE OF PIPE SUPPORTS:

A. Design and provide pipe supports for piping 1/2-inch (13 mm) and larger to include the following loads:
   1. Gravity Force: This force includes the weight of pipe, pipe contents (hydro load), valves, in-line equipment, insulation and any other weight imposed on the piping and/or pipe support.
   2. Thermal Expansion Force: This force is developed by the restraint of free end displacement of the piping due to thermal growth.
   3. Hydrostatic/Dynamic Forces: These forces are developed due to the internal pressure (positive and negative) during operation of the piping system. These forces include the forces due to water hammer, pressure pulses due to rapid valve closure, fluid discharge resulting from pump startup, operation of positive displacement pumps, etc.
   4. Wind Loadings: Wind loadings.

B. Provide supports, guides, anchors, flexible couplings and expansion joints in accordance with the coupling and joint manufacturers' specifications and requirements.

C. For all pump suction and discharge nozzles provide an anchor located between the pump nozzles and the nearest expansion joint or non-rigid coupling.

D. Where possible, provide pipe supports, which are the manufacturers' standard products.
   1. Provide pipe supports with individual means of adjustment for alignment.
   2. Provide pipe supports complete with appurtenances including locking and adjusting nuts.
   3. Hanger rods shall be subjected to tension only.
   4. Where lateral or axial pipe movement occurs, provide hangers for the necessary swing without exceeding 4 degrees. Provide base supports designed using pipe slides. The bearing surfaces: 0.06 coefficient of friction or less.
   5. Provide concrete inserts capable of supporting the design loads.
   6. Metal framing systems will be acceptable to support piping 2 inch (50 mm) and smaller.
   7. Provide insulated piping supported using rigid load bearing insulation (baton board type) with 16 gauge (1.5 mm) shields to fit between the insulation and the support. Shields to encompass a minimum 1/3 of the pipe circumference and be 12 inch (300 mm) in length.
   8. Provide load-bearing insulation capable of supporting the load, as a minimum on the bottom 60 degrees of the pipe support. Cope insulation and adjust to avoid interference of steel structures.
   9. Provide supplementary steel as needed.
   10. Do not support pipes from other pipe, conduits or metal stairs.
   11. Chain, strap, T-bar, perforated bar and/or wire hangers are not acceptable.
   12. Contact between piping and dissimilar metals such as hangers, building structural work or equipment subject to galvanic action is not acceptable.
   13. All pipe supports located in fluid flow shall be supplied with double nutting.

E. Provide thrust anchors to resist thrust where required. Wall pipes may be used as thrust anchors if so designed. Welded attachments shall be of material comparable to that of the piping, and designed in accordance with governing codes.

F. Provide expansion joints where indicated and where required based on Contractor's design of the pipe support system. Indicate expansion joints on submittal drawings.

G. For piping 2-inch (50 mm) and smaller provide manufacturer's standard supports and standard spacing guidelines

H. Pipe supports connected to structural framing and slabs are subject to the following limitations:
   1. Less than 100 lb horizontal load per support.
   2. Vertical loads not to exceed an average of 100 P.S.F. for slabs, with a maximum vertical load per hanger of 2,500 lbs.
   3. Maximum of one pipe support per foot of slab width perpendicular to the span.
   4. Piping not supported from floors by metal framing must meet the limitations as specified above.

I. All outside above ground supports shall be Type 316L stainless steel as specified herein.

J. Provide pipe supports that do not overload or over stress the piping, equipment, or structure that they are supporting or to which they are attached. Allowable pipe stress to be within ANSI B31.1 code allowable.

K. The Contractor shall provide the services of a field service technician (preferably from the pipe support manufacturer) to field coordinate the locations of supports and resolve interferences and conflicts encountered during installation.

2.3 FABRICATION:

A. Provide pipe supports formed in accordance with paragraph 5.1 of MSS-SP-58.

B. Providing welding in accordance with Structural Welding Code.

C. Provide dimensional tolerances as specified in MSS-SP-89.

D. Provide threading and tapping in accordance with MSS-SP-89.

2.4 SHOP PAINTING:

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Division 09, Section “High Performance Coatings.”

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install items in accordance with manufacturers' printed instructions and as indicated and specified herein.

B. Perform welding in accordance with Structural Welding Code:
   1. Visually inspect welding while the operators are making the welds and again after the work is completed in accordance with AWS D1.1 Section 6.0. After the welding is completed, hand or power wire brush welds, and clean them before the Qualified Inspector makes the check inspection. The Qualified Inspector shall inspect welds with magnifiers under light for surface cracking, porosity, and slag inclusions; excessive

roughness; unfilled craters; gas pockets; undercuts; overlaps; size and insufficient throat and concavity. The Qualified Inspector shall inspect the preparation of grove welds for throat opening and for snug positioning for back-up bars.

2. Nondestructive evaluation of welds connecting structural steel members subjected to critical stresses: Perform in accordance with the weld quality and standards of acceptance in AWS D1.1.
3. Magnetic Particle Inspection: Perform in accordance with ASTM E709.
4. Liquid Penetrant Inspection: Perform in accordance with ASTM E165.
5. For weld areas containing defects exceeding the standards of acceptance in accordance with AWS D1.1, Section 3.7. Provide additional testing of the repaired area at no additional cost to the Owner.
6. Test Locations: As selected by the Engineer.
7. Correct any deficiencies detected as directed by the Engineer at no additional cost to the Owner.

C. Proceed with the installation of the pipe supports only after required building structural work has been completed and concrete support structure has reached its 28-day compressive strength as specified in Division 03, Section “Cast-in-Place Concrete.”

D. Install pipe supports to comply with MSS-SP-89. Group parallel runs of horizontal piping to be supported together on trapeze type hangers.

E. Install pipe supports to provide indicated pipe slopes. Do not exceed maximum pipe deflection allowed by ANSI B31.1.

F. For exposed continuous pipe runs, install pipe supports of same type and style as installed for adjacent similar piping.

G. Install pipe supports to allow controlled movement of piping systems. Permit freedom of movement between pipe anchors, and facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

H. Piping to be free to move when it expands or contracts except where fixed anchors are indicated or required by the Contractor's pipe support systems. Where hanger rod swing length cannot be provided or where pipe movement based on expansion of 1 inch/100 feet (10 mm/10 m), for each 100 degrees F (50 degrees C) change in temperature exceed 1/2-inch (13 mm), provide sliding supports.

I. Prevent contact between dissimilar metals. Where concrete or metal support is used, place 1/8-inch (3 mm) thick Teflon, neoprene rubber, or plastic strip under piping at point of bearing. Cut to fit entire area of contact between pipe and pipe support.

J. Prevent electrolysis in support of copper tubing by use of pipe supports which are plastic coated. Electrician's tape is not an acceptable isolation method.

K. Apply an anti-seize compound to nuts and bolts on all pipe supports.

L. Locate reinforcing steel in concrete structure with x-ray prior to drilling for embedment plates and anchor bolts. Avoid contact or interference with reinforcing steel.

3.2 INSTALLATION OF BUILDING ATTACHMENTS:

A. Support piping from structural framing, unless otherwise indicated.

B. Concrete Inserts:
   1. Use existing embedded concrete items whenever possible.
   2. Use expansion anchors only when existing embedded attachment points are not available or unsuitable. Attach to hardened concrete or completed masonry.

3.3 THRUST ANCHORS AND GUIDES:

A. Thrust Anchors:
   1. Center thrust anchors between expansion joints and between elbows and expansion joints for suspended piping. Anchors must hold pipe rigid to force expansion and contraction movement to take place at expansion joints and/or elbows and to preclude separation of joints.
   2. Restraining rod size and number shall be as indicated and adhere to manufacturers recommendations as a minimum.

B. Pipe guides: Provide adjacent to sliding expansion joints in accordance with recommendations of the National Association of Expansion Joint Manufacturers and the specific joint manufacturer.

3.4 PIPE SUPPORTS:

A. Where piping of various sizes is to be supported together, space supports for the largest pipe size and install intermediate supports for smaller diameter pipes.

B. Provide minimum of two pipe supports for each pipe piece.

C. Where pipe connects to equipment, support pipe independently from the equipment. Do not use equipment to support piping.

D. Provide pipe supports so that there is no interference with maintenance or removal of equipment.

E. Unless otherwise indicated or authorized by the Engineer, place piping running parallel to walls approximately 1-1/2 inch (40 mm) out from face of wall and at least 3 inches (75 mm) below ceiling.

F. Pedestal pipe supports: adjustable with stanchion, saddle, and anchoring flange. Provide grout between baseplate and floor.

G. Piping supports for vertical piping passing through floor sleeves: use hot dipped galvanized steel riser clamps.

H. Support piping to prevent strain on valves, fittings, and equipment. Provide pipe supports at changes in direction or elevation, adjacent to flexible couplings, adjacent to non-rigid joints, and where otherwise indicated. Do not install pipe supports in equipment access areas or bridge crane runs.

I. Stacked horizontal runs of piping along walls may be supported by metal framing system attached to concrete insert channels.

J. Do not support piping from other piping.

K. Designs generally accepted as exemplifying good engineering practice, using stock or production parts, shall be utilized whenever possible.

L. Whenever possible, pipe attachments for horizontal piping shall be pipe clamps.

M. All rigid rod hangers shall provide a means of vertical adjustment after erection.

N. Where the piping system is subjected to shock loads, such as disturbances due to pump discharge or thrust due to actuation of safety valves, hanger design shall include provisions for rigid restraints or shock absorbing devices.

O. Hanger rods shall be subject to tensile loading only. At hanger locations where lateral or axial movement is anticipated suitable linkage shall be provided to permit rod swing.

P. Hanger spacing shall not exceed the spacing listed below:
   1. In the case of concentrated loads the supports shall be placed as close as possible to the load to reduce the bending stress.
   2. Where changes in direction of the piping system occur between supports, the total length between supports shall be kept to less than three-fourths of the full span. When practical, a support shall be placed immediately adjacent to any change in direction of the piping system.

Q. Where practical, riser piping shall be supported independently of the connected horizontal piping. Pipe support attachments to the riser piping shall be riser clamp shear lugs. Welded attachments shall be of material comparable to that of the piping, and designed in accordance with governing codes. If friction is relied upon to support riser piping proper justification and documentation shall be submitted to ensure that enough friction force is provided to resist the applied loading.

R. Hanger components shall not be used for purposes other than for which they were designed. They shall not be used for rigging and erection purposes.

S. All threads shall be UNC unless otherwise specified.

T. TFE slide bearing plates with steel backup plates shall be stitch weld attachments to the structure. A 1/8-inch (3 mm) fillet weld, 1/2-inch (13 mm) long every 3 inches (75 mm) on center each side of an element shall be used unless otherwise indicated or specified by the manufacturers' written recommendations. Bearing elements with slots or holes shall be stitch welded in place for location. The TFE surfaces of the bearings shall be maintained clean and free from grit, dirt or grease.

3.5 INSULATED PIPING:

A. Attach clamps, including spacers (if any), to piping with clamps projecting through insulation; do not exceed allowable pipe stresses.

B. Where vapor barriers are indicated on water piping, install coated protective shields.

END OF SECTION 40 2319.01

SECTION 40 4113

PROCESS PIPING HEAT TRACING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes plumbing piping heat tracing for freeze prevention, domestic hot-water-temperature maintenance, and snow and ice melting on roofs and in gutters and downspouts with the following electric heating cables:
   1. Self-regulating, parallel resistance.

B. Scope
   1. Heat tracing for all process piping, where identified on the drawings.

1.2 SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For electric heating cable.

1.3 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

1.4 CLOSEOUT SUBMITTALS

A. Operation and maintenance data.

1.5 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace electric heating cable that fails in materials or workmanship within specified warranty period.
   1. Warranty Period: Three years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SELF-REGULATING, PARALLEL-RESISTANCE HEATING CABLES

A. Comply with IEEE 515.1.

B. Heating Element: Pair of parallel No. 16 AWG, tinned or nickel-coated, stranded copper bus wires embedded in crosslinked conductive polymer core, which varies heat output in response to temperature along its length. Terminate with waterproof, factory-assembled, non-heating leads with connectors at one end, and seal the opposite end watertight. Cable shall be capable of crossing over itself once without overheating.

C. Electrical Insulating Jacket: Flame-retardant polyolefin.

D. Cable Cover: Tinned-copper braid and polyolefin outer jacket with ultraviolet inhibitor.

E. Maximum Operating Temperature (Power On): 150 deg F (65 deg C).

F. Maximum Exposure Temperature (Power Off): 185 deg F (85 deg C).

G. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

H. Capacities and Characteristics:
   1. Maximum Heat Output: 5 W/ft. (16.4 W/m) or 8 W/ft. (26 W/m).
   2. Piping Diameter as indicated on process drawings.
   3. Number of Parallel Cables as required.
   4. Spiral Wrap Pitch as required.
   5. Electrical Characteristics for Single-Circuit Connection:
      a. Volts: 120.
      b. Phase: Single phase.
      c. Hertz: 60 Hz.
      d. Full-Load Amperes as required.
      e. Minimum Circuit Ampacity: 20A.
      f. Maximum Overcurrent Protection: 20A.

2.2 CONTROLS

A. Pipe-Mounted Thermostats for Freeze Protection:
   1. Remote bulb unit with adjustable temperature range from 30 to 50 deg F (minus 1 to plus 10 deg C).
   2. Snap action; open-on-rise, single-pole switch with minimum current rating adequate for connected cable.
   3. Remote bulb on capillary, resistance temperature device, or thermistor for directly sensing pipe-wall temperature.
   4. Corrosion-resistant, waterproof control enclosure.

2.3 ACCESSORIES

A. Cable Installation Accessories: Fiberglass tape, heat-conductive putty, cable ties, silicone end seals and splice kits, and installation clips all furnished by manufacturer, or as recommended in writing by manufacturer.

B. Warning Labels: Refer to Section 26 0553 "Identification for Plumbing Piping and Equipment."

C. Warning Tape: Continuously printed "Electrical Tracing"; vinyl, at least 3 mils (0.08 mm) thick, and with pressure-sensitive, permanent, waterproof, self-adhesive back.
   1. Width for Markers on Pipes with OD, Including Insulation, Less Than 6 Inches (150 mm): 3/4 inch (19 mm) minimum.
   2. Width for Markers on Pipes with OD, Including Insulation, 6 Inches (150 mm) or Larger: 1-1/2 inches (38 mm) minimum.

2.4 MANUFACTURERS

A. Following are the manufacturers:
   1. Raychem
   2. Or approved equal

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install electric heating cable across expansion, construction, and control joints according to manufacturer's written instructions; use cable-protection conduit and slack cable to allow movement without damage to cable.

B. Electric Heating-Cable Installation for Freeze Protection for Piping:
   1. Install electric heating cables after piping has been tested and before insulation is installed.
   2. Install electric heating cables according to IEEE 515.1.
   3. Install insulation over piping with electric cables according to process pipe insulation.
   4. Install warning tape on piping insulation where piping is equipped with electric heating cables.

C. Set field-adjustable switches and circuit-breaker trip ranges.

D. Ground equipment according to Section 26 0526 "Grounding and Bonding for Electrical Systems."

E. Connect wiring according to Section 26 0519 "Low-Voltage Electrical Power Conductors and Cables."

3.2 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
   1. Perform tests after cable installation but before application of coverings such as insulation, wall or ceiling construction, or concrete.
   2. Test cables for electrical continuity and insulation integrity before energizing.
   3. Test cables to verify rating and power input. Energize and measure voltage and current simultaneously.

B. Repeat tests for continuity, insulation resistance, and input power after applying thermal insulation on pipe-mounted cables.

C. Cables shall be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

E. Remove and replace damaged heat-tracing cables.

END OF SECTION 40 4113

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 40 9000

PLANT INSTRUMENTATION AND
CONTROL SYSTEM GENERAL REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish, install, calibrate, test, and place in satisfactory operation, instrumentation and control system equipment necessary to perform specified functions in accordance with the requirements of Sections 40 9XXX and the Drawings. The system includes, but is not necessarily limited to, the following equipment:
   1. Primary sensor/transducers, field instruments, and associated mounting hardware as specified in Section 40 9100, Primary Sensors and Field Instruments.
   2. Local control panels, monitoring panels, and existing panel modifications as shown on the Drawings.
   3. An expansion of the existing plant-wide control system including processors, communication modules, input/output modules, operator interface stations, as specified and as shown on the Drawings.
   4. Interconnecting cables, wiring, and associated components. Ethernet networking components such as switches, transceivers, fiber optic and twisted-pair patch panels and patch cables, and equipment enclosures as specified and shown in the Contract Documents and in Section 40 9553, Network Devices.

B. Configuration and programming of control system end devices such as but not limited to: instruments, device serial networks, actuator master stations, variable frequency drives, motor protection units, actuators, etc., shall be provided by the Contractor. Unit process logic residing in the process area PLC(s), OIT system and/or HMI system depicting the process monitoring and controls shall be provided by the Contractor.

C. This Section and the other Division 40 Sections illustrate and describe the overall instrumentation and control system functional and operational requirements.

D. Contractor shall conform to the requirements specified within Division 40 9000 for the selection of equipment and materials, installation methods, configuration and programming. In addition, it should be noted that Division 40 9000, Plant Instrumentation and Control System General Requirements, are not limited to work in this Division, but are also imposed for equipment and systems specified in other Divisions of the Contract Documents.

   11. Underwriters Laboratories (UL)
   12. Occupational Safety and Health Administration (OSHA)

1.3 DEFINITIONS

A. Control System: The Control System shall be comprised of all the instrumentation and control system equipment throughout the Contract Documents, including but not limited to:
   1. Instrument loop components including, but not limited to: primary elements, sensors, transducers, transmitters, indicators, controllers, and recorders.
   2. Final operators or control elements including, but not limited to: control valves, solenoids, motors, adjustable frequency drives, and louver operators.
   3. Indicating and control devices including, but not limited to: operator interface terminals, pushbuttons, selector switches, pilot lights, recorders, and indicators.
   4. Ancillary components including, but not limited to: instrument power supplies, signal repeaters, signal isolators, current trips, adder/subtractor modules, relays, and timers.
   5. Instrumentation power requirements including, but not limited to: dedicated power, power conditioning, uninterruptable power supplies, and grounding systems.
   6. Cabinets, consoles, panels, and enclosures
   7. Alarm systems
   8. Boiler controls and control systems
   9. Controls for process equipment and systems including, but not limited to: service pumps, chemical systems, filtration, sample pumps, sump pumps, and treatment systems
   10. Motor controls
   11. Programmable controllers (PLCs)
   12. Distributed control systems (DCSs)
   13. Supervisory control and data acquisition systems (SCADA)
   14. Wiring and conduit
   15. Network Communication system equipment and wiring

B. Instrumentation and Control System Integrator: The instrumentation and control system integrator shall furnish a complete and integrated instrument and control system including, but not limited to: detailed design, engineering, fabrication, assembly, testing, checkout, commissioning, debugging, and training in accordance with the Contract Documents.

1.4 SYSTEM DESCRIPTION

A. General Design Requirements:

1. Power Supplies:
    a. All electrically powered equipment and devices shall be suitable for operation on 115 V +/- 10%, 60 Hz +/- 2 Hz power. If a different voltage or better regulation is required, a suitable regulator or transformer shall be provided.
    b. Appropriate 24 VDC power supplies for analog loop power shall be furnished for each two wire transmitter. Power supplies shall be mounted in control panels or enclosures.
    c. Provide power supplies sized for a minimum of 130% of the maximum simultaneous current draw of all connected load.
    d. A power on off switch or a molded case circuit breaker shall be furnished for each item requiring 120 VAC electrical power.
    e. Provide isolation transformers, transient voltage surge suppressers, line voltage regulators, and output line reactors for power distribution as required to eliminate electrical noise and/or transients entering on power lines.
2. Signal Requirements:
    a. The control system shall be designed to use 4 to 20 mA DC analog signals and/or digital communication networks as specified in Sections 40 9XXX, or as shown on Contract Drawings.
    b. Signal converters and repeaters shall be provided where required for proper interfacing. Power supplies shall be sized adequately for signal converter and repeater loads.
    c. Signals shall be isolated from ground. Shields of 4 to 20 mA and thermocouple 2-wire systems shall be grounded at a single point only. Ground 4 to 20 mA shields only at the control panel that contains the associated 2-wire loop power supply, unless shown otherwise. Ground thermocouple sensors at the thermocouple.
    d. This system will be used in a water treatment plant environment where there can be high energy AC fields, DC control pulses, and varying ground potentials between the sensors/transducers and the system components. The system design shall be adequate to provide proper protection against interferences from all such possible situations.
3. Miscellaneous:
    a. All new equipment provided shall be listed by Underwriters Laboratory or other testing agency as defined in these Specifications. Such listing requirements only apply for equipment where such listings exist.
    b. All instrumentation and control system components shall be heavy duty types, suitable for continuous service in a municipal water treatment plant environment.
    c. All similar components shall be products of a single manufacturer and shall consist of equipment which are currently in production and shall remain in production for at least 2 years.
    d. All instrumentation and control system components shall be designed to automatically return to accurate measurement within 60 seconds upon restoration of power after a power failure or when transferred to standby power supply.
    e. Surge and lightning protection shall be provided for all power supplies, field instruments, and all other control system components to protect against damage by electrical surges.
    f. All field mounted instruments and system components shall be designed for installation in high humidity and corrosive service conditions. All field mounted instrument enclosures, junction boxes, and appurtenances shall have a NEMA 4X endorsement, at a minimum. Hazardous areas require a NEMA 7 endorsement.

g. All components with interconnections to field devices shall be wired through terminal blocks. Integral terminals, such as that of a relay, are not an acceptable alternate.
h. All components furnished including field and rear of panel instruments shall be tagged with the item number and nomenclature indicated on the Contract Documents and/or approved Shop Drawings.
i. Ranges and scales specified herein shall be coordinated to suit field conditions and equipment furnished.
j. Field mounted devices, instruments and control panels/enclosures located outdoors shall be protected from exposure to freezing temperatures and from overheating due to prolonged exposure to high ambient temperatures and shall be provided with sunshields where necessary to protect the enclosure surfaces from the additional heating effects of exposure to direct sunlight.
k. Field instruments mounted in hazardous areas shall be provided as "factory sealed" units whenever available which can be installed in non-explosion proof enclosures in Division 2 areas and in explosion proof enclosures in Division 1 areas, in both cases without the need for conduit seals.

4. System Designs:
a. Range, scale, and setpoint values specified are for initial setting and configuration. Modifications to these values may be required based on actual equipment furnished and as necessary to implement proper and stable process actions which are determined as systems are placed in operation. These modifications shall be done by Contractor at no additional cost to the Owner.
b. For any items where ranges, scales, and setpoints may not have been specified, Contractor shall submit a recommendation to the Owner for review.

1.5 SUBMITTALS

A. Product Data: Control System Components Submittal Requirements:
1. Sensors/transducers and field instruments: Product data and Manufacturer's literature include the following:
a. Instrument Specification Form: SP20 Instrumentation Specification Forms were developed by the ISA Standards Committee for most commonly used instruments. Submit a completed SP20 instrument specification form for each instrument.
b. Manufacturer's product name and model number and all required accessories
c. Instrument tag number from Contract Documents
d. Manufacturer's standard catalog product data with irrelevant sections crossed out.
e. Description of construction features
f. Performance and operation data
g. Installation and mounting details, instructions, and recommendations
h. Identification of all wiring interconnections and points of connection
i. Service requirements
j. Dimensions
2. Programmable Controller (PLC) System Information:
a. System Description:
1) Detailed block diagram showing system hardware configuration and identifying manufacturers and model numbers of system components.
2) Format, protocol, and procedures for remote communications and local communications with input/output modules and peripheral devices
3) On-line and off-line capabilities for programming, system utilities and diagnostics

4) Input/output point listing with I/O module cross reference identification
5) List of repair parts and test equipment

b. Equipment Hardware:
1) Manufacturer's standard catalog product data for all system components
2) Layout drawings showing front, rear, end, and plan views to scale of all processing equipment, I/O components, power supplies, and peripheral devices.
3) Construction details, features, and procedures
4) Interconnection diagrams including termination details, cable identification lists, and cable lengths
5) Plans showing equipment layout in control panels
6) Installation requirements, instructions, and/or recommendations

c. Software Description:
1) Standard technical documentation covering all aspects of the programmable controller software functions and capabilities, including functional descriptions and programming procedures related to control, monitoring, logging, and alarming functions.
2) Documentation describing memory type, size and structure, and listing I/O and Data Table memory and size of memory available for programs.

3. Control Panel and Enclosure Information:
a. Layout Drawings shall include the following:
1) Front and plan views to scale
2) Dimensional information
3) Tag number and functional name of components mounted in and on panel or enclosure
4) Product information on all panel components:
a) Manufacturer's product name and model number
b) Instrument tag number from Contract Documents
c) Manufacturer's standard catalog product data with irrelevant information crossed out
d) Description of construction features
e) Performance and operation data
f) Installation and mounting details, instructions, and recommendations
g) Identification of all wiring interconnections and points of connection
h) Service requirements
i) Dimensions
5) Nameplate location and legend including text, letter size, and colors to be used
6) Location of anchoring connections and holes
7) Location of external wiring and/or piping connections
8) Mounting and installation details

b. Panel schematic and internal point-to-point wiring and/or piping diagrams shall include the following:
1) Name of panel or enclosure
2) Wiring sizes, types, and numbers
3) Piping sizes, types, and numbers
4) Terminal strip and block numbers for all interconnections.
5) Color coding
6) Functional name and manufacturer's designation for components to which wiring and piping are connected

c. Electrical control schematics in accordance with SAE HS-1738 standards for all circuits indicated in the specifications or on the Contract Drawings. Generic or typical wiring diagrams, not specific to equipment being provided, will not be accepted. Tables or charts to describe wire numbers will not be accepted. All wires shall be labeled and shown on the submittal drawings as shown on the sample drawings at the end of this Section.

d. Plan showing control panel and enclosure equipment layout in each area.

e. Stock lists or Bill of Materials for each panel including tag number, functional name, manufacturer's name, manufacturer's model number, and quantity for all components mounted in or on the panel or enclosure. Bill of Materials shall include the information shown on the sample drawings at the end of this Section.

f. Heat calculations for each panel or enclosure to verify that there is sufficient dissipation and/or generation of heat to maintain interior panel temperatures within the maximum and minimum operating temperature of all panel components with ambient temperatures as specified below.

g. Samples:
   1) One (1) sample nameplate for exterior panel mounting
   2) One (1) sample nameplate for interior panel device mounting
   3) One (1) sample terminal block
   4) Three (3) sample wire labels

4. Field Wiring (Riser) Diagrams:
   a. Shall include the following:
      1) Wiring and conduit sizes, types, and numbers
      2) Terminal strip numbers for each wire termination
      3) Color coding
      4) Location, functional name, and manufacturer's designation of items to which wiring and/or piping are connected
      5) Point to point wiring diagrams shall include all interconnections between field devices, panels, control stations, lighting panels, and motor starters.

5. PLC I/O Loop Wiring Diagrams:
   a. Prepare drawings on a module-by-module basis and include the following information:
      1) Rack numbers, module type and slot number, and module terminal point numbers. Also include location and identification of all intermediate panel and/or field terminal block and strip numbers to which I/O wiring and power supply wiring is connected. Identify all power supply circuit numbers and ratings.
      2) Wiring sizes, type, wire numbers and color coding
      3) Designation of conduits in which field I/O wiring is routed
      4) Location, functional name, tag numbers and manufacturer model numbers of panel and field devices and instruments to which I/O wiring is connected. For discrete I/O devices use P&ID electrical symbols tagged with designation shown on SAE HS-1738 drawings.

B. Operation and Maintenance (O&M) Manuals:
   1. Operating and Maintenance Instructions, the Instrumentation and Control System O&M Manuals shall include:
      a. Name, address, and telephone number of each manufacturer's local service representative. Also include internet web site URL and email address when available.

b. Complete list of supplied system hardware parts with full model numbers referred to system part designations, including spare parts and test equipment provided.
c. Copy of all approved submittal information and system shop drawings as specified herein with corrections made to reflect all shop drawing review comments and the actual system as tested and delivered to the site for installation.
d. Manufacturer's Original Copies of Hardware, Installation, Assembly, Programming, and Operations Manuals for all control system components. Manuals shall include the following information:
    1) General descriptive information covering the basic features of the equipment
    2) Physical description covering layout and installation requirements and all environmental constraints
    3) Standard technical documentation covering the procedures for programming, operation, start-up, shutdown, and calibration of the equipment and explaining how the various control functions are performed.
    4) Principles of operation explaining the logic of operation; provide information covering operation to a component level.
    5) Maintenance procedures covering checkout, troubleshooting, and servicing; checkout procedures shall provide the means to verify the satisfactory operation of equipment, trouble-shooting procedures shall serve as a guide in determining faulty components, and servicing procedures shall cover requirements and recommended time schedule for calibration, cleaning, lubrication and other housekeeping and preventive maintenance procedures.
    6) Wiring, schematic, and logic diagrams
    7) Safety considerations relating to operation and maintenance procedures
    8) Manufacturer's recommended spare parts list with model numbers

2. After the initial Operating and Maintenance Instructions have received an acceptable disposition, the manual has been field verified and all final corrections have been made by the Contractor, submit 2 electronic versions of the approved manuals on CD to the Owner.
    a. The electronic color copy shall be an original, computer generated multi-page Portable Document Format (PDF) file. Scans or pictures of document text will not be accepted.
        1) Provide a hyperlinked and bookmarked colored index page hyperlinked and bookmarked to appropriate pages. There shall be a universal return to the index on all pages linking back to the index page.
        2) All oversized pages shall be properly sized (to original dimensions) and orientated correctly.
        3) Each PDF file shall be no larger than 100 Mb. Any additional files shall be suffixed with an underscore and a number indicating its position.
    b. Data files, such as those for drawings, source code, ladder logic, etc. shall be submitted in its native electronic format, in addition to PDF form for printing.
    c. If self-adhesive labels are provided, it must fully cover the CD and be exactly centered on the CD. The front surface of the CD shall contain the following type written information:
        1) Contract number
        2) Specification Section number
        3) Submittal number
        4) Brief submittal description
        5) Submittal date

C. Supplier's Qualifications:

1. Shall submit experience of successful instrumentation and control system equipment installations as specified in paragraph 1.6 of this Section.

D. Installation/Inspection Data:
   1. Prior to commissioning, furnish to Owner an installation inspection report certifying that all equipment has been installed correctly and is operating properly.
   2. The report shall describe the inspection and test procedure and include any repairs, modifications, or other work performed during the factory test or on-site.
   3. The report shall be signed by the Contractor and the system integrator's authorized representative.

E. Product/Material Certifications
   1. Submit to the Owner certified calibration certificates for field instruments and devices specified in Section 40 9XXX, a minimum of 3 weeks prior to commissioning.
      a. Receipt of any calibration certificate shall in no way imply acceptance of any work or instrument.
      b. The calibration certificates shall contain the information shown on the sample calibration certificate included at the end of this Section.
      c. Each calibration certificate shall be signed and dated by the authorized manufacturer's representative and Contractor.

F. Record Drawings and Documentation:
   1. All revised shop drawings and documentation shall be submitted to the Engineer to replace out dated drawings and documentation contained in the System O&M Manuals. Specific instructions for out dated drawing removal and replacement shall be provided with the record drawing submittal.
   2. Record Drawings shall include all data required to identify, locate, and trace circuits.
      a. Required data shall include, but not be limited to, equipment names, conduit numbers, boxes, conductor labels and colors, and terminals.
      b. Control Panel Layout Drawings shall include, but not be limited to, the following information:
         1) Bill of materials identifying all components
         2) Enclosure layouts (interior and exterior) including face, sides, back, and subpanels identifying all components
         3) Nameplate legend for all components
      c. Interconnect Wiring Diagrams shall include, but not be limited to, the following information:
         1) Identify all wiring components between each end device and PLC terminal(s).
         2) Conductor labels shall be consistent throughout loops.
      d. Control Diagrams shall include, but not be limited to, the following information:
         1) Index of equally spaced reference numbers along left side of Control Diagram
         2) Include terminal numbers/colors for each control component.
      e. Provide separate connection drawings for components requiring greater number of interconnects to maintain clarity of information.
         1) Information shall include terminal numbers, conductor labels, point, polarity, and function.
      f. Terminal strip drawings shall include terminal strip name, number, point, and conductor label on each side of terminal.

g. PLC rack layout drawings shall include physical module/slot configuration along with point number and description.

3. All Electrical and Instrumentation Record Drawings shall be submitted in hard copy format.

G. Commissioning Procedures and Documentation:

1. Provide the following approved and updated documentation for use before system commissioning.
   a. Complete panel schematic and detailed internal point-to-point wiring interconnect drawings
   b. Complete electrical control schematics
   c. Complete panel layout drawings
   d. Complete field wiring diagrams
   e. The drawings corrected and modified by the Contractor during commissioning shall form the basis for the "As-Built" record drawing requirement as specified in this Section.

H. Storage Requirements:

1. System Integrator shall submit to Owner the storage requirements and recommendations for the equipment prior to shipment.

1.6 QUALITY ASSURANCE

A. General:

1. The instrumentation and control system shall be furnished by a single supplier who shall assume responsibility for providing a complete and integrated system.
2. All equipment, components, and materials required shall be furnished by the single supplier who shall assume the responsibility for adequacy and performance of all items.
3. The supplier shall identify those system components which are not of his manufacture.
4. The supplier shall supply his company's quality assurance plan, and for components which are not of his manufacture, the component manufacturer's quality assurance plan. The plans shall include but not necessarily be limited to: method of testing, raw material criteria, methods of documentation, station control, "Burn In", final tests, serialization coding, and packaging.

B. Instrumentation and Control System Integrator's Qualifications:

1. Shall be a financially sound firm having at least 5 years continuous experience in designing, implementing, supplying and supporting instrumentation and control systems which are comparable to the instrumentation system in terms of hardware, software, cost, and complexity.
2. Shall have in existence at the time of bid advertisement, an experienced engineering and technical staff capable of designing, implementing, supplying, and supporting the instrumentation system and handling the submittal, testing, and training requirements.
3. Shall have an emergency response time ability of less than 4 hours to the project site.
4. Shall have a thorough working knowledge of water/wastewater treatment processes and control philosophy in accordance with standard practices of the water/wastewater treatment industry.
5. System Integrator shall be one of the following:
   a. Dublin Technical Systems, Inc. of Dublin, Ohio
   b. Dmytryka Jacobs Engineers, Inc. of Toledo, Ohio
   c. Quality Controls, Inc of Cincinnati, Ohio

C. Instrumentation and Control System Integrator's Responsibility:
   1. Contractor shall retain the system integrator to assume the responsibilities specified below. However, execution of these specified duties by the system integrator shall not relieve Contractor of the ultimate responsibility for the control equipment.
      a. Detailed design, engineering, fabrication, assembly, wiring, testing, and debugging of the instrumentation and control system in accordance with the Contract Documents, the reviewed submittal drawings, and all referenced standards and codes.
      b. Preparation, assembly, submission, and correction of all instrumentation and control system submittals in accordance with the Contract Documents.
      c. Proper integration and interfacing of the instrumentation and control system hardware, field devices, and panels including required interfacing with package control systems furnished by other equipment suppliers, with existing equipment, and with the plant electrical system.
      d. Supervision of the installation of the instrumentation and control system, instruments, panels, cabinets, wiring, and other components require.
      e. Calibration, testing, and startup of the instrumentation and control system.
      f. Training of Owner personnel in operation and maintenance of the instrumentation and control system.
      g. Handling of all warranty obligations for the control system components.

D. Coordination and Progress Meetings:
   1. Contractor and a representative of the system integrator shall be required to attend meetings applicable to this Section's scope of work.
   2. Representatives at the meetings shall have the competence and authority to make any and all necessary decisions. Decisions and statements made at the meetings shall commit the Contractor and system integrator to agreed procedures and schedules.

E. System Integrator Project Personnel:
   1. Contractor shall require the system integrator to provide the following project personnel:
      a. Project Manager:
         1) The system integrator shall appoint a project manager who shall coordinate and schedule all work and assure that the project schedule is met.
         2) The project manager shall act as the liaison with Contractor for the installation of the instrumentation and control system equipment and shall assist in all matters required for proper coordination and interfacing of the equipment and processes.
      b. Field Engineer:
         1) The system integrator shall appoint a field engineer with responsibilities as follows:
            a) Provide advice and technical consultation relative to installation techniques and procedures for equipment furnished.
            b) Provide guidance and support on-site throughout the control system installation and start-up period.
            c) Installed system checkout, calibration, adjustment, and start up including tuning of every control loop.
            d) Involvement in the onsite system training of plant personnel.
            e) Resolving of control problems encountered during initial startup and testing of all instrumentation and control equipment.

2) The field engineer shall have a minimum of 5 years experience in systems engineering and start up and shall have a thorough working knowledge of the hardware supplied for the instrumentation and control system.

c. The system integrator shall submit resumes for Field Engineer which detail their relevant experience as specified above.

1.7 DELIVERY, STORAGE AND HANDLING

A. Instrumentation and control system equipment shall be packaged at the factory prior to shipment to protect each item from damage during shipment and storage.

B. All equipment shall be handled and stored in accordance with manufacturer's instructions and relevant organization standards. Owner shall have the right to inspect stored equipment.

C. Packing and Shipping
1. Package equipment as required to protect it from damage.
2. Mount heavy items on pallets or skids to facilitate handling.

D. Acceptance at Site
1. Inspect all equipment at the time of delivery.
   a. Ensure that no damage has occurred during shipment.
   b. Verify make, model, and quantity.
2. Record the following information:
   a. Description/model of equipment.
   b. Date and time of delivery.
   c. Assessment of condition.
3. Handle equipment carefully to prevent damage.
4. Remove any damaged equipment from site and replace with new equipment.

E. Storage and Protection.
1. Store the equipment provided until it can be installed.
2. Provide a clean, dry, heated, and dust-free location for storage.
3. Such conditions must meet the requirements of the system integrator and manufacturer.

1.8 PROJECT/SITE CONDITIONS

A. Interior Locations: The following are defined as interior locations:
1. Any location within the boundaries of the foundation of any building.
2. Any location within the superstructure of other structures not classified as buildings.

B. Wet Locations: The following are defined as wet locations:
1. All exterior locations.
2. All interior locations below grade.
3. All interior locations where wet materials are processed, pumped, transported, or stored.

C. Corrosive Locations: The following are defined as corrosive locations.
1. All locations with chemical feed/transfer equipment
2. All locations with chemical storage tanks
3. All locations where chemical storage drums are located.

D. Environmental Conditions:
   1. The control system shall be designed and constructed for continuous operation without forming condensation under the following temperature and humidity conditions:
      a. Space Conditioned Areas shown on the Drawings:
         1) Ambient Temperature: normal conditions 59 to 90°F; abnormal conditions 40 to 104°F.
         2) Relative Humidity: normal conditions 20 to 80%
         3) Abnormal conditions up to 95%
      b. Indoor locations for control panels and instruments:
         1) Ambient Temperature: 40 to 120°F
         2) Relative Humidity: 0 to 100%
      c. Outdoor locations for instruments:
         1) Ambient Temperature: -30 to 120°F
         2) Relative Humidity: 0 to 100%

E. Wet and Corrosive Areas:
   1. Instruments and control system components shall be designed and constructed to provide adequate protection against corrosion from gases and chemical which are commonly found in water/wastewater treatment plant environments such as but not limited to zinc orthophosphate, ozone, oxygen, chlorine, and carbon dioxide.

F. Portions of the instrumentation and control system will be located in areas that may be subjected to excessive vibrations. The control system integrator/manufacturer shall specify any vibration limitations which are required for the equipment and provide vibration proof mountings accordingly.

G. Hazardous (Classified) Areas: Hazardous (classified) areas are defined as in accordance with the NEC, NFPA 820, and as shown on the Drawings. All equipment installed in these areas shall conform to requirements for installation in the designated hazardous area as described in Articles 500, 501, and 502 of the NEC.

PART 2 - PRODUCTS

2.1 GENERAL

A. Mounting Hardware: Provide mounting hardware meeting the requirements of Division 26.

B. Identification: Provide equipment identification meeting the requirements of Division 26.

C. Calibrators and Programmers
   1. Provide calibrators/programmers for all I&C equipment that cannot be calibrated from the controls built into the unit.
   2. Provide a minimum of one calibrator/programmer for each type of equipment supplied.

D. Adjustable Dead-Band
   1. Provide dead-band adjustment for all output contacts from all I&C equipment.
   2. Provide a minimum of ±10 percent adjustment.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Existing Conditions
   1. Compare the site and existing facilities with the Contract Documents.
   2. With respect to the conditions of the premises, locate connections of existing facilities and any obstructions that may be encountered and conduct work to minimize disruption to existing conditions.

B. Field Measurements: Field-verify all locations and dimensions to ensure that the equipment will be properly located, readily accessible, and installed in accordance with all pertinent codes and regulations, the contract documents, and the referenced standards.

3.2 INSTALLATION - GENERAL

A. General
   1. Equipment locations as shown on the drawings are approximate unless dimensioned.
   2. Coordinate equipment locations with existing conditions and adjust locations as required.
   3. The Contractor shall furnish, fabricate, and mount all instrument stands and brackets. Mounting of stands and instruments shall be per installation detail drawings. All stands must be level, plumb, rigid, and free from vibration. Additional support shall be added where required for vibration-free mounting.
   4. Once instrumentation and control equipment has been set in place, Contractor shall maintain Space Conditioned Areas dust-free and with the following environmental conditions:
      a. Ambient Temperature: 65 to 80°F
      b. Relative Humidity: 50 to 70%
      c. Chlorine: ISA S71.04, Class G2 or better
   5. Provide temporary heating, cooling, dehumidification, humidification and air purification as necessary to provide the above conditions

B. Instrumentation wiring is shown schematically on the plan or described by narrative in the specifications. Contractor to provide type and quantity of wiring necessary to perform the function specified in Sections 40 9XXX and shown on the Drawings. See Division 26 wire and cable sections for "uses permitted." Analog signal conductors and discrete signal conductors shall always be in separate conduits or cable tray compartments. Power wiring shall be in conduits and cable tray compartments separate from all signal wiring.
   1. The Contractor shall terminate field wiring for equipment specified under this section. The system integrator shall check instrument installation and field wiring before instrument devices are electrically powered by Contractor. Wires shall be terminated at terminal blocks with crimp type, preinsulated tongue lugs. Lugs shall be of the appropriate size for the terminal block screws and for the number and size of the wires terminated. All signal shields shall have only one ground point that shall be located at the closest control panel. Seal around all conductors inside conduits as they enter equipment. Use watertight seal (closed cell RTU foam type) entering or leaving every building, box, or instrument. Install conduit water relief or "weep" on the system side of all seals to prevent intrusion of water into the equipment.
   2. Spare Wiring: Signal and interlock wiring shall contain spare conductors in every raceway. Spare conductors shall be provided in pairs and shall be clearly and distinctly marked at every access point indicated where the pairs start and stop. The minimum number of spare pairs shall be 25 percent of the number of active pairs with a minimum of one spare pair.

C. Valves

1. General Application: Use gate and ball valves for shutoff duty; globe and ball valves for throttling duty.
2. Access: Locate valves for easy access and provide separate support where necessary.
3. Unions: Install valves and unions for each fixture and item of equipment arranged to allow equipment removal without system shutdown.
4. Stems: Install valves in horizontal piping with stem at or above the center of the pipe.
5. Clearance: Install valves in a position to allow full stem movement.

D. Threaded Connections
1. Procedure
   a. Note the internal length of threads in valve ends, and proximity of valve internal seat or wall to determine how far pipe should be threaded into valve.
   b. Align threads at point of assembly.
   c. Apply appropriate tape or thread compound to the external pipe threads (except where dry seal threading is specified).
   d. Assemble joint, wrench-tight. Wrench on valve shall be on the valve end into which the pipe is being threaded.

E. Tagging
1. All instrumentation equipment shall be provided with identification tags in accordance with the plans and Division 26 Section “Electrical identification”. Each field instrument shall have a stainless steel tag.
2. The device tags shall be mounted using stainless steel screws.

3.3 ADJUSTING

A. Set Points: Alarm and control set points shall be adjusted to their operational values before the start of the field test.

B. Calibration: Calibration adjustments shall be performed before the start of the field test. Testing shall commence after calibration verification for each instrument is provided to the Engineer.

3.4 FIELD QUALITY CONTROL

A. Piping Tests: After piping systems have been put into service, inspect for leaks. Adjust pipes, valves, or fittings to stop leaks; replace equipment if leak persists.

B. Field Test
1. A technical representative of the system integrator and the Contractor shall perform a field test on the entire instrumentation and control system. All equipment provided by the system integrator and all interrelated equipment provided by other suppliers, such as pumps, blowers, valve operators, chemical feeders, motor controls, etc., shall be installed and operating properly before the test starts.
2. All test equipment and materials shall be provided by the system integrator.
3. As a minimum, the test shall consist of the following:
   a. All wiring shall be checked at each termination point for correct wire size, type, color, termination, and wire number.
   b. All instruments and devices shall be checked to verify compliance with the specifications and approved shop drawings. The calibration of analog devices shall be verified including the zero and span.

c. Analog wiring shall be checked for correct polarity and ground continuity at each termination point in the loop.
d. All digital inputs shall be activated at the field element to verify proper response on the OIT.
e. All analog inputs shall be tested at the field transmitter over a full range to verify proper response at OIT. Analog loops shall be verified at each termination point at 0, 25, 50, 75 and 100% signal levels.
f. All digital and analog outputs shall be forced, via the OIT, or PLC if necessary, to verify proper response at the final control element.
g. Communications shall be tested between all components, including existing equipment.
h. Verify proper calibration of all instruments by independent measurements, such as checking levels with a measuring rod or pole, performing drawdown tests on wells to check flow rates, performing laboratory tests on samples, etc.
i. Create temporary test conditions to simulate variations in process operation by throttling valves, controlling pump speed, shutting down process equipment, operating safety devices, etc. Where safety concerns or process limitations prohibit physical simulation and when agreed to by the Owner, simulated process signals may be used. Test conditions shall be sufficient to test the operation of every function of the instrumentation and control system including:
    1) Alarms and safety shutdowns.
    2) Equipment start/stop and speed controls.
    3) Pacing of chemical feed equipment.
    4) Recorders and indicators.
    5) Process controller operation and recovery from upsets.
    6) Programmable logic controller (PLC) or Supervisory Control and Data Acquisition (SCADA) system inputs and outputs.
    7) PLC or SCADA system programming.
j. The test shall be performed according to the test procedures submitted. As each phase of the test is completed, test data sheets shall be signed and dated. The test data sheets shall document any modifications to the control and alarm settings, process engineering unit changes, programming changes, wiring changes, problems encountered, and steps taken to solve the problems.
k. The commissioning effort shall be documented using forms similar to the sample Loop Validation/Inspection Tests form at the end of this Section.

3.5 CLEANING

A. Instrumentation System: The instrumentation system components shall be kept clean and free of dust during the storage, start-up, demonstration, and warranty period.

B. Control Panels and Consoles: Clean dust and dirt accumulation inside and outside control panels and consoles, on a monthly basis, during start-up and demonstration period.

3.6 DEMONSTRATION

A. General: The Contractor shall perform a 30-day operational demonstration of the complete instrumentation and control system. The demonstration shall conform to the following requirements. The 30-day operational demonstration shall not begin until the field test is completed and all problems and defects encountered during the field test have been corrected.

B. System Acceptance: System acceptance shall not occur until the entire instrumentation and control system has performed as a functioning unit continuously for 30 consecutive days without loss of control and monitoring function, except for periods of scheduled maintenance. Failure of any component, software function, or required function shall require a restart of the 30-day operational demonstration until 30 consecutive days of continuous operation have been completed.

C. Staffing: Provide for the services of a qualified service technician for the duration of the 30-day demonstration. The service technician shall be on call 24 hours per day, 7 days a week.

3.7 PROTECTION

A. The Contractor shall protect the instrumentation system components from water, dust, dirt, and corrosion during the start-up, demonstration, and warranty period.

3.8 INSTRUCTION OF PERSONNEL

A. Field Training: Training shall be conducted on all I&C equipment provided under the 40 9XXX series Sections, and related electrical and interfaces to equipment provided by other division sections. Training sessions shall be conducted as follows:
   1. Provide 40 hours of training by factory-authorized representative of equipment to Owner's personnel.
   2. Training courses shall include hardware components emphasizing operation, calibration, maintenance, interface with other systems, and associated theory.
   3. Minimum Goals: Training shall incorporate operational requirements described in these specifications. Training shall provide the plant operations personnel with the following:
      a. Control set point and dead band modifications.
      b. Control system start-up and shutdown.
      c. Routine diagnostic checks and maintenance.
      d. Field instrument calibration and maintenance.
      e. Equipment diagnostic testing and replacement of failed parts.
   4. The process control system integrator shall submit a training program that provides the plant operations personnel a theoretical background and a broad range of related skills to achieve the listed goals. The instructor(s) shall be experienced in system applications similar to the equipment specified herein. The resumes of the training staff for instructing the plant operations personnel shall be available for review by the Owner. The plant operations personnel trainees shall be subjected to program testing, evaluation, and counseling. Study assignments shall be made and later reviewed by the instructors to the satisfaction of class attendees. Trainees shall be encouraged to freely ask questions during the instruction periods.
   5. The Contractor shall provide all classroom training courses and all hands-on training at the project site. Contractor shall provide tables, chairs, and all training documentation for training attendees.
   6. Provide text material for self-study and to supplement classroom lectures. The personnel attending the training courses shall be permitted to retain text materials for future reference.

B. The Contractor shall develop a training program tailored to the Owner's needs including type and quantity of treatment plant personnel, a curriculum of described courses, duration of courses, and training facilities. The Contractor shall submit for approval a detailed outline of the proposed training schedule, how the training courses are to be conducted, and estimated

dates for beginning and end of each training phase. The Contractor shall be responsible for the cost of the training program. The Owner shall be responsible for the trainee salaries and overhead costs.

SECTION 40 9100

PRIMARY SENSORS AND FIELD INSTRUMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Scope:
   1. Contractor shall furnish, install, calibrate, test, adjust, and place into operation the primary sensors and field instruments as shown on the Drawings and specified herein to the satisfaction of Owner.
   2. The Drawings and Specifications illustrate and specify functional and general construction requirements of the sensors and field instruments and do not necessarily show or specify all components, wiring, piping, and accessories required to make a completely integrated system. Contractor shall provide all components, piping, wiring, accessories, and labor required for a complete, workable, and integrated system.
   3. Contractor shall be responsible for installing in-line pressure and flow elements and for providing taps in the process piping systems for installation of other flow and pressure sensing instrumentation.

B. Coordination: Coordinate with other suppliers for installation of all items specified herein and required to ensure the complete and proper interfacing of all the components and systems.

C. Related Sections:
   1. Section 40 9513, Control Panels

1.2 REFERENCES

A. AMSE B40.100, Pressure Gauges and Gauge Attachments

B. ASTM A269, Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing for General Service

C. ASTM A312/A312M, Standard Specification for Seamless, Welded, and Heavily Cold Worked Austenitic Stainless Steel Pipes

D. ASTM A403/A403M, Standard Specification for Wrought Austenitic Stainless Steel Piping Fittings

E. ASTM B88, Standard Specification for Seamless Copper Water Tube

G. NEMA 250, Enclosures for Electrical Equipment

H. National Institute of Standards and Technology (NIST)

1.3 SUBMITTALS

A. Comply with Section 40 9000, Instrumentation and Control System General Requirements

PART 2 - PRODUCTS

2.1 IDENTIFICATION TAGS

A. Type: White engraved phenolic

B. Function: Identify specific characteristics of all sensors and field instruments. All instruments, whether field or panel mounted, shall have an identification tag.

C. Performance Requirements:
1. Tag numbers of sensors and field instruments shall be as shown on the drawings and as specified. For items not shown or specifically tagged, the item tag number shall be established by the system supplier.
2. Information to be permanently engraved onto the tag shall include the identifying tag number, manufacturer, model number, service, and range.
3. The tags shall be fastened to the device with self-tapping stainless steel screws. Where fastening with screws cannot be accomplished secure with 1/8 inch stranded stainless steel wire rope and secured with a crimp sleeve. Provide hole in end of tag for attachment of wire.
4. All sensors and field instruments mounted on or within control panels and enclosures shall have the identification tag installed so that the engravings are easily visible to service personnel. Panel mounted devices shall have the tag attached to the rear of the device.

D. Construction Features:
1. Tags shall be engraved with 3/16-inch letters and constructed as follows:
a. 1/8- inch thick laminated phenolic for engraving composed of core laminated on both sides with a matte (non-glare) finish cover sheet
b. Core to be black; cover sheet to be white
c. Mounting holes to be centered on width and 1/4 inch from each end

2.2 LEVEL INSTRUMENTATION

A. RADAR LEVEL METER
1. Type: Non-contact system using a microwave transmitter/receiver, a horn or rod antenna and a microprocessor-based signal processor. Frequency modulated continuous wave of electromagnetic energy is transmitted through the antenna towards the surface of the material to be measured and energy is reflected back in the form of echoes. The transit time of the reflected radar signal is measured and evaluated in the signal processor. The level (or volume) of the material is read out in engineering units.
2. System Performance Requirements:
a. Accuracy:
1) Less than 32 feet: +/- 0.6 inches or better
2) Greater than 32 feet: +/- 0.3 percent of span or better
b. Maximum range: 65 feet
c. Repeatability: +/- 0.1% or better
d. Frequency: 25 GHz
e. Modulation: Frequency Modulated Continuous Waveform (FMCW)
f. Power Requirements: 24 VDC loop power
g. Transmitter analog output: 4 to 20 mA, 750 ohm maximum load
h. Transmitter digital output protocol: HART

i. Ambient Temperature: +15 to 25°C

3. Required Features:
   a. Antenna:
      1) Mountings: Flange mounting
      2) Rod Antenna Material: PTFE
      3) Flange and mounting hardware material: Type 316 stainless steel
      4) Maximum transmitter power: 30 microwatts
   b. Transmitter/Processor:
      1) Enclosure: Copper-free Aluminum, epoxy coated, NEMA 6, IP67
      2) Operator Control: Illuminated LCD. Programming by keypad or non-invasive programming using handheld programmer or magnetized probe
      3) Memory: non-volatile ROM/EEPROM
   c. Accessories:
      1) Handheld programmer
4. Manufacturer and Model:
   a. Series SITRANS LR250 as manufactured by Siemens
   b. Or approved equal

B. LIQUID POINT-LEVEL SWITCH
1. Function: To sense specific level for a process fluid by means on RF admittance technology. An output relay is actuated when the sensing element comes in contact with the process fluid.
2. Features:
   a. Field selectable for low or high level detection.
   b. Sensing element material: Suitable for the process liquid.
   c. Mounting: ¾" NPT for mating to non-metallic flange.
   d. NEMA 4X/IP66 Housing
   e. Area classification: General purpose
3. Electrical Characteristics:
   a. Electronics mounted integral to sensor
   b. Single DPDT relay contacts rated at 5A @ 120VAC
   c. Relay time delay adjustable up to 60 seconds response time
   d. Input Power: 19-250VAC, 18-200VDC, auto sensing
4. Manufacturer and Model:
   a. Model ThePoint as manufactured by AMETEK Drexelbrook
   b. Or approved equal

C. FLOAT SWITCH
1. Type: Direct acting, pear shaped, eccentric weighted, displacement type liquid level sensor
2. Construction Features:
   a. Float Body: Hollow hermetically sealed, rigidly molded of polypropylene containing mechanical switch and eccentric metal weight
   b. Mechanical Switch: SPDT switch rated 10 A resistive at 120 VAC and 5 A resistive at 30 VDC
   c. Weight: Weight to cause sensor to hang straight down from cable when not immersed and only allow float to pivot when immersed in liquid of specific gravity 1.0. External weights or floats that completely rise to the surface will not be permitted.
   d. Electrical Cable:

1) Heavy duty, 3 conductor, flexible and submersible cable, sheathed in PVC or chlorinated polyethylene rubber and connected to float and switch with watertight seal
2) Manufacturer's continuous length cable furnished shall be of sufficient length to extend to junction box.

3. Manufacturer and Model:
   a. Model ENM-10 as manufactured by ITT Flygt
   b. Or approved equal

D. WET FLOOR DETECTION SWITCH
1. Type: A direct acting float that moves up and down a stationary stem or rod surrounded by a permeable shield for protection and to minimize sloshing. The float shall rise or lower with liquid level and activate a magnetic switch within the stem or rod.
2. Features:
   a. Float body: 316 Buna N with magnet in float for actuating switch in rod. Float shall rise when immersed in water.
   b. Mechanical switch inside of rod: Hermetically sealed reed switch
   c. Rod material: Type 316 stainless steel
   d. Slosh and Protection Shield: Polycarbonate Plastic
3. Manufacturer and Model:
   a. LS-270 Series as manufactured by Gems Sensors
   b. Or approved equal

E. WET FLOOR DETECTION SWITCH (CHEMICAL AREAS)
1. Function: To detect wet floors in the chemical containment areas.
2. Type: A direct acting float that moves up and down a stationary stem or rod. The float shall rise or lower with liquid level and activate a magnetic switch within the stem or rod.
3. All wetted components shall be fully compatible for continuous immersion in chemical solutions.
4. Features:
   a. Float body: CPVC with magnet in float for actuating switch in rod. Float rises when immersed in water.
   b. Mechanical switch inside of rod: Hermetically sealed reed switch.
   c. Rod material: CPVC
   d. Mounting Bracket: Provide a wall mount bracket constructed of chemically-compatible material. Bracket shall position detector as close to floor as possible and allow full adjustment of detector position.
5. Manufacturer and Model:
   a. LS-74780 Series as manufactured by Gems Sensors.
   b. Or approved equal

F. SUBMERSIBLE LEVEL TRANSMITTER
1. Type: Submersible piezoresistive element measuring the level with reference to atmospheric pressure.
2. Performance Requirements:
   a. Accuracy: +/- 0.25% full scale
   b. Range: See Schedule
   c. Power: 12-30VDC loop power
   d. Transmitter Output: 4-20mADC, 2-wire loop powered
   e. Temperature Range: 0-180°F
   f. Pressure Limit: 2x full scale

3. Required Features:
    a. Mounting: As shown on the drawings.
    b. Housing: 316SS with 1/2" NPT and ETFE Cable
    c. Electrical Protection: Lightning and Surge protection
4. Manufacturer and Model:
    a. Model PBLT2 by Dwyer Instruments
    b. Or approved equal

2.3 FLOW INSTRUMENTATION

A. MAGNETIC FLOWMETER

1. General:
    a. Flowtube: Produce low level, high impedance pulsed DC signal proportional to the rate of fluid flow using the principle of electromagnetic induction.
    b. Pulsed DC Magnetic Flow Transmitter: Drive the flowtube coils with pulsed DC power and convert the flowtube output signal into a DC current output proportional to the flow rate.
2. System (Flowtube and Transmitter) Performance Requirements:
    a. Flow Range: As specified in the Instrument Schedule
    b. System Accuracy (with Analog Output): +/- 0.55% of flow rate or better over range from 2 fps to 33 fps
    c. System Repeatability: +/- 0.15% of flow rate or +/- 0.15 fps, whichever is greater
    d. Drift: Complete 0 stability
    e. Minimum Fluid Conductivity Limit: 5 micromho per centimeter or less
    f. Transmitter Outputs:
        1) 4 to 20 mA, direct acting and isolated
        2) High accuracy, field adjustable scaled pulse output to drive local totalizer
    g. Power Consumption: Not to exceed 20 VA for flowtube and transmitter combined
    h. Operating Temperature: Suitable for operation with process fluid temperature from -23 to 140°F
    i. Pressure Rating: Greater than or equal to test pressure specified in Section 40 0513, Exposed Piping Installation, for appropriate piping system
3. Construction and Required Features:
    a. Flowtube:
        1) Type: Lined metal flowtubes
        2) Size: As specified in the Instrument Schedule
        3) Interchangeability: Ratio of flow velocity to voltage reference signals generated shall be identical for all meter sizes to permit interchangeability with transmitter without requiring circuit modifications.
        4) System accuracy specified above shall be proven by submittal of flow test curves of the actual meters being furnished.
        5) Test curves shall show a minimum of 8 equally spaced flow points. Tests shall be performed using water and a weight or volume tank, or reference meters that are traceable and calibrated to NAMAS or NIST standards.
        6) Tube Material:
            a) Meter tubes 12 inches and smaller: Type 304 stainless steel
            b) Metering tubes 14 inches and larger: Type 304 stainless steel, 0.125-inch wall thickness or greater
        7) Electrodes Material: Type 316 stainless steel, unless otherwise specified in the Instrument Schedule

8) Lining: Teflon®, Elastomer, Neoprene, or polyurethane unless otherwise specified in the Instrument Schedule
9) Enclosure:
a) Materials and Rating: Stainless steel, polyurethane coated sheet steel, or cast low-copper aluminum alloy NEMA 6P, submersible to 33 feet
b) Finish: Finish exterior, except for flange faces, with a high build epoxy paint
10) End Connections: ANSI Class 150 pounds flange suitable for mating with pipe specified
11) Electrical Connections: 1/2-inch NPT tapped holes for power conduit fitting and signal conduit fittings

b. Pulsed DC Magnetic Flow Transmitter:
1) Solid state construction
2) Pulse and analog output with superimposed HART communication protocol. Outputs shall be galvanically isolated from input and earth ground
3) Automatic zeroing feature making it unnecessary to zero the instrument before or after placing it in operation
4) Precalibrated span adjustment providing continuous span adjustment over entire range
5) Enclosure:
a) NEMA 4
b) Finish: Epoxy coating
6) Mounting:
a) All transmitter and driver electronics shall be remotely mounted from the flow tubes at locations shown on the Drawings.
b) Provide complete stainless-steel mounting hardware
c) Type of mounting (wall, support frame or pipe stand) as required
7) Local Indication:
a) 8-character minimum LCD with field selectable engineering units
8) Power Requirements: 115 VAC +/- 10%, 60 Hz, +/- 3 Hz power supply

c. Accessories:
1) Manufacturer's recommended cables of sufficient length for connection between flowtube and transmitter electronics
2) Type 316 stainless steel grounding rings for flowtubes
3) Type 316 stainless steel grounding straps
4) Provide a NEMA 4X rated 120 VAC power on-off switch.
5) Provide spool piece for replacement of each different size flow tube where no bypass piping is provided.
6) Provide 1 calibrator suitable to calibrate all flow tubes provided.

4. Manufacturer and Model:
a. Sitrans Series 5100 flow tube and 5000 Series transmitter as manufactured by Siemens
b. Or approved equal

B. CLAMP-ON FLOWMETER
1. General
a. The meter shall be a clamp-on design which mounts externally to the pipe and with no liquid contact.
b. The meter shall utilize the transit-time measurement technique and employ the use of two microprocessors.

c. The meter shall also employ an alternate Doppler measurement technique for liquids with high solid content. The meter shall automatically toggle from transit time to Doppler measurement if the signal decays due to high solids content and toggle back once the signal improves. The time delay for the toggle feature shall be programmable.
d. Transducers shall be supplied with multi-point wet flow calibration certificate and shall have an accuracy of +/- 1%.

2. Transducer Features
   a. Transducers shall have built-in RTD for measuring the transducer block temperature and automatically compensating for temperature effects including changes in fluid viscosity and density.
   b. Transducers shall be encased in stainless steel with an integral armored stainless steel jacketed TRIAX cable. The use of COAX and BNC cable is not acceptable.
   c. Transducers shall be mounted in a full sealed stainless steel mounting track and have the ability to be coupled using permanent coupling pads. Use of grease is not acceptable.
   d. Transducer markings shall be laser scribed and solvent resistant. Use of adhesive labels is not acceptable.
3. Meter features
   a. The meter shall have the ability to automatically recognize the transducers when they are connected.
   b. The meter shall not require a "zero calibration" in the field. The zero calibration shall be factory pre-set and certified prior to shipment.
   c. The meter shall have the ability to automatically calculate the Reynolds number and corresponding flow regime (laminar, turbulent, and transitional).
   d. The meter shall provide automatic liquid sonic velocity compensation, and have built in liquid tables for liquid viscosity and density settings.
   e. The meter electronics shall be housed in a NEMA4X enclosure and shall display flow rate, flow velocity, mass flow, total flow, signal strength, signal quality, liquid sonic velocity, and the flow regime.
   f. The meter shall be capable of outputting multiple 4-20ma signals, voltage 0-1 V or 0-10 V high precision frequency 0-1 kHz or 0-10 kHz galvanically isolated, RS-232, RS-484, binary output pulse of alarm for relay total and meter status.
   g. The meter shall have the ability to status alarm for conditions of fault, flow direction, sound velocity limit, and flow velocity limit.
   h. The meter shall have the ability to set the 4-20 ma signal to a settable status and alarm condition.
   i. The meter shall have RS-232 output and internal memory with a minimum storage of 100,000 data points.
4. Accessories
   a. Provide all necessary straps and anchors to affix the transducers to the pipe and meter to the wall.
   b. Provide all necessary cables for connection between the transducers and the meter.
5. Sizes and Ratings
   a. System Accuracy: ±1.0 percent of rate from 0 to 100 percent of range.
   b. Meter shall read within the prescribed accuracy with fluid velocities from 0.01 feet per second to 57 feet per second.
   c. Drift: Complete zero stability.
   d. Process Fluid Temperature: 40 to 120 deg F
6. Warranty

a. Strap on flowmeter shall include a minimum 1 year factory warranty. Field service shall be included at no additional cost during the warranty period.

7. Manufacturer: Subject to compliance with the requirements of this specification, available manufacturers of clamp-on flow meters include, but are not limited to, the following:
   a. Flexim 7407
   b. Or approved equal

C. CHEMICAL FLOWMETER

1. Provide flow sensors to assure that chemical is being delivered. Sensors shall be installed at the point of injection and shall operate from 50% to 150% of the typical service flow as show in the flow meter schedule.
2. Materials of Construction
   a. Body: 316 SST
   b. Pistons: Carbon
   c. Bearing: Rulon
   d. O-rings: Teflon
3. Minimum Accuracy:
   a. +/- 5% at flowrates of 7 to 29 mL/min
   b. +/- 10% at flowrate of 3 to 90 mL/min
4. Manufacturer:
   a. Max Machinery, Model 234, with 4-20 mA output

2.4 PRESSURE INSTRUMENTATION

A. DIGITAL PRESSURE TRANSMITTER/SWITCH

1. Type: Gauge pressure.
2. Function: Provide analog output signal directly proportional to sensed pressure.
3. Performance Specifications:
   a. Adjustable Range: See Instrument Schedule
   b. Number of Switches and Setpoints: One.
   c. Setpoint Accuracy: 0.5% of full range span.
   d. Power Supply: 10-36Vdc loop-power.
   e. Outputs:
      1) Analog: 4-20mAdc isolated.
      2) Discrete: SPST rated for 300mA @ 120VAC
4. Required Features:
   a. Repeatability: 0.1% of full range span.
   b. Programmable response time delay: 2 seconds minimum.
   c. Programmable for automatic or manual reset.
   d. Field adjustable setpoint over full range by means of external touchpad.
   e. Display: 0.5” 4-digit (minimum), LCD.
   f. Screw type terminals.
   g. ½” NPT female process connection.
   h. ½” NPT female electrical connection.
   i. Pressure sensor element shall be 316SS.
   j. NEMA 4X epoxy-coated aluminum enclosure.
   k. Programming and data shall be protected by non-volatile EEPROM.
5. Manufacturers:
   a. United Electric Controls, One Series.
   b. Or approved equal

B. PRESSURE TAPS, SENSING LINES, AND ACCESSORIES

1. Water Pressure Sensing Lines and Accessories for Flow and Pressure Transmitters:
   a. Material: Copper Water Tube, ASTM B88, Type L, drawn temper or annealed
   b. Pressure Rating: 150 psi
   c. Size: 1/2-inch outer diameter for water
   d. Connections: Brass Compression Type, "Swagelok" by Crawford, or approved equal
   e. Shut-off Valves:
      1) Type: Ball
      2) Pressure Rating: 150 psi
      3) Body, Ball and Stem: Brass
      4) Packing: High Density TFE
      5) Handle: Nylon with metal travel stops
      6) Support Rings: TFE coated brass
      7) End Connections: Removable "Swageloks"
      8) Model: Whitey Series 40 for water, or approved equal
   f. Manifolds:
      1) Type: 5-valve and 3-valve meter manifolds
      2) Materials: 316 SS Body, Bonnets and Stems; Delrin seats; Teflon Packing
      3) Manufacturer: Anderson-Greenwood, or approved equal
2. Air Pressure Sensing Lines and Accessories for Air Flow/Pressure Transmitters:
   a. Material: Type 316 Stainless Steel Tubing, ASTM A269, Medium Wall Thickness
   b. Pressure Rating: 150 psi
   c. Size: 3/8-inch outer diameter for air
   d. Connections: 316 Stainless Steel Compression Type, "Swagelok" by Crawford, or approved equal
   e. Shut-off Valves:
      1) Type: Ball
      2) Pressure Rating: 150 psi
      3) Body, Ball and Stem: Type 316 Stainless Steel
      4) Packing: High Density TFE
      5) Handle: Nylon with metal travel stops
      6) Support Rings: TFE coated Type 316 stainless steel
      7) End Connections: Removable "Swageloks"
      8) Model: Whitey Series 40 for air, or approved equal
3. Manifolds:
   a. Type: 5-valve and 3-valve meter manifolds
   b. Materials: Type 316 stainless steel Body, Bonnets and Stems; Delrin seats; Teflon Packing
   c. Manufacturer: Anderson-Greenwood, or approved equal
4. Pressure Tap Sensing Lines and Accessories for Pressure Switches and Pressure Gauges:
   a. For Process Sensing Taps in Ductile Iron, Steel and Stainless Steel Piping Systems:
      1) Material and Fittings: Type 304L Stainless Steel Pipe (ASTM A312) and threaded fittings and adapters (ASTM A403) in accordance with Section 40 0513, Process Piping.
      2) Sizes: 1/2 inch minimum for main sensing piping and 1/4-inch gauge and switch connections
      3) Pressure Rating: Equal to or greater than the applicable system test pressure as specified in the Schedule in Section 40 0513, Process Piping.
      4) Accessories:

a) For applications not requiring diaphragm seals, provide separate 1/2-inch stainless steel threaded ball valve for each gauge and switch.
b) For applications requiring diaphragm seals, provide separate 1/2-inch threaded stainless-steel ball valve for seal process side shutoff. Ball valves shall be provided in accordance with the specifications in Section 40 0523, Process Valves, Gates, and Accessories.

b. For Process Sensing Taps in Copper and Thermoplastic Piping Systems:
1) Pipe Material and Fittings: Use same type of pipe material and fittings as that used in the process piping system. PVC pipe and fittings shall be provided in accordance with the requirements of Section 40 0513, Process Piping.
2) Sizes: 1/2 inch minimum for main process sensing piping and 1/4 inch for gauge and switch connections
3) Pressure Rating: Equal to or greater than the applicable system test pressure as specified in Section 40 0513, Process Piping.
4) Accessories:
a) For copper piping system taps with or without seals, provide a separate 1/2-inch minimum threaded brass or bronze ball valve for each gauge and switch.
b) For PVC piping systems with or without diaphragm seals, provide a separate 1/2-inch threaded PVC ball valve for process sensing line shutoff. Ball valves shall be provided in accordance with the specifications in Section 40 0523, Process Valves, Gates, and Accessories.

C. DIAPHRAGM SEAL
1. General: Furnish diaphragm seals for pressure gauges and switches at locations shown and as specified.
2. Required Features:
a. Provide fill/bleed screw to permit filling of instrument and diaphragm seal
b. Instrument Connection: 1/4-inch NPT
c. Process Connection: 1/2-inch NPT
d. Working Pressure Rating: Equal to or greater than the attached gauge or switch operating pressure specified in Exposed Piping Schedule in Section 40 0513, Process Piping, whichever is greater
e. Bolting Materials: Type 316 stainless steel
f. Provide a clean-out ring which holds the diaphragm captive in the upper housing to allow the upper housing assembly to be removed for recalibration or cleaning of the process side housing without the loss of filling liquid or change in calibration.
3. Construction Features:
a. Top Housing: Type 316 stainless steel
b. Diaphragms, O-rings and Gaskets:

Process Fluid	Diaphragm	O-Ring	Gasket
Chlorine Gas	Teflon	Teflon	Teflon
Chlorine Solution	Teflon	Teflon	Teflon
Alum	Teflon	Teflon	Teflon
Lime	316 SS	Teflon	Teflon
Sodium Hypochlorite	Teflon	Teflon	Teflon
Sludge	316 SS	Buna-N	Buna-S

c. Process Side Housing Material: 316 stainless steel for metallic piping; PVC or CPVC to match non-metallic piping
d. Sensing Liquid: Use silicone except for process fluids containing chlorine. When the process fluid contains chlorine, the filling liquid shall be Halocarbon 63 or Flurolube 63.

4. Assembly and Calibration:
   a. The complete diaphragm seal assembly, including gauge, switch or transmitter, shall be factory assembled, filled and calibrated to the ranges and switch setpoints specified prior to shipment.
   b. CONTRACTOR shall be responsible for assuring that fill volumes and sensitivities of the supplied seals and diaphragms are suitable to provide the required gauge, switch or transmitter accuracy over the specified measurement range or at switch setpoints.
   c. Location and orientation of the gauges, switches and seal assemblies shall be coordinated with the actual piping and equipment installations so that gauges and indicators shall be easily read and accessed for maintenance by plant personnel.
5. Manufacturer and Model:
   a. Type 101 as manufactured by Ashcroft
   b. Or approved equal

2.5 TEMPERATURE INSTRUMENTATION

A. DIGITAL TEMPERATURE TRANSMITTER

1. Function: Provide analog output signal directly proportional to sensed temperature.
2. Performance Specifications:
   a. Adjustable Range: See Instrument Schedule
   b. Number of Switches and Setpoints: One.
   c. Setpoint Accuracy: 0.5% of full range span.
   d. Power Supply: 10-36Vdc loop-power.
   e. Outputs:
      1) Analog: 4-20mAdc isolated.
      2) Discrete: SPST solid state rated for 600mA @ 120VAC
3. Required Features:
   a. Repeatability: 0.1% of full range span.
   b. Programmable response time delay: 2 seconds minimum.
   c. Programmable for automatic or manual reset.
   d. Field adjustable setpoint over full range by means of external touchpad.
   e. Display: 0.5” 4-digit (minimum), LCD.
   f. Screw type terminals.
   g. ½” NPT female process connection.
   h. ½” NPT female electrical connection.
   i. Temperature sensor element shall be 316SS.
   j. NEMA 4X epoxy-coated aluminum enclosure.
   k. Programming and data shall be protected by non-volatile EEPROM.
4. Sensor: Provide local sensor unless shown otherwise on the Drawings.
5. Manufacturers:
   a. United Electric Controls, One Series.
   b. Or approved equal

2.6 ANALYTICAL INSTRUMENTATION

A. RESIDUAL CHLORINE ANALYZER

1. Description: Amperometric chlorine probe for reagentless free chlorine measurement.
2. Analyzer
    a. Number of Sensors: Up to four (4)
    b. Number of Analog Outputs: Up to four (4)
    c. Display: 4" minimum, color.
    d. Power: 120V
    e. Output: 4-20 mA
    f. Enclosure: NEMA 4X FRP
    g. Maximum Dimensions: 11" x 13" x 6" (W x H x D)
    h. Note: Where possible combine multiple sensors/probes on a single analyzer/transmitter.
3. Probe
    a. Type: Membrane-covered amperometric three-electrode system
    b. Measured: Free residual chlorine
    c. Probe range: 0.05 -5 mg/L
    d. Resolution: 0.01 mg/L
    e. Reproduction: ±5%
    f. Stability: -1% per month (without calibration)
    g. Working electrode: Gold catholde
    h. Counter electrode: SST anode
    i. Reference electrode: silver/silver halide
    j. Temperature range: 41 to 113 degrees F
    k. pH Range: 4-9 s.u.
    l. First polarization time: 120 minutes
    m. Re-polarization time: 30 minutes
    n. Calibration: Manual using DPD
    o. Housing Material: PVC
4. Accessories:
    a. Flow cell: Provide a polycarbonate flow cell and backplate. Provide dual flow cell in instances where two probes are required. Mount using 304 SST hardware.
5. Spare Parts:
    a. Two (2) membrane caps per chlorine sensor.
6. Product and Manufacturer:
    a. Chemtrac HydroACT HA4 analyzer, CP4 probe.
    b. Foxcraft FX-CL-F analyzer, 301254X probe.

B. pH/OXIDATION REDUCTION POTENTIAL (ORP) ANALYZERS

1. Description: Three electrode (process, reference, and ground) differential pH/ORP probe and a microprocessor-based analyzer/transmitter designed to measure pH/ORP of the sample and produce a proportional output signal linear to the pH/ORP.
2. Analyzer
    a. Number of Sensors: 4
    b. Number of Analog Outputs: 4
    c. Display: 4" minimum, color.
    d. Power: 120V
    e. Output: 4-20 mA
    f. Enclosure: NEMA 4X
    g. Maximum Dimensions: 11" x 13" x 6" (W x H x D)
    h. Note: Where possible combine multiple sensors/probes on a single analyzer/transmitter.

3. pH Probe
    a. Type: W-type rod membrane, pH electrode
    b. Measured: pH
    c. Probe range: 0 – 14 s.u.
    d. Slope: 95 – 102%
    e. Stability: < -0.01 s.u. per hour (without calibration)
    f. Reproducibility: < 0.01 s.u
    g. Working electrode: Gold catholde
    h. Counter electrode: SST anode
    i. Reference electrode: silver/silver halide
    j. Temperature range: 41 to 113 degrees F
    k. pH Range: 4-9 s.u.
    l. First polarization time: 120 minutes
    m. Re-polarization time: 30 minutes
    n. Calibration: Manual using DPD
    o. Housing Material: PVC
4. Accessories:
    a. Flow cell: Provide a polycarbonate flow cell and backplate. Provide dual flow cell in instances where two probes are required. Mount using 304 SST hardware.
5. Materials
    a. Sensor
        1) Body and salt bridge: PEEK.
        2) Junction: Kynar.
        3) Process electrode: Glass (pH), glass and platinum (ORP).
        4) Ground electrode: Titanium.
        5) O-ring seals: Viton.
    b. Analyzer/Transmitter Enclosure: NEMA 4X.
    c. Insertion Mounting Assembly: Stainless steel, type 316.
6. Ratings and Performance
    a. Sensor
        1) Range: 0 to 14 pH; -1500 to +1500 mV ORP.
        2) Sensitivity: +/- 0.01 pH; +/- 0.5 mV ORP.
        3) Stability: 0.03 pH; 2mV ORP per 24 hours, non cumulative.
        4) Operating temperature: 23 to 158 degrees F.
        5) Maximum pressure: 100 psi at 158 degrees.
        6) Maximum flow rate: 10 fps.
    b. Analyzer/Transmitter
        1) Repeatability: 0.05% of span.
        2) Stability: 0.05% of span for 24 hours, non-cumulative.
        3) Analog outputs: 4 to 20 mA isolated.
        4) Ambient temperature range: -4 to 104 deg F.
        5) Relative humidity: 0 to 95% non-condensing.
        6) Input power: 120 V a. c., 35W maximum.
        7) Output contacts: 120 V a. c., 5 Amp resistive maximum.
        8) Analog outputs: 500 Ohms maximum impedance.
7. Product and Manufacturer
    a. Hach pHD Series pH/ORP sensor and sc200 analyzer/transmitter.
    b. Rosemount 389VP sensor and 1056 analyzer/transmitter.

C. CONDUCTIVITY ANALYZERS

1. Description: Inductive conductivity sensor that induces a low current in a solution and measures the magnitude of the current to determine the conductivity.
2. Features
    a. Sensor
        1) Non-contacting inductive sensor.
        2) Internal platinum RTD for temperature compensation.
        3) Insertion mounting.
        4) Nominal 1/2-inch bore diameter.
    b. Analyzer/Transmitter
        1) Solid state, microprocessor-based.
        2) Non-volatile memory for all user settings.
        3) Capable of operating with up to two sensors.
        4) Two independent PID controllers.
        5) Plug and play operation, automatically detects sensor type.
        6) Built-in data logger, stores 6 months of data at 15-minute intervals with 2 sensors.
        7) Two analog outputs.
        8) Three SPDT alarm/control relays.
        9) LCD graphic display with LED backlighting.
3. Accessories
    a. Digital gateway.
    b. Extension cable.
    c. Insertion mounting assembly with ball valve, 2 inch NPT.
4. Materials
    a. Sensor Body: Teflon.
    b. Analyzer/Transmitter Enclosure: NEMA 4X.
    c. Insertion Mounting Assembly: Stainless steel, type 316.
5. Ratings and performance
    a. Sensor
        1) Range: 0-200 up to 0-2,000,000 microSiemens/cm.
        2) Sensitivity: +/- 0.01 pH; +/- 0.5 mV ORP.
        3) Stability: 0.03 pH; 2mV ORP per 24 hours, non cumulative.
        4) Operating temperature: 14 to 392 deg F.
        5) Maximum pressure: 200 psi.
        6) Maximum flow rate: 10 fps.
    b. Analyzer/Transmitter
        1) Repeatability: 0.05% of span.
        2) Stability: 0.05% of span for 24 hours, non-cumulative.
        3) Analog outputs: 4 to 20 mA isolated.
        4) Ambient temperature range: -4 to 104 deg F.
        5) Relative humidity: 0 to 95% non-condensing.
        6) Input power: 120 V a. c., 35W maximum.
        7) Output contacts: 120 V a. c., 5 Amp resistive maximum.
        8) Analog outputs: 500 Ohms maximum impedance.
6. Product and Manufacturer
    a. Hach 3700 sensor and sc200 analyzer/transmitter.
    b. Rosemount 400VP and 1056 analyzer/transmitter.

D. FLUORIDE ANALYZER
1. Description: Ion selective electrode to monitor fluoride ion concentration in potable water.

2. Analyzer
    a. Number of Sensors: 1
    b. Number of Analog Outputs: 1
    c. Display: 3 digit red LED.
    d. Power: 120V
    e. Output: 4-20 mA
    f. Enclosure: NEMA 4X Polycarbonate
    g. Maximum Dimensions: 11” x 8” x 5” (W x H x D)
3. Probe
    a. Type: Ion selective electrode (ISE)
    b. Measured: Fluoride
    c. Probe range: 0 - 10 mg/L
    d. Resolution: 0.01 mg/L
    e. Accuracy: ±0.2%
    f. Reference half cell: Silver/silver chloride, saturated KCl
    g. Primary Junction: Porous ceramic, statured KCl in crossed linked polymer
    h. Secondary Junction: Solid-state non-porous cross-linked conductive polymer embedded in HDPE/Kynar support matrix, excess saturated KCl salt system in cross linked polymer
    i. Temperature range: 41 to 122 degrees F
    j. pH Range: 5.5 - 9.5 s.u.
    k. Calibration: Manual (1 point offset)
    l. Material: Radel R-5000 NT
4. Accessories:
    a. Flow cell: Provide a 12” x 24” x ½” (H x W x D) PVC panel for mounting with a 0-25 psi pressure reducer, 0 – 5 gph rotometer with SST valve, brass barbed connectors for ¼” ID tubing, ½” SCH 80 PVC piping to keep sensor tip wet, 1” PVC pipe tee with twist lock sensor receptacle, and inlet and backpressure PVC ball valves.
5. Product and Manufacturer:
    a. Foxcraft FX-300-F analyzer, SF-8T-UL probe.

E. PHOSPHATE ANALYZER
1. Description: Analyzer to monitor orthophosphate concentration in potable water.
2. Analyzer/Probe
    a. Number of Sensors: 1
    b. Number of Analog Outputs: 1
    c. Power: 120V
    d. Output: 4-20 mA
    e. Serial Interface: RS-232
    f. Enclosure: NEMA 4X FRP
    g. Maximum Dimensions: 26” x 10” x 7” (H x W x D)
    h. Measured: Orthophosphate (as PO_4 or as PO_4-P)
    i. Probe range (as PO_4): 0.09 - 9 mg/L
    j. Probe range (as PO_4-P): 0.03 - 3 mg/L
    k. Cycle Time: 5 – 9999 minutes
    l. Accuracy: ±2% or 2x detection limit
    m. Temperature range: 41 to 131 degrees F
3. Accessories:

a. Reagents: Provide a sufficient amount of VMO reagent suitable for 12 months of operation at a 5 minute sample cycle. Provide reagent line priming package, reagent and cleaning solution bottle with connection lines, and reagent rack.

4. Product and Manufacturer:
   a. ChemScan mini oP

2.7 SCHEDULES

A. Schedule: See attachment.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Items shall be inspected for damage upon delivery to the site.

B. Damaged components shall not be installed.

3.2 INSTALLATION

A. Contractor shall require the system supplier to furnish the services of qualified factory-trained servicemen to assist in the installation of the instrumentation and control system equipment.

B. Install each item in accordance with manufacturer's recommendations in accordance with the Contract Documents. Transmitters and instruments which require access for periodic calibration or maintenance shall be mounted so they are accessible while standing on the floor. Care shall be taken in the installation to ensure sufficient space is provided between instruments and other equipment or piping to allow for easy removal and servicing.

C. All items shall be mounted and anchored using stainless steel hardware unless otherwise noted.

D. All field instruments shall be rigidly secured to walls, stands, or brackets as required by the manufacturer and as shown on the Contract Drawings.

E. Conform to all applicable provisions of the NEMA standards, NEC, and local, State, and Federal codes when installing the equipment and interconnecting wiring.

SECTION 40 9443

PLANT CONTROL SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 specification sections, apply to this section.

B. Related Sections: The following sections contain requirements that relate to this section.
1. Division 26 Section “Basic Electrical Requirements”.
2. Division 26 Section “Basic Electrical Materials”.
3. Division 26 Section “Signal and Communication Cables”.
4. Division 26 Section “Wires, Cables, and Connectors”.
5. Division 40 Section “Instrumentation – General”.
6. Division 40 Section “Control Panels”.

1.2 DESCRIPTION OF WORK

A. General: Provide all labor, tools, equipment, and materials necessary for a complete and operational Plant Control System in accordance with the plans and as specified herein.

B. Contractor shall furnish all labor, materials, and components, and shall provide all design, assembly, testing, and start-up services required to provide a complete and operational programmable controller system (referred to herein as PLC) as specified and shown on the Drawings. The system includes, but is not necessarily limited to the following:
1. Processor modules.
2. Communication equipment.
3. Input/output (I/O) modules.
4. Operator interface equipment.
5. Mounting racks.
6. Power supplies.
7. Programming equipment.
8. Software.

1.3 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with requirements of the National Electrical Code (NEC) and all other applicable federal, state, and local codes and regulatory requirements.

B. Standards: Materials and workmanship shall conform to the following standards:
1. National Electrical Manufacturers Association (NEMA).
2. Institute of Electrical and Electronic Engineers (IEEE).
3. American National Standards Institute (ANSI).
4. National Fire Protection Association (NFPA).
5. Underwriters' Laboratories (UL).
6. International Society for Measurement and Control (ISA).

C. Qualifications
   1. Manufacturer's Qualifications: Firms regularly engaged in the manufacture of programmable logic controllers (PLCs) whose products have been in satisfactory use in similar service for not less than 5 years.
   2. Installer's Qualifications: Firm with at least 5 years of successful installation experience on projects with materials and equipment similar to items specified herein.

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data for all components.

B. Materials List: Submit a bill of materials listing quantities, manufacturer's name, and catalog numbers.

C. Wiring Diagrams: Submit wiring diagrams showing all connections for all equipment furnished under this section. Wire, terminal, and component labeling shall follow established facility conventions where applicable.

D. System Hardware and Software Documents: Furnish a system block diagram, I/O drawings, and control strategy descriptions. Turn over all factory software documentation and manuals to the Engineer after completion of field testing.

E. Dimensional Drawings: Furnish dimensional drawings for each piece of equipment to be provided.

F. Program Documentation: Submit annotated printouts of all PLC and Human Machine Interface (HMI) programs. Provide copies of all PLC and HMI programs on a flash drive.

G. Manufacturer's Data Sheet: Provide manufacturer's data sheet on all equipment including model numbers, serial numbers, ranges, scales, and a detail of each component.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Storage and Protection: Store the items furnished under this section in a manner that meets the requirements of the manufacturer until they can be installed. Use all means necessary to protect the material of this section before, during, and after installation, and to protect the installed work and materials of all other trades.

1.6 DEFINITIONS

A. Training Day: A training day is defined as 8 hours of classroom and hands-on instruction, including two 15-minute breaks and excluding lunchtime, Monday through Friday.

1.7 SCADA ALLOWANCE

A. The Contractor shall include in the bid an allowance for the purchase of computers, accessories, peripherals, and/or furniture for the Owner. These components shall be provided by the System Integrator. The Owner shall be able to select the computers, accessories, peripherals, and/or furniture during the shop drawing review process with technical input from the System Integrator.

PART 2 - PRODUCTS

2.1 SCADA SYSTEM

A. Programmable Logic Controller (PLC) Components:
   1. Rack Mounted:
      a. Processor Module: 1756-L81E
      b. Digital Input Module: 1756-IA16I
      c. Digital Output Module: 1756-OW16I
      d. Analog Input Module: 1756-IF8I
      e. RTD Analog Input Module: 1756-IR12
      f. Analog Output Module: 1756-OF8I
      g. Communication Module: 1756-EN2T
      h. Power Supply: 1756-PA75/B
      i. Chassis: 1756-A17
   2. Protocol Gateway:
      a. Model as required for native protocol to Ethernet/IP conversion for quantity of connected devices.
      b. DIN Rail mounted
   3. Manufacturers:
      a. All components shall be manufactured by Allen-Bradley or an Encompass Partner.

B. Operator Interface Terminal (OIT):
   1. Features:
      a. Touch screen flat display
      b. LED backlit LCD
      c. 24-bit 16.7M colors
      d. Size: 15” diagonal nominal, unless otherwise noted
      e. Resolution: 1024x768, minimum
      f. Communications: Ethernet/IP, USB
      g. SD card slot
      h. NEMA 12
      i. Real-time battery backed clock
      j. Memory: 1 GB RAM and 1 GB user storage
      k. Input Power: 120VAC
   2. Manufacturers:
      a. Allen-Bradley, PanelView 5510

2.2 SCHEDULES

A. Schedule: See attachment.

PART 3 - EXECUTION

3.1 CUSTOM PROGRAMMING

A. Custom Programming of all vendor provided control panels, including their PLCs and OITs, shall be provided by that vendor under the applicable specification section of the associated equipment.
   1. Provide database spreadsheets for peer-to-peer communication coordination between other onsite PLCs that need to share data.
   2. Provide database spreadsheets for Plant HMI/SCADA communication coordination.

3. Provide annotated copies of all PLC programs.
4. Provide an electronic copy of all PLC and OIT programming files for the Owner on a flash drive. Format shall be as required to reload into PLC memory. Logic version shall be the final program after all equipment has been installed and commissioned and Operational Demonstration is complete and successful to the Owner's approval.

B. Custom Programming of non-vendor provided control panels, including their PLCs and OITs, will be provided by the Owner.

C. Custom Programming of plant's existing HMI/SCADA will be provided by the Owner.

D. Variable Frequency Drives
1. Provide programming for all VFDs connected to the network.
2. Read and display the contents of a minimum of eight registers in each VFD.
3. Coordinate with the Owner prior to the start of programming to select the register to be displayed.

E. Graphic Screens
1. Submit all graphic screens for Owner review and comment when sixty percent complete.
2. Provide navigation controls on all screens to allow movement between screens.
3. Conform to NFPA 79, Industrial Machinery on colors for indicators and controls.
4. Conform to Owner standards for colors of process equipment and piping.
5. Utilize industry standard symbols or graphically realistic drawings for process equipment.
6. Provide a separate screen for each group of process equipment.
7. Group related screens in a logical manner such as by building, plant flow, liquid stream/solids stream, etc.
8. At a minimum, provide the following screens:
    a. Plant Overview
    b. NF Building Overview
    c. Break Tank Pumps Overview
    d. NF Feed Pumps Overview
    e. NF Skids Overview
    f. Corrosion Inhibitor System Overview
    g. Sodium Hydroxide System Overview
    h. Sodium Bisulfite System Overview
    i. Antiscalant System Overview
    j. Break Tank Pump Control Graphics
    k. NF Feed Pump Control Graphics
    l. Corrosion Inhibitor Chemical Equipment Control Graphics
    m. Corrosion Inhibitor Chemical Feed Control Graphic
    n. Sodium Hydroxide Chemical Equipment Control Graphics
    o. Sodium Hydroxide Chemical Feed Control Graphic
    p. Sodium Bisulfite Chemical Equipment Control Graphics
    q. Sodium Bisulfite Chemical Feed Control Graphic
    r. Antiscalant Chemical Equipment Control Graphics
    s. Antiscalant Chemical Feed Control Graphic
    t. Chemical Feed Building Overview
    u. Sodium Hypochlorite System Overview
    v. Fluoride System Overview
    w. Sodium Hypochlorite Chemical Equipment Control Graphics
    x. Sodium Hypochlorite Chemical Feed Control Graphic

y. Fluoride Chemical Equipment Control Graphics
z. Fluoride Chemical Feed Control Graphic
aa. Electrical Service Overview
bb. Alarm Summary Screens
cc. Equipment Runtimes (with resets) Screen
dd. Totalizers Screen
ee. (10) Analog Signal Trending Screens – Owner Directed
ff. (10) Overview/Control Screens – Owner Directed

F. Global Programmed Control Strategies
1. Meet with Plant Personnel before start of programming to determine:
a. Time of day for resetting of daily totalizers
b. Security Levels for all screens
c. The master PCS clock and approach to sync network devices
2. Display all alarms at the HMI.
3. Provide means to acknowledge all alarms at the HMI.
4. Provide alarms for PLC failure and network failure.
5. Totalize the number of starts for all process equipment and display on the plant HMI.
6. All process setpoints displayed on HMI screens and read back for confirmation.
7. All process setpoints adjustable from the HMI screens with correct security level.
8. Perform a runtime calculation for all process equipment at PLC and display at the HMI.
9. Display rate, total, and daily total for all process flows at the HMI.
10. Display all process levels at the HMI.
11. Store average daily flow rates and peak hourly flow rates of all flow meters one year or more at SCADA.
12. One year of data shall be stored for trending with data saved every 15 minutes. Daily totals shall also be saved. Each year, or at any time, the Operator shall be able to copy this data to a CD or DVD in a spreadsheet format.
13. All inline instrumentation shall be shown with instantaneous values on the HMI. One year of data shall be stored for trending. Each year, or at any time, the Operator shall be able to copy this data to a CD or DVD in a spreadsheet format.
14. All data shall be automatically graphed when chosen by the operator. These trending graphs shall not reset when closed or when the operator switches between data screens or other graphs.
15. All bits/elements in PLC logic shall be commented. If not used, then comment as SPARE.
16. SCADA historical graphs shall include programming to constantly refresh to appear as a “live, historical trend“.

G. SCADA Programming Funtional Requirements
1. The Functional Descriptions below are intended to aid in defining the scope of work for PLC/OIT/HMI programming. These functional descriptions are intended to be supplemental to the requirements as shown on the Drawings. Hardwired interlocks for equipment control may not be described below. Hardwired interlocks shall be mimicked in PLC logic.
2. Where the referenced detail applies to multiple, similar equipment controls, only one is described. Control for associated equipment is similar.
3. Reference the PLC I/O schedules. The PLC I/O shall be utilized by PLC/HMI programming, as required, to allow the respective equipment to function as described by the Contract Documents.

a. All alarm and equipment status monitoring PLC I/O inputted into the Plant Control System (PCS) shall be annunciated via the HMI.

4. All references to set points as "adjustable" below shall include the capability to adjust the set point via the HMI.

5. FUNCTIONAL DESCRIPTION INDEX:
   a. "6. NF BUILDING BREAK TANK"
   b. "7. NF BUILDING SOFTENING SYSTEM"
   c. "8. CORROSION INHIBITOR CHEMICAL FEED SYSTEM"
   d. "9. SODIUM HYDROXIDE CHEMICAL FEED SYSTEM"
   e. "10. SODIUM BISULFITE CHEMICAL FEED SYSTEM"
   f. "11. ANTISCALANT CHEMICAL FEED SYSTEM"
   g. "12. SODIUM HYPOCHLORITE CHEMICAL FEED SYSTEM"
   h. "13. FLUORIDE CHEMICAL FEED SYSTEM"
   i. "14. HIGH SERVICE PUMPS"
   j. "15. EXISTING PROCESS CONTROL MODIFICATIONS"
   k. "16. EMERGENCY POWER"
   l. "17. CRITICAL ALARMS"

6. NF BUILDING BREAK TANK
   a. Break Tank 1 Level
      1) General: Used to continuously monitor the liquid level in the Break Tank.
      2) Control:
         a) Local: None
         b) PCS: None
      3) Logic Interlocks/Permissives:
         a) Used for control of existing groundwater wells.
      4) Monitoring:
         a) Local: Instantaneous level indication
         b) PCS: Break Tank 1 Level
      5) Alarms:
         a) Local: None
         b) PCS: High-High, High, Low, Low-Low Break Tank 1 Level, Loss of Signal
   b. Break Tank 1 Low Cutoff Level
      1) General: Used to protect the Break Tank Pumps from operating when level is too low.
      2) Control:
         a) Local: None
         b) PCS: None
      3) Logic Interlocks/Permissives:
         a) None
      4) Monitoring:
         a) Local: None
         b) PCS: None
      5) Alarms:
         a) Local: None
         b) PCS: Break Tank 1 Low Level

7. NF BUILDING SOFTENING SYSTEM
   a. Break Tank Pump 1

1) General: Used to source water from the Break Tank to the NF Building process (softening and/or bypass).
2) Control:
    a) Local: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the LOCAL position, the operator shall have the ability to START and STOP the pump via the START/STOP pushbuttons.
    b) VFD: The VFD frequency can be manually adjusted utilizing the potentiometer or VFD HIM module at the VFD.
    c) PCS: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of Break Tank Pump 1 via the HMI.
        (1) PC MANUAL: The operator shall have the ability to manually start/stop and adjust the frequency of Break Tank Pump 1.
        (2) AUTO: Break Tank Pump 1 shall be automatically controlled via PLC programming. Break Tank Pump 1 speed shall be varied maintain an operator entered NF Feed Pump Suction Header Pressure setpoint. Break Tank Pumps shall be assigned a Lead, Lag 1, Lag 2, or Standby role and start/stop as needed to meet the setpoint.
3) Logic Interlocks/Permissives:
    a) NF Bypass Valve must not be closed for the pump to operate.
4) Monitoring:
    a) Local: Running, Stopped
    b) VFD: Running, Stopped, Frequency, Amps, Volts
    c) PCS: Remote, Running, Stopped, Frequency, Amps, Volts, VFD LOR Switch Position
5) Alarms:
    a) Local: General Alarm
    b) VFD: VFD Fault Alarm
    c) PCS: Motor High Temperature, High Discharge Pressure, VFD Fault, Loss of Signal

b. Break Tank Pump 1 Discharge Pressure
1) General: Used to continuously monitor the discharge pressure for Break Tank Pump 1.
2) Control:
    a) Local: None
    b) PCS: None
3) Logic Interlocks/Permissives:
    a) None
4) Monitoring:
    a) Local: Instantaneous pressure indication
    b) PCS: Break Tank Pump 1 Discharge Pressure
5) Alarms:
    a) Local: None
    b) PCS: High-High, High, Low, Low-Low Break Tank Pump 1 Discharge Pressure, Loss of Signal

c. NF Bypass Flow
1) General: Used to continuously monitor the NF Bypass flow rate.
2) Control:

a) Local: None
b) PCS: None

3) Logic Interlocks/Permissives:
a) Reference the NF Bypass Flow Control Loop

4) Monitoring:
a) Local: Instantaneous flow indication
b) PCS: NF Bypass Flow

5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low NF Bypass Flow, Loss of Signal

d. NF Bypass Flow Control Valve

1) General: Used to divert flow around the membrane skids.

2) Control:
a) Local: With the LOCAL-STOP-REMOTE selector switch at the actuator in the LOCAL position, the operator can open or close the valve by using the OPEN-CLOSE selector switch at the actuator. With the LOCAL-STOP-REMOTE selector switch at the actuator in the STOP position, the actuator will stop and maintain its current position.
b) PCS: With the LOCAL-STOP-REMOTE selector switch at the actuator in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the NF Bypass Flow Control Valve via the HMI.
(1) PC MANUAL: The operator shall have the ability to manually set a desired position.
(2) AUTO: The NF Bypass Flow Control Valve shall be automatically controlled via PLC programming. Operators shall have the ability to select between FIXED, HARDNESS, and PERCENT control modes.
(a) FIXED: The valve position shall vary in order to maintain an operator entered desired NF Bypass Flow rate.
(b) HARDNESS: The valve position shall vary in order to maintain an operator entered desired Blended Water Hardness.
a. If no Break Tank Pumps are operating and a plant run command is active, the valve shall move to the operator entered plant startup initial position and shall remain at that position until a Break Tank Pump starts operating.
b. Flow rate = [(BW flowrate x BW hardness) – (NFP flowrate x NFP hardness)] / NFF hardness
(c) PERCENT: The valve position shall vary in order to maintain an operator entered desired NF Bypass Flow rate as a percentage of Blended Water Flow.
a. If no Break Tank Pumps are operating and a plant run command is active, the valve shall move to the operator entered plant startup

initial position and shall remain at that position until a Break Tank Pump starts operating.

3) Logic Interlocks/Permissives: None
4) Monitoring:
   a) Local: Opened, Closed, Position
   b) PCS: Remote, Opened, Closed, Position
5) Alarms:
   a) Local: Fault
   b) PCS: Fault, Loss of Signal

e. Break Tank Pumps Discharge Header Pressure
1) General: Used to continuously monitor the pressure for Break Tank Pump Discharge Header.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) None
4) Monitoring:
   a) Local: Instantaneous pressure indication
   b) PCS: Break Tank Pumps Discharge Header Pressure
5) Alarms:
   a) Local: None
   b) PCS: High-High, High, Low, Low-Low Break Tank Pumps Header Discharge Pressure, Loss of Signal

f. Cartridge Filter 1 Differential Pressure
1) General: Used to monitor if the Cartridge Filter needs cleaned.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) None
4) Monitoring:
   a) Local: Instantaneous differential pressure indication
   b) PCS: Cartridge Filter 1 Differential Pressure
5) Alarms:
   a) Local: None
   b) PCS: High-High, High, Low, Low-Low Cartridge Filter 1 Differential Pressure, Loss of Signal

g. NF Feed ORP (Pre-Injection) Level
1) General: Used to continuously monitor the ORP level of the NF Feed water prior to chemical injection.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) Used for chemical feed dosing calculations.
4) Monitoring:
   a) Local: Instantaneous ORP level indication
   b) PCS: NF Feed ORP (Pre-Injection) Level
5) Alarms:

a) Local: None
b) PCS: High-High, High, Low, Low-Low NF Feed ORP (Pre-Injection) Level, Loss of Signal

h. NF Feed Pumps Suction Header Pressure
1) General: Used to continuously monitor the pressure for NF Feed Pumps Suction Header.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) Used for Break Tank Pump speed control.
4) Monitoring:
a) Local: Instantaneous pressure indication
b) PCS: NF Feed Pumps Suction Header Pressure
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low NF Feed Pumps Suction Header Pressure, Loss of Signal

i. NF Feed ORP (Post-Injection) Level
1) General: Used to continuously monitor the ORP level of the NF Feed water after chemical injection.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) None
4) Monitoring:
a) Local: Instantaneous ORP level indication
b) PCS: NF Feed ORP (Post-Injection) Level
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low NF Feed ORP (Post-Injection) Level, Loss of Signal

j. NF Feed Pump 1 Suction Pressure
1) General: Used to continuously monitor the pressure for NF Feed Pump 1 Suction.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) None
4) Monitoring:
a) Local: Instantaneous pressure indication
b) PCS: NF Feed Pump 1 Suction Pressure
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low NF Feed Pump 1 Suction Pressure, Loss of Signal

k. NF Feed Pump 1
1) General: Used to source water to the membrane skids.
2) Control:

a) Local: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the LOCAL position, the operator shall have the ability to START and STOP the pump via the START/STOP pushbuttons.
b) VFD: The VFD frequency can be manually adjusted utilizing the potentiometer or VFD HIM module at the VFD.
c) PCS: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of NF Feed Pump 1 via the HMI.
(1) PC MANUAL: The operator shall have the ability to manually start/stop and adjust the frequency of NF Feed Pump 1.
(2) AUTO: NF Feed Pump 1 shall be automatically controlled via PLC programming. NF Feed Pump 1 speed shall be varied as called for by the NF Skids Master PLC.

3) Logic Interlocks/Permissives: None
4) Monitoring:
a) Local: Running, Stopped
b) VFD: Running, Stopped, Frequency, Amps, Volts
c) PCS: Remote, Running, Stopped, (2) Vibration Sensors, (2) Motor Bearing Temps, Frequency, Amps, Volts, VFD LOR Switch Position
5) Alarms:
a) Local: General Alarm
b) VFD: VFD Fault Alarm
c) PCS: Motor High Temperature, (2) High Vibration Alarms, (2) High Bearing Temp Alarm, Low Suction Pressure, High Discharge Pressure, VFD Fault, Loss of Signal

l. NF Feed Pump 1 Discharge Pressure
1) General: Used to continuously monitor the pressure for NF Feed Pump 1 Discharge.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) None
4) Monitoring:
a) Local: Instantaneous pressure indication
b) PCS: NF Feed Pump 1 Discharge Pressure
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low NF Feed Pump 1 Discharge Pressure, Loss of Signal

m. Degasifier 1
1) General: Used to remove gases from the water before entering the clearwell.
2) Control:
a) Local: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the LOCAL position, the operator shall have the ability to START and STOP the blower via the START/STOP pushbuttons.

b) PCS: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of Degasifier 1 via the HMI.
(1) PC MANUAL: The operator shall have the ability to manually start/stop Degasifier 1.
(2) AUTO: Degasifier 1 shall be automatically controlled via PLC programming. Degasifier 1 shall operate whenever the plant is running.

3) Logic Interlocks/Permissives: None
4) Monitoring:
a) Local: Running, Stopped
b) PCS: Running, Stopped, Remote
5) Alarms:
a) Local: Alarm
b) PCS: Motor High Temperature, Motor Overload

n. Degasifier 1 Inlet Screen Differential Pressure
1) General: Used to monitor if Degasifier 1 Screen needs cleaned.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) None
4) Monitoring:
a) Local: Instantaneous differential pressure indication
b) PCS: Degasifier 1 Screen Differential Pressure
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low Degasifier 1 Inlet Screen Differential Pressure, Loss of Signal

o. Blended Water Flow
1) General: Used to continuously monitor the Blended Water flow rate.
2) Control:
a) Local: None
b) PCS: Operator shall have the ability to select MAINTENANCE, FLOWMETER, or SUM TOTAL as the BW Flow signal source via the HMI.
(1) MAINTENANCE: The operator shall have the ability to enter in a flow value during flowmeter maintenance to reduce impact on chemical feed systems.
(2) FLOWMETER: The signal from this flowmeter is used.
(3) SUM TOTAL: The sum of all Skid Discharge Flows plus the NF Bypass Flow signal is used.
3) Logic Interlocks/Permissives:
a) Used for the chemical feed dosing calculations.
4) Monitoring:
a) Local: Instantaneous flow indication
b) PCS: Blended Water Flow
5) Alarms:
a) Local: None

b) PCS: High-High, High, Low, Low-Low Blended Water Flow, Loss of Signal

p. Blended Water pH
1) General: Used to continuously monitor the pH level of the Blended Water.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) Used for chemical feed dosing calculations.
4) Monitoring:
a) Local: Instantaneous pH indication
b) PCS: Blended Water pH
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low Blended Water pH, Loss of Signal

q. Blended Water Chlorine Residual
1) General: Used to continuously monitor the chlorine residual of the Blended Water.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) None
4) Monitoring:
a) Local: Instantaneous Chlorine Residual indication
b) PCS: Blended Water Chlorine Residual
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low Blended Water Chlorine Residual, Loss of Signal

r. Blended Water Fluoride Residual
1) General: Used to continuously monitor the fluoride residual of the Blended Water.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) None
4) Monitoring:
a) Local: Instantaneous Fluoride Residual indication
b) PCS: Blended Water Fluoride Residual
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low Blended Water Fluoride Residual, Loss of Signal

s. Blended Water Phosphate Residual
1) General: Used to continuously monitor the phosphate residual of the Blended Water.
2) Control:
a) Local: None

b) PCS: None

3) Logic Interlocks/Permissives:
   a) None
4) Monitoring:
   a) Local: Instantaneous Phosphate Residual indication
   b) PCS: Blended Water Phosphate Residual
5) Alarms:
   a) Local: None
   b) PCS: High-High, High, Low, Low-Low Blended Water Phosphate Residual, Loss of Signal

t. NF Concentrate Conductivity
1) General: Used to continuously monitor the conductivity of the skid concentrate.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) None
4) Monitoring:
   a) Local: Instantaneous conductivity indication
   b) PCS: NF Concentrate Conductivity
5) Alarms:
   a) Local: None
   b) PCS: High-High, High, Low, Low-Low NF Concentrate Conductivity, Loss of Signal

u. NF Concentrate pH
1) General: Used to continuously monitor the pH level of the NF Concentrate.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) None
4) Monitoring:
   a) Local: Instantaneous pH indication
   b) PCS: NF Concentrate pH
5) Alarms:
   a) Local: None
   b) PCS: High-High, High, Low, Low-Low NF Concentrate pH, Loss of Signal

v. NF Skid Control Interface
1) General: All control of individual NF Skids, Membrane Cleaning System, and associated equipment is performed by the NF Skids Master PLC. Custom programming requirements for that vendored system are specified under Section 466340. Programming requirements described below are provided under this Section for NF Building ACP PLC/OIT and SCADA.
2) Operator shall have the ability to enter the following water quality parameters for NF Feed and NF Permeate. These values will be used to determine the NF Bypass flowrate when operated in HARDNESS mode.
   a) Total Hardness in NF Feed (THNFF = 366 mg/L as $CaCO_3$
   b) Total Hardness in NF Permeate (THNFP = 10.8 mg/L as $CaCO_3$
3) PLC shall calculate and SCADA shall indicate and trend the following:

a) Total NF Feed flow rate (Total NFF = NFP + NFC)
b) NF Bypass Flow (NFB = NFP x %NFB).
c) Indicate Raw Water Flow Rate (RW = NFF + NFB).
d) Actual %NFB (%NFB = NFB / BLW)
(1) NFB from flow meter
(2) BLW = NFP flow meters from skids + NFB flow meter
(3) THBLW = [(NFB x THNFF) + (NFP x THNFP)] / BW

4) All Skid OIT and MCS screen information and operator entry shall be duplicated at SCADA.

w. NF Process Start/Stop

1) Control: Operator shall have the ability to place the softening process on automated Start/Stop control. If enabled, the plant shall start if the existing clearwell level drops below an operator adjustable setpoint. The plant shall shutdown if the clearwell level rises above an operator adjustable setpoint. Operator shall have the ability to select which clearwell level to use as the primary control signal.

2) When the plant startup is auto initiated:
a) Open NF Bypass Valve to initial setpoint.
b) Start Chemical Feed Systems.
c) Start Break Tank Pump.
d) Start UV System.
e) Start NF Feed Pumps and NF Skids (in multiples of two). The quantity of skids needed shall be based on NF Skid Call Level setpoints.

3) When the plant shutdown is auto initiated:
a) NF Skids and NF Feed Pumps shall perform a permeate flush or forward flush before stopping.
b) Break Tank Pumps shall continue to operate until all NF Skids and NF Feed Pumps have stopped.
c) Stop UV System.
d) Close NF Bypass Valve.
e) Stop Chemical Feed Systems.

8. CORROSION INHIBITOR CHEMICAL FEED SYSTEM

a. Corrosion Inhibitor Storage Tank 1 Level

1) General: Used to continuously monitor the liquid level in Corrosion Inhibitor Storage Tank 1.

2) Control:
a) Local: None
b) PCS: None

3) Logic Interlocks/Permissives:
a) Reference the Corrosion Inhibitor Chemical Transfer Sequence.

4) Monitoring:
a) Local: Instantaneous level indication
b) PCS: Corrosion Inhibitor Storage Tank 1 Level

5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low Corrosion Inhibitor Storage Tank 1 Level, Loss of Signal

b. Corrosion Inhibitor Storage Tank 1 Outlet Valve

1) General: Used to isolate Corrosion Inhibitor Storage Tank 1 from the outlet header.
2) Control:
   a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
   b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
      (4) PC MANUAL: The operator shall have the ability to open or close the valve.
      (5) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Corrosion Inhibitor Chemical Transfer Sequence.
3) Logic Interlocks/Permissives:
   a) Reference the Corrosion Inhibitor Chemical Transfer Sequence.
4) Monitoring:
   a) Local: Opened, Closed
   b) PCS: Remote, Opened, Closed
5) Alarms:
   a) Local: None
   b) PCS: None

c. Corrosion Inhibitor Storage Tank 1 Recirc Valve
1) General: Used to direct chemical to Corrosion Inhibitor Storage Tank 1 from the transfer pump.
2) Control:
   a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
   b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
      (1) PC MANUAL: The operator shall have the ability to open or close the valve.
      (2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Corrosion Inhibitor Chemical Transfer Sequence.
3) Logic Interlocks/Permissives:
   a) Reference the Corrosion Inhibitor Chemical Transfer Sequence
4) Monitoring:
   a) Local: Opened, Closed
   b) PCS: Remote, Opened, Closed
5) Alarms:
   a) Local: None
   b) PCS: None

d. Corrosion Inhibitor Transfer Pump
1) General: Used to pump Corrosion Inhibitor chemical between tanks.
2) Control:

a) Local: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the LOCAL position, the operator shall have the ability to START and STOP the pump via the START/STOP pushbuttons.
b) PCS: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI.
(1) PC MANUAL: The operator shall have the ability to manually start/stop the pump.
(2) AUTO: Corrosion Inhibitor Transfer Pump shall be automatically controlled via PLC programming. The pump shall operate as called for by the Corrosion Inhibitor Chemical Transfer Sequence.

3) Logic Interlocks/Permissives:
a) Reference the Corrosion Inhibitor Chemical Transfer Sequence.

4) Monitoring:
a) Local: Running, Stopped
b) PCS: Running, Stopped, Remote

5) Alarms:
a) Local: Alarm
b) PCS: Motor High Temperature, Motor Overload

e. Corrosion Inhibitor Day Tank Inlet Valve

1) General: Used to direct chemical to Corrosion Inhibitor Day Tank from the transfer pump.

2) Control:
a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
(1) PC MANUAL: The operator shall have the ability to open or close the valve.
(2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Corrosion Inhibitor Chemical Transfer Sequence.

3) Logic Interlocks/Permissives:
a) Reference the Corrosion Inhibitor Chemical Transfer Sequence.

4) Monitoring:
a) Local: Opened, Closed
b) PCS: Remote, Opened, Closed

5) Alarms:
a) Local: None
b) PCS: None

f. Corrosion Inhibitor Day Tank High Level

1) General: Used to prevent overfilling the day tank.

2) Control:
a) Local: None.
b) PCS: None.

3) Logic Interlocks/Permissives:
   a) Reference the Corrosion Inhibitor Chemical Transfer Sequence.
4) Monitoring:
   a) Local: None
   b) PCS: None
5) Alarms:
   a) Local: None
   b) PCS: Corrosion Inhibitor Day Tank High Level

g. Corrosion Inhibitor Day Tank Weight
1) General: Used to continuously monitor the weight of the Corrosion Inhibitor Day Tank.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) Reference the Corrosion Inhibitor Chemical Transfer Sequence.
4) Monitoring:
   a) Local: Instantaneous weight indication
   b) PCS: Corrosion Inhibitor Day Tank Weight
5) Alarms:
   a) Local: None
   b) PCS: High-High, High, Low, Low-Low Corrosion Inhibitor Day Tank Weight, Loss of Signal

h. Corrosion Inhibitor Feed Pump 1
1) General: Used to inject Corrosion Inhibitor into the water for treatment.
2) Control:
   a) Local: With the LOCAL-REMOTE selector switch at the pump in the LOCAL position, the operator can operate the pump per the manufacturer's interface.
   b) PCS: With the LOCAL-REMOTE selector switch at the pump in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI. Operator shall have the ability to enter the solution concentration, specific gravity, and pump capacity.
      (1) PC MANUAL: The operator shall have the ability to manually start/stop the pump and set a desired speed.
      (2) AUTO: Corrosion Inhibitor Feed Pump 1 shall be automatically controlled via PLC programming. Operators shall have the ability to select between FIXED and DOSE control modes.
         (a) FIXED: The pump speed shall maintain an operator entered desired lbs/day setpoint.
         (b) DOSE: The pump speed shall vary in order to maintain an operator entered desired mg/L setpoint.
3) Logic Interlocks/Permissives:
   a) Corrosion Inhibitor Day Tank Low-Low Level Alarm must be inactive for pump to operate.
4) Monitoring:
   a) Local: Running, Stopped
   b) PCS: Running, Stopped, Remote
5) Alarms:

a) Local: Fault
b) PCS: Fault, Loss of Signal, Flow Deviation Alarm

i. Corrosion Inhibitor Chemical Transfer Sequence
1) General: Used for automated control of transferring chemical between tanks.
2) Control:
a) Local: The operator shall have the ability at the LCP to manually operate system equipment to transfer chemical.
b) PCS: The chemical transfer sequence shall automatically enable the piping path and start/stop and open/close devices as configured by an operator via the HMI. The operator shall choose the desired function by pressing the TRANSFER, RECIRC, or DAY TANK FILL pushbuttons on the HMI.
(1) TRANSFER:
a. The operator shall select the source Storage Tank, destination Storage Tank, and enter a Stop level setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the source tank outlet valve and destination tank recirc valve shall open.
d. Once both opened, the transfer pump shall operate until the Stop level is reached.
e. Once the level is reached, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The source storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. The destination storage tank High Level Alarm must be inactive for the transfer pump to start.
i. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.
j. All applicable equipment must not have any active alarms in order to initiate the transfer.
(2) RECIRC:
a. The operator shall select a storage tank and enter a desired time duration setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the storage tank outlet and recirc valves shall open.
d. Once both opened, the transfer pump shall operate until the time duration has expired.
e. Once time expires, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the sequence.
i. All applicable equipment must not have any active alarms in order to initiate the sequence.

(3) DAY TANK FILL:

a. The operator shall select the source storage tank and enter a Stop weight setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the storage tank outlet valve and day tank inlet valve shall open.
d. Once both opened, the transfer pump shall operate until the Stop weight is reached.
e. Once the weight is reached, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. Day Tank High Weight Alarm must be inactive for the transfer pump to start.
i. Day Tank High Level Alarm must be inactive for the transfer pump to start.
j. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.
k. All applicable equipment must not have any active alarms in order to initiate the transfer.

j. Corrosion Inhibitor Feed Room Emergency Eyewash/Shower Flow Switch
1) General: Used to detect an activation of the emergency eyewash/shower.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives: None
4) Monitoring:
a) Local: None
b) PCS: None
5) Alarms:
a) Local: None
b) PCS: Corrosion Inhibitor Feed Room Emergency Eyewash/Shower Activated

k. Corrosion Inhibitor Containment Area Wet Floor Switch
1) General: Used to detect a Corrosion Inhibitor tank leak.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives: None
4) Monitoring:
a) Local: None
b) PCS: None
5) Alarms:
a) Local: None
b) PCS: Corrosion Inhibitor Containment Area Wet Floor Switch Activated

9. SODIUM HYDROXIDE CHEMICAL FEED SYSTEM

a. Sodium Hydroxide Storage Tank 1 Level
   1) General: Used to continuously monitor the liquid level in Sodium Hydroxide Storage Tank 1.
   2) Control:
      a) Local: None
      b) PCS: None
   3) Logic Interlocks/Permissives:
      a) Reference the Sodium Hydroxide Chemical Transfer Sequence.
   4) Monitoring:
      a) Local: Instantaneous level indication
      b) PCS: Sodium Hydroxide Storage Tank 1 Level
   5) Alarms:
      a) Local: None
      b) PCS: High-High, High, Low, Low-Low Sodium Hydroxide Storage Tank 1 Level, Loss of Signal

b. Sodium Hydroxide Storage Tank 1 Outlet Valve
   1) General: Used to isolate Sodium Hydroxide Storage Tank 1 from the outlet header.
   2) Control:
      a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
      b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
         (1) PC MANUAL: The operator shall have the ability to open or close the valve.
         (2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Sodium Hydroxide Chemical Transfer Sequence.
   3) Logic Interlocks/Permissives:
      a) Reference the Sodium Hydroxide Chemical Transfer Sequence.
   4) Monitoring:
      a) Local: Opened, Closed
      b) PCS: Remote, Opened, Closed
   5) Alarms:
      a) Local: None
      b) PCS: None

c. Sodium Hydroxide Storage Tank 1 Recirc Valve
   1) General: Used to direct chemical to Sodium Hydroxide Storage Tank 1 from the transfer pump.
   2) Control:
      a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
      b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.

(1) PC MANUAL: The operator shall have the ability to open or close the valve.
(2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Sodium Hydroxide Chemical Transfer Sequence.

3) Logic Interlocks/Permissives:
a) Reference the Sodium Hydroxide Chemical Transfer Sequence

4) Monitoring:
a) Local: Opened, Closed
b) PCS: Remote, Opened, Closed

5) Alarms:
a) Local: None
b) PCS: None

d. Sodium Hydroxide Transfer Pump

1) General: Used to pump Sodium Hydroxide chemical between tanks.

2) Control:
a) Local: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the LOCAL position, the operator shall have the ability to START and STOP the pump via the START/STOP pushbuttons.
b) PCS: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI.
(1) PC MANUAL: The operator shall have the ability to manually start/stop the pump.
(2) AUTO: Sodium Hydroxide Transfer Pump shall be automatically controlled via PLC programming. The pump shall operate as called for by the Sodium Hydroxide Chemical Transfer Sequence.

3) Logic Interlocks/Permissives:
a) Reference the Sodium Hydroxide Chemical Transfer Sequence.

4) Monitoring:
a) Local: Running, Stopped
b) PCS: Running, Stopped, Remote

5) Alarms:
a) Local: Alarm
b) PCS: Motor High Temperature, Motor Overload

e. Sodium Hydroxide Day Tank Inlet Valve

1) General: Used to direct chemical to Sodium Hydroxide Day Tank from the transfer pump.

2) Control:
a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
(1) PC MANUAL: The operator shall have the ability to open or close the valve.

(2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Sodium Hydroxide Chemical Transfer Sequence.

3) Logic Interlocks/Permissives:
   a) Reference the Sodium Hydroxide Chemical Transfer Sequence.
4) Monitoring:
   a) Local: Opened, Closed
   b) PCS: Remote, Opened, Closed
5) Alarms:
   a) Local: None
   b) PCS: None

f. Sodium Hydroxide Day Tank High Level
1) General: Used to prevent overfilling the day tank.
2) Control:
   a) Local: None.
   b) PCS: None.
3) Logic Interlocks/Permissives:
   a) Reference the Sodium Hydroxide Chemical Transfer Sequence.
4) Monitoring:
   a) Local: None
   b) PCS: None
5) Alarms:
   a) Local: None
   b) PCS: Sodium Hydroxide Day Tank High Level

g. Sodium Hydroxide Day Tank Weight
1) General: Used to continuously monitor the weight of the Sodium Hydroxide Day Tank.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) Reference the Sodium Hydroxide Chemical Transfer Sequence.
4) Monitoring:
   a) Local: Instantaneous weight indication
   b) PCS: Sodium Hydroxide Day Tank Weight
5) Alarms:
   a) Local: None
   b) PCS: High-High, High, Low, Low-Low Sodium Hydroxide Day Tank Weight, Loss of Signal

h. Sodium Hydroxide Feed Pump 1
1) General: Used to inject Sodium Hydroxide into the water for treatment.
2) Control:
   a) Local: With the LOCAL-REMOTE selector switch at the pump in the LOCAL position, the operator can operate the pump per the manufacturer's interface.
   b) PCS: With the LOCAL-REMOTE selector switch at the pump in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI. Operator shall have the ability to enter the solution concentration, specific gravity, and pump capacity.

(1) PC MANUAL: The operator shall have the ability to manually start/stop the pump and set a desired speed.
(2) AUTO: Sodium Hydroxide Feed Pump 1 shall be automatically controlled via PLC programming. Operators shall have the ability to select between FIXED and DOSE control modes.
(a) FIXED: The pump speed shall maintain an operator entered desired lbs/day setpoint.
(b) DOSE: The pump speed shall vary in order to maintain an operator entered desired Blended Water pH setpoint.

3) Logic Interlocks/Permissives:
a) Sodium Hydroxide Day Tank Low-Low Level Alarm must be inactive for pump to operate.

4) Monitoring:
a) Local: Running, Stopped
b) PCS: Running, Stopped, Remote

5) Alarms:
a) Local: Fault
b) PCS: Fault, Loss of Signal, Flow Deviation Alarm

i. Sodium Hydroxide Carrier Water Valve

1) General: Used to convey chemical for injection into the process stream.

2) Control:
a) Local: None
b) PCS: The operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
(1) PC MANUAL: The operator shall have the ability to open or close the valve.
(2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall be open when any Sodium Hydroxide Feed Pump is operating.

3) Logic Interlocks/Permissives:
a) None

4) Monitoring:
a) Local: None
b) PCS: Opened, Closed

5) Alarms:
a) Local: None
b) PCS: None

j. Sodium Hydroxide Chemical Transfer Sequence

1) General: Used for automated control of transferring chemical between tanks.

2) Control:
a) Local: The operator shall have the ability at the LCP to manually operate system equipment to transfer chemical.
b) PCS: The chemical transfer sequence shall automatically enable the piping path and start/stop and open/close devices as configured by an operator via the HMI. The operator shall choose the desired function by pressing the TRANSFER, RECIRC, or DAY TANK FILL pushbuttons on the HMI.
(1) TRANSFER:
a. The operator shall select the source Storage Tank, destination Storage Tank, and enter a Stop level setpoint.

b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the source tank outlet valve and destination tank recirc valve shall open.
d. Once both opened, the transfer pump shall operate until the Stop level is reached.
e. Once the level is reached, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The source storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. The destination storage tank High Level Alarm must be inactive for the transfer pump to start.
i. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.
j. All applicable equipment must not have any active alarms in order to initiate the transfer.

(2) RECIRC:

a. The operator shall select a storage tank and enter a desired time duration setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the storage tank outlet and recirc valves shall open.
d. Once both opened, the transfer pump shall operate until the time duration has expired.
e. Once time expires, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the sequence.
i. All applicable equipment must not have any active alarms in order to initiate the sequence.

(3) DAY TANK FILL:

a. The operator shall select the source storage tank and enter a Stop weight setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the storage tank outlet valve and day tank inlet valve shall open.
d. Once both opened, the transfer pump shall operate until the Stop weight is reached.
e. Once the weight is reached, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.

h. Day Tank High Weight Alarm must be inactive for the transfer pump to start.
i. Day Tank High Level Alarm must be inactive for the transfer pump to start.
j. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.
k. All applicable equipment must not have any active alarms in order to initiate the transfer.

k. Sodium Hydroxide Feed Room Emergency Eyewash/Shower Flow Switch
1) General: Used to detect an activation of the emergency eyewash/shower.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives: None
4) Monitoring:
a) Local: None
b) PCS: None
5) Alarms:
a) Local: None
b) PCS: Sodium Hydroxide Feed Room Emergency Eyewash/Shower Activated

l. Sodium Hydroxide Containment Area Wet Floor Switch
1) General: Used to detect a Sodium Hydroxide tank leak.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives: None
4) Monitoring:
a) Local: None
b) PCS: None
5) Alarms:
a) Local: None
b) PCS: Sodium Hydroxide Containment Area Wet Floor Switch Activated

m. Sodium Hydroxide Feed Room Temperature
1) General: Used to continuously monitor the temperature of the Sodium Hydroxide Feed Room.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) None
4) Monitoring:
a) Local: Instantaneous temperature indication
b) PCS: Sodium Hydroxide Feed Room Temperature
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low Sodium Hydroxide Feed Room Temperature, Loss of Signal

10. SODIUM BISULFITE CHEMICAL FEED SYSTEM

a. Sodium Bisulfite Storage Tank 1 Level
   1) General: Used to continuously monitor the liquid level in Sodium Bisulfite Storage Tank 1.
   2) Control:
      a) Local: None
      b) PCS: None
   3) Logic Interlocks/Permissives:
      a) Reference the Sodium Bisulfite Chemical Transfer Sequence.
   4) Monitoring:
      a) Local: Instantaneous level indication
      b) PCS: Sodium Bisulfite Storage Tank 1 Level
   5) Alarms:
      a) Local: None
      b) PCS: High-High, High, Low, Low-Low Sodium Bisulfite Storage Tank 1 Level, Loss of Signal

b. Sodium Bisulfite Storage Tank 1 Outlet Valve
   1) General: Used to isolate Sodium Bisulfite Storage Tank 1 from the outlet header.
   2) Control:
      a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
      b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
         (1) PC MANUAL: The operator shall have the ability to open or close the valve.
         (2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Sodium Bisulfite Chemical Transfer Sequence.
   3) Logic Interlocks/Permissives:
      a) Reference the Sodium Bisulfite Chemical Transfer Sequence.
   4) Monitoring:
      a) Local: Opened, Closed
      b) PCS: Remote, Opened, Closed
   5) Alarms:
      a) Local: None
      b) PCS: None

c. Sodium Bisulfite Storage Tank 1 Recirc Valve
   1) General: Used to direct chemical to Sodium Bisulfite Storage Tank 1 from the transfer pump.
   2) Control:
      a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
      b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.

(1) PC MANUAL: The operator shall have the ability to open or close the valve.
(2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Sodium Bisulfite Chemical Transfer Sequence.

3) Logic Interlocks/Permissives:
a) Reference the Sodium Bisulfite Chemical Transfer Sequence

4) Monitoring:
a) Local: Opened, Closed
b) PCS: Remote, Opened, Closed

5) Alarms:
a) Local: None
b) PCS: None

d. Sodium Bisulfite Transfer Pump

1) General: Used to pump Sodium Bisulfite chemical between tanks.

2) Control:
a) Local: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the LOCAL position, the operator shall have the ability to START and STOP the pump via the START/STOP pushbuttons.
b) PCS: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI.
(1) PC MANUAL: The operator shall have the ability to manually start/stop the pump.
(2) AUTO: Sodium Bisulfite Transfer Pump shall be automatically controlled via PLC programming. The pump shall operate as called for by the Sodium Bisulfite Chemical Transfer Sequence.

3) Logic Interlocks/Permissives:
a) Reference the Sodium Bisulfite Chemical Transfer Sequence.

4) Monitoring:
a) Local: Running, Stopped
b) PCS: Running, Stopped, Remote

5) Alarms:
a) Local: Alarm
b) PCS: Motor High Temperature, Motor Overload

e. Sodium Bisulfite Day Tank Inlet Valve

1) General: Used to direct chemical to Sodium Bisulfite Day Tank from the transfer pump.

2) Control:
a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
(1) PC MANUAL: The operator shall have the ability to open or close the valve.

(2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Sodium Bisulfite Chemical Transfer Sequence.

3) Logic Interlocks/Permissives:
   a) Reference the Sodium Bisulfite Chemical Transfer Sequence.
4) Monitoring:
   a) Local: Opened, Closed
   b) PCS: Remote, Opened, Closed
5) Alarms:
   a) Local: None
   b) PCS: None

f. Sodium Bisulfite Day Tank High Level
1) General: Used to prevent overfilling the day tank.
2) Control:
   a) Local: None.
   b) PCS: None.
3) Logic Interlocks/Permissives:
   a) Reference the Sodium Bisulfite Chemical Transfer Sequence.
4) Monitoring:
   a) Local: None
   b) PCS: None
5) Alarms:
   a) Local: None
   b) PCS: Sodium Bisulfite Day Tank High Level

g. Sodium Bisulfite Day Tank Weight
1) General: Used to continuously monitor the weight of the Sodium Bisulfite Day Tank.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) Reference the Sodium Bisulfite Chemical Transfer Sequence.
4) Monitoring:
   a) Local: Instantaneous weight indication
   b) PCS: Sodium Bisulfite Day Tank Weight
5) Alarms:
   a) Local: None
   b) PCS: High-High, High, Low, Low-Low Sodium Bisulfite Day Tank Weight, Loss of Signal

h. Sodium Bisulfite Feed Pump 1
1) General: Used to inject Sodium Bisulfite into the water for treatment.
2) Control:
   a) Local: With the LOCAL-REMOTE selector switch at the pump in the LOCAL position, the operator can operate the pump per the manufacturer's interface.
   b) PCS: With the LOCAL-REMOTE selector switch at the pump in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI. Operator shall have the ability to enter the solution concentration, specific gravity, and pump capacity.

(1) PC MANUAL: The operator shall have the ability to manually start/stop the pump and set a desired speed.
(2) AUTO: Sodium Bisulfite Feed Pump 1 shall be automatically controlled via PLC programming. Operators shall have the ability to select between FIXED and DOSE control modes.
(a) FIXED: The pump speed shall maintain an operator entered desired lbs/day setpoint.
(b) DOSE: The pump speed shall vary in order to maintain an operator entered desired NF Feed ORP (Pre-Injection) setpoint.

3) Logic Interlocks/Permissives:
a) Sodium Bisulfite Day Tank Low-Low Level Alarm must be inactive for pump to operate.

4) Monitoring:
a) Local: Running, Stopped
b) PCS: Running, Stopped, Remote

5) Alarms:
a) Local: Fault
b) PCS: Fault, Loss of Signal, Flow Deviation Alarm

i. Sodium Bisulfite Chemical Transfer Sequence

1) General: Used for automated control of transferring chemical between tanks.

2) Control:
a) Local: The operator shall have the ability at the LCP to manually operate system equipment to transfer chemical.
b) PCS: The chemical transfer sequence shall automatically enable the piping path and start/stop and open/close devices as configured by an operator via the HMI. The operator shall choose the desired function by pressing the TRANSFER, RECIRC, or DAY TANK FILL pushbuttons on the HMI.
(1) TRANSFER:
a. The operator shall select the source Storage Tank, destination Storage Tank, and enter a Stop level setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the source tank outlet valve and destination tank recirc valve shall open.
d. Once both opened, the transfer pump shall operate until the Stop level is reached.
e. Once the level is reached, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The source storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. The destination storage tank High Level Alarm must be inactive for the transfer pump to start.
i. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.
j. All applicable equipment must not have any active alarms in order to initiate the transfer.
(2) RECIRC:

a. The operator shall select a storage tank and enter a desired time duration setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the storage tank outlet and recirc valves shall open.
d. Once both opened, the transfer pump shall operate until the time duration has expired.
e. Once time expires, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the sequence.
i. All applicable equipment must not have any active alarms in order to initiate the sequence.

(3) DAY TANK FILL:

a. The operator shall select the source storage tank and enter a Stop weight setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the storage tank outlet valve and day tank inlet valve shall open.
d. Once both opened, the transfer pump shall operate until the Stop weight is reached.
e. Once the weight is reached, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. Day Tank High Weight Alarm must be inactive for the transfer pump to start.
i. Day Tank High Level Alarm must be inactive for the transfer pump to start.
j. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.
k. All applicable equipment must not have any active alarms in order to initiate the transfer.

j. Sodium Bisulfite Feed Room Emergency Eyewash/Shower Flow Switch

1) General: Used to detect an activation of the emergency eyewash/shower.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives: None
4) Monitoring:
   a) Local: None
   b) PCS: None
5) Alarms:
   a) Local: None

b) PCS: Sodium Bisulfite Feed Room Emergency Eyewash/Shower Activated

k. Sodium Bisulfite Containment Area Wet Floor Switch
1) General: Used to detect a Sodium Bisulfite tank leak.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives: None
4) Monitoring:
a) Local: None
b) PCS: None
5) Alarms:
a) Local: None
b) PCS: Sodium Bisulfite Containment Area Wet Floor Switch Activated

l. Sodium Bisulfite Feed Room Temperature
1) General: Used to continuously monitor the temperature of the Sodium Bisulfite Feed Room.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) None
4) Monitoring:
a) Local: Instantaneous temperature indication
b) PCS: Sodium Bisulfite Feed Room Temperature
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low Sodium Bisulfite Feed Room Temperature, Loss of Signal

11. ANTISCALANT CHEMICAL FEED SYSTEM
a. Antiscalant Transfer Pump
1) General: Used to pump Antiscalant chemical between tanks.
2) Control:
a) Local: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the LOCAL position, the operator shall have the ability to START and STOP the pump via the START/STOP pushbuttons.
b) PCS: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI.
(1) PC MANUAL: The operator shall have the ability to manually start/stop the pump.
(2) AUTO: Antiscalant Transfer Pump shall be automatically controlled via PLC programming. The pump shall operate as called for by the Antiscalant Chemical Transfer Sequence.
3) Logic Interlocks/Permissives:
a) Reference the Antiscalant Chemical Transfer Sequence.
4) Monitoring:

a) Local: Running, Stopped
b) PCS: Running, Stopped, Remote

5) Alarms:
a) Local: Alarm
b) PCS: Motor High Temperature, Motor Overload

b. Antiscalant Day Tank High Level
1) General: Used to prevent overfilling the day tank.
2) Control:
a) Local: None.
b) PCS: None.
3) Logic Interlocks/Permissives:
a) Reference the Antiscalant Chemical Transfer Sequence.
4) Monitoring:
a) Local: None
b) PCS: None
5) Alarms:
a) Local: None
b) PCS: Antiscalant Day Tank High Level

c. Antiscalant Day Tank Weight
1) General: Used to continuously monitor the weight of the Antiscalant Day Tank.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) Reference the Antiscalant Chemical Transfer Sequence.
4) Monitoring:
a) Local: Instantaneous weight indication
b) PCS: Antiscalant Day Tank Weight
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low Antiscalant Day Tank Weight, Loss of Signal

d. Antiscalant Feed Pump 1
1) General: Used to inject Antiscalant into the water for treatment.
2) Control:
a) Local: With the LOCAL-REMOTE selector switch at the pump in the LOCAL position, the operator can operate the pump per the manufacturer's interface.
b) PCS: With the LOCAL-REMOTE selector switch at the pump in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI. Operator shall have the ability to enter the solution concentration, specific gravity, and pump capacity.
(1) PC MANUAL: The operator shall have the ability to manually start/stop the pump and set a desired speed.
(2) AUTO: Sodium Bisulfite Feed Pump 1 shall be automatically controlled via PLC programming. Operators shall have the ability to select between FIXED and DOSE control modes.
(a) FIXED: The pump speed shall maintain an operator entered desired lbs/day setpoint.

(b) DOSE: The pump speed shall vary in order to maintain an operator entered desired mg/L setpoint using the sum of all Skid Inlet Flows.

3) Logic Interlocks/Permissives:
   a) Antiscalant Day Tank Low-Low Level Alarm must be inactive for pump to operate.
4) Monitoring:
   a) Local: Running, Stopped
   b) PCS: Running, Stopped, Remote
5) Alarms:
   a) Local: Fault
   b) PCS: Fault, Loss of Signal, Flow Deviation Alarm

e. Antiscalant Injection Flow
   1) General: Used to detect that Antiscalant is being injected into the process stream.
   2) Control:
      a) Local: None
      b) PCS: None
   3) Logic Interlocks/Permissives:
      a) An Antiscalant Feed Pump must be operating for alarm logic to be active.
      b) Antiscalant flow must be present for an NF Skid to operate.
   4) Monitoring:
      a) Local: None
      b) PCS: None
   5) Alarms:
      a) Local: None
      b) PCS: Antiscalant No Flow Alarm

f. Antiscalant Chemical Transfer Sequence
   1) General: Used for automated control of transferring chemical between tanks.
   2) Control:
      a) Local: The operator shall have the ability at the LCP to manually operate system equipment to transfer chemical.
      b) PCS: The operator shall be able to fill the day tank automatically using PLC programming.
         (1) DAY TANK FILL:
            a. The operator shall select the source storage tank and enter a Stop weight setpoint.
            b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
            c. Once the button is pressed, the transfer pump shall operate until the Stop weight is reached.
            d. Once the weight is reached, the transfer pump shall stop.
            e. Day Tank High Weight Alarm must be inactive for the transfer pump to start.
            f. Day Tank High Level Alarm must be inactive for the transfer pump to start.
            g. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.

h. All applicable equipment must not have any active alarms in order to initiate the transfer.

12. SODIUM HYPOCHLORITE CHEMICAL FEED SYSTEM
    a. Sodium Hypochlorite Storage Tank 1 Level
        1) General: Used to continuously monitor the liquid level in Sodium Hypochlorite Storage Tank 1.
        2) Control:
            a) Local: None
            b) PCS: None
        3) Logic Interlocks/Permissives:
            a) Reference the Sodium Hypochlorite Chemical Transfer Sequence.
        4) Monitoring:
            a) Local: Instantaneous level indication
            b) PCS: Sodium Hypochlorite Storage Tank 1 Level
        5) Alarms:
            a) Local: None
            b) PCS: High-High, High, Low, Low-Low Sodium Hypochlorite Storage Tank 1 Level, Loss of Signal
    b. Sodium Hypochlorite Storage Tank 1 Outlet Valve
        1) General: Used to isolate Sodium Hypochlorite Storage Tank 1 from the outlet header.
        2) Control:
            a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
            b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
                (3) PC MANUAL: The operator shall have the ability to open or close the valve.
                (4) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Sodium Hypochlorite Chemical Transfer Sequence.
        3) Logic Interlocks/Permissives:
            a) Reference the Sodium Hypochlorite Chemical Transfer Sequence.
        4) Monitoring:
            a) Local: Opened, Closed
            b) PCS: Remote, Opened, Closed
        5) Alarms:
            a) Local: None
            b) PCS: None
    c. Sodium Hypochlorite Storage Tank 1 Recirc Valve
        1) General: Used to direct chemical to Sodium Hypochlorite Storage Tank 1 from the transfer pump.
        2) Control:
            a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.

b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
(1) PC MANUAL: The operator shall have the ability to open or close the valve.
(2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Sodium Hypochlorite Chemical Transfer Sequence.

3) Logic Interlocks/Permissives:
a) Reference the Sodium Hypochlorite Chemical Transfer Sequence

4) Monitoring:
a) Local: Opened, Closed
b) PCS: Remote, Opened, Closed

5) Alarms:
a) Local: None
b) PCS: None

d. Sodium Hypochlorite Dilution Water Flow

1) General: Used to continuously monitor the Sodium Hypochlorite Dilution Water flow rate.

2) Control:
a) Local: None
b) PCS: None

3) Logic Interlocks/Permissives:
a) Reference the Sodium Hypochlorite Dilution Control Loop.

4) Monitoring:
a) Local: Instantaneous flow indication
b) PCS: Sodium Hypochlorite Dilution Water Flow

5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low Sodium Hypochlorite Dilution Water Flow, Loss of Signal

e. Sodium Hypochlorite Storage Tank 1 Dilution Water Valve

1) General: Used to direct dilution water to Sodium Hypochlorite Storage Tank 1 to lower the solution concentration.

2) Control:
a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
(1) PC MANUAL: The operator shall have the ability to open or close the valve.
(2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Sodium Hypochlorite Dilution Control Loop.

3) Logic Interlocks/Permissives:
a) Reference the Sodium Hypochlorite Dilution Control Loop.

4) Monitoring:
a) Local: Opened, Closed

b) PCS: Remote, Opened, Closed

5) Alarms:
   a) Local: None
   b) PCS: None

f. Sodium Hypochlorite Transfer Pump
1) General: Used to pump Sodium Hypochlorite chemical between tanks.
2) Control:
   a) Local: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the LOCAL position, the operator shall have the ability to START and STOP the pump via the START/STOP pushbuttons.
   b) PCS: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI.
      (1) PC MANUAL: The operator shall have the ability to manually start/stop the pump.
      (2) AUTO: Sodium Hypochlorite Transfer Pump shall be automatically controlled via PLC programming. The pump shall operate as called for by the Sodium Hypochlorite Chemical Transfer Sequence.
3) Logic Interlocks/Permissives:
   a) Reference the Sodium Hypochlorite Chemical Transfer Sequence.
4) Monitoring:
   a) Local: Running, Stopped
   b) PCS: Running, Stopped, Remote
5) Alarms:
   a) Local: Alarm
   b) PCS: Motor High Temperature, Motor Overload

g. Sodium Hypochlorite Day Tank Inlet Valve
1) General: Used to direct chemical to Sodium Hypochlorite Day Tank from the transfer pump.
2) Control:
   a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
   b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
      (1) PC MANUAL: The operator shall have the ability to open or close the valve.
      (2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Sodium Hypochlorite Chemical Transfer Sequence.
3) Logic Interlocks/Permissives:
   a) Reference the Sodium Hypochlorite Chemical Transfer Sequence.
4) Monitoring:
   a) Local: Opened, Closed
   b) PCS: Remote, Opened, Closed
5) Alarms:

a) Local: None
b) PCS: None

h. Sodium Hypochlorite Day Tank Level
1) General: Used to continuously monitor the liquid level in Sodium Hypochlorite Day Tank.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) Reference the Sodium Hypochlorite Chemical Transfer Sequence.
4) Monitoring:
a) Local: Instantaneous level indication
b) PCS: Sodium Hypochlorite Day Tank Level
5) Alarms:
a) Local: None
b) PCS: High-High, High, Low, Low-Low Sodium Hypochlorite Day Tank Level, Loss of Signal

i. Sodium Hypochlorite Day Tank High Level
1) General: Used to prevent overfilling the day tank.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives:
a) Reference the Sodium Hypochlorite Chemical Transfer Sequence.
4) Monitoring:
a) Local: None
b) PCS: None
5) Alarms:
a) Local: None
b) PCS: Sodium Hypochlorite Day Tank High Level

j. Sodium Hypochlorite Disinfection Feed Pump 1
1) General: Used to inject Sodium Hypochlorite into the water for disinfection treatment.
2) Control:
a) Local: With the LOCAL-REMOTE selector switch at the pump in the LOCAL position, the operator can operate the pump per the manufacturer's interface.
b) PCS: With the LOCAL-REMOTE selector switch at the pump in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI. Operator shall have the ability to enter the solution concentration, specific gravity, and pump capacity.
(1) PC MANUAL: The operator shall have the ability to manually start/stop the pump and set a desired speed.
(2) AUTO: Sodium Hypochlorite Disinfection Feed Pump 1 shall be automatically controlled via PLC programming. Operators shall have the ability to select between FIXED and DOSE control modes.
(a) FIXED: The pump speed shall maintain an operator entered desired lbs/day setpoint.

(b) DOSE: The pump speed shall vary in order to maintain an operator entered desired mg/L setpoint while using Blended Water Flow.

3) Logic Interlocks/Permissives:
   a) Sodium Hypochlorite Day Tank Low-Low Level Alarm must be inactive for pump to operate.
4) Monitoring:
   a) Local: Running, Stopped
   b) PCS: Running, Stopped, Remote
5) Alarms:
   a) Local: Fault
   b) PCS: Fault, Loss of Signal, Flow Deviation Alarm

k. Sodium Hypochlorite Oxidation Feed Pump 1
   1) General: Used to inject Sodium Hypochlorite into the water for oxidation treatment.
   2) Control:
      a) Local: With the LOCAL-REMOTE selector switch at the pump in the LOCAL position, the operator can operate the pump per the manufacturer's interface.
      b) PCS: With the LOCAL-REMOTE selector switch at the pump in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI. Operator shall have the ability to enter the solution concentration, specific gravity, and pump capacity.
         (1) PC MANUAL: The operator shall have the ability to manually start/stop the pump and set a desired speed.
         (2) AUTO: Sodium Hypochlorite Oxidation Feed Pump 1 shall be automatically controlled via PLC programming. Operators shall have the ability to select between FIXED and DOSE control modes.
            (a) FIXED: The pump speed shall maintain an operator entered desired lbs/day setpoint.
            (b) DOSE: The pump speed shall vary in order to maintain an operator entered desired mg/L setpoint while using Total Filter Flow.
   3) Logic Interlocks/Permissives:
      a) Sodium Hypochlorite Day Tank Low-Low Level Alarm must be inactive for pump to operate.
   4) Monitoring:
      a) Local: Opened, Closed, Position
      b) PCS: Remote, Opened, Closed, Position
   5) Alarms:
      a) Local: Fault
      b) PCS: Fault, Loss of Signal

l. Sodium Hypochlorite Chemical Transfer Sequence
   1) General: Used for automated control of transferring chemical between tanks.
   2) Control:
      a) Local: The operator shall have the ability at the LCP to manually operate system equipment to transfer chemical.

b) PCS: The chemical transfer sequence shall automatically enable the piping path and start/stop and open/close devices as configured by an operator via the HMI. The operator shall choose the desired function by pressing the TRANSFER, RECIRC, or DAY TANK FILL pushbuttons on the HMI.

(1) TRANSFER:

a. The operator shall select the source Storage Tank, destination Storage Tank, and enter a Stop level setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the source tank outlet valve and destination tank recirc valve shall open.
d. Once both opened, the transfer pump shall operate until the Stop level is reached.
e. Once the level is reached, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The source storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. The destination storage tank High Level Alarm must be inactive for the transfer pump to start.
i. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.
j. All applicable equipment must not have any active alarms in order to initiate the transfer.

(2) RECIRC:

a. The operator shall select a storage tank and enter a desired time duration setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the storage tank outlet and recirc valves shall open.
d. Once both opened, the transfer pump shall operate until the time duration has expired.
e. Once time expires, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the sequence.
i. All applicable equipment must not have any active alarms in order to initiate the sequence.

(3) DAY TANK FILL:

a. The operator shall select the source storage tank and enter a Stop level setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the storage tank outlet valve and day tank inlet valve shall open.

d. Once both opened, the transfer pump shall operate until the Stop level is reached.
e. Once the level is reached, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. Day Tank High Level Alarm must be inactive for the transfer pump to start.
i. Day Tank High Level Switch Alarm must be inactive for the transfer pump to start.
j. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.
k. All applicable equipment must not have any active alarms in order to initiate the transfer.

m. Sodium Hypochlorite Dilution Control Loop
1) General: Used for automated control of adding dilution water to storage tanks to reduce the concentration of the solution.
2) Control:
a) Local: The operator shall have the ability at the LCP to manually operate system equipment to add dilution water.
b) PCS: The operator shall be able to add dilution water automatically using PLC programming.
(1) Dilution Water Sequence:
a. The operator shall select which storage tanks to add dilution water to and enter a GALLONS setpoint.
b. The applicable Storage Tank Dilution Water Valves will open.
c. Once the GALLONS setpoint has been reached, the valves shall close.
d. Applicable Storage Tank(s) High Level Alarm(s) must be inactive for the sequence to start.
e. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the sequence.
f. All applicable equipment must not have any active alarms in order to initiate the sequence.

n. Sodium Hypochlorite Containment Area Wet Floor Switch
1) General: Used to detect a Sodium Hypochlorite tank leak.
2) Control:
a) Local: None
b) PCS: None
3) Logic Interlocks/Permissives: None
4) Monitoring:
a) Local: None
b) PCS: None
5) Alarms:
a) Local: None
b) PCS: Sodium Hypochlorite Containment Area Wet Floor Switch Activated

o. Sodium Hypochlorite Feed Room Temperature
1) General: Used to continuously monitor the temperature of the Sodium Hypochlorite Feed Room.

2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) None
4) Monitoring:
   a) Local: Instantaneous temperature indication
   b) PCS: Sodium Hypochlorite Feed Room Temperature
5) Alarms:
   a) Local: None
   b) PCS: High-High, High, Low, Low-Low Sodium Hypochlorite Feed Room Temperature, Loss of Signal

13. FLUORIDE CHEMICAL FEED SYSTEM

a. Fluoride Storage Tank 1 Level
   1) General: Used to continuously monitor the liquid level in Fluoride Storage Tank 1.
   2) Control:
      a) Local: None
      b) PCS: None
   3) Logic Interlocks/Permissives:
      a) Reference the Fluoride Chemical Transfer Sequence.
   4) Monitoring:
      a) Local: Instantaneous level indication
      b) PCS: Fluoride Storage Tank 1 Level
   5) Alarms:
      a) Local: None
      b) PCS: High-High, High, Low, Low-Low Fluoride Storage Tank 1 Level, Loss of Signal

b. Fluoride Storage Tank 1 Outlet Valve
   1) General: Used to isolate Fluoride Storage Tank 1 from the outlet header.
   2) Control:
      a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
      b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
         (1) PC MANUAL: The operator shall have the ability to open or close the valve.
         (2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Fluoride Chemical Transfer Sequence.
   3) Logic Interlocks/Permissives:
      a) Reference the Fluoride Chemical Transfer Sequence.
   4) Monitoring:
      a) Local: Opened, Closed
      b) PCS: Remote, Opened, Closed
   5) Alarms:
      a) Local: None

b) PCS: None

c. Fluoride Storage Tank 1 Recirc Valve
   1) General: Used to direct chemical to Fluoride Storage Tank 1 from the transfer pump.
   2) Control:
      a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
      b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
         (1) PC MANUAL: The operator shall have the ability to open or close the valve.
         (2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Fluoride Chemical Transfer Sequence.
   3) Logic Interlocks/Permissives:
      a) Reference the Fluoride Chemical Transfer Sequence
   4) Monitoring:
      a) Local: Opened, Closed
      b) PCS: Remote, Opened, Closed
   5) Alarms:
      a) Local: None
      b) PCS: None

d. Fluoride Transfer Pump
   1) General: Used to pump Fluoride chemical between tanks.
   2) Control:
      a) Local: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the LOCAL position, the operator shall have the ability to START and STOP the pump via the START/STOP pushbuttons.
      b) PCS: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI.
         (1) PC MANUAL: The operator shall have the ability to manually start/stop the pump.
         (2) AUTO: Fluoride Transfer Pump shall be automatically controlled via PLC programming. The pump shall operate as called for by the Fluoride Chemical Transfer Sequence.
   3) Logic Interlocks/Permissives:
      a) Reference the Fluoride Chemical Transfer Sequence.
   4) Monitoring:
      a) Local: Running, Stopped
      b) PCS: Running, Stopped, Remote
   5) Alarms:
      a) Local: Alarm
      b) PCS: Motor High Temperature, Motor Overload

e. Fluoride Day Tank Inlet Valve

1) General: Used to direct chemical to Fluoride Day Tank from the transfer pump.
2) Control:
   a) Local: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the OPEN position, the actuator shall open. With the OPEN-REMOTE-CLOSE selector switch at the LCP in the CLOSE position, the actuator shall close.
   b) PCS: With the OPEN-REMOTE-CLOSE selector switch at the LCP in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the actuator via the HMI.
      (1) PC MANUAL: The operator shall have the ability to open or close the valve.
      (2) AUTO: The valve shall be automatically controlled via PLC programming. The valve shall open and close as called for by the Fluoride Chemical Transfer Sequence.
3) Logic Interlocks/Permissives:
   a) Reference the Fluoride Chemical Transfer Sequence.
4) Monitoring:
   a) Local: Opened, Closed
   b) PCS: Remote, Opened, Closed
5) Alarms:
   a) Local: None
   b) PCS: None

f. Fluoride Day Tank High Level
1) General: Used to prevent overfilling the day tank.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) Reference the Fluoride Chemical Transfer Sequence.
4) Monitoring:
   a) Local: None
   b) PCS: None
5) Alarms:
   a) Local: None
   b) PCS: Fluoride Day Tank High Level

g. Fluoride Day Tank Weight
1) General: Used to continuously monitor the weight of the Fluoride Day Tank.
2) Control:
   a) Local: None
   b) PCS: None
3) Logic Interlocks/Permissives:
   a) Reference the Fluoride Chemical Transfer Sequence.
4) Monitoring:
   a) Local: Instantaneous weight indication
   b) PCS: Fluoride Day Tank Weight
5) Alarms:
   a) Local: None
   b) PCS: High-High, High, Low, Low-Low Fluoride Day Tank Weight, Loss of Signal

h. Fluoride Feed Pump 1
   1) General: Used to inject Fluoride into the water for treatment.
   2) Control:
      a) Local: With the LOCAL-REMOTE selector switch at the pump in the LOCAL position, the operator can operate the pump per the manufacturer's interface.
      b) PCS: With the LOCAL-REMOTE selector switch at the pump in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of the pump via the HMI. Operator shall have the ability to enter the solution concentration, specific gravity, and pump capacity.
         (1) PC MANUAL: The operator shall have the ability to manually start/stop the pump and set a desired speed.
         (2) AUTO: Fluoride Feed Pump 1 shall be automatically controlled via PLC programming. Operators shall have the ability to select between FIXED and DOSE control modes.
            (a) FIXED: The pump speed shall maintain an operator entered desired lbs/day setpoint.
            (b) DOSE: The pump speed shall vary in order to maintain an operator entered desired mg/L setpoint while using Blended Water Flow.
   3) Logic Interlocks/Permissives:
      a) Fluoride Day Tank Low-Low Level Alarm must be inactive for pump to operate.
   4) Monitoring:
      a) Local: Running, Stopped
      b) PCS: Running, Stopped, Remote
   5) Alarms:
      a) Local: Fault
      b) PCS: Fault, Loss of Signal, Flow Deviation Alarm

i. Fluoride Chemical Transfer Sequence
   1) General: Used for automated control of transferring chemical between tanks.
   2) Control:
      a) Local: The operator shall have the ability at the LCP to manually operate system equipment to transfer chemical.
      b) PCS: The chemical transfer sequence shall automatically enable the piping path and start/stop and open/close devices as configured by an operator via the HMI. The operator shall choose the desired function by pressing the TRANSFER, RECIRC, or DAY TANK FILL pushbuttons on the HMI.
         (1) TRANSFER:
            a. The operator shall select the source Storage Tank, destination Storage Tank, and enter a Stop level setpoint.
            b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
            c. Once the button is pressed, the source tank outlet valve and destination tank recirc valve shall open.
            d. Once both opened, the transfer pump shall operate until the Stop level is reached.

e. Once the level is reached, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The source storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. The destination storage tank High Level Alarm must be inactive for the transfer pump to start.
i. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.
j. All applicable equipment must not have any active alarms in order to initiate the transfer.

(2) RECIRC:

a. The operator shall select a storage tank and enter a desired time duration setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the storage tank outlet and recirc valves shall open.
d. Once both opened, the transfer pump shall operate until the time duration has expired.
e. Once time expires, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the sequence.
i. All applicable equipment must not have any active alarms in order to initiate the sequence.

(3) DAY TANK FILL:

a. The operator shall select the source storage tank and enter a Stop weight setpoint.
b. The operator shall initiate the sequence by pressing the INITIATE TRANSFER pushbutton on the local control panel.
c. Once the button is pressed, the storage tank outlet valve and day tank inlet valve shall open.
d. Once both opened, the transfer pump shall operate until the Stop weight is reached.
e. Once the weight is reached, both valves shall travel closed.
f. Once either valve is closed, the transfer pump shall stop.
g. The storage tank Low-Low Level Alarm must be inactive for the transfer pump to start.
h. Day Tank High Weight Alarm must be inactive for the transfer pump to start.
i. Day Tank High Level Alarm must be inactive for the transfer pump to start.
j. All applicable equipment must be in REMOTE-AUTO mode in order to initiate the transfer.
k. All applicable equipment must not have any active alarms in order to initiate the transfer.

j. Fluoride Containment Area Wet Floor Switch
   1) General: Used to detect a Fluoride tank leak.
   2) Control:
      a) Local: None
      b) PCS: None
   3) Logic Interlocks/Permissives: None
   4) Monitoring:
      a) Local: None
      b) PCS: None
   5) Alarms:
      a) Local: None
      b) PCS: Fluoride Containment Area Wet Floor Switch Activated

14. HIGH SERVICE PUMPS
   a. High Service Pump 5
      1) General: Used to pump water into the water distribution system.
      2) Control:
         a) Local: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the LOCAL position, the operator shall have the ability to START and STOP the pump via the START/STOP pushbuttons.
         b) VFD: The VFD speed can be manually adjusted utilizing the manual speed potentiometer or VFD HIM module at the VFD.
         c) PCS: With the LOCAL-OFF-REMOTE selector switch at the local control panel in the REMOTE position, the operator shall have the ability to select PC MANUAL or AUTO control of High Service Pump 5 via the HMI.
            (1) PC MANUAL: The operator shall have the ability to manually start/stop and adjust the speed of High Service Pump 5.
            (2) AUTO: High Service Pump 5 shall be automatically controlled via PLC programming. High Service Pump 5 shall be incorporated into the existing High Service Pump control scheme.
      3) Logic Interlocks/Permissives: None
      4) Monitoring:
         a) Local: Running, Stopped
         b) VFD: Running, Stopped, Frequency, Amps, Volts
         c) PCS: Remote, Running, Stopped, (2) Vibration Sensors, (2) Motor Bearing Temps, Frequency, Amps, Volts, VFD LOR Switch Position
      5) Alarms:
         a) Local: General Alarm
         b) VFD: VFD Fault Alarm
         c) PCS: Motor High Temperature, (2) High Vibration Alarms, (2) High Bearing Temp Alarm, Low Suction Pressure, High Discharge Pressure, VFD Fault, Loss of Signal

15. EXISTING PROCESS CONTROL MODIFICATIONS
   a. Groundwater Wells and Pretreatment Systems
      1) General: Used to pump water to the plant and provide treatment upstream of the NF Building Softening process.

2) Control: Modify groundwater pumps level control to be based on Break Tank levels instead of Clearwell levels.
   a) Operator shall have the ability to select Break Tank 1 or Break Tank 2 Level as control variable.

16. EMERGENCY POWER

a. Automatic Transfer Switch
   1) General: Used to automatically transfer plant power to generator during a utility power outage.
   2) Control:
      a) Local: Per manufacturer
      b) PCS: None
   3) Logic Interlocks/Permissives:
      a) Generator running and Automatic Transfer Switch in the Emergency Source position will initiate step loading logic for loads to be sequentially started.
   4) Monitoring:
      a) Local: Per manufacturer
      b) PCS: Utility Source Available, Emergency Source Available, Utility Source Connected, Emergency Source Connected
   5) Alarms:
      a) Local: Per manufacturer
      b) PCS: Not in Auto

b. Generator
   1) General: Used to supply emergency power to the plant during a utility power outage.
   2) Control:
      a) Local: Per manufacturer
      b) PCS: None
   3) Logic Interlocks/Permissives:
      a) Generator running and Automatic Transfer Switch in the Emergency Source position will initiate step loading logic for loads to be sequentially started.
   4) Monitoring:
      a) Local: Per manufacturer
      b) PCS: Running, Stopped, Remote
   5) Alarms:
      a) Local: Per manufacturer
      b) PCS: General Alarm, Not in Auto

17. CRITICAL ALARMS

a. General: Programming shall include the following as critical alarms. Critical alarms shall initiate a telephone call to designated personnel.
   1) Utility Power Failure
   2) PLC Failure Alarm
   3) Emergency NF Process Shutdown

3.2 EXAMINATION

A. Verification of Conditions: Prior to all work of this section, carefully inspect the installed work of all other trades and verify that all such work is complete to the point where this installation may properly commence.

B. Discrepancies: In the event any discrepancies are discovered, immediately notify the Owner's Representative in writing. Do not proceed with installation in areas of discrepancy until all such discrepancies have been fully resolved.

3.3 PREPARATION

A. Protection
   1. All equipment and materials shall be packed at the factory to protect each item from damage during shipment and storage.
   2. Provide blocking and cushioning materials to prevent damage during shipment.
   3. Panel mounted instruments and equipment to be installed inside enclosures, panels, or consoles shall be mounted and assembled at the panel manufacturer's facility.

3.4 INSTALLATION

A. General: Install equipment, as indicated, with manufacturer's written instructions and with recognized industry practices.

3.5 FIELD QUALITY CONTROL

A. Inspection: Provide for services of a qualified representative of the manufacturer to inspect and approve installation.

B. Tests: Upon completion of all inspections, and prior to acceptance, perform field tests outlined in Division 40 Section “Plant Instrumentation and Control System General Requirements”.

C. Operational Demonstration: After completion of the field test, perform a 30-day operational demonstration as specified in Division 40 Section “Plant Instrumentation and Control System General Requirements”.

3.6 DEMONSTRATION

A. General: When all required tests have been performed and prior to final acceptance, the Contractor shall perform a 30-day operational demonstration in accordance with the requirements of Division 40 Section “Plant Instrumentation and Control System General Requirements”.

3.7 EXTRA MATERIALS

A. Spare Parts: The Contractor shall provide uninstalled spare parts to the Owner to facilitate proper maintenance and minimize downtime of the PLC system.

B. Quantity: Provide spares for each type of module listed below equal to 10 percent of the total of each type used in the system rounded up to the next whole number.
   1. Processor Modules
   2. Power Supply
   3. Digital Input Modules

4. Digital Output Modules
5. Analog Input Modules
6. RTD Analog Input Modules
7. Analog Output Modules
8. Analog Input/Analog Output Modules
9. Flex I/O Modules
10. Flex I/O Module Terminal Blocks

C. Provide (6) OIT protective screen overlays.

D. Replacements: Any spare part used during the start-up, demonstration, and warranty period shall be replaced by the Contractor at no cost.

3.8 PLC SYSTEM TRAINING

A. General.
1. Provide a training course customized for the control system hardware.
2. Provide training on the operation and maintenance of the control system hardware.
3. Provide training manuals for each attendee plus two additional manuals in archival preservation at the project site.
4. Include the following in each manual.
   a. An agenda
   b. Defined objectives for each lesson.
5. Provide all equipment, materials, and supplies used in the training.
6. For guidance in planning the required instruction, assume that attendees will have a high school education or equivalent and basic electrical maintenance knowledge.

B. Location, duration, and schedule.
1. Teach the course at the project site.
2. Provide one day of training for five personnel designated by the Owner.
3. Conduct training after completion of the Contractor's field testing.

3.9 INPUT/OUTPUT SCHEDULE

A. Abbreviations
1. AI = Analog Input
2. AO = Analog Output
3. CPU = Processor
4. DI = Digital Input
5. DO = Digital Output
6. RTD = RTD Analog Input

B. Installed spare inputs and outputs (I/O): In addition to the I/O listed below, provide a minimum of 10 percent installed.
1. All SPARE I/O shall be wired to terminal blocks within the PLC enclosure.

SECTION 40 9513

CONTROL PANELS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General:
   1. Drawings and general provisions of Contract.
   2. General and Supplementary Conditions and all Division 1 specification sections.

B. Related Sections of Division 26.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to install control panels and consoles in accordance with the Plans and as specified herein.

1.3 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with requirements of the National Electrical Code (NEC) and all other applicable federal, state, and local codes and regulatory requirements.

B. Standards: Materials and workmanship shall conform to the following standards:
   1. National Electrical Manufacturers Association (NEMA).
   2. Institute of Electrical and Electronic Engineers (IEEE).
   3. American National Standards Institute (ANSI).
   4. National Fire Protection Association (NFPA).
   5. Underwriters' Laboratories (UL).
   6. Joint Industrial Council (JIC).
   7. International Society for Measurement and Control (ISA).

C. Qualifications
   1. Manufacturer's Qualifications: Firms regularly engaged in the manufacture of control panels whose products have been in satisfactory use in similar service for not less than 5 years.
   2. Installer's Qualifications: Firm with at least 5 years of successful installation experience on projects with materials and equipment similar to items specified herein.

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data for enclosures and all components.

B. Materials List: Submit a bill of materials listing quantities, manufacturer's name, and catalog numbers.

C. Wiring Diagrams: Submit wiring diagrams showing all connections for all equipment furnished or installed under this section.
   1. Elementary diagrams shall follow JIC standards.
   2. Instrument loop diagrams shall follow the ISA Standard S5.4.

3. Wire, terminal, and component labeling shall follow established facility conventions where applicable.

D. Shop Drawings: Provide control panel layout drawings which follow JIC standards. Provide shop drawings for each control panel and console as follows:
   1. Dimensional drawings of each enclosure and mounting panel.
   2. Scaled layout drawings identifying name and location of all components and nameplates.
   3. Mounting details including location of anchoring flanges, holes, and data on anchor bolt sizing and load-carrying capacity.
   4. Entry and exit locations of external wiring and conduit and equipment connections.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Storage and Protection: The Contractor shall store the items furnished under this section until they can be installed. Such storage shall meet the requirements of the manufacturer and be approved by the Owner. Use all means necessary to protect the material of this section before, during, and after installation, and to protect the installed work and materials of all other trades.

PART 2 - PRODUCTS

2.1 ENCLOSURES

A. Enclosure shall be NEMA 4X, unless otherwise specified or shown on the Drawings.
   1. Hinged Door Enclosures: Material of construction shall be fiberglass, 304 stainless steel or as shown on the Drawings.
      a. Manufacturer: Hoffman Enclosures, Inc.; Saginaw Control and Engineering; Stahlin Enclosures; or approved equal.
   2. Fabricated control panel shall be UL508A labeled.

2.2 COMPONENTS

A. As specified in related sections.

B. Miscellaneous Equipment
   1. Slotted plastic wiring ducts with snap-on covers.
   2. Nylon spiral wrap wiring sheaths.
   3. Nylon cable ties with screw anchors.
   4. Nameplates as specified in Division 26. Nomenclature as shown on the Drawings.
   5. Stainless steel screws, fasteners, and miscellaneous hardware, unless otherwise noted.

C. Corrosion Inhibitor Device: Shall be provided for all control enclosures. Provide one (1) unit per 5 cubic feet of volume. Provide one (1) replacement unit for each inhibitor device installed. Devices shall be Hoffman A-HCI 10E or approved equal. Install and date mark while enclosure is in fabricator's shop.

D. Provide thermostatically controlled electric heater in each enclosure for condensation prevention. Heater shall be sized for 40°F temperature rise above ambient, based on enclosure dimensions. Locate heater in compliance with manufacturer recommendations.

E. Surge Protection

1. Provide surge protection for all communication, analog and digital signals which the cable/conductor(s) enter from outside or underground. These signals include, but are not limited to, all 120VAC digital inputs and 24VDC analog inputs.
    a. Surge protection devices shall be type Category C as defined by IEEE C62.41, and consist of a base and a replaceable plug-in surge element.
2. Provide surge protection on all other PLC inputs, PLC outputs, relays and all other instrumentation and control system components as recommended by the manufacturer of each device.
3. Surge protection device shall include a visual indicator for "fault/no protection" indication.
4. Manufacturer: Pheonix Contact, Edco, Thor Systems or approved equal.

F. Power Supplies
1. Provide power supplies as required for the various components and functions of this contract.
2. Required Features:
    a. Provide power for 2-wire transmitter loops using 4-20mAdc current signals.
    b. Input Voltage: 115 VAC.
    c. Output Voltage: 24V to 45V DC, or 12V to 16V DC, as required.
    d. Voltage Regulation: $\pm$ 5 percent.
    e. Fusing: 115 VAC line.
    f. Loop circuits: Suitable for 1 loop circuit only.
    g. Mounting: Suitable for wall mounting inside of panel enclosure.
3. Manufacturers:
    a. Allen-Bradley Bulletin 1606.
    b. Moore Industries.
    c. Or approved equal.

G. Lighting Kit: Provide a 120VAC, fluorescent light fixture inside the enclosure. Fixture shall use 20 watt lamps, minimum. Each light shall include a manual on/off toggle switch and a 120VAC convenience outlet.

H. Uninterruptible Power Supply (UPS).
1. General: Provide a UPS to supply power to the control panel's associated PLC, radio, and internal power supplies during failure of normal power. Maintain battery power to load for 30 minute duration with "no breaks," or interruptions. Upon return of normal ac power, automatically equalize recharge batteries and revert to floating condition.
2. Enclosures: Free standing enclosures sized to house both the batteries and the electronics. DIN rail mounted units may be used when loads/battery time comply with specification requirements.
3. Rectifier/Charger: Solid state rectifiers/charger sized to supply dc power to both the batteries and the static inverter. Equip with automatic shutdown to prevent discharging the batteries completely.
4. Static Inverter: Single phase solid-state static inverter to supply regulated ac output.
5. Batteries: Sealed, maintenance-free lead acid batteries.
6. Detachable line cord and NEMA 5-20R output receptacles.
7. Available Manufacturers: Subject to compliance with requirements, manufacturers offering UPS systems which may be incorporated in the work include, but are not limited to, the following:
    a. APC
    b. Liebert

c. Pheonix Contact

I. Network Access Port
1. For enclosures that include a programmable logic controller (PLC), provide a door mounted GFCI 120VAC duplex power outlet, rated 3A minimum, with front door mounted RJ-45 Ethernet jack connected to the PLC network.
2. Provide a nameplate engraved with “For Programming Use Only”.
3. NEMA 4X rated with hinged cover and securing latch
4. Power external outlet from a dedicated circuit breaker.
5. Provide CAT6 Ethernet cable internally from port to network switch.
6. Manufacturer:
   a. Grace Engineered Products, Inc
   b. Phoenix Contact
   c. Or approved equal

J. Miscellaneous Equipment
1. Slotted plastic wiring ducts with snap-on covers.
2. Nylon spiral wrap wiring sheaths.
3. Nylon cable ties with screw anchors.
4. Nameplates as specified in Division 26 Section “Electrical Identification”, and as shown on the Plans.
5. Stainless steel screws, fasteners, and miscellaneous hardware unless otherwise noted.

2.3 SHOP FABRICATION

A. Fully assemble and test each panel at the factory prior to shipment.
1. Ensure that all wires and cables are securely connected.
2. Ensure all labels and nameplates are easily readable.
3. Perform 100% continuity checks.
4. Provide a temporary power source (120VAC), and check voltage on all applicable circuits, including all 24VDC power supplies.
5. Provide documents and drawings of the completed testing procedures.
6. Complete the fabrication and testing to the satisfaction of the Owner or its designee.
7. Factory Acceptance Test (FAT) – At the discretion of the Owner or its designee, fabricated panels may be subjected to inspection and testing prior to arrival at site. The FAT may be a prerequisite for acceptance. The Contractor shall plan for personnel to arrive at the fabricator’s facility for the FAT. The Contractor shall also allow provisions for a Contractor’s representative and a technician to assist in testing. Temporary power and networking should also be expected as part of the FAT procedure.
   a. A punch list shall be generated by the FAT personnel for any modifications needed prior to shipment to the Owner’s facility. Successful completion of the FAT is a prerequisite for delivery to the Owner’s facility. All FAT punch list items shall be resolved.

B. As a minimum, test all wiring circuits for conductivity and demonstrate that all specified functions can be performed.

C. Identify all components with laminated plastic nameplates.

D. Provide all devices, electrical hardware, wiring, support hardware, fasteners and other components required to make the control enclosures complete and workable units.

E. Estimated Size: Minimum sizes are shown on the Drawings. Contractor shall furnish enclosures of the size and quantity required to house the manufacturers' equipment supplied and all other electrical components installed in the enclosures.

F. Provide stainless steel quick-release latching clamps on three sides of each door and pad-lockable hasp and staple on all panels.

G. All hardware on the enclosures including hinges, pins, clamps, nuts, bolts, washers, screws, etc., shall be stainless steel.

H. Design panels so that conduits and wiring enter and leave through the bottom of the enclosures, unless noted otherwise.

I. Component Arrangement
   1. Group all like components.
   2. Place all internal components on sub-panels.
   3. Arrange all components to allow easy access for connections and service, and to allow removal without affecting other components.
   4. Provide a minimum of 2.5” from device terminals to edge of closest wiring duct.

J. Component Installation
   1. Make all panel cutouts carefully and leave no visible gaps between components and panels.
   2. Mount all components plumb and square.
   3. Attach all components and nameplates with stainless steel machine screws into drilled and tapped holes.
   4. Support and restrain all components to prevent movement.
   5. Attach all relays to mounting strips or rails.

K. Wiring
   1. Route wiring horizontally or vertically.
   2. Protect wiring to door-mounted devices with spiral nylon sheath.
   3. Separate alternating current (ac) and direct current (dc) wiring a minimum of 4 inches. Separate AC and DC buses.
   4. All DC (+) wiring shall be separately fused per device.
   5. Label all wires at each termination with a unique number.
   6. Label each terminal with a unique number.
   7. Terminate all external wiring on terminal blocks.
   8. Terminate all internal wiring on terminal blocks or device terminals. Device neutrals shall not be daisy-chained between devices.
   9. Group all externally powered wiring and terminate on knife disconnect isolating terminal blocks.
   10. Terminate all wiring to devices powered from the control panel on fused terminal blocks.
   11. Fused terminal blocks shall include LED blown fuse indication.
   12. Color code all internal wiring as follows:
      a. Line Voltage ac Power and Control: Black.
      b. AC Control Circuits: Red.
      c. DC Wiring: Blue (positive), Blue with White Stripe (negative).
      d. Externally Powered Wiring: Yellow.
      e. Neutral Conductors: White.
      f. Equipment Grounding Conductors: Green.

13. Route all wiring on sub-panels through plastic wiring ducts with removable covers. Wiring duct shall not be filled over 50%, including spares.
14. Support all wiring to prevent movement or sagging.
15. Secure all cable ties with bolted or screwed mounting plates.
16. Provide a warning sign, placed in a conspicuous location in the interior of the panel, identifying yellow wiring as being powered from an external source and warning that disconnecting power to the panel will not de-energize externally powered wiring.

L. Panel Grounding
1. Provide ground studs factory welded to the enclosure and the enclosure door.
2. Provide tinned copper braided ground strap between enclosure and door.
3. Provide a minimum #8 AWG ground wire from sub-panel to enclosure mounting stud.
4. Ground control power transformer secondary directly to sub-panel immediately adjacent to transformer.
5. Where signal cable shields are to be grounded in the control panel, connect to the equipment ground bus.
6. Connect all DC commons to the low-level isolated dc ground bus.

2.4 EXTRA MATERIALS

A. Spare Parts: The Contractor shall provide uninstalled spare parts to the Owner to facilitate proper maintenance and minimize downtime of the PLC system.
1. Quantity: Provide spares for each type listed below equal to 10 percent of the total of each type used in the system rounded up to the next whole number.
a. Control Relay
b. Power Supply
c. Pilot Light
d. Selector Switch
e. Pushbutton
f. Fuses
g. Terminal Block
2. Replacements: Any spare part used during the start-up, demonstration, and warranty period shall be replaced by the Contractor at no additional cost.

PART 3 - EXECUTION

3.1 INSTALLATION:

A. General: Install equipment as indicated, in accordance with manufacturer's written instructions, and with recognized industry practices.

B. Examination
1. Verification of Conditions: Prior to all work of this section, carefully inspect the installed work of all other trades and verify that all such work is complete to the point where this installation may properly commence.
2. Discrepancies: In the event any discrepancies are discovered, immediately notify the Owner's Representative in writing. Do not proceed with installation in areas of discrepancy until all such discrepancies have been fully resolved.

C. Preparation
1. Protection.

a. All equipment and materials shall be packed at the factory to protect each item from damage during shipment and storage.
b. Provide blocking and cushioning materials to prevent damage during shipment.
c. Provide temporary lifting lugs on shipping package as needed.
d. Include approximately 1 pint of touch-up paint for each finish color in shipment.

2. Surface Preparation: The work shall be carefully laid out in advance. Where cutting, drilling, etc., of floors, walls, ceilings, or other surfaces is necessary, this work shall be carefully done. Any damage to building, piping, or equipment shall be repaired by skilled mechanics of the trades involved, and at no additional cost to the Owner.

D. Application

1. Enclosure, Cabinets, Console Installation.
   a. Locate as shown on the contract drawings. Freestanding enclosures and consoles require an Electrical Equipment Pad provided and installed by this Contractor. Refer to detail on Drawings.
   b. Floor-mounted control panels shall be installed utilizing all stainless steel hardware consisting of concrete anchor and machine bolt assembly.
   c. Wall-mounted panels shall be offset from walls with standoffs. Wall-mounted panels requiring freestanding mounting shall be supported on stainless steel strut with cross bracing and stainless steel hardware.
   d. Seal all conduit entrances watertight.

3.2 FIELD QUALITY CONTROL

A. Tests: Upon completion of all inspections and prior to acceptance by the Owner, perform the field tests outlined in Division 40 Section “Instrumentation – General”.

B. Inspection: Upon completion of this portion of the work, the Contractor shall provide for the services of a qualified representative of the manufacturer to inspect and approve the installation.

END OF SECTION 40 9513

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 40 9553

NETWORK DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General:
   1. Drawings and general provisions of Contract.
   2. General and Supplementary Conditions and all Division 1 specification sections.

B. Related Sections: Refer to Division 40 9XXX Sections for additional requirements related to this section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to install network switches in accordance with the plans and as specified herein.

B. Types: The types of equipment specified in this section include the following.
   1. Ethernet Switch
   2. Ethernet Media Converter
   3. DIN-rail Fiber Patch Panel

1.3 DEFINITIONS

A. Abbreviations
   1. AHJ. Authority having jurisdiction.
   2. NRTL. Nationally recognized testing laboratory.

1.4 SUBMITTALS

A. General
   1. Comply with the requirements of Division 01 Section “Submittal Procedures”.
   2. Submit information as described below.
   3. Provide all information necessary to determine compliance with the Plans and specifications.

B. Product Data
   1. Manufacturer’s product data sheets, delete or cross out non-applicable information.

C. Quality Control Submittals
   1. Field test reports. Submit certified copies of the field test reports.
   2. Manufacturer’s instructions: Submit manufacturer's current installation instructions.

D. Contract Closeout Submittals: Operation and maintenance (O&M) data

PART 2 - PRODUCTS

2.1 PRODUCT REQUIREMENTS – GENERAL

A. General
   1. Provide new and unused products of current manufacture.
   2. Provide products free from defects affecting performance.
   3. All units of the same type shall be from the same manufacturer.

B. Listing and Labeling
   1. Provide UL listed and labeled products.
   2. Products not bearing an NRTL label must be pre-approved in writing by the AHJ.

2.2 ETHERNET SWITCH

A. General: Provide an Ethernet switch for segment connection to the network backbone for area PLCs and operator workstations and as shown on the Drawings.

B. Features
   1. Minimum of (2) send/receive 100Base-FX fiber optic ports
   2. Minimum of (8) 10/100Base-TX (RJ-45) ports
   3. Per-port Status Indicators
      a. Link Integrity
      b. Disabled
      c. Activity
      d. Speed
      e. Half/Full Duplex
   4. Alarm Relay: 1A @ 30VDC
   5. Memory Card
   6. Management console port:
      a. Mini USB cable (driver provided)
   7. Power Requirements: 12-48VDC

C. Performance Requirements:
   1. Support spanning tree protocol
   2. Support ring topology
   3. Switch Management”
      a. Support Simple Network Management Protocol (SNMP)
      b. Bridging Management Information Base
      c. Remote Monitoring (RMON) control
   4. Comply to IEEE 802.3x Full-Duplex on 10Base-T and 100Base-T
   5. Full performance from 32 to 113°F, 5-95% humidity non-condensing

D. Small Form Factor Pluggable Module (SFP):
   1. SFP module shall be provided as integral part of the Ethernet switch to provide connection into fiber optic media as shown on the Drawings.
   2. Support for IEEE 802.3z, 1000BASE-SX standard for 1Gbps data transmission rate.

E. Product Manufacturer and Model
   1. Stratix 5700 Switch, 1783-BMS10CL or equivalent latest compatible series, as manufactured by Allen-Bradley

2.3 ETHERNET MEDIA CONVERTER

A. Description: Converts 10/100Base-T(X) Ethernet media from copper to fiber optic.

B. Features
1. Converts to utilized fiber optic cable type as indicated on the Drawings.
2. (1) 10/100MBit/s RJ45 Port
3. (1) 100MBit/s SC-FX Port
4. Fiber wavelength shall be 1300nm
5. Auto-negotiation
6. Integrated MDI/MDIx changeover
7. Status and diagnostic indicators on device
8. Redundant power supply capable
9. DIN rail mounted
10. Conforms to IEEE 802.3
11. Input power: 24VDC
12. Operating Temperature Range: 32degF – 131degF
13. Humidity: 30-95%, non-condensing

C. Manufacturers: Subject to compliance, provide products manufactured by one of the following:
1. Phoenix Contact
2. Hirschmann
3. Or approved equal.

2.4 DIN-RAIL FIBER PATCH PANEL

A. General: Shall be designed to manage and organize fiber optic cables to and from the equipment or cabling plant.
1. Single panel housing fiber optic enclosure adapted for DIN-rail mounting
2. Protect fiber optic connections for patching or splicing requirements
3. Accommodate up to 12 fibers per enclosure and shall be constructed of steel
4. Include removable covers and pass-through holes
5. Model and Manufacturer:
a. SPH-01P, enclosure by Corning
b. CCH-CP12-15T, adapter plate by Corning

PART 3 - EXECUTION

3.1 INSTALLATION

A. General
1. Conform to manufacturer recommended installation guidelines.
2. Mount the Ethernet switches in enclosures indicated on the Drawings.

B. Physical Network Architecture
1. Physically configure the plant-wide LAN system as shown on the Drawings.
2. Some workstations will be equipped with two network interface cards (NIC) for connection to both networks.
3. IP addresses shall be assigned by Owner for all equipment connected to the plant networks.

3.2 FIELD QUALITY CONTROL

A. Field Test
1. Conduct testing after all connections are made.

2. Test the switches for proper operation by simulating fault conditions at the input terminals of the LAN equipment.
3. Correct any malfunction or error in the designed performance.
4. Check the operation after all LAN equipment has been wired by manually activating the inputs with testing devices that simulate network traffic.

B. Manufacturer Field Services
1. Provide the services of a factory-trained manufacturer representative to configure and start-up equipment specified under this Section.
2. Certify in writing that that the equipment has been installed, configured, and tested in accordance with manufacturer recommendations.

3.3 EXTRA MATERIALS

A. Spare Parts: The Contractor shall provide uninstalled spare parts to the Owner to facilitate proper maintenance and minimize downtime of the PLC system.
1. Quantity: Provide spares for each type listed below equal to 10 percent of the total of each type used in the system rounded up to the next whole number.
a. Ethernet Switch
b. Ethernet Media Converter
c. DIN-rail Fiber Patch Panel
2. Replacements: Any spare part used during the start-up, demonstration, and warranty period shall be replaced by the Contractor at no additional cost.

END OF SECTION 40 9553

SECTION 41 2200

CRANES AND HOISTS

PART 1 - GENERAL

1.1 REFERENCES

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section.

1.2 SCOPE

A. Hoist systems for the NF high pressure feed pumps, as shown on the Contract Drawings.

B. Furnish all professional services, labor, material, equipment, and appurtenances required to provide runway beams and required sway bracing, cranes and hoists complete and operational.

1.3 RELATED WORK SPECIFIED ELSEWHERE

A. Section 05 1200, Structural Steel Framing.

B. Section 09 9100. Painting.

C. Section 13 3419, Metal Building Systems.

D. Division 26 – Electrical.

1.4 QUALITY ASSURANCES

A. Codes and Standards
1. AGMA, Standards of American Gear Manufacturers Association.
2. AISC, Specification for the Design, Fabrication, and Erection of Structural Steel for Buildings.
3. American Society for Testing and Materials Specifications
4. ANSI B30.2, Overhead and Gantry Cranes (Top Running Bridge, Multiple Girder).
5. American Welding Society
6. ANSI B30.11, Monorail Systems and Underhung Cranes
7. ANSI B30.16, Standard for Overhead Hoists
8. ASME B30.11, Monorail Systems and Underhung Cranes.
9. CMMA No. 70, Top Running Bridge and Gantry.
10. CMMA No. 74, Top Running and Under Running Electric Overhead Travelling Cranes.
11. Hoist Manufacturers Institute
12. HMI 100, Electric Wire Rope Hoists.
13. HMI 200, Standard Specification for Hand Operated Chain Hoists.
14. HMI 400, Electric Chain Hoist.
15. Monorail Manufacturers Association
16. National Electric Code
17. NEMA, Standards of National Electric Manufacturers Association.

B. Materials: All materials shall be new, and the completed overhead handling system shall be essentially the product of one crane manufacturer regularly engaged in the production of such equipment.

C. Service Class: All equipment shall be designed for minimum "Class C" (Moderate Service) as specified in the ANSI MH27.1 Specifications, and operation in normal ambient temperatures (0 deg to 40 deg C) and normal indoor conditions, free from excessive dust, moisture and corrosive fumes.

D. Vertical Impact: Where powered hoists are used, an impact allowance shall be included in design calculations for carriers (trolleys), cranes, and runways. The impact allowance shall be 1/2% of the rated load for each foot per minute (1.6% of the rated load for each meter per minute) of hoisting speed with a minimum allowance of 15% and a maximum of 50%.

E. Electrical Devices and Equipment: Comply with Division 26 – Electrical, and with Electrical Drawings.

F. Manufacturer's Qualifications: The Manufacturer of Work of this Section shall have 5 years' minimum proven experience in such work and shall have satisfactorily completed 3 jobs of similar size and type within the last 5 years.

G. Professional Engineer:
   1. Engage registered professional engineer legally qualified to practice in the same state as the Site and experienced in providing engineering services of the kind indicated.
   2. Responsibilities include:
      a. Carefully reviewing hoist/monorail system performance and design criteria stated in the Contract Documents.
      b. Preparing written requests for clarifications or interpretations of performance or design criteria for submittal to ENGINEER by CONTRACTOR.
      c. Preparing or supervising preparation of design calculations and related drawings, Shop Drawings, and a comprehensive engineering analysis verifying compliance of hoist/monorail system runways with requirements of the Contract Documents.
      d. Signing and sealing all calculations and design drawings, and Shop Drawings related to hoist/monorail runway beam design.

H. Manufacturer's Field Representative
   1. Conform to the requirements of Division 01 Section "Quality Control", paragraph 1.7, Manufacturer's Field Services.
   2. The Manufacturer of the Work of this Section shall provide a qualified field representative at the Site. Such field representative shall instruct the Contractor's personnel in the proper handling, installation, start-up, and operation of the equipment and shall instruct the Owner's personnel in the proper start-up, operation, and maintenance of the equipment. The instruction period for the Owner's personnel shall be a minimum of 8 hours.

I. Testing: Each hoist shall be given a shop test, including dynamic loading in accordance with the Manufacturer's test specification and shall comply with the latest edition of ANSI B30.16, Standard for Overhead Hoists.

1.5 SUBMITTALS

A. All submittals shall conform completely to the requirements of the Contract Documents, including all requirements set forth in Division 01 Section “Submittal Procedures”.

B. Reference Submittals
   1. Installation data, handling and storage instructions.
   2. Maintenance and operating instructions.
   3. Material Certification.
   4. Professional Engineer Certification.
   5. Installer Certification.
   6. Source Quality Control Submittals:
      a. When performed or when required by ENGINEER, submit results of source quality control testing and inspections performed at the mill or shop.
   7. Field Quality Control Submittals:
      a. Load test report, including copy of certifications of test weights.
   8. Manufacturer’s Reports: Submit written report of results of each visit to Site by Manufacturer's Field Representative, including purpose and time of visit, tasks performed, and results obtained.

C. Shop Drawings
   1. Submit for review Shop Drawings showing the following:
      a. Complete description of entire system in sufficient detail to permit item by item comparison with Contract Documents. Layout drawings for all equipment showing installation details, assembly and accessories.
      b. Dimensions and required clearances
      c. Equipment weights
      d. Performance characteristics.
      e. Maximum support reactions.
      f. Specialized wiring diagrams, if applicable.
      g. Deviations from Contract Documents.
   2. Product Data: Include Manufacturer's specifications and installation instructions for each component or product used in the system.

D. Delegated Design Submittals: Submit the following:
   1. Detailed structural design drawings showing details of monorail and support systems, including:
      a. Bracing details.
      b. Member loads and design stresses.
      c. Calculations used for determining member stresses.
      d. Connection details.
      e. Maximum allowable and calculated deflections.
   2. Clearly show dimensions and assumptions on which design is based. Indicate referenced standards and codes. Information shall be project specific.

E. Spare Parts
   1. Spare parts utilized during startup and prior to acceptance of the equipment shall be replaced by the Contractor at no additional cost to the Owner.
   2. Spare parts shall be shipped with the equipment and stored by the Contractor until turned over to the Owner during project closeout.

1.6 HANDLING, DELIVERY, AND STORAGE

A. Handling, delivery, and storage of the Work of this Section shall be in accordance with the Manufacturer's recommendations.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE:

A. System Description:
1. Hoists shall conform to headroom, hook elevation, and side clearance requirements shown and indicated in the Contract Documents, and shall provide required available lift height and capacity.

B. Design Criteria:
1. Monorail runway beam:
a. Monorail runway beam, including bracing and attachment to supporting structure, shall conform to AISC Specification for Structural Steel Buildings, and AISC Code of Standard Practice for Steel Buildings and Bridges, and shall conform to Specifications in Division 5, Metals.
b. Monorail track, hangers, supports, plates and connection elements shall conform to ASTM A36 or A572 Grade 50 steel, as required by design.
c. Welding shall conform to AWS D1.1.
d. Bolts shall conform to ASTM A325, with ASTM A563 nuts and ASTM F436 hardened washers. Connections shall conform to the RCSC Specification for Structural Joints Using ASTM A325 or A490 Bolts.
e. Deflection of runway beam under rated load (not including impact) shall not exceed 1/450 of span.
2. Runway Rail Stops:
a. Design to withstand the horizontal load produced by the hoist. Hoist manufacturer shall supply bumpers with sufficient energy absorbing capacity to absorb the horizontal impact load on runway stop.

2.2 HOIST SYSTEMS

A. Schedule

Location	**Capacity**	**Hoist Type**	**Trolley Type**	**Lifting Height**
High Pressure Feed pumps	3.0 ton	Electric	Electric	As shown on Drawings

B. Electric Wire Rope Hoist with Motorized Trolley
1. Manufacturer: ACCO Lifting Products.
2. Max Lift: 15 feet.
3. Lift Speed: 2-speed lift @ 15/5 fpm.
4. Hoist Trolley: Single speed @ 50 fpm with soft start and trolley brake.
5. Power: 460/3/60 with 115 volt controls.
6. Features: Trolley drop down lugs rail sweeps with rubber bumpers, geared limit switch, overload cut off, multiple disc motor brake, mechanical load brake, gravity upper hook ravel limit switch, class F insulation, 30 minute duty motors, NEMA 12 hoist enclosures, drop forged load block with swivel hook and spring latch, helical gearing, stainless steel

ID tags, trolley brake, epoxy painted hoist, thermal overloads, mainline contactor, trolley brake, trolley soft start, 2-part single reeved hoist.

C. Hoist Runway:
1. Provide AISC standard structural steel shapes or manufacturer's standard runways.
Runway shall be installed on the Pre-engineered metal building frame on supports provided by the Pre-engineered metal building manufacturer. Contractor is responsible for providing Pre-engineered metal building manufacturer and design engineer with all support loads required for proper design of the runway beam supports.
Runway shall include end stops at each end. Location as called out on the drawings or as specified during shop drawing review. End stops shall be CMAA designed.

2.3 FINISHING

A. Provide manufacturer's standard shop-applied coating suitable for the service indicated.

B. Surface Preparation and Painting:
1. Surface preparation and shop painting is required for ferrous metals, equipment, and accessories. Do not paint stainless steel and machined surfaces.
2. Clean and apply in the shop prime coat and finish coat in accordance with Division 09, Section "High Performance Coatings".

C. Gears, bearing surfaces, and other machined surfaces shall receive a heavy application of rust-inhibiting coating that shall be maintained during storage and until equipment is placed into operation.

2.4 TOOLS AND SPARE PARTS

A. Supply tools and a spare parts kit for each crane furnished as recommended by the manufacturer.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine conditions under which materials and equipment are to be installed and notify ENGINEER in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

B. Inspect and verify that no part of the building, structure, piping, mechanical systems including ductwork, electrical systems including lighting and conduit, or other elements that will interfere with proper operation of hoist along the entire length of monorail track.

3.2 INSTALLATION

A. General
1. Provision and welding of sway bracing shall be by this Contractor.
2. Comply with Section 05 1200, Structural Steel Framing, for testing and inspection of welds.
3. Coordinate location of runway beam with Pre-Engineered Metal Building manufacturer. Refer to Section 13 3419, Metal Building Systems.

4. Electrical power required for connectors on runway conductor shall be coordinated with the Electrical Contractor prior to roughing-in of conduit.

B. Touch-Up Coating: Touch-up all damaged coating surfaces with compatible coating of identical color in such a manner that there shall be no evidence of damage.

3.3 OPERATION AND DEMONSTRATION

A. The completed installation of the Work of this Section shall be demonstrated to the Owner's personnel. Maintenance and Operation manuals shall be reviewed with the Owner's personnel.

END OF SECTION 41 2200

SECTION 43 1251

COMPRESSED AIR SYSTEM

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including, but not limited to Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. Work of this section includes furnishing and installing a plant-wide compressed air system and includes the following.
   1. Air compressor and reviver.
   2. Refrigerated air drier and coalescing filter.
   3. Compressed air piping and fittings.
   4. Compressed air accessories and spare parts.

B. All equipment and piping shall be installed as described herein, as recommended by the equipment manufacturers, and as required in related section including the following:
   1. Division 40 Section “Process Piping”.
   2. Division 40, Section “Process Valves, Gates, and Accessories”.
   3. Division 40, Section “Pipe Supports”.

C. All electrical components shall comply with Division 26.

D. Equipment furnished and installed under this section shall be assembled, erected and placed in proper operating condition in full compliance with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by the engineer.

1.3 QUALITY ASSURANCE

A. Manufacturer’s Qualifications
   1. The compressor and drier manufacturer shall be the same manufacturer.
   2. All valves and accessories of a similar type (i.e. all ball valves, all hose reels, all quick release couplings, etc.) shall be of the same manufacturer.

1.4 SUBMITTALS

A. All submittals shall conform completely to the requirements of the Contract Documents, including all requirements set forth in Division 01, General Requirements.

B. Product Data
   1. Catalog cut sheets and written description of each item describing its operation.
   2. Construction materials.
   3. Rated capacities of the compressor and drier.
   4. Motor and electrical data.

C. Shop Drawings
   1. Detailed dimensional drawings indicating overall dimensions, elevations, weights, sizes and required clearances.
   2. Diagrams indicating any special maintenance items such as oil compartments and removable accessories.
   3. Anchoring and mounting details.

D. Operation and Maintenance Manual. O&M Manuals shall be in accordance with Division 01, Section "Operation and Maintenance Data".

1.5 SPARE PARTS

A. Spare parts shall be of the same manufacture and quality as those provided with the equipment. Spare parts shall be suitable packaged in accordance with the Manufacturer's recommendations, with labels indicating the contents of each package. Spare parts shall be delivered to the Owner with the equipment of this section.

B. Provide the following spare parts shall be included:
   1. Two (2) compressor motor drive belts.
   2. Two (2) quarts of the manufacturer-recommended compressor oil.
   3. Two (2) 5-micron particulate filter elements.
   4. Two (2) coalescing filter elements.

1.6 HANDLING, DELIVERY, AND STORAGE

A. The compressed air equipment shall be completely factory assembled, aligned, and securely crated for shipment. When received at the site, the equipment shall be stored in its shipping container until ready for installation. The equipment shall be stored in a clean, dry, place, and indoors until ready for installation. Equipment shall not be allowed to freeze.

PART 2 - PRODUCTS

2.1 AIR COMPRESSOR

A. General: The air compressor shall be a dual-motor compressor with a horizontal-oriented receiver tank. The two motors shall be mounted directly to the receiver and the receiver shall be complete with legs to be anchored to a 4-inch thick housekeeping pad.

B. Performance requirements:

1.	Minimum receiver tank capacity:	200 gallons
2.	Number of motors:	2
3.	Maximum motor horsepower:	7.5
4.	Power requirements:	460 volt, 3 phase, 60 hertz.
5.	Minimum air flow at 80 psi:	8.5 CFM

C. Accessories
   1. Provide a duplex motor control panel for operation and alternation of motors, as well as control of the automated blow-down valve and setpoints. Panel shall include a disconnect switch.
   2. Provide OSHA-approved belt guards for each motor.

3. Provide an automatically actuated blow-down valve for programmable operation to drain the receiver tank. Contractor shall install piping from the valve discharge to the nearest floor drain. Valve shall be capable of manual operation in the event of actuator failure. Alternatively, a second drain port with a manual valve can be provided.
4. Receiver shall have an ASME code-rated pressure relief valve.
5. Provide a pressure gauge on the receiver or air discharge line capable of operating over the full range of system pressure.
6. Provide a 5-micron particulate filter and housing on the outlet of the compressor prior to the refrigerated drier.
7. Contractor shall install a 4-inch thick concrete housekeeping pad with dimensions adequate to install the compressor. Provide all necessary stainless steel anchor bolts to affix the compressor to the pad.
8. Provide all necessary adapter fittings and piping to connect the compressor discharge to the particulate filter and air drier.
9. Contractor shall hard-wire the compressor and provide all necessary conduit and disconnects in accordance with Division 26.

D. Manufacturer
1. Quincy.
2. Ingersoll Rand.
3. Puma.
4. Engineer Approved Equal.

2.2 REFRIGERATED AIR DRIER AND COALESCING FILTER

A. General: Provide a refrigerated air drier and coalescing filter housing to provide clean, dry air to the compressed air system.

B. The drier shall be mounted directly onto the compressor by the manufacturer.

C. Mount the coalescing filter housing and accessories directly to the wall with adequate clearances for maintenance and filter replacement. Provide spare filters as specified in “Spare Parts”.

D. Performance requirements: Minimum pressure and air flow capacity shall be equal to or greater than the compressor output capacity.

E. Power Requirements: 120 volt, single phase, 60 Hertz.

F. Accessories
1. Provide all necessary local controls for operation of the refrigerated drier and coalescing filter.
2. Provide an automated drain valve for programmable and periodic draining of the drier. Drain valve shall include a silencer.
3. If shipped lose, the contractor shall install the drier on a 4-inch thick concrete housekeeping pad with dimensions adequate for the equipment footprint. Provide all necessary stainless steel anchor bolts to affix the direr to the pad. The pad may be integral to the compressor pad.
4. Provide all necessary adapter fittings and piping to connect the drier discharge piping to the coalescing filter and the filter to the compressed air system piping.

5. Provide all necessary electrical components for a fully operational system in accordance with division 26.

G. Manufacturer: Shall be the same as the compressor.

2.3 COMPRESSED AIR PIPING

A. Piping: Rigid compressed air piping is specified in Division 40 “Process Piping”.

B. For short-run connections between equipment such as the compressor and drier, use of braided stainless steel flex hose suitable for compressed air is acceptable.

2.4 VALVES AND ACCESSORIES

A. Provides stainless steel ball valves as indicated on the drawings and as required for isolation of piping branches.

B. Valves used for connection to quick release couplings shall be threaded. All other valves used for the compressed air system may be threaded or grooved end suitable for Victaulic connections.

C. Quick release couplings: Provide and install brass locking sleeve quick release couplings with nitrile seals and appropriate inserts for quick connections to ‘loose-shipped’ air hoses. Couplings shall be suitable for 3/8” diameter inserts. Provide at each compressed air drop leg as indicated and the drawings and listed in the accessories in this section.

D. At a minimum, provide the following compressed accessories:
1. Four (4) spare 3/8” diameter quick release couplings.
2. Four (4) spare 3/8” diameter quick release coupling inserts.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install as shown on the Contract Drawings, approved shop drawings, and as recommended by the Manufacturer. Compressor and drier shall be installed on a concrete housekeeping pad.

B. Add oil to the compressor in accordance to manufacturer’s recommendations.

C. Provide piping to route the discharge of the automatic drains to the nearest floor drain.

3.2 FIELD TESTS

A. After initial startup of the compressor and drier system, a preliminary running-in period will be provided to make field tests and necessary adjustments. The Owner will then operate the compressed air system for a period of fourteen consecutive calendar days.

B. At the end of the specified period of operation, the system will be accepted if, in the opinion of the Engineer, the compressor, drier, and piping and accessories have operated satisfactorily without leaks, excessive vibration, and other operational problems.

END OF SECTION 43 1251

SECTION 43 2100.02

VERTICAL TURBINE PUMPS AND APPURTENANCES

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Provide and test vertical turbine pumps, motors, suction cans, and appurtenances as indicated and in compliance with Contract Documents.

B. All pump wetted parts must be constructed of materials meeting NSF 61.

C. Connections of electrical, control and instrumentation components shall be furnished and installed as specified in divisions 26 and 40 9XXX.

1.2 REFERENCES:

A. ASTM International (ASTM):

   1. 61: Drinking Water System Components - Health Effects

G. National Electrical Manufacturers Association (NEMA):
   1. MG1: Motors and Generators.

1.3 SUBMITTALS:

A. Submit the following shop drawings in accordance with Division 01, Section "Submittal Procedures":
   1. Data regarding pump and motor characteristics and performance:
      a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically duplicate pumps, showing they meet indicated and specified requirements for head, capacity, horsepower, efficiency and NPSH3. Curves shall be provided per HI standards.
         1) For units of same size and type, provide curves for a single unit only.
      b. Provide catalog performance curves at maximum pump speed indicated and specified for each service showing maximum and minimum impeller diameters available, acceptable operating range (AOR) and preferred operating range (POR).
      c. Results of shop performance tests as specified.
      d. Submit curves for guaranteed performance, and shop performance tests on 8-1/2-inch by 11-inch (A4) sheets, one curve per sheet.
      e. Listing and value of all internal friction losses for the entire pump assembly.
      f. Shaft power loss
      g. Thrust bearing power loss
   2. Characteristic curves for variable speed pumps for maximum pump speed and for speeds required to obtain minimum pump flow and head conditions specified and indicated. Identify curves by speed and provide all curves on one sheet. Provide NPSH3 curve for each speed.
   3. Shop drawing data for accessory items.
   4. Certified setting plans, with tolerances, for anchor bolts.
   5. Manufacturer's literature as needed to supplement certified data.
   6. Operating and maintenance instructions and parts lists.
   7. Listing of reference installations as specified with contact names and telephone numbers.
   8. Certified results of hydrostatic testing.
   9. Certified results of dynamic balancing.
   10. Bearing temperature operating range for the service conditions specified.
   11. List of recommended spare parts other than those specified.
   12. Shop and field inspection reports.
   13. Bearing Life: Certified by the pump motor manufacturer. Include design data.
   14. Pump shop test results.
   15. Motor shop test results.
   16. Qualifications of field service engineer.
   17. Recommendations for short and long-term storage.
   18. Resonant frequency analysis.
   19. Shop and field testing procedures, pump and piping set up, equipment to be used and ANSI/HI testing tolerances to be followed.
   20. Special tools.
   21. Number of service person-days provided and per diem field service rate.

22. Results of field vibration test data including a vibration signature for each pump and drive assembly. Provide vibration testing procedure for review.
23. Recommended location of discharge pressure gauges.
24. Manufacturer's product data, specifications and color charts for shop painting.
25. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
26. The latest ISO 9001 series certification.
27. Provide a scaled drawing for each pump service showing the pumps and motors including equipment weights, lifting attachments, and clearances for equipment removal and maintenance.
28. Operation and Maintenance Manual. O&M Manuals shall be in accordance with Division 01, Section "Operation and Maintenance Data".

1.4 SPARE PARTS:

A. Comply with the requirements specified in Division 01, Section "Product Requirements".

B. Provide spare parts that are identical to and interchangeable with similar parts installed.
   1. For each pump:
      a. One complete set of gaskets.
      b. One mechanical seal repair kit for each pump provided with mechanical seals.
      c. One set of wearing rings.
   2. For each set of pumps of the same size and performance.
      a. One set of all special tools required.

1.5 QUALITY ASSURANCE:

A. Comply with the requirements specified in Division 01, Section "Quality Control".

B. Pumps shall be the product of one manufacturer.

C. Pumps shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest American Welding Society Code or equivalent.

E. Shop tests as specified.

F. The Contractor shall obtain the pumps, motors, discharge columns, discharge heads, suction cans and appurtenances from the pump manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.
   1. The Contractor shall coordinate the variable frequency motor controllers with the pump and motor manufacturer and submit as part of the shop drawings a written statement signed by the Contractor, pump manufacturer, motor manufacturer and variable frequency motor controller manufacturer that the variable frequency motor controller manufacturer has received the required information from the pump and motor manufacturers and that all parties have reviewed the system and coordinated the equipment selection. Also include all motor data and information that has been used for the coordination.

G. Services of Manufacturer's Representative as stated in Division 01, Section "Field Quality Control" and as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
   1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment.
   2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
   3. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:
      a. 2 person-days per treatment facility.
   4. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.
      a. 2 person-days per treatment facility.
   5. Field Performance Testing: Field performance test equipment specified.
      a. 2 person-days per treatment facility.
   6. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.
      a. 1 person-days.
   7. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
   8. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

I. Installations will be provided for the size specified as well as similar sizes if less than 5 installations have occurred in the last five (5) years.

J. If equipment proposed is heavier or taller, than specified and indicated; provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner.
   1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

K. For variable speed pump systems the pump manufacturer must perform an analysis of the combined motor and pump assembly for resonant frequency or their harmonics independent of a structure (above ground).
   1. Submit a copy of these calculations for review prior to manufacture or fabrication of any materials.
   2. Should calculations indicate the probability of encountering such frequencies within the speed range required, provide all additional supporting devices necessary to affect the unit mass, and raise or lower resonant point within the speed range required.
   3. Provide and install such additional devices at no additional cost to the Owner.

1.6 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in Division 01, Section "Product Requirements".

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION:

A. Pump capacities and operating data are indicated in the Process Pump Schedule.

B. Break Tank Pumps: Pump filtered water from the break tank to the NF Bypass and cartridge filters.

C. NF Feed Pumps: Pump cartridge filter effluent to the NF skids.

D. High Service Pumps: Pump finished water to the distribution system.

E. Design Heads:
1. The head requirements indicated are the heads required at the pump's discharge head flange.
2. For wet pit pumps, the pump manufacturer must include all internal losses from the intake bell to the discharge head flange.
3. For pumps installed in a suction can, the pump manufacturer must include all internal losses from the intake of the suction can to the discharge head flange.

F. Coordinate pump dimensions and weights with hoists and bridge cranes as specified in Division 41, Section "Cranes and Hoists" and as indicated.

2.2 MANUFACTURERS:

A. Vertical Turbine Pumps:
1. Floway
2. Flowserve
3. Peerless

2.3 SEISMIC DESIGN REQUIREMENTS:

A. Conform to the requirements indicated on the structural drawings.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

2.4 PUMP CONSTRUCTION:

A. Pumps: Vertical turbine pumps, driven as indicated in the Process Pump Schedule.

B. Pump configuration as indicated in the Process Pump Schedule.

C. Rotation: Counterclockwise, viewed from the drive end.

D. Design and proportion all parts of pump for the service specified and indicated.

E. Pumping assemblies, including pump, and motor, to operate within vibration and bearing temperature limits specified over the full operable range of the pump performance.

F. Provide no more than the number of stages as indicated in the Process Pump Schedule to meet the performance specified and indicated.

G. Provide room for inspection, repair and adjustment.

H. Equip pumping assemblies with all specified and required accessories, including lifting attachments.

I. Apply a never seize compound to all bolts.

J. Bowl Assembly:
   1. Pump Bowls: Free from blow-holes, sand holes and all other defects and faults. Bowls to be coated with a NSF 61 coating as specified herein. Provide flanged bowls with Type 316 stainless steel hardware.
   2. Either of the following material options is acceptable:
      a. Cast Iron ASTM A48 Class 30.
      b. Ductile Iron ASTM A395 60-40-18.
   3. Pump Shaft:
      a. ASTM A582, Type 416 Stainless Steel.
   4. Impellers:
      a. Type: Turbine.
      b. Material (either option is acceptable):
         1) Aluminum Bronze ASTM B148, no lead content.
         2) Stainless steel ASTM A743/A743M CF8M.
      c. Provide bowl and impeller wear rings (either option is acceptable):
         1) Aluminum Bronze ASTM B148 bowl and impeller wear rings, no lead content.
         2) Stainless steel ASTM A743/A43M CA-40 bowl and impeller wear rings.
      d. Provide the impellers secured to the shaft with a tapered lock bushing for shafting 2-3/16 inches (56 mm) and smaller and thrust washer, key and snap ring for shafting larger than 2-3/16 inches (56 mm).
      e. Dynamically balance impellers.
   5. Suction Bell with flared inlet (either option is acceptable):
      a. ASTM A48 Class 30 cast iron
      b. Ductile Iron ASTM A395 60-40-18.
   6. Suction Bell Bearing:
      a. Copper Bismuth Alloy, Federalloy® or equal.
      b. Provide a sand collar of Copper Bismuth Alloy, Federalloy or equal, attached to shaft with a Type 316 stainless steel set screw arrangement.
      c. Provide a suction bowl plug or cap of cast iron.
   7. Intermediate Bowl Bearings:
      a. Copper Bismuth Alloy, Federalloy or equal.
   8. Discharge Bowl and Connector Bearings:
      a. Provide bearings of bronze Copper Bismuth Alloy, Federalloy or equal.
   9. Discharge Bowl:
      a. Provide a flanged discharge bowl of ASTM A48 Class 30 cast iron.

K. Discharge Head:

1. Provide size and configuration as indicated in the Process Pump Schedule.
2. Material:
    a. ASTM A120, A53/A53M and A283 Grade D steel.
        1) Provide a minimum of four (4) supports at maximum of 90 degree spacing from baseplate to motor flange for all variable speed applications (this requirement may be negated or modified as a result of the FEA/lateral and torsional analysis).
3. Provide integral flange for bolting to column flange.
4. Provide a foundation plate of cast iron ASTM A48/A48M Class 30 or fabricated steel ASTM A36.
5. Connection:
    a. Flanged: ANSI/ASME 16.5, 150-lb.
6. Provide pump head and baseplate designed to withstand all thrust conditions imposed by the pump and driver during operation at the specified and indicated conditions and at future conditions specified and indicated.
7. Provide pumps with vertical solid shaft (VSS) motors with spacer type couplings.
8. Pumps with a separate thrust bearing arrangement are not acceptable.
9. Provide neoprene gasket between top column flange and discharge head.
10. Provide a plugged pre-lubrication connection with a Type 316 stainless steel plug.
11. Provide a minimum 3/4-inch NPT drain connection.
12. Provide Type 316 stainless steel guard and hardware.

L. Column and Shafting:
1. Type: Flanged with Open Line shaft and Type 316 stainless steel bolts and nuts.
    a. Size: As indicated in the Process Pump Schedule.
2. Material: Steel ASTM A53 Grade B.
    a. Provide section lengths as indicated, but no longer than 10 feet-0 inches (3000 mm). Provide number of sections to allow pump to be removed within space indicated.
3. Provide pipe thickness in accordance with AWWA standard wall pipe.
4. Line shaft and couplings: AISI stainless steel (minimum 410 SST).
5. Bearing retainer: Copper Bismuth Alloy, Federalloy, Copper Bismuth C89835, Engineer Approved Equal.
6. Bearing: Copper Bismuth Alloy, Federalloy, or Engineer Approved Equal.
7. Connector Bearing: Bronze Copper Bismuth Alloy, Federalloy, or Engineer Approved Equal.
8. Hardware: Type 316 stainless steel.
9. Transition: Provide a tapered transition where size of discharge bowl and column are not the same.
10. For pumps without suction cans, provide lifting lugs with lifting eyes 180 degrees apart below each column flanged connection for pump removal.

2.5 MECHANICAL SEALS:

A. Provide stuffing box with split mechanical seal
1. Manufacturer: Chesterton Style 442, Flex-a-Seal style 85, or Engineer Approved Equal
2. Materials:
    a. Gland: Type 316 stainless steel.
    b. Rotary Holder: Type 316 stainless steel.
    c. Hardware: Type 316 stainless steel.

d. Springs: Hastelloy C or Elgiloy
e. Rotating Faces: Silicon Carbide.
f. Stationary Faces: Silicon Carbide.
g. Elastomers: Viton
h. Restriction Bushing: Split type, glass filled teflon.

3. Seals will be installed in the pumps at the jobsite by the seal manufacturer's field service technician.

B. Provide a NPT water flush connection – minimum 3/8 inch.

2.6 PUMP SUCTION CAN:

A. Type:
1. Above grade suction:
a. Connection:
1) Flanged: ANSI/ASMB B16.5 Class 150.
2. Below ground suction:
a. Connections:
1) Flanged: ANSI/ASME B16.5 Class 150.
2) Provide a vent for each can.
3. Can Diameter: As indicated in the Process Pump Schedule.
4. Suction Size: As indicated in the Process Pump Schedule.
5. Provide vanes at the bottom and sides of the can in accordance with ANSI/HI 9.8
6. Provide can wall thickness designed for a test pressure of 1.50 times the maximum suction pressure indicated.
7. Provide a can vent, minimum 1 inch (25 mm) or as required by the pump manufacturer.
8. Provide drain/flushing connection at bottom of can as indicated.

B. Material:
1. 304 or 316 SST.

2.7 MOTORS:

A. Provide in accordance with Division 26, Section "Polyphase Integral Horsepower Motors" and as specified and indicated.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of pumps under any point on the pump curve (without operating in the motor service factor).

C. Motor enclosure and motor speed: As indicated in the Process Pump Schedule.

D. Provide motors with base supports with machined registered joints for mounting on pump discharge head.

E. Provide vertical solid shaft (VSS) motors and non-reverse ratchets.

F. Non Reverse Ratchets:
1. Ball type only.
2. Size for a minimum of 200 percent of the full motor torque.

G. In addition to the requirements for bearings specified under Electric Motors in Division 26, Section "Polyphase Integral Horsepower Motors", provide pump motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.

H. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet (1 metre) from motor.

I. Operate without overheating at the speeds specified and indicated.

J. Service Factor: 1.15, with 1.0 inverter duty rating for pumps equipped with variable frequency motor controllers.

K. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

L. Rating: 460V, 3-phase, 60 Hertz.

M. Insulation: Class F with Class B temperature rise, 40 degrees C ambient.

N. Site Altitude: Less than 3,300 feet (1000 metres) above sea level.

O. Motors shall be provided with over-temperature switches in the windings. Switch action shall be as shown on the drawings.

2.8 SHOP PAINTING:

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces and interior of column and discharge head, NSF 61 high solids epoxy in accordance with Division 09, Section "High Performance Coatings."

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

2.9 SHOP TESTING:

A. Provide motor shop testing in accordance with Division 26, Section "Polyphase Integral Horsepower Motors".

B. Pump Tests:
   1. Test pump bowls, column and discharge head under a hydrostatic head of at least 75 psi (500 kPa) or 150 percent of rated shutoff head, whichever is greater. Test pump assembled.
   2. Certified performance Testing.
      a. Run pump at full speed rating point for 60 minutes prior to start of any testing.
      b. Full speed tests:

1) Test pumps at the conditions specified and indicated and take not less than seven operating points between shut-off and run out. Test points must be at the conditions specified and indicated.
2) Take readings to determine flow, differential pressure, rpm, horsepower, and efficiency.
3) Operate each pump for not less than one hour and take readings to determine that the pump will operate as specified and indicated without cavitation at the specified minimum head condition with not more than the specified NPSH available. Test with the job submergence as indicated.

c. Variable speed tests:
1) Conduct tests as specified above for full speed at reduced speeds except that tests for cavitation at run out are not required.
2) Run one speed test at speed required to discharge the minimum rating point specified and indicated with one point of test at the minimum rating point.
3) Run a second test at a speed approximately midway between full and minimum speed.
4) Run addition tests for each reduced speed operating condition specified and indicated.

d. Factory tests on pumps:
e. Provide a minimum of 30 days written notice to the Engineer prior to shop testing.

3. Run all tests in accordance with the latest standards of the Hydraulic Institute and as specified.
4. Testing Acceptance Grade and Tolerances:
a. ANSI/HI 14.6 Acceptance Grade: 1U.
b. Efficiency Tolerance: -0 percent.
c. If pumps do not meet the tolerances specified, trim the impeller and retest until the specified results are obtained.
5. In the event that specified tests indicate that pump or motor will not meet specifications, Engineer has the right to require additional complete witnessed tests for all pumps and motors at no additional cost to the Owner.
6. Repeat tests until specified results are obtained.
7. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

2.10 VIBRATION AND TEMPERATURE MONITORING

A. General:
1. Manufacturer shall provide pump/motor vibration/temperature motoring as specified.

B. Vibration Monitoring
1. Pump vibration shall be monitored using velocity sensors.
2. Number of Sensors: Two (2) per Pump
3. Location: Per pump manufacturer, 90 degree offset between sensors.
4. Manufacturer Make/Model: Allen Bradley Model EK-48958

C. Temperature Monitoring
1. Motor bearing temperatures shall be monitored using resistance temperature detectors (RTDs).
2. Provide 100 ohm, 3-wire, platinum, RTDs prewired to NEMA 4X terminal box mounted on motor base.
3. Number of Sensors: Two (2) per Pump

4. Location: Motor bearings.

2.11 CONTROLS

A. Control components, where specified within this section, shall be provided under this section.

B. The equipment specified under this section shall operate manually/automatically as shown on the drawings and specified in sections 40 9XXX. Any additional materials of equipment required by this section's manufacturer, but not shown on the drawings or specified in sections 40 9XXX, to allow this equipment to function in the required manner, shall be furnished and installed under this section.

C. Provide all miscellaneous supports, brackets, fasteners, and fabrications required to mount and install equipment controls provided under this section.

PART 3 - EXECUTION

3.2 INSTALLATION:

A. Install items in accordance with shop drawings, manufacturer's printed instructions and as indicated.

B. Install pumping units on a concrete pad and align thereon.
1. Set base on metal shims placed directly under the part of the base carrying the greatest weight and spaced close enough to provide uniform support.

C. After alignment is correct, grout using high grade non-shrink grout.
1. Do not imbed leveling nuts in grout.

D. All electrical power and control connections shall be furnished under division 26.

3.3 FIELD TESTING:

A. Test piping connections to prove the pump nozzle are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with pump nozzles. This must be performed and the piping acceptable prior to any field performance testing.

B. Field testing will not be conducted without an accepted procedure, calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Division 01 for checklist.

C. After installation of pumping equipment, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct running test for each pump in presence of the Engineer determine its ability to operate within the vibration and temperature limits specified, and to deliver its rated capacity under specified conditions.
1. During tests, observe and record head, capacity, pump bearing housings and motor bearing temperature, noise and vibration and motor inputs.
a. Provide vibration signature test data for each pump and drive assembly.
1) Limit: Within ANSI/HI Standards.

b. Bearing Temperature: Bearing temperature not to exceed 180 degrees F (82 degrees C).
c. Test Duration: Determined by the Engineer, but not less than three hours of continuous operation at each condition specified and indicated.

2. Run each pump for minimum four hours prior to taking temperature readings of the pumps, motors, and shafting.
3. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.
4. Repeat tests until specified results are obtained.
5. Contractor to provide all water labor, piping, equipment, flow meters and test gauges for conducting tests.
   a. Contractor shall provide calibrated test gauges for all permanently installed gauges and portable calibrated flow meters for all pumping systems even in those cases where permanent flow meters are installed.
   b. All calibrations must be within 30 days of the field testing.
   c. The testing will not be started and will not be accepted until the calibrated testing equipment stated above is operational and all certifications have been submitted.
   d. Contractor is responsible for delivery and disposal of water used for testing.

D. Make all adjustments necessary to place equipment in specified working order at time of above tests.

E. Test pump on product only. If product is not available, test with water. Water for testing furnished by Contractor.

F. Remove all replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted.

3.4 FIELD TOUCH-UP PAINTING

A. After installation and testing, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.5 CONTRACT CLOSEOUT:

A. Provide in accordance with Division 01, Section “Closeout Procedures”.

END OF SECTION 43 2100.02

RARWTP PUMP SCHEDULE

A. NF Feed Pumps

1.	Tag Nos:	NFFP-1, 2, 3, 4, 5, 6
2.	Number of Units:	Six (6)
3.	Location:	NF Building
4.	Capacity:	1,288 gpm
5.	Head:	370 feet
6.	Minimum Shutoff Head:	430 feet
7.	Minimum Overall Efficiency:	80%
8.	Constant Speed or VFD:	VFD
9.	Minimum Suction Size:	12-inch
10.	Minimum Discharge Size:	10-inch
11.	Max Pump Speed:	1,185 rpm
12.	Max Motor Size:	200 hp
13.	Max Motor Speed:	1,200 rpm
14.	Motor Enclosure Type:	TEFC
15.	Drive Type:	Direct
16.	Notes:	Pumps installed in suction cans.
17.	Can Diameter:	20-inch

B. High Service Pumps

1.	Tag Nos:	HSP-5
2.	Number of Units:	One (1)
3.	Location:	High Service Pump Building
4.	Capacity:	2,475 gpm
5.	Head:	240 feet
6.	Minimum Shutoff Head:	330 feet
7.	Minimum Overall Efficiency:	77%
8.	Constant Speed or VFD:	VFD
9.	Minimum Suction Size:	N/A
10.	Minimum Discharge Size:	14-inch
11.	Max Pump Speed:	1,770 rpm
12.	Motor Size:	250 hp
13.	Max Motor Speed:	1,800 rpm
14.	Motor Enclosure Type:	TEFC
15.	Drive Type:	Direct
16.	Notes:	Suction can is existing and already installed.
17.	Can Diameter:	20-inch

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 43 2100.23

END SUCTION CENTRIFUGAL PUMPS

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Provide and test process pumps, motors, drives, and appurtenances as indicated and in compliance with Contract Documents.

B. Connections of electrical, control and instrumentation components shall be furnished and installed as specified in divisions 26 and 40 9XXX.

1.2 REFERENCES:

A. American Bearing Manufacturers Association (ABMA):
   1. 9: Load Ratings and Fatigue Life for Ball Bearings.
   2. 11: Load Ratings and Fatigue Life for Roller Bearings.

B. American National Standards Institute (ANSI):
   1. S1.11: Standard Octave-Band and Fractional-Octave-Band and Digital Filters.

C. ASTM International (ASTM):
   1. A36/A36M: Standard Specification for Carbon Structural Steel.
   2. A48/A48M: Standard Specification for Gray Iron Castings.
   3. A108: Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished
   4. B584: Standard Specification for Copper Alloy Sand Castings for General Applications

D. Hydraulic Institute (HI):
   1. Current Standards.
   2. 14.6: Rotodynamic Pumps for Hydraulic Performance Acceptance Tests

E. National Electrical Manufacturers Association (NEMA):
   1. MG1: Motors and Generators.

1.3 SUBMITTALS:

A. Submit the following shop drawings in accordance with Division 01, Section “Submittal Procedures”:
   1. Data regarding pump and motor characteristics and performance:
      a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically duplicate pumps, showing they meet indicated and specified requirements for head, capacity, horsepower, efficiency and NPSHr.
         1) For units of same size and type, provide curves for a single unit only.
      b. Provide catalog performance curves at maximum pump speed indicated and specified for each service showing maximum and minimum impeller diameters available, acceptable operating range (AOR) and preferred operating range (POR).
      c. Results of shop performance tests as specified.

d. Submit curves for guaranteed performance, and shop performance tests, one curve per sheet.

2. Characteristic curves for variable speed pumps for maximum pump speed and for speeds required to obtain minimum pump flow and head conditions specified and indicated. Identify curves by speed and provide all curves on one sheet. Provide $NPSH_r$ curve for each speed.
3. Shop drawing data for accessory items.
4. Certified setting plans, with tolerances, for anchor bolts.
5. Manufacturer's literature as needed to supplement certified data.
6. Operating and maintenance instructions and parts lists.
7. Listing of reference installations as specified with contact names and telephone numbers.
8. Certified results of hydrostatic testing.
9. Certified results of dynamic balancing.
10. Bearing temperature operating range for the service conditions specified.
11. List of recommended spare parts other than those specified.
12. Shop and field inspection reports.
13. Bearing Life: Certified by the pump manufacturer. Include design data.
14. Pump shop test results.
15. Motor shop test results.
16. Qualifications of field service engineer.
17. Recommendations for short and long-term storage.
18. Shop and field testing procedures, pump and piping set up, equipment to be used and ANSI/HI testing tolerances to be followed.
19. Special tools.
20. Number of service person-days provided and per diem field service rate.
21. Results of field vibration test data including a vibration signature for each pump and drive assembly. Provide vibration testing procedure for review.
22. Recommended location of suction and discharge pressure gauges.
23. Manufacturer’s product data, specifications and color charts for shop painting.
24. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
25. The latest ISO 9001 series certification.
26. Operation and Maintenance Manual. O&M Manuals shall be in accordance with Division 01, Section “Operation and Maintenance Data”.

1.4 SPARE PARTS:

A. Comply with the requirements specified in Division 01, Section “Product Requirements”.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.
1. For each pump:
   a. One complete set of gaskets and O-rings.
   b. Three complete sets of packing. Including lantern ring for each pump provided with packing.
   c. One mechanical seal repair kit and restriction brushing or spare mechanical seal for each pump provided with mechanical seals.
   d. One shaft sleeve.
2. For each set of pumps of the same size and performance.
   a. One set of all special tools required.

1.5 QUALITY ASSURANCE:

A. Comply with the requirements specified in Division 01, Section “Quality Control”.

B. Pumps of the same type shall be the product of one manufacturer.

C. Pumps shall be manufacturer’s standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

E. Shop tests as specified.

F. The Contractor shall obtain the pumps, motors, and appurtenances from the pump manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.
   1. The Contractor shall coordinate the variable frequency motor controllers with the pump and motor manufacturer and submit as part of the shop drawings a written statement signed by the Contractor, pump manufacturer, motor manufacturer and variable frequency motor controller manufacturer that the variable frequency motor controller manufacturer has received the required information from the pump and motor manufacturers and that all parties have reviewed the system and coordinated the equipment selection. Also include all motor data and information that has been used for the coordination.

G. Services of Manufacturer's Representative as stated in Division 01, Section “Product Requirements” and as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
   1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
   2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:
      a. 1 person-days per treatment facility.
   3. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.
      a. 1 person-days per treatment facility.
   4. Performance Testing: Field performance test equipment specified.
      a. 1 person-days per treatment facility.
   5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.
      a. 1 person-days.
   6. Credit to the Owner, all unused service person-days specified above, at the manufacturer’s published field service rate.
   7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

I. Manufacturer of pumps shall have a minimum of five (5) operating installations with pumps of the size specified and in the same service as specified operating for not less than five (5) years.

1.6 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in Division 01, Section “Product Requirements”.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION:

A. Pump capacities and operating data are indicated in the Pump Schedule.

B. Pumps normally operate with a flooded suction except that pumps will be subject to a suction lift if indicated in the Process Pump Schedule.

2.2 END SUCTION CENTRIFUGAL PUMPS:

A. Manufacturers:
1. Flowserve
2. Sulzer

B. Type: Non-overloading, single stage volute centrifugal pumps. Direct coupled to motor.
1. Key seated, provide Type 316 stainless steel lock nuts.

C. Materials Configuration No. 1:
1. Casing, Bearing Frame and Seal Plate:
   a. Ductile Iron ASTM A395 60-40-18.
2. Impeller, enclosed or semi open, dynamically balanced (either option is acceptable):
   a. Ductile Iron ASTM A 395 60-40-18.
   b. Type 316L SST.
   c. Duplex SST CD6MN ASTM A890A.
3. Shaft (either option is acceptable):
   a. Type 316 stainless steel.
   b. Duplex SST AISI 329.
4. Sleeves (either option is acceptable):
   a. Type 316 stainless steel.
   b. Duplex SST AISI 329.

D. Materials Configuration No. 2:
1. Casing, Bearing Frame and Seal Plate (either option is acceptable):
   a. Type 316L SST.
   b. Duplex SST CD6NM ASTM A890A.
2. Impeller, enclosed or semi open, dynamically balanced (either option is acceptable):
   a. Type 316L stainless steel.
   b. Duplex SST CD6MN ASTM A890A.
3. Shaft (either option is acceptable):

a. Type 316 SST.
b. Duplex SST AISI 329.

4. Sleeves (either option is acceptable):
   a. Type 316 stainless steel.
   b. Duplex SST AISI 329.

E. Bearing: Grease lubricated ball bearings.

F. Mechanical Seals: Provide as specified herein.

G. Motors: Provide as specified herein.

H. Couplings: Provide as specified herein.

I. Baseplates: Provide as specified herein.

2.3 PUMP CONSTRUCTION – GENERAL:

A. Design and proportion all parts of pump specially adapted for the service specified and indicated.

B. Pump Mounting:
   1. Horizontal Pumps:
      a. Mount each pump and drive on a common baseplate.
         1) Material: ASTM A36/A36M fabricated structural steel.
         2) Provide structural steel shape bases for pumps 4-inch (100 mm) and larger and bent form bases for pumps smaller than 4-inch (100 mm) unless otherwise specified.
         3) Provide bases with provisions for grouting and for anchor bolts.
         4) Design baseplates to support pump and driver.
         5) Provide planed surfaces of bearing pads for pumps and drives.

C. Design casings for removal of rotating parts without disconnecting suction and/or discharge piping.

D. Provide lifting devices on pump casings for handling.

E. Provide ribs or reinforcing required to withstand the specified hydrostatic test pressure, to prevent deflection caused by hydraulic thrust and to support the motor.

F. Provide components with machined registered concentric shoulder fits for precision alignment. Equipment without registered fits is not acceptable.

G. Seals:
   1. Provide split mechanical seals for all direct coupled pumps unless otherwise specified.
   2. Pump seals shall not require seal water.
   3. Mechanical seal:
      a. Materials:
         1) Gland: Type 316 stainless steel.
         2) Rotary Holder: Type 316 stainless steel.
         3) Hardware: Type 316 stainless steel.

4) Springs: Hastelloy C or Elgiloy.
5) Rotating Faces: Silicon Carbide.
6) Stationary Faces: Silicon Carbide.
7) Elastomers: Viton.
8) Restriction Bushing: Split type, glass filled teflon.

b. Provide Enviroseal Spiraltrac bushing version D, type A.
1) For vertically mounted pumps provide seal vent as indicated and in accordance with API Plan 13.

H. Couplings:
1. Non lubricated, polyurethane flex material type.
2. Split design.
3. Spacer type.
4. Manufacturer: Rexnord Omega, TB Woods SEC-series, or Engineer Approved Equal.
5. Provide guards for protection for personnel, conforming to OSHA requirements.

2.4 MOTORS:

A. Provide in accordance with Division 26, Section "Polyphase Integral Horsepower Motors" and as specified and indicated.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of pumps under any condition of operation specified and indicated without operating in the motor service factor.

C. Motor enclosure and motor speed: As indicated in the Process Pump Schedule.

D. Provide motors for horizontal pumps with mounts for bolting to baseplate.

E. In addition to the requirements for bearings specified under Electric Motors in Division 26, Section "Polyphase Integral Horsepower Motors", provide pump motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.

F. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet from motor.

G. Operate without overheating at the speeds specified and indicated.

H. Service Factor: 1.15, with 1.0 inverter duty rating for pumps equipped with variable frequency motor controllers.

I. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

J. Rating: 460V, 3-phase, 60 Hertz.

K. Insulation: Class F with Class B temperature rise, 40 degree C ambient.

L. Site Altitude: Less than 3,300 feet above sea level.

M. Provide Inpro/Seal bearing isolators.

N. Motors shall be provided with over-temperature switches in the windings. Switch action shall be as shown on the drawings.

2.5 SHOP PAINTING:

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Division 09, Section "High Performance Coatings".

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

2.6 SHOP TESTING:

A. Provide in accordance with Division 01, Section "Starting and Adjusting".

B. Provide motor shop testing in accordance with Division 26, Section "Polyphase Integral Horsepower Motors".

C. Pump Tests:
1. Test pump casings under a hydrostatic head of at least 75 psi or 150 percent of rated shutoff head, whichever is greater.
2. Provide certified performance tests as specified herein for all pumps
3. Certified performance testing.
   a. Run pump at full speed rating point for 60 minutes prior to start of any testing.
   b. Full speed tests:
      1) Test pumps at the conditions specified and indicated and take not less than seven operating points between shut-off and run out. Test points must be at the conditions specified and indicated.
      2) Take readings to determine flow, differential pressure, rpm, horsepower, and efficiency.
      3) Operate each pump for not less than one hour and take readings to determine that the pump will operate as specified and indicated without cavitation at the specified minimum head condition with not more than the specified NPSH available. Test with the job submergence as indicated.
   c. Variable speed tests:
      1) Conduct tests as specified above for full speed at reduced speeds except that tests for cavitation at run out are not required.
      2) Run one speed test at speed required to discharge the minimum rating point specified and indicated with one point of test at the minimum rating point.
      3) Run a second test at a speed approximately midway between full and minimum speed.
      4) Run addition tests for each reduced speed operating condition specified and indicated.
   d. Factory tests on pumps:
      1) Use tested job motors that are shipped to the pump testing facility for use in the pump tests.

2) Use factory test motors.
3) Use factory calibrated test drives.

e. Provide a minimum of 30 days written notice to the Engineer prior to shop testing.

4. Run all tests in accordance with the latest standards of the Hydraulic Institute and as specified.
5. Testing Acceptance Grade and Tolerances:
   a. ANSI/HI 14.6 Acceptance Grade: 1E.
   b. If pumps do not meet the tolerances specified, trim the impeller and retest until the specified results are obtained.
6. In the event that specified tests indicate that pump or motor will not meet specifications, Engineer has the right to require additional complete tests for all pumps and motors at no additional cost to the Owner.
7. Repeat tests until specified results are obtained.
8. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

2.7 CONTROLS

A. Control components, where specified within this section, shall be provided under this section.

B. The equipment specified under this section shall operate manually/automatically as shown on the drawings and specified in sections 40 9XXX. Any additional materials of equipment required by this section's manufacturer, but not shown on the drawings or specified in sections 40 9XXX, to allow this equipment to function in the required manner, shall be furnished and installed under this section.

C. Provide all miscellaneous supports, brackets, fasteners, and fabrications required to mount and install equipment controls provided under this section.

PART 3 - EXECUTION

3.2 INSTALLATION:

A. Install items in accordance with accepted shop drawings, manufacturer's printed instructions and as indicated.

B. Install pumping units on a concrete pad and align thereon.
   1. Coupling halves must be disconnected and only reconnected after alignment.
   2. Set base on metal shims placed directly under the part of the base carrying the greatest weight and spaced close enough to provide uniform support.

C. Horizontal pumps: Dowel pump and drive to baseplate after alignment in field to facilitate realignment after disassembly.

D. Final Coupling Alignment:
   1. Perform only after base is installed and piping is connected and pump nozzle connections tested in accordance with paragraph 3.2.
   2. If realignment is required piping must be disconnected prior to alignment, piping reconnected and alignment checked prior to connecting coupling halves.

E. After alignment is correct, grout using high grade non-shrink grout.

1. For horizontal pumps fill entire base and leave no gaps or voids.
2. Do not imbed leveling nuts in grout.

F. All electrical power and control connections shall be furnished under division 26.

3.3 FIELD TESTING:

A. Test piping connections to prove the pump nozzle are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with pump nozzles. This must be performed and the piping acceptable prior to any field performance testing.

B. Field testing will not be conducted without an accepted procedure, calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Division 01 for checklist.

C. After installation of pumping equipment, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct running test for each pump in presence of the Engineer to determine its ability to operate within the vibration and temperature limits specified, and to deliver its rated capacity under specified conditions.
   1. During tests, observe and record head, capacity, pump bearing housings and motor bearing temperature, noise and vibration and motor inputs.
      a. Provide vibration signature test data for each pump and drive assembly.
         1) Limit: 100 percent of ANSI/HI allowable limits.
      b. Bearing Temperature: Bearing temperature not to exceed 180 degrees F (82 degrees C).
      c. Test Duration: Determined by the Engineer, but not less than three hours of continuous operation at each condition specified and indicated.
   2. Run each pump for minimum four hours prior to taking temperature readings of the pumps, motors, and shafting.
   3. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.
   4. Repeat tests until specified results are obtained.
   5. Contractor to provide all water labor, piping, testing equipment, equipment, flow meters and test gauges for conducting tests.
      a. Contractor shall provide calibrated test gauges for all permanently installed gauges and portable calibrated flow meters for all pumping systems even in those cases where permanent flow meters are installed.
      b. All calibrations must be within 30 days of the field testing.
      c. The testing will not be started and will not be accepted until the calibrated testing equipment stated above is operational and all certifications have been submitted.
      d. Contractor is responsible for delivery and disposal of water used for testing.

D. Make all adjustments necessary to place equipment in specified working order at time of above tests.

E. Test pump on product only. If product is not available, test with water. Water for testing furnished by Contractor.

F. Remove all replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the

Engineer that equipment will perform the service specified, indicated and as submitted and accepted.

3.4 FIELD TOUCH-UP PAINTING:

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.5 CONTRACT CLOSEOUT:

A. Provide in accordance with Division 01, Section “Closeout Procedures”.

END OF SECTION 43 2100.23

RARWTP PUMP SCHEDULE

A. Break Tank Pumps

1.	Tag Nos:	BTP-1, 3, 4, 6 (BTP-2 and 5 are future)
2.	Number of Units:	Four (4)
3.	Location:	NF Building
4.	Material Coniguration:	No. 1
5.	Capacity:	3,756 gpm
6.	Head:	93 feet
7.	Minimum Shutoff Head:	120 feet
8.	Minimum Efficiency:	80%
9.	Constant Speed or VFD:	VFD
10.	Minimum Suction Size:	N/A
11.	Minimum Discharge Size:	10-inch
12.	Max Pump Speed:	1,180 rpm
13.	Max Motor Size:	125 hp
14.	Max Motor Speed:	1,200 rpm
15.	Motor Enclosure Type:	TEFC
16.	Drive Type:	Direct

B. Membrane Cleaning System Pumps

1.	Tag Nos:	MCSP-1, 2
2.	Number of Units:	Two (2)
3.	Location:	NF Building
4.	Material Coniguration:	No. 2
5.	Capacity:	1,080 gpm
6.	Head:	127 feet
7.	Minimum Shutoff Head:	145 feet
8.	Minimum Efficiency:	75%
9.	Constant Speed or VFD:	VFD
10.	Minimum Suction Size:	6-inch
11.	Minimum Discharge Size:	4-inch
12.	Max Pump Speed:	1,770 rpm
13.	Max Motor Size:	60 hp
14.	Max Motor Speed:	1,800 rpm
15.	Motor Enclosure Type:	TEFC
16.	Drive Type:	Direct

SECTION 43 2121

CHEMICAL TRANSFER PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. The Contractor shall provide transfer pumps for the chemical(s) as listed in this Specification.

C. Connections of electrical, control and instrumentation components shall be furnished and installed as specified in divisions 26 and 40 9XXX.

1.2 QUALITY ASSURANCE

A. Pump shall be a product of a manufacturer regularly engaged in the production of such equipment for not less than the past 5 years.

B. The equipment manufacturer shall provide a full warranty for a period of one (1) year after plant start-up.

1.3 SUBMITTALS

A. Provide technical submittals in accordance with Division 01 Section “Submittal Procedures”, demonstrating that all equipment provided conforms completely to the requirements of this Section.

B. Product Data
1. Catalog cut sheets and description of all items.
2. Materials of construction.

C. Operation and Maintenance Manual.
1. O&M Manuals shall be in accordance with Division 01, Section “Operation and Maintenance Data”.

1.4 SPARE PARTS
1. For each size pump provided, provide one (1) shelf spare pump.

1.5 HANDLING, DELIVERY AND STORAGE

A. Handling and storage instructions shall accompany equipment delivered to the site. Store all equipment.

PART 2 - PRODUCTS

2.1 PUMP

A. General: Pumps shall be a seal-less magnetic drive unit with isolated housing container and suitable for the chemical being pumped. Chemical shall be pumped without direct connection with the motor. Pump shall be suitable for the application as identified in the pump schedule.

B. Design:
   1. Mounting Configuration: Horizontal, close coupled
   2. Pump Casing: Ductile iron with PTFE chemically resistant lining.
   3. Impeller: single piece closed impeller.
   4. Shaft, Bushings, and Thrust Ring: Silicone Carbide.

C. Motor
   1. NEMA C-face.
   2. Motor Speed: 1800 rpm.
   3. Electrical Characteristics: 460V, 3-Phase, 60 Hz.
   4. Motors shall be provided with over-temperature switches in the windings. Switch action shall be as shown on the drawings.

D. Design
   1. Separate magnetic drive assembly.
   2. Suitable for chemicals with properties as identified in the Pump Schedule.
   3. Self Priming.
   4. Ceramic bushings.

E. Manufacturer:
   1. ANSIMAG, KM Series.

2.2 CONTROLS

A. Control components, where specified within this section, shall be provided under this section.

B. The equipment specified under this section shall operate manually/automatically as shown on the drawings and specified in sections 40 9XXX. Any additional materials of equipment required by this section's manufacturer, but not shown on the drawings or specified in sections 40 9XXX, to allow this equipment to function in the required manner, shall be furnished and installed under this section.

C. Provide all miscellaneous supports, brackets, fasteners, and fabrications required to mount and install equipment controls provided under this section.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Installation shall be complete and in accordance with the Drawings and Manufacturer's recommendations.

B. All electrical power and control connections shall be furnished under division 26.

END OF SECTION 43 2121

RARWTP TRANSFER PUMP SCHEDULE

A. Sodium Bisulfite ($NaHSO_3$)

1.	Concentration:	38%
2.	pH:	3.8
3.	Specific Gravity:	1.33
4.	Capacity:	60 gpm @ 20-ft TDH
5.	Number of Pumps Installed:	1
6.	Maximum Motor Size:	2 hp

B. Antiscalant (A.S.)

1.	Concentration:	100%
2.	pH:	3
3.	Specific Gravity:	1.10
4.	Capacity:	60 gpm @ 20-ft TDH
5.	Number of Pumps Installed:	1
6.	Maximum Motor Size:	2 hp

C. Sodium Hypochlorite (NaOCl)

1.	Concentration:	12.5% (Diluted to 6.25% onsite)
2.	pH:	13
3.	Specific Gravity:	1.12
4.	Capacity:	60 gpm @ 20-ft TDH
5.	Number of Pumps Installed:	1
6.	Maximum Motor Size:	2 hp

D. Sodium Hydroxide (NaOH)

1.	Concentration:	50%
2.	pH:	14 s.u.
3.	Specific Gravity:	1.53
4.	Capacity:	60 gpm @ 20-ft TDH
5.	Number of Pumps Installed:	1
6.	Maximum Motor Size:	2 hp

E. Fluoride (FLUOR.)

1.	Concentration:	23%
2.	pH:	1.20
3.	Specific Gravity:	1.20
4.	Capacity:	60 gpm @ 20-ft TDH
5.	Number of Pumps Installed:	1
6.	Maximum Motor Size:	2 hp

F. Corrosion Inhibitor (PHOS.)

1.	Concentration:	28.5%
2.	pH:	3.8
3.	Specific Gravity:	1.29
4.	Capacity:	60 gpm @ 20-ft TDH
5.	Number of Pumps Installed:	1
6.	Maximum Motor Size:	2 hp

SECTION 43 3225

FORCED DRAFT DEGASIFIER TOWERS

PART 1 - GENERAL

1.1 DESCRIPTION:

A. This Section includes the design, fabrication, materials, installation, and testing of FRP degasifiers for removing carbon dioxide from NF permeate.

1.2 REFERENCES:

A. American Society of Civil Engineers (ASCE):
   1. 7: Minimum Design Loads for Buildings and Other Structures

B. American Society of Mechanical Engineers (ASME):

   6. D2563: Standard Practice for Classifying Visual Defects in Glass-Reinforced Plastic Laminate Parts
   7. D2584: Standard Test Method for Ignition Loss of Cured Reinforced Resins
   8. D3299: Standard Specification for Filament-Wound Glass-Fiber-Reinforced Thermoset Resin Corrosion-Resistant Tanks
   9. D4024: Standard Specification for Machine Made "Fiberglass" (Glass-Fiber-Reinforced Thermosetting Resin) Flanges
   10. D5421: Standard Specification for Contact Molded “Fiberglass” (Glass-Fiber-Reinforced Thermosetting Resin) Flanges
   11. F467: Standard Specification for Nonferrous Nuts for General Use
   12. F468: Standard Specification for Nonferrous Bolts, Hex Cap Screws, Socket Head Cap Screws, and Studs for General Use
   13. F593: Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.

D. NSF International (NSF):
   1. 61: Drinking Water System Components - Health Effects

1.3 SUBMITTALS:

A. Submit the following shop drawings in accordance with Division 01, Section “Submittal Procedures”.
   1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the capacity, size and arrangement as indicated and specified.
   2. Shop drawing data for accessory items.
   3. Certified setting plans, with tolerances, for anchor bolts.
   4. Manufacturer’s literature as needed to supplement certified data.
   5. Operating and maintenance instructions and parts list.
   6. Listing of reference installations as specified with contact names and telephone numbers.

B. Submit degasifier layout drawings showing dimensions, wall thickness, mounting brackets, knuckle radii, inlet and outlet nozzle location and orientation, and construction.

C. Submit installation instructions for installing tower on a concrete slab.

D. Submit manufacturer's catalog data and descriptive literature for tower system and associated equipment. Submit dimensional drawings. Show materials of construction by ASTM reference and grade. Show coatings, appurtenances, anchor bolts (number, size, and method of fastening), and hardware.

E. Submit manufacturer's catalog information on the packing proposed to be used. Submit calculations to verify depth of media required.

F. Submit hydraulic calculations to show even distribution of water over the media.

G. Submit tower manufacturer’s recommended bolt torques for flanges.

H. Submit a certificate listing the resin to be used, its composition, and that it is NSF approved for use in potable water. Show glass and resin content and thickness of the component sections.

I. Submit calculations for structural and seismic design of walls and design of tie-down lugs (number, size, and embedment length of anchor bolts) signed and sealed by an engineer registered in the State of Ohio. Also submit erection calculations prepared and signed by an engineer registered in the State of Ohio for lifting hardware, erection stresses, strong-backs, and other hardware required during erection of the unit. Provide erection drawings.

J. Submit sample copies of the data forms and report forms for recording and reporting laboratory test data.

K. Submit copies of a laboratory report showing the results of tests conducted on cutouts from the tower shells. Perform the following tests on each tower:
   1. Glass content, degree of cure, and physical properties as described in ASTM D3299, Sections 10 and 11.
   2. Glass content of total tower wall thickness per ASTM D2584.
   3. Submit test reports before shipping towers to the project site. Do not ship towers until after the Owner has reviewed the test reports.
   4. Recommended spare parts other than those specified.
   5. Recommendations for short and long term storage.
   6. Recommended baffle design, if baffles are required.

7. Hoist data and dimensional data.
8. Qualifications of Field Service Engineer.
9. Tag numbers for all equipment.
10. Special tools.
11. Number of service person-days provided and per diem field service rate.
12. Field inspection/testing reports.
13. Material Certification
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
14. Operation and Maintenance Manual. O&M Manuals shall be in accordance with Division 01, Section "Operation and Maintenance Data".

1.4 SPARE PARTS:

A. Comply with the requirements specified in Division 01, Section "Product Requirements".

B. Provide spare parts that are identical to and interchangeable with similar parts installed
   1. One set of all special tools required.

1.5 QUALITY ASSURANCE:

A. Comply with the requirements specified in Division 01, Section "Quality Control".

B. Forced draft degasifier towers are to be the product of one manufacturer.

C. Mixers to be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Service of Manufacturer's Representative as stated in Division 01, Section "Quality Control" and as specified herein.

E. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified.
   1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve the Contractor of the obligation to provide sufficient services to place equipment in operation as specified.
   2. Installation: Inspect location of anchor bolts, setting, leveling, alignment, field erection, etc.; coordination of piping, electrical and miscellaneous utility connections; but not less than:
      a. 2 person-days
   3. Functional Testing: Calibrate, check, align and perform functional testing with water: Tests to include all items specified.

a. 1 person-days
b. Provide letters from Contractor certifying that the field and functional testing has been completed and that the equipment is operational and ready for field performance testing.

4. Field Performance Testing: Field performance test equipment as specified.
   a. 1 person-days per system
5. Vendor Training: Provide classroom and field operation and maintenance instructions, including all slides, videos, handouts and preparation to lead and teach classroom sessions:
   a. 0.5 person-days.
6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

F. Manufacturer of forced draft degasifier tower must have a minimum of five (5) years of successful operating experience with the size and type of mixer and service conditions specified and indicated.

1.6 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in Division 01, Section “Product Requirements”.

PART 2 - PRODUCTS

2.1 SERVICE CONDITIONS:

A. Design the degasifiers to remove carbon dioxide from the NF Permeate.

2.2 MANUFACTURERS:

A. DeLoach Industries, Inc.

B. Tonka Equipment Co.

2.3 DEGASIFIER TOWER CONSTRUCTION:

A. The degasifiers shall be forced draft FRP countercurrent slat tray towers. Provide the degasifiers complete including the structural housing, media, media support, access panels, connections for piping and ducting, header lateral water distribution system, air inlet, air inlet transition duct, demister, air outlet, liquid outlet, and structural anchorage.

B. See drawings for degasifier layout and nozzle orientation.

C. The degasifier tower shall be square in cross section with a cover and venturi-shaped stack projecting at least 18 inches above the cover section.

D. Vessel or tower internal components, except the media, shall be factory installed.

E. The vessel or tower base shall be flat and shall contain the necessary lugs for anchoring to the concrete base. The base shall include a liquid outlet at the vessel center, as shown in the drawings. Fit the liquid outlet with a vortex breaker in the form of a nozzle.

F. The minimum wall thickness shall be 1/4 inch. Maximum wall deflection under any combination of loading conditions shall be 1/4 inch. Sandwich laminate construction shall be permitted.

G. Fit the degasifier tower with the following flanged nozzles. Refer to the drawings for size and orientation of nozzles.
1. One (1) influent nozzle.
2. One (1) effluent nozzle.
3. One (1) drain nozzle.
4. One (1) air inlet nozzle.
5. Two (2) media access hatches.

H. The inlet distribution system shall be a piping grid with nonclog spray nozzles to assure a uniform liquid distribution over the packing media. Design shall provide for field adjustment.

2.4 RESIN:

A. Resin: Derakane 411-350 WSR. Resin shall be suitable for continuous immersion in the liquid described in the subsection herein on "Service Conditions" and shall be resistant to those fluids as defined by ASTM C581.

2.5 STRUCTURAL DESIGN AND SUPPORTS:

A. Design anchors and anchor bolts per the following requirements:

B. Seismic Design Parameters
1. Refer to the structural drawings.

C. Wind Design Parameters
1. Refer to the structural drawings.

D. An unreinforced concrete structural slab shall not be considered to have structural value in the design of the anchor bolts. Tension and shear values for drilled or epoxied anchor shall be ICBO approved. Maximum hoop stress shall not exceed 1/10 of the ultimate hoop strength of the laminate.

E. The loading conditions for the design of the degasifier and attachment to the concrete slab shall also include a roof load of 10 psf (0.5 kPa), material dead loads, forces imposed by the liquid splashing downward, and forces imposed by the air moving upward.

2.6 LAMINATE CONSTRUCTION:

A. Provide at least three inner laminated layers as a corrosion barrier on the tower interior totaling a minimum of 100 mils (2.5 mm) in thickness. The inner layer shall be resin rich, shall consist of a NSF certified for potable water polyester organic fiber, and shall be a minimum of 20 mils (0.5 mm) thick. Glass content in the inner layer shall be 20 percent +/- 5 percent by weight.

B. The remaining two layers shall be composed of 1-1/2 lb/min chopped strand mat having a glass content of 25 percent +/- 5 percent applied at a rate of 3 ounces per square foot (955 mL/m^2) (915 g/m^2). The inner liner shall be formed not sprayed. Chopped roving fibers shall be 1/2 to 2 inches (13 to 50 mm) in length.

C. The average glass content of the inner three layers shall be 27 percent +/- 5 percent by weight.

D. The exterior layer shall be contact molded finish with a UV protected Gelcoat finish.

E. The total tower wall thickness shall have an average glass content of 55 percent by weight +/- 5 percent per ASTM D2584.

2.7 FRP:

A. Maximum tensile and flexural stress under any loading conditions shall not exceed 1,500 psi (10 MPa).

B. Laminate mechanical and physical properties for FRP elements shall be as follows:
1. Ultimate Tensile Strength per ASTM D638: 11,000 psi (76 MPa) minimum.
2. Flexural Strength per ASTM D790: 16,000 psi (110 MPa) minimum.
3. Flexural Modulus of Elasticity per ASTM D790: 900,000 psi (6205 MPa) minimum.

2.8 QUALITY CONTROL:

A. Construction shall comply with ASTM D2563, Level II, except that maximum frequency of air bubble in liner portion of laminate shall be 10 per square inch (15,500/m^2) of laminate with maximum bubble size of 1/16-inch (1.6 mm). Wall hardness shall be at least 90 percent of the resin manufacturer's recommended Barcol hardness, with a minimum Barcol hardness of 30, with the resin fully cured. Maximum strain in the laminate shall be 0.001 inch/inch (mm/mm). Maximum air bubble size in the laminate shall be 1/16 inch (1.6 mm). Maximum strain in the laminate shall be 0.001 inch/inch. Appearance of the tower interior and exterior shall comply with ASTM D3299, Section 9.

2.9 ULTRAVIOLET PROTECTION:

A. Provide ultraviolet protection in the form of a surface coating of a permanent Gelcoat rich exterior layer, pigmented white. Surfaces shall be smooth, hard, and glossy. Thickness of this external layer shall be at least 10 mils (0.25 mm).

2.10 REINFORCEMENT AT OPENINGS:

A. Where nozzles, manways, or openings are provided, reinforce the tower wall with a min of eight layers composed of 1-1/2 lb min chopped strand mat having a glass content of 25% +/-5 percent applied at a rate of 3 ounces per square foot (955 mL/m^2)(915 g/m^2). Chopped roving fibers may be utilized and then covered with chopped strand. All reinforcing shall be a minimum ½ to ¾ inches thick.

B. For openings 12 inches (300 mm) and larger, provide additional reinforcing plies of woven roving and chopped glass in the structural layers of the tower base wall laminate at the opening location point when the tower shell is built.

2.11 TIE-DOWN LUGS AND ANCHOR BOLT MATERIALS:

A. Tie-down lugs shall be FRP material bonded to the FRP tower shell to meet all required structural and seismic load requirements specified. Anchor bolts shall be Type 316 stainless steel. Bolts shall conform to ASTM A193, Grade B8M. Nuts shall conform to ASTM A194, Grade 8M. Lugs shall be FRP integrally bonded by hand layout to assure control thickness and structural integrity. Design bolts and washers to prevent bolt pull out due to uniform and nonuniform vertical, horizontal, torsional, fatigue, and cyclical loading.

2.12 FLANGED NOZZLES:

A. Nozzles shall be flanged, minimum 2-inch (50 mm) size. Flange bolting pattern dimensions shall conform to ASME B16.5, Class 150.

B. Flanged nozzles shall have conical gusset supports and shall be designed for a minimum torque of 2,000 foot-pounds (2700 Nm) and a minimum bending moment of 1,500 foot-pounds (2000 Nm). Attach the gusset to the full perimeter of the flange and at the intersection with the tower wall to provide 360-degree distribution of stresses. Nozzle construction shall be of the molded type per ASTM D3299.

C. Flanges shall be FRP, conforming to ASTM D4024 or D5421. The resin used to manufacture the flanges shall be NSF certified for potable water and the same as that used to manufacture the tower. Flanges shall be flat faced. Flange thickness shall be at least 1.5 times the nozzle wall thickness, with a minimum flange thickness of 1/2-inch (13 mm).

2.13 GASKETS FOR FLANGED NOZZLES AND MANWAYS:

A. Gaskets for flanged nozzles and manways 12 inches (300 mm) and smaller shall be full faced, 3/16-inch (5 mm) thick, having a hardness of 50 to 70 durometer A. Gaskets for nozzles and manways larger than 12 inches (300 mm) shall be full faced, 1/4-inch (6 mm) thick, having a hardness of 50 to 70 durometer A. Gasket material shall be EPDM. When the mating flange has a raised face, remove the raised face.

2.14 BOLTS AND NUTS FOR FLANGED NOZZLES AND MANWAYS:

A. Bolts shall be Type 316 stainless steel, per ASTM A193, Grade B8M. Nuts shall conform to ASTM A194, Grade 8M. Provide washer for each nut and bolt head. Washers shall be of the same material as the nuts.

2.15 FLAT BOTTOM HEADS:

A. Construct flat bottom heads integrally with the tower shell as one seamless piece.

2.16 RADIUS OF TURNS AND KNUCKLES:

A. Tanks or towers shall have minimum knuckle radii of 1 1/2 inches.

2.17 LIFTING LUGS:

A. Provide at least four side-mounted lifting lugs on each tower.

2.18 PIPE SUPPORTS:

A. Pipe supports shall be FRP integrally laminated into the tank or tower shell. Bolts, nuts, washers, and screws shall be Type 316 stainless steel. Provide washer under each nut, bolthead, and screw head.

2.19 TOWER MEDIA AND MIST ELIMINATOR:

A. Media shall be PVC slat trays. The slat trays shall be removable through the tower access manway. A single slat tray shall consist of convex PVC slats attached to a 4-inch-deep FRP channel frame nominal 4 feet by 12 feet (1200 mm x 3650 mm) using slot head stainless steel screws with nylon grips. The PVC slats shall be staggered from tray to tray to facilitate mass transfer. The slat trays shall be self-spacing, self-supporting, and self-aligning with the bottom tray.

B. Mist eliminator shall be polypropylene Koch-Glitsch, LP Flexichevron Style I, Munters Corporation DV 270 (T 271). Mist eliminator shall remove a minimum of 99 percent of entrained droplets down to 40 microns in diameter. Polypropylene used for the mist eliminator shall have the following properties:

Density	0.90 g/mL
Tensile strength	4,900 psi (34 MPa) minimum
Flexural yield stress	6,000 psi (41 MPa) minimum
Flexural modulus of elasticity	170,000 psi (1172 MPa) minimum

2.20 LIQUID DISTRIBUTOR AND MIST ELIMINATOR STRUCTURAL SUPPORT MEMBERS:

A. Provide FRP structural members to support liquid distributor and mist eliminators. Structural members shall not obstruct more than 10 percent of the tower cross-sectional area.

2.21 LIQUID DISTRIBUTORS:

A. Liquid distributor shall be a header lateral using the non-clog spray nozzle type as manufactured by DeLoach Industries Inc. Distributor shall be accessible through the tower access manways.

2.22 EXHAUST STACK:

A. The exhaust stack shall be constructed of FRP in the same manner and thickness as the degasifier shell. The stack shall be square with a 316 SST insect screen and rainshield.

B. Provide stainless steel bird screen over the exhaust stack opening. The bird screen shall be 1/2-inch-square mesh fabricated of 0.063-inch, Type 316 stainless steel wire.

2.23 BLOWER:

A. Blowers shall be supplied by the Degasification manufacture and shall be factory fitted to the connection transition duct and the degasification tower. Blower make shall be Loren Cook.

B. Overall sound-pressure level of each blower/motor assembly shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet from motor.

2.24 MOTORS:

A. Provide in accordance with Division 26, Section "Motors" and as specified and indicated.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of blower under any condition of operation specified and indicated without operating in the motor service factor.

C. Motor enclosure and motor speed: As indicated in the Blower Schedule.

D. In addition to the requirements for bearings specified under Electric Motors in Division 26, Section "Motors", provide blower motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.

E. Operate without overheating at the speeds specified and indicated.

F. Service Factor: 1.15.

G. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

H. Rating: 460V, 3-phase, 60 Hertz.

2.25 SHOP PAINTING:

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Division 09, Section "High Performance Coatings".

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

2.26 AIR INLET TRANSITION DUCT:

A. Design and provide a transition air duct from each fan to the inlet flange of each degasifier. Duct shall have flanged inlet and outlet connections. Construct the duct in the same manner and thickness as the degasifier shell.

PART 3 - EXECUTION

3.1 INSPECTION:

A. After delivery to the site, the Owner will check FRP elements for cracks, holes, and other characteristics listed in ASTM D2563, Table I. Remove any FRP item not complying with ASTM D2563, Table I, Level II from the project site.

3.2 TOWER INSTALLATION:

A. Install towers level as shown in the drawings. Erect vertical towers in accordance with ASTM D3299, Appendix X1.2. Provide a rubber pad or layers of roofing felt between the tower bottom and the underlying slab as recommended by the tower manufacturer.

B. Set each degasifier in place on the elevated slab, leveled and anchored to the slab.

C. Load tower media.

3.3 INSTALLATION VERIFICATION:

A. Prior to checking final piping alignment to the tower, the piping system shall be complete as follows.

B. Complete pipe pressure testing, dry out the system, and remove hydrotest blind flanges.

C. Install and adjust permanent supports and hangers.

D. Remove temporary supports and hangers.

E. The system piping components and tower shall be at the same ambient temperature within a range of 10 degrees F (6 degrees C) before starting final piping alignment checks.

F. Verify that the connecting tower piping is properly constructed. This inspection shall include verification of gasket material, gasket size, and the material, size, and length of flange bolts, studs, and nuts.

3.4 INSTALLING BOLTS AND NUTS FOR FIBERGLASS FLANGES AND MANWAYS:

A. Prior to fit-up, lubricate the threads of the bolts and nuts per Division 40, Section “Process Piping”. Tighten the nuts by hand until they are snug. Use a torque wrench to tighten the nuts. Tighten the nuts in 5 lbf-ft (7 Nm) increments according to the sequences shown in Figure 2 of ASTM D4024 or Figure 3 of ASTM D5421. For flanges with more than 20 bolts, use similar alternating bolt tightening sequences. Increase the bolt torque uniformly to the level recommended by the flange manufacturer for field installation.

3.5 FLANGE AND PIPING ALIGNMENT REQUIREMENTS:

A. Do not spring flanges of connecting piping into position.

B. Line up pipe flange bolt holes with tower nozzle bolt holes within 1/16-inch (1.6 mm) maximum offset from the center of the bolt hole to permit insertion of bolts without applying any external force to the piping.

C. The tower and piping flange faces shall be parallel to less than 0.001 inch per inch (mm/mm) of pipe flange outer diameter up to a maximum of 0.030 inch (0.76 mm). For piping flange outer diameters smaller than 10 inches (250 mm), the flanges shall be parallel to 0.010 inch (0.25 mm) or less.

D. Flange face separation shall be within the gasket spacing +/-1/16 inch. Use only one gasket per flanged connection.

E. Separately work connecting piping systems into position to bring the piping flanges into alignment with the matching tower flanges. Do not move tower to achieve piping alignment.

3.6 LABELING AND MARKING:

A. Provide a tag for the unit bearing the tag number, unit capacity, and pertinent design information.

3.7 FIELD TESTING:

A. Operate the degasifier system under design conditions for 24 hours. Correct any deviations from normal operation such as excessive vibration, noise, or other abnormal operation at no additional cost to the Owner. Verify that the pressure, flow rate, and motor amperage are within 5 percent of the values shown on the certified rating.

B. Adjust inlet distribution and media depth as necessary during initial plant start-up and testing.

3.8 CONTRACT CLOSEOUT

A. Provide in accordance with Division 01, Section “Closeout Procedures”.

END OF SECTION 43 3225

RARWTP DEGASIFIER SCHEUDLE

A. Degasifiers

1.	Tag Nos:	DG-1, DG-2
2.	Number of Units:	Two (2)
3.	Location:	Outdoors
4.	Capacity:	3,090 gpm
5.	Maximum Loading Rate:	26 gpm/SF
6.	Dimensions (max):	11-ft x 11-ft x 12-ft (L x W x H)
7.	Packing Bed Depth:	7-ft
8.	Inlet Size:	12-inch
9.	Outlet Size:	16-inch (DG-2 has offset outlet, see drawings)
10.	Blower:	
	a. Electrical:	460 volts, 3 phase, 60 Hz
	b. Maximum Motor Size:	7.5 hp
	c. Enclosure:	TEFC
	d. Service Factor:	1.15
11.	Influent Water Quality	
	a. pH:	5.73 s.u.
	b. Temperature:	55 degrees C
	c. Alkalinity:	8.6 mg/L as $CaCO_3$
12.	Performance Requirement:	>90% removal Free CO_2

SECTION 46 0630

PROCESS CHEMICALS

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section.

B. Description of Work
   1. Provision of process chemicals

1.2 QUALITY ASSURANCE

A. Chemical suppliers shall have been regularly engaged in the manufacture of the specified chemicals for a minimum of five years.

1.3 SUBMITTALS

A. For all chemicals submit the following:
   1. MSDS.
   2. Product name and manufacturer.
   3. Product data.

B. Submit procedures and chemicals used for cleaning and sterilization for start-up and commissioning of membrane systems and chemical feed systems.

1.4 HANDLING, DELIVERY, AND STORAGE

A. Handling, delivery, and storage of each chemical shall be in accordance with the manufacturer's written instructions.

PART 2 - PRODUCTS

2.1 CHEMICALS PROVIDED VIA BULK DELIVERY

A. Sodium Bisulfite ($NaHSO_3$)
   1. Type: – liquid solution.
   2. NSF 60 certification required.
   3. Grade: Technical.
   4. Concentration: 38%
   5. Specific Gravity: 1.33
   6. Sodium Sulfate: <3.5%.
   7. pH: 3.6 - 4.6.
   8. Density: 10.93 - 11.43.
   9. Iron: <15 ppm.
   10. Manufacturer: Nalco, Bonded, Kemira, Brenntag, Univar or equal.

B. Sodium Hydroxide (NaOH)

1. Sodium hydroxide shall conform to ANSI/AWWA B501
2. Type: Sodium Hydroxide, Liquid Solution.
3. Grade: Technical.
4. NSF 60 certification required.
5. Concentration: 50%.
6. Specific Gravity: 1.53
7. Freezing Point: -20 deg F.
8. Manufacturer: Nalco, Bonded, Kemira, Brenntag, Univar or equal.

C. Corrosion Inhibitor (PHOS.)
1. Aqueous solution of orthophosphate commercial formulation designed to control red water, remove rust and scale deposits from water lines, and protect against corrosion or pitting.
2. Form: Clear homogeneous liquid
3. Concentration: 28.5% total phosphate
4. Freezing point: <24 deg F.
5. Shelf life (neat): 1 year.
6. Freeze/thaw stable.
7. Totally soluble at any dilution.
8. NSF 60 certification required.
9. Specific Gravity: 1.29 – 1.35
10. pH: 3.8, +/- 0.5
11. Manufacturer: Carus 4500 or equal

D. Sodium Hypochlorite (NaOCl):
1. Sodium Hypochlorite Solution conforming with ANSI/AWWA Standard B300
2. Type: Sodium Hypochlorite solution in bulk.
3. Concentration: Nominal 12.5%, as Cl_2. (Diluted to 6.25% onsite)
4. Vapor pressure: 12.1 mm Hg @20ºC
5. Density: 10.0 lbs/gal
6. pH: 11.2 – 11.4
7. NSF 60 certification required.
8. Manufacturer: Nalco, Bonded, Kemira, Brenntag, Univar or equal.

E. Fluoride (FLUOR.)
1. Fluorosilicic Acid shall conform to the requirements of ANSI/AWWA B703-00
2. NSF 60 certification required.
3. Concentration: 23%, +/- 1%.
4. Boiling Point: 222 deg F (105 deg C)
5. Freezing Point: -4 deg F (-15.5 deg C)
6. Specific Gravity: 1.20
7. Solubility in Water: Complete.
8. Molecular Weight: 144.08
9. pH (1% solution): 1.2
10. Appearance and Odor: Water white to straw yellow burning liquid with pungent odor.
11. Manufacturer: Nalco, Bonded, Kemira, Brenntag, Univar or equal.

2.2 CHEMICALS PROVIDED IN TOTES

A. Antiscalant (A.S.):

1. Antiscalant shall inhibit the formation and growth of alkaline earth carbonate and sulfate scales, disperse suspended solids and colloids, and stabilize metallic ions.
2. Antiscalant shall eliminate acid feed for scale control by inhibiting the precipitation of calcium carbonate up to a calcium carbonate nucleation index (CCNI) of 2.3. Antiscalant shall maintain scale inhibition even in the presence of iron. Antiscalant shall inhibit calcium carbonate scale up to an LSI of 2.6 and a CCPP of 900.
3. NSF 60 certification required.
4. Form: Liquid.
5. Appearance: Clear colorless to yellow liquid
6. Solubility in Water: complete.
7. Specific Gravity: 1.10 +/- 0.05
8. pH: 3 - 4.
9. Manufacturer: AWC A-102 Ultra

PART 3 - EXECUTION (NOT USED)

END OF SECTION 46 0630

RARWTP PROCESS CHEMICAL SCHEDULE

A.

CHEMICAL	CONTRACTOR TO PROVIDE:
Sodium Bisulfite ($NaHSO_3$)	45,000 lbs
Sodium Hydroxide (NaOH)	45,000 lbs
Corrosion Inhibitor (PHOS.)	45,000 lbs
Antiscalant (A.S.)	Three (3) 275 gallon totes
Sodium Hypochlorite (NaOCl)	45,000 lbs
Fluoride (FLUOR.)	45,000 lbs

SECTION 46 3323

LIQUID CHEMICAL WEIGHING EQUIPMENT

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. The Work of this Section includes providing and installing load-cell type chemical container scales and indicators for chemical day tanks.

1.2 QUALITY ASSURANCE

A. Provide and install equipment adequate in size, capacity, and number to accomplish the work of this Section in a safe and timely manner.

B. Scales shall have a full-scale accuracy better than 1/4 of 1%. Equipment not meeting this requirement shall be replaced at no additional cost to the owner.

1.3 DELIVERY, STORAGE, & HANDLING

A. Delivery, storage, and handling shall meet the requirements of manufacturer/supplier in general and the following specifically:
   1. Shipping: Pack all spare parts in containers bearing labels clearly designating contents and the specific equipment for which they are intended.

B. Receiving
   1. Contractor shall inspect and inventory items upon delivery to site.
   2. Contractor shall store and safeguard equipment, material, instructions, and spare parts in accordance with manufacturer's written instructions.

1.4 SUBMITTALS

A. Manufacturers literature, illustration, specifications and engineering data including: dimensions, materials, size, weight, performance data, flow rate, motor horsepower (or current draw) and speed.

B. Operation and Maintenance Manual. O&M Manuals shall be in accordance with Division 01, Section “Operation and Maintenance Data”.

C. Contractor shall verify chemical compatibility of piping, solvents, gaskets, seals, o-rings, etc. for each chemical feed system. Provide chemical compatibility charts and manufacturer’s written verification of compatibility for each chemical feed system.

1.5 WARRANTY

A. Scales shall carry a full five (5) year factory warranty.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Force Flow Equipment

B. Eagle Microsystems Inc.

C. Scaletron Industries LTD

2.2 CHEMICAL DAY TANK SCALES

A. Scales for day tanks shall be suitable for weighing the chemical noted on the Drawings and shall be of the digital readout/electronic load cell type.

B. Platform height shall be of the low profile type and have four adjustable hold down lugs.

C. Scales shall have 80 mil minimum dry thickness epoxy coating that is resistant to moisture, chemicals, abrasion, impact and UV light.

D. Scales shall be of the single load cell design with the weight transferred by a pivoted platform to a single load cell of the shear beam strain gauge type.

E. A flexible cable shall connect the load cell to the indicator readout. Cable length shall be field measured.

F. Scales shall be Force Flow Industries Chem-Scale with Tuff-coat Environmental Armor or approved equal. The max capacity (lbs) and the size of the day tank shall be as provided herein.

2.3 INDICATOR DISPLAY

A. Instrument Enclosure, Outputs & Alarms: Indicator shall carry CE marking and shall be housed in a NEMA 4X, UL approved enclosure. Power supply is 120 V, 1-phase, 60 hertz.

B. The indicator shall have the following features:
   1. Number of Channels: As indicated in the scale schedule.
   2. 20-key digital keypad & ability to display the required number of channels simultaneously.
   3. An adjustable 4-20 mA signals that output the net weight and chemical feed rate for each scale.
   4. Display an alarm in any of the following conditions: Low level, high level, low feed rate, high feed rate, max daily use, min. daily use, supply exhausted, and load cell failure. An alarm log shall store the most recent 10 alarm conditions with time and date of occurrence.
   5. Provide one 4-20 mA outputs and 6 alarm/control output contacts per channel for each of the chemicals listed in the schedule.

C. Display & Inventory Control Software: Keypad and menu items shall have independent password protection to prevent unauthorized operation. A numerical and bar graph display shall give operator the ability to monitor chemical by weight, volume, or percent full. Each channel shall have a user selectable, two digit scale ID number and shall display net remaining, pure

chemical remaining, feed rate, daily usage, total amount used, days until empty, gross weight, and tare weight. A TANK LOAD key shall pause & project usage accumulation during chemical re-supply to maintain accurate usage data over multiple tank loads. A data log shall store the daily usage for each of the previous 31 days. Indicator re-calibration in the field shall be accomplished through the keypad and shall not require the use of dead weights.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Contractor shall install items as specified and as shown on the Drawings in accordance with manufacturer's printed instructions.

B. All electrical power and control connections shall be furnished under division 26.

3.2 MANUFACTURER'S SERVICES

A. Conform to the requirements of Division 01, Section “Quality Control”.

B. Provide a minimum of two trips for a total of 32 hours on site for startup and coordination with General Contractor and the process equipment OEM.

C. Startup services and training of Owner's personnel shall be at such times as requested by the Owner.

D. Additional time required to perform these services shall be at no additional cost to the Owner. The Owner shall be credited for the unused portion of startup services.

END OF SECTION 46 3323

RARWTP SCALE SCHEDULE

A. Sodium Bisulfite (NaHSO3)
   1. Chemical Properties:
      a. SG: 1.33
      b. Concentration: 38%
   2. Day Tank Dimensions:
      a. See Division 46, Section "Polyethylene Chemical Storage Tanks and Appurtenances".
      b. Tank dimensions will vary with tank manufacturer. Scale manufacturer to verify tank dimensions with Contractor.
   3. Indicator:
      a. Number of Channels: 1
   4. Capacity: 0 – 1500 lbs

B. Antiscalant (A.S.)
   1. Chemical Properties:
      a. SG: 1.10 ± 0.05
      b. Concentration: 100%
   2. Day Tank Dimensions:
      a. See Division 46, Section "Polyethylene Chemical Storage Tanks and Appurtenances".
      b.
      c. Tank dimensions will vary with tank manufacturer. Scale manufacturer to verify tank dimensions with Contractor.
   3. Indicator:
      a. Number of Channels: 1
   4. Capacity: 0 – 500 lbs

C. Sodium Hydroxide (NaOH)
   1. Chemical Properties:
      a. SG: 1.53
      b. Concentration: 50%
   2. Day Tank Dimensions:
      a. See Division 46, Section "Polyethylene Chemical Storage Tanks and Appurtenances".
      b. Tank dimensions will vary with tank manufacturer. Scale manufacturer to verify tank dimensions with Contractor.
   3. Indicator:
      a. Number of Channels: 1
   4. Capacity: 0 – 4000 lbs

D. Fluoride (FLUOR.)
   1. Chemical Properties:
      a. SG: 1.20
      b. Concentration: 23%
   2. Day Tank Dimensions:
      a. See Division 46, Section "Polyethylene Chemical Storage Tanks and Appurtenances".

b. Tank dimensions will vary with tank manufacturer. Scale manufacturer to verify tank dimensions with Contractor.

3. Indicator:
   a. Number of Channels: 1
4. Capacity: 0 – 1000 lbs

E. Corrosion Inhibitor (PHOS.)
1. Chemical Properties:
   a. SG: 1.29
   b. Concentration: 28.5%
2. Day Tank Dimensions:
   a. See Division 46, Section "Polyethylene Chemical Storage Tanks and Appurtenances".
   b. Tank dimensions will vary with tank manufacturer. Scale manufacturer to verify tank dimensions with Contractor.
3. Indicator:
   a. Number of Channels: 1
4. Capacity: 0 – 2000 lbs

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 46 3344

CHEMICAL PERISTALTIC METERING PUMPS AND APPURTENANCES

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Provide and test chemical peristaltic metering pumps and appurtenances, as indicated and in compliance with Contract Documents.

B. Provide each chemical pumping system complete. And before acceptance make each system fully operational and ready for use by the Owner.

C. Chemical systems to meet:
   1. Recommended Standards for Water Works (2012 edition or the latest revision), Part 5.

D. Connections of electrical, control and instrumentation components shall be furnished and installed as specified in divisions 26 and 40 9XXX.

1.2 REFERENCES:

A. ASTM International (ASTM):
   1. A36: Standard Specification for Carbon Structural Steel
   2. A48: Standard Specification for Gray Iron Castings
   3. A322: Standard Specification for Steel Bars, Alloy, Standard Grades
   4. A570: Steel, Sheet and Strip, Carbon, Hot-Rolled, Structural Quality

B. National Electrical Manufacturers Association (NEMA):
   1. ICS 1: Industrial Control and Systems General Requirements
   2. MG1: Motors and Generators

C. Recommended Standards for Water Works (2012 edition or the latest revision), Part 5.

1.3 SUBMITTALS:

A. Submit the following shop drawings in accordance with Division 01, Section “Submittal Procedures”:
   1. When the Contractor proposes equipment which requires an arrangement differing from that indicated on the drawings or specified, prepare and submit for review detailed structural, mechanical, and electrical drawings and equipment lists, utilities consumption schedule and operating instructions, showing necessary changes and embodying special features of the equipment he proposes to furnish. Make changes, if accepted at no additional cost to Owner.
   2. Submit certified shop drawings, manufacturer's specifications, catalog data, descriptive literature, illustrations, and other materials necessary for proper appraisal of quality and function.
   3. Include factory work sheets which identify each piece of equipment as specified herein and on drawings.

4. Sales bulletins or other general publications are not acceptable as submittals for review except where necessary to provide supplemental technical data.
5. Number and identify equipment to correspond with terminology on drawings. Use these numbers on all submittal sheets and shop drawings.
6. Furnish for each system piping schematic and wiring schematic with interconnection diagram and a complete description of operation.
7. Pump Control Panel:
    a. Front elevations, with and without door.
    b. Elementary wiring connection diagram.
    c. Catalog sheets for devices in the control panel.
    d. Use NEMA device designations and symbols for electric diagrams. Make contents of elementary connection diagrams in accordance with NEMA ICS 1.
    e. Manufacturer's standardized elementary diagrams will not be acceptable unless applicable portions of the diagram have been clearly identified and non-applicable portions deleted or crossed out.
8. Vendor to confirm with calculations that the pumps offered can handle the piping as shown.
9. Operating and maintenance instructions and parts lists.
10. Templates or certified setting plans, with tolerances, for anchor bolts.
11. Recommended spare parts other than those specified.
12. Recommendations for short and long term storage.
13. Submit recommended charging pressures for pulsation dampeners.
14. Submit accuracy and readability limits for pump speed indicators.
15. Manufacturer's product data and specifications for shop painting.
16. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
17. The latest ISO 9000 series certification or certified quality assurance/control program document.
18. Provide qualifications of service/start-up personnel.
19. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Based on incompatibility with the service conditions, provide technical data and provide proposed materials.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
20. O&M Manuals. O&M Manuals shall be in accordance with Division 01, Section "Operation and Maintenance Data".

1.4 QUALITY ASSURANCE:

A. Comply with the requirements specified in Division 01, Section "Quality Control".

B. General:

1. Do the work required by and in accordance with applicable State and local codes; arrange for all permits, inspections and tests required by these codes. Provide systems and items of equipment that conform to applicable safety standards including those for safety of personnel.
2. One vendor to provide equipment and appurtenances, regardless of manufacturer, and is responsible for the satisfactory operation of the systems. Substitutions on functions specified are not acceptable.
3. Provide components to manufacturer's standard for service intended unless otherwise required.
4. Pumps of the same type to be the product of one manufacturer. Provide equipment of manufacturers' latest and proven design. Pumps to be standard cataloged products.
5. Drawings and specifications direct attention to certain required features of the equipment, but do not purport to cover all details entering into its design, construction and installation; nevertheless, furnish and install equipment so that systems will be complete and ready for operation.

C. Service:
1. Services of Manufacturer's Representative stated in Division 01, Section “Quality Control" and as specified herein.
2. Provide services of factory-trained Service Personnel, specifically trained on type of equipment specified.
   a. Submit qualifications of Service Engineer for review.
   b. Person-day requirements listed exclusive of travel time, and do not relieve Contractor of obligation to provide sufficient service to place equipment in satisfactory operation.
   c. Installation: Sufficient time to assist in location of anchor bolts; setting, leveling, alignment, field erection, etc.; coordination of piping, electrical, miscellaneous utility connections, but not less than:
      1) 3 person-days per treatment facility.
   d. Start-Up: Sufficient time for calibration, testing and start-up, but not less than:
      1) 1 person-days per treatment facility.
   e. Performance Testing: Time for field acceptance testing, but not less than:
      1) 2 person-days per treatment facility.
   f. Instruction: Sufficient time for classroom and/or field operation and maintenance instruction, but not less than:
      1) 1 person-days.
   g. Credit to the Owner unused service person-days specified above at the manufacturer's published field service rate plus any costs of travel.
3. The minimum days specified above does not relieve the manufacturer of responsibility of providing sufficient service to place components and systems in satisfactory operation. Provide, in addition to time periods specified above, time and material used to correct defective equipment at no additional cost to Owner.
4. 8-hour days specified are exclusive of travel time.
5. Turn on no form of energy to any part of systems prior to receipt by Engineer of certified statement of approval of installation from Contractor containing his supplier's authorization to energize system unless done by the supplier's servicemen may do so for purposes of checkout.
6. The Manufacturer's Representative must maintain a factory trained serviceman with parts within 150 miles of this Owner.

D. Pumps, Motors and Controllers:
   1. Pump manufacturer shall furnish the pumps, motors, and appurtenances regardless of manufacturer, as a complete package to ensure proper coordination and compatibility of equipment.
   2. Prior to shipment to job site, pump manufacturer must perform a test on the combined motor and pump assembly.

1.5 SPARE PARTS:

A. Furnish following spare parts, identical and interchangeable with similar parts installed in work:
   1. For each chemical metering pump:
      a. One (1) replacement head for each pump provided.
   2. One of each type and material back pressure valve with one spare diaphragm and spring for each.
   3. Provide all other manufacturer's recommended spare parts necessary to maintain each piece of equipment for a period of one year.

B. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which they are intended.

C. Deliver spare parts at same time as equipment to which they pertain. Properly store and safeguard such spare parts until completion of work, and then deliver to Owner.

1.6 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in Division 01, Section “Product Requirements”.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION:

A. Pump capacities and operating data are indicated in the Metering Pump Schedule.

2.2 GENERAL:

A. Provide systems constructed of components which are compatible and suitable for intended service.

B. Drawings and specifications indicate energy sources that will be provided. Provide all other devices necessary to obtain proper operation of system from these energy sources.

2.3 PERISTALTIC METEIRNG PUMPS:

A. Acceptable manufacturers:
   1. Watson-Marlow Qdos.

B. Configuration
   1. See schedule and drawings.

C. Pump Construction

1. Pumps shall be positive displacement type complete with replaceable cartridge-style peristaltic pumphead and self-contained variable speed drive.
2. Pumps shall be self-priming and shall have a maximum suction lift capability of up to 30' vertical water column.
3. Discharge Pressure Rating: 100 psi continuous (145 psi intermittent for Qdos 30).
4. Pumps shall be capable of pumping both liquids and gases without vapor locking.
5. Pumphead
    a. Technology: Provide tool-free cartridge-style peristaltic pumphead. Pumphead must be serviceable as a single replaceable component.
    b. Housing construction: Corrosion resistant and high impact resistant glass filled PPS or PPE/PS.
    c. Geometry: Pumphead shall consist of sealed track housing with in-line porting. Suction and discharge ports shall be 180 degrees apart with bottom suction and top discharge.
    d. Rotor: Pumphead rotor shall be constructed of glass filled Nylon, sealed within the track housing, and supported by its own bearings. Peristaltic occlusion level shall be factory set to ensure flow accuracy of +/- 1% and repeatability performance of +/- 0.5% and shall not require any field adjustment.
    e. Contact Materials: All pumphead components in the fluid path must be NSF61 listed and shall be of materials specified by the manufacturer as compatible with the process fluid.
    f. Leak containment/detection: In the event of peristaltic element failure, the leak sensor shall shut the pump down immediately with all process fluid contained within the sealed pumphead.
        (1) Sensor type: Utilize non-contacting optical sensor. Sensor shall not come in contact with the process fluid, shall contain no moving parts, shall not depend on the capacitance of the process fluid, shall not require fluid to leak out of the pump housing for engagement, nor shall require any sensitivity or calibration adjustment.
        (2) Alarm: Sensor shall shut down the pump, give a visual indication on the drive controller, and if specified shall provide an output general alarm signal.
        (3) Sealed pumphead shall have a controlled drain-to-waste port.
    g. Port connections: Pumphead shall utilize polypropylene compression fittings which shall mate to 10mm ID reinforced, transparent PVC interface hose. Provide polypropylene compression by ½" NPT adaptors for connecting interface hose to process line.
6. Drive
    a. Rating: Continuous 24 hour operation, 113 degrees F ambient.
    b. Voltage: Drive shall be suitable for 120 VAC, 60Hz, single phase with an internal switch-mode power supply. Supply nine-foot length mains power cord with standard 115VAC three-prong plug.
    c. Max drive power consumption: 190 VA.
    d. Enclosure: NEMA 4X constructed out of corrosion and impact resistant engineering plastic, 20% Glass filled PPE/PS. Enclosure shall house the drive motor and all control circuitry in one integrated unit.
    e. Direct coupled pumphead with fully protected drive
        (1) Pumphead shall direct couple mount to the controller via a splined drive shaft and shall be locked in place by two tool-free thumbscrews or lever mechanism.

(2) Pumphead shall be fully sealed to prevent any contamination of the controller or drive shaft by process fluid.
(3) Pumphead shall contain its own rotor bearings and not impart an overhung load on the pump shaft.
(4) Pumpheads shall be supplied mounted to the left or right side of the drive enclosure as specified in the drawings. If not specified, pumpheads shall mount to right side of the enclosure.
(5) Drive shall stop shaft rotation and give visual alarm in the event the pumphead is removed.

f. Drive motor: brushless DC motor with integral gearbox and closed loop tachometer feedback.
(1) Circuitry complete with temperature and load compensation and protection.

7. Human-Machine Interface (HMI) and Control Manual Control Interface
a. Display: Backlit graphical Display to display pump tag number, flow rate, and programming instructions. Display shall also provide visual indication of running status via screen color: Blue = Running, White = Stopped and Red = Warning.
b. Keypad: Keypad for start, stop, speed increment, speed decrement, rapid prime, and programming.
c. Flow units: Programmable in either ml/min or gallons/hour.
d. Security: Programmable keypad lock and PIN security for optional lockout of all keys except emergency start/stop.
e. Auto Restart: feature to resume pump status in the event of power outage interruption.
f. Fluid level monitor: Programmable flow totalization to advise operator when their supply tank is low.
8. Supply auto control features to meet the following minimum functionality requirements.
a. Remote Control Inputs:
1) Start/Stop Control: Digital Input. Configurable command sense allowing open to equal run or open to equal stop. Configurable to be a keypad start/stop override in Manual mode.
2) Speed Command: 4-20mA speed input, with input signal trimmable and speed scaleable over any part of the drive speed range. 1,600:1 turndown with incremental steps of 10 microamps required.
3) Leak Detector Run/Stop Control: Digital Input.
4) Auto/Manual Mode Control: Digital Input.
b. Status Outputs:
1) Pump Fault: Digital Output
2) Speed Status: Analog 4-20 mA Output.
3) Start/Stop Status: Digital Output
4) Leak Detector Status: Digital Output.
5) Auto/Manual Mode Control: Digital Output.

D. CONTROLS
1. Control components, where specified within this section, shall be provided under this section.
2. The equipment specified under this section shall operate manually/automatically as shown on the drawings and specified in sections 40 9XXX. Any additional materials of equipment required by this section's manufacturer, but not shown on the drawings or specified in sections 40 9XXX, to allow this equipment to function in the required manner, shall be furnished and installed under this section.

3. Provide all miscellaneous supports, brackets, fasteners, and fabrications required to mount and install equipment controls provided under this section.

2.4 PANEL CONSTRUCTION

A. Chemical pump assemblies should be provided on a FRP, PP, or HDPE shelf as shown in the drawings which can be mounted on the floor.

B. Each panel shall include the following:
   1. One (1) shelf for each pump provided, suitable for mounting.
   2. Calibration column(s), with appropriate isolation valves, vent piping, and vent connection, as indicated on the drawings.
   3. Discharge pressure gauge(s), as indicated on the drawings.
   4. Pressure Relief valve(s), as indicated on the drawings. PRVs shall include a sight glass for visual observation if the pump is reliving via the valve.
   5. Back Pressure valve(s), where indicated on the drawings.
   6. Sight gauge(s), for visual indication that chemical is being fed, as indicated on the drawings.
   7. Carrier water solenoid, needle valve, and rotameter, where indicated on the drawings.

C. Maximum Dimensions
   1. Two (2) Pump Panel: 36” x 20” x 48” (W x D x H)
   2. Three (3) Pump Panel: 50” x 20” x 48” (W x D x H)

D. Piping
   1. All pump panel piping shall be PVC Pipe and Fittings (Schedule 80) in accordance with Division 40, Section “Process Piping”. Solvent cement shall be IPS Corporation Weld-On 724, without exception.

E. Valves
   1. All pump panel valves shall be Ball Valve (Thermoplastic) in accordance with Division 40, Section “Process Valves, Gates, and Accessories.” Ball valves shall be Asahi Type 21/21A, without exception.

F. Accessories
   1. Each pump panel shall include the accessories as shown on the drawings, including, but not limited to the following:
   2. Back Pressure (Anti-Siphon) Valves:
      a. Provide back pressure regulating valve(s) where indicated on the drawings. Provide back pressure regulators of polyvinylchloride or CPVC construction, and having Hypalon or Teflon diaphragms, suitable for the fluid being pumped, to protect upper works of valve from process fluid. Provide spring opposed diaphragms with loading pressures adjustable by means of screw in top works. Field-adjust valves to settings required of the system. Setting to be minimum pressure to occur upstream of the valve, as installed in system, while pump is operating.
      b. Provide materials of construction compatible with the service specified and indicated.
   3. Pressure Relief Valves:

a. Provide pressure valves where indicated on drawings. Provide pressure relief of PVC or CPVC construction, and having Hypalon or Teflon diaphragms, suitable for the fluid being pumped, to protect upper works of valve from process fluid. Provide spring opposed diaphragms with loading pressures adjustable by means of screw in top works. Field-adjust valves to settings required of the system. Setting to be the maximum pressure to occur downstream of the valve, as installed in system, while pump is operating.

4. Carrier water:
   a. Where indicated on the drawings, provide a connection for carrier water. Piping shall include a solenoid valve, need valve, and rotameter.
5. Calibration Column:
   a. Provide calibration column(s) where indicated on the drawings.
   b. Size for a minimum 30-second draw down at maximum pump speed.
   c. Material: Schedule 40 clear PVC pipe with Schedule 80 fittings.
6. Injection Quill/Nozzle:
   a. Manufacturer:
      (1) Saf-T-Flo EB-146.
      (2) Engineer Approved Equal.
   b. Valve/Process Connection Size: 1-inch
   c. Inlet Connection Size: ½-inch
   d. Solution Tube Size: ½-inch
   e. For each injection point, provide an injection quill/nozzle assembly that is removable without dewatering the process line.
   f. Each quill shall include an integrated check valve. Check valve shall be the spring-loaded ball check type. Refer to the Metering Pump Schedule for the check valve seal material type.
   g. Each quill shall include a flexible hose assembly, provided by the quill manufacturer. Hose size shall be ½-inch and shall be clear braided PVC.
   h. Unions shall be provided for easy removal, refer to drawings for details.
   i. Valve Material: 316 SST
   j. Solution Tube Insertion Length: Refer to the Metering Pump Schedule.
   k. Solution Tube Material: Refer to the Metering Pump Schedule.
   l. Tip Configuration: Refer to the Metering Pump Schedule.

2.5 SHOP TESTING:

A. Motor Test:
   1. Give each motor a standard commercial test in the shop of the motor manufacturer and submit certified copies of the test results to the Engineer for review prior to installation of the motors.

B. Pump Test:
   1. Certified performance testing.
      a. Conduct tests as specified above for full speed at reduced speeds. Run one speed test at speed required to discharge the minimum rating point. Run a second test at a speed approximately midway between full and minimum speed.
      b. Factory tests on pumps must be conducted using the actual job motor and gear reducer.
   2. Run tests in accordance with the latest standards of the Hydraulic Institute, where applicable.

3. Inlet Vacuum Test:
    a. Test assembled pump running on air.
    b. Run test for a minimum of 5 minutes and record vacuum reading which must meet or exceed 95 percent full vacuum.
4. Repeat tests until specified results are obtained.
5. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to Owner.

C. Piping Test:
1. Wet test the entire skid with water to 1.5 times its design operating pressure.

PART 3 - EXECUTION

3.1 INSTALLATION:

A. Install equipment and appurtenances in accordance with manufacturer's printed instructions, as indicated and specified.

B. Install pumping units on a concrete pad. Assure there is no pipe stress on pump piping connections.

C. All electrical power and control connections shall be furnished under division 26.

3.2 FIELD CALIBRATION AND TESTING:

A. General:
1. Coordinate testing with operation of other portions of the facility. Arrange for temporary piping and wiring modifications which may be needed if chemical cannot be fed at intended dosing points, or if other interconnected electrical equipment is not operational.
2. Calibrate in the presence of the Engineer.
3. After cleaning, completely test each chemical feed system to verify that equipment is capable of performing its specified function in satisfactory manner without mechanical or electrical defects, binding, or operational difficulties. Correct defects and deficiencies and repeat all tests until satisfactory results are obtained. Correct excessive vibration leakage or noise. Make connections watertight or dusttight.
4. Demonstrate accuracy of units and bring within limits specified herein.
5. At the time of the tests, make final adjustments necessary to place equipment in satisfactory working order.
6. Test and calibrate equipment and accessories specified herein in accordance with manufacturer's printed instructions over full operating range of equipment.
7. Water testing is permitted where appropriate for preliminary testing purposes; however, conduct acceptance tests using appropriate chemicals for which each system was designed.
8. Complete preliminary and calibration testing and corrections prior to acceptance testing, as specified herein, to be conducted with the manufacturer's technical representative.
9. Copies of tests to be furnished to the Engineer.
10. Neutralize and dilute chemicals wasted during testing procedures with 10 volumes of water prior to disposal into plant drain system. Direct dumping into drains without prior neutralization and dilution is hazardous and not permitted.
11. Identify any exceptions to specification in documentation.

B. Chemical Pumps (Acceptance Tests):

1. Submit five copies of manufacturer's preliminary and calibration pump curves showing numerical values of pump discharge to nearest tenth of a gallon per hour.
2. Perform testing at 100, 75, 50 and 25 percent of speed settings.
3. Submit individual pump calibration curves to Engineer at least 15 days prior to acceptance testing. Notify Engineer when pumps are ready for acceptance testing, and make no adjustments or modifications to pumps after that time, without written permission of Engineer.
4. During acceptance testing demonstrate correct functioning of control stations.
5. Perform testing in the following manner:
    a. Test pumps by filling calibration standpipe with chemical and measuring time to pump a given volume out of the standpipe, with all other equipment valved off. Make test measurements of at least fifty seconds duration, using two stopwatches reading time to nearest one-hundredth second. Discard measured times differing more than one-half second. Average times differing by one-half second or less. Record averaged time for use in determining acceptability of pumps.
    b. For pumps equipped with back pressure valves, perform testing at the back pressure valve setting of 50 psig.
6. To determine deviation, compare measured pump output at various settings with output indicated by manufacturer's calibration curves. Pumps with deviation greater than plus or minus 3.0 percent of maximum pump output are not acceptable.
7. Add 0.5 percent to the deviation for the acceptance of pumps delivering slurries.
8. If pump output varies excessively, it is possible the pump is air bound. Operate pump for five minutes at back pressure valve setting of 50 psig. Pumps unable to relieve themselves of air within five-minute period are not acceptable.
9. Operate pumps for period of four hours to demonstrate satisfactory operation.

3.3 FIELD TOUCH-UP PAINTING:

A. After installation and accepted testing by the Engineer apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.4 CONTRACT CLOSEOUT:

A. Provide in accordance with Division 01, Section “Closeout Procedures”.

END OF SECTION 46 3344

RARWTP METERING PUMP SCHEDULE

A. Sodium Bisulfite ($NaHSO_3$)

1.	Feed Location:	NF Feed (NFF)
2.	Chemical Flowrate:	0.45 to 2.70 gph
3.	Backpressure:	60 psig
4.	Pump Panel:	Two (2) Pumps
5.	Injection Quill:	
a.	Solution Tube Material:	Hastelloy C276
b.	Solution Tube Length:	10-inch
c.	Tip Configuration:	Standard
d.	Check Valve Seal:	EPDM

B. Antiscalant (A.S.)

1.	Feed Location:	NF Feed (NFF)
2.	Chemical Flowrate:	0.41 to 0.83 gph
3.	Backpressure:	60 psig
4.	Pump Panel:	Two (2) Pumps
5.	Injection Quill:	
a.	Solution Tube Material:	Hastelloy C276
b.	Solution Tube Length:	10-inch
c.	Tip Configuration:	Standard
d.	Check Valve Seal:	EPDM

C. Sodium Hypochlorite (NaOCl) - Oxidation

1.	Feed Location:	Raw Water (RW)
2.	Chemical Flowrate:	3.79 to 11.36 gph
3.	Backpressure:	<30 psig
4.	Pump Panel:	Two (2) Pumps

D. Sodium Hypochlorite (NaOCl) - Disinfection

1.	Feed Location:	NF Permeate (NFP) or NF Bypass (NFB)
2.	Chemical Flowrate:	8.15 to 16.31 gph
3.	Backpressure:	<30 psig
4.	Pump Panel:	Three (3) Pumps
5.	Injection Quill (NFP):	
a.	Solution Tube Material:	Hastelloy C276
b.	Solution Tube Length:	8-inch
c.	Tip Configuration:	Standard
d.	Check Valve Seal:	Viton
6.	Injection Quill (NFB):	
a.	Solution Tube Material:	PVC
b.	Solution Tube Length:	6-inch
c.	Tip Configuration:	Standard
d.	Check Valve Seal:	Viton

E. Sodium Hydroxide (NaOH)

1.	Feed Location:	NF Permeate (NFP) or NF Bypass (NFB)
2.	Chemical Flowrate:	2.98 to 11.94 gph
3.	Backpressure:	<30 psig
4.	Pump Panel:	Two (2) Pumps

5. Injection Quill (NFP):
    a. Solution Tube Material: Hastelloy C276
    b. Solution Tube Length: 8-inch
    c. Tip Configuration: Standard
    d. Check Valve Seal: Viton
6. Injection Quill (NFB):
    a. Solution Tube Material: PVC
    b. Solution Tube Length: 6-inch
    c. Tip Configuration: Standard
    d. Check Valve Seal: Viton

F. Fluoride (FLUOR.)
1. Feed Location: NF Bypass (NFB)
2. Chemical Flowrate: 1.65 to 2.69 gph
3. Backpressure: <30 psig
4. Pump Panel: Two (2) Pumps
5. Injection Quill:
    a. Solution Tube Material: PVC
    b. Solution Tube Length: 6-inch
    c. Tip Configuration: Standard
    d. Check Valve Seal: EPDM

G. Corrosion Inhibitor (PHOS.)
1. Feed Location: NF Bypass (NFB)
2. Chemical Flowrate: 1.55 to 4.66 gph
3. Backpressure: <30 psig
4. Pump Panel: Two (2) Pumps
5. Injection Quill:
    a. Solution Tube Material: PVC
    b. Solution Tube Length: 6-inch
    c. Tip Configuration: Standard
    d. Check Valve Seal: Viton

SECTION 46 3393.01

POLYETHYLENE CHEMICAL STORAGE TANKS AND APPURTENANCES

PART 1 - GENERAL

1.1 DESCRIPTION:

A. Provide and test plastic chemical storage tanks and appurtenances as indicated and in compliance with Contract Documents.

B. Provide each chemical storage system complete in details and before acceptance make each system fully operational and ready for use by the Owner.

C. Chemical systems to meet:
   1. Recommended Standards for Water Works (2012 edition or the latest revisions), Part 5.

D. Chemical for testing to be supplied by the Contractor in accordance with Division 46, Section "Process Chemicals".

1.2 REFERENCES:

4. 29 CFR Part 1926.501 Fall Protection
5. 29 CFR Part 1926.502 Fall Protection

G. Uniform Building Code (UBC):
1. Tank Restraints.

1.3 SUBMITTALS:

A. Submit the following in accordance with Division 01, Section “Submittal Procedures”:
1. When the Contractor proposes tanks which requires an arrangement differing from that indicated on the drawings or specified, prepare and submit for review detailed structural, mechanical, and electrical drawings and equipment lists, utilities consumption schedule and operating instructions, showing all necessary changes and embodying all special features of the equipment he proposes to furnish. Make changes, if accepted at no additional cost to Owner.
2. Operating and maintenance instructions and parts lists.
3. Shop drawings data for accessory items.
4. Templates or certified setting plans, with tolerances, for anchor bolts.
5. Number and identify components to correspond with terminology on drawings. Use these numbers on all submittal sheets and shop drawings.
6. Recommendations for short and long term storage.
7. Sales bulletins or other general publications are not acceptable as submittals for review except where necessary to provide supplemental technical data.
8. Provide a listing of the materials recommended for each service specified and indicated.
9. ISO 9000 series certification or other quality control manual demonstrating a complete system for quality management.
10. Tank manufacturers must be capable of providing a list of customers using at least five (5) similar tanks for the same chemical applications for at least ten (10) years.
11. Material Certification:
    a. Provide certification from the manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of three (3) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
12. Certified results of factory tests.

B. Special Requirements:
1. Manufacturer's specification, catalog data and illustrations.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".
1. Failure to include all drawings applicable to the equipment specified in this section will result in rejection of the entire submittal with no further review.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.
   1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
   2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in rejection of the entire submittal with no further review and consideration.

1.4 QUALITY ASSURANCE:

A. Do work required by and in accordance with applicable State and local codes; arrange for permits, inspections and tests required by these codes; and provide complete systems ready for use. Provide tanks and accessories that conform to applicable safety standards including those for safety of personnel.

B. Provide components to manufacturer's standard for service intended unless otherwise required.

C. Provide components and accessories of manufacturers' latest and proven design.

D. The drawings and specifications direct attention to certain required features of the tanks, but do not purport to cover details entering into its design, construction and installation; nevertheless, provide tanks so that systems will be complete and ready for operation.

E. Provide supervisory services for satisfactory installation, with factory-trained serviceman to assist in determining location and orientation.

F. Coordinate the work schedule of other parts of the chemical systems manufacturer's service personnel during construction, testing, start-up, and acceptance, to coordinate with the tank manufacturer.

G. Upon completion of the installation, provide services of above serviceman for field testing.

H. Clean tanks internally prior to shipping.

I. Shop test and provide certificates as specified.

1.5 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in Division 01, Section "Product Requirements”.

1.6 WARRANTY

A. Manufactuer shall provide a full 5 year replacement warranty for all tanks.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION:

A. General:

1. Tank plans, elevation and data as indicated.
2. Tank data includes pressure, temperature, shell, head, connections, materials, design and construction details along with nozzle information.
3. Provide tanks with lifting lugs for handling and a tie-down system for installation.
4. Provide tank nozzles meeting ASME B16-5, as indicated. Project nozzles at least 4-inches (100 mm) from the tank surface.
5. Provide overflow pipe support brackets on side of tank, to support overflow pipe.
6. Equip tank with an internal support bracket for holding level instrument as specified and all interior piping.
7. Provide spare connections with the specified type of nuts, bolts, gaskets and blind flanges.
8. Clean tanks internally prior to shipment to meet NSF 61. Ship tanks protected to prevent damage to tanks and their protective coatings. Provide open nozzles with masonite or plywood covers.
9. Provide top of tank capable of supporting its equipment, walkway and maintenance personnel.
10. Provide an anchorage point at the top of the storage tank(s), in accordance with OSHA 29 CFR Part 1926.500, 1926.501 and 1926.502.

2.2 TANKS:

1. Manufacturers (Flat Bottom Tanks):
   a. Poly Processing.
2. Manufacturers (Conical Bottom Tanks):
   a. Snyder Industries.
3. Provide High Density Cross-Linked Polyethylene Vertical/Horizontal storage tanks, with all accessories as specified.
4. All tanks shall be fume-tight.
5. The XLPE Tanks shall be as manufactured in accordance with the definitions given in ASTM-D1998 Type I (Standard Specification for Polyethylene Upright Storage Tanks). The tanks shall be manufactured by the rotational molding process.
6. All tanks shall be designed for a specific gravity of 1.90, using a hoop stress value of no greater than 600 psi at 100 degrees F, with a safety factor of no less than 2, using the Barlow Formula for calculating wall thickness. For applications in excess of 100 degrees F design conditions, lower values for the design hoop stress shall be used.
7. The tank shall be molded from a virgin High Density Cross-Linked Polyethylene resin, with no fillers.
8. Impact Test: Shall be done in accordance with ASTM D746. Standard method shall be used in this test.
9. The nominal value for the properties of the polyethylene plastic material shall be as follows, as supplied by the resin suppliers.

Test Procedure	Units	XLPE	HDPE
Density/ASTM D1505	g/cc	0.940 to 0.945	0.939
ESCR Cond. A, F50/ASTM D1693 10 Percent Igepal	Hrs.	>1000	1000
Tensile Strength/ASTM D638	psi	2,600	3,900
Flexural Modulus/ASTM D790	psi	1000,000 to 110,000	86,500
Heat Distortion Tem./ASTM D648 At 66 psi	Degrees C	67 Degrees	-
Long Term Hydrostatic (LTHS) (Creep)	psi	900	-
FDA-grade resin	-	No	Yes
UV-stabilized	-	Yes	Yes

10. The tanks shall be designed for 1.9 Specific Gravity using a hoop stress value of no greater than 600 psi at 100 degrees F, with a safety factor of no less than 2, using the Barlow Formula for calculating wall thickness. For applications in excess of 100 degrees F design conditions, lower values for the design hoop stress shall be used.
11. Where indicated, resin shall include an additional medium density polyethylene (OR-1000) liner with four times the antioxidant properties of a standard polyethylene bonded to the interior surface during the manufacturing process.
12. All edges cut out for manway or other openings shall be trimmed to have smooth edges.

B. Fittings
   1. Bulk Tanks
      a. Lower sidewall connection: Day tank fill line connections to bottom of bulk tanks shall be integrally molded flanged outlet type connections. The connection shall be an integral part of the tank, molded from the same materials as the tank, and located flush with the tank bottom to provide complete drainage of liquid through the sidewall of the tank. Inserts are not permitted. Bolted flange shall be constructed of one 150 lb ANSI pattered flanged and flanged gasket. Stud bolts shall have encapsulated chemical resistant injection molded polyethylene heads and include gaskets to provide a sealing surface between the bolt and and the inerior tank wall.
      b. All other sidewall connections: All other sidewall connections to bulk tanks shall be bolted one-piece sure seal (B.O.S.S.) double flanged fittings constructed of polyethylene. Bolts shall we welded to a backing ring and be encapsulated in polyethylene.
      c. All dome connections: All connections to the dome of the bulk tanks shall be PVC self-aligning bulkhead type.
   2. Day Tanks
      a. All sidewall connections: All sidewall connections to bulk tanks shall be bolted one-piece sure seal (B.O.S.S.) double flanged fittings constructed of polyethylene. Bolts shall we welded to a backing ring and be encapsulated in polyethylene.
      b. All dome connections: All connections to the dome of the bulk tanks shall be PVC self-aligning bulkhead type.
   3. Coordinate fittings with connected instruments.

2.3 MATERIALS OF CONSTRUCTION:

A. All fittings, gaskets, and bolts on chemical feed piping and accessories shall be as follows. Liners shall be provided as indicated.

Chemical	Liner	Fitting Material	Gasket Material	Bolt Material
Sodium Bisulfite ($NaHSO_3$)	NA	SCH 80 PVC	EPDM	316 SST
Antisclant (A.S.)	NA	SCH 80 PVC	EPDM	316 SST
Sodium Hypochlorite (NaOCl)	OR-1000	SCH 80 PVC	Viton	Titanium
Sodium Hydroxide (NaOH)	NA	SCH 80 PVC	EPDM	316 SST
Corrosion Inhibitor (PHOS.)	NA	SCH 80 PVC	Viton	Hastelloy C-276
Fluoride (FLUOR.)	NA	SCH 80 PVC	Viton	Hastelloy C-276
MCS/Permeate Flush Tanks	NA	SCH 90 PVC	EPDM	316 SST

2.4 TANK ACCESSORIES:

A. Flexible Expansion Joints:
   1. Provide expansion joints where indicated on the drawings to allow the tank to expand and contract when filling and draining.
   2. Bulk Tank Sidewall Connections:
      a. Provide PolyProcesscing FlexiJoint Expansion Joint (or Engineer approved equal) at these locations. Joint shall be a flexible PTFE connector desiged to compensate for misalignment, absorb expanions and contraction, and isolate vibration and shock. Joint shall be made of 100% virgin PTFE resin. Flanges shall be CPVC. Bolts and gaskets shall be per the materials of construction table in this specification section.
   3. Day Tank Top Connections:
      a. Provide Synder Flexmaster (or Engineer approved equal) flexible fitting connector at these locations.

B. Bolted Sealed Top Manway:
   1. Provide sealed manway for all bulk tanks. Manways shall be constructed of polyethylene material. The bolts and gaskets shall be as specified under the materials of construction. Manways shall seal fume-tight.

C. Anti-foam Assembly:
   1. Provide anti-foam elbow assemblies at fill connections for all bulk tanks. Assembly shall consist of a 45 degree elbow and nipple extending to within 3-inches of the tank wall to direct liquid smoothly down the interior surface of the tank.

D. Overflow Piping:
   1. Overflow pipes shall etended into manufacturer provided 5 gallon buckets. Piping shall be installed such that the bucket can be removed if needed. Contractor shall ensure that buckets are filled with water prior to chemical being added to tanks.

E. Reverse float level indication:
   1. A reverse float level indicator shall be provided on all bulk storage tanks. The indicator shall act inverserly to the tank contents and shall not allow tank contents into exterior site

tube. The indiactor shall include a PVC float, neon orange indicator, polypropylene rope, 4-inch interior perforated pipe, PVC roller guide elbwos, a 2-inch clear UV resistant PVC sight tube, and all required pipe supports.

F. Ladders:
1. Rigid FRP ladder with cage and return to be provided on each bulk tank (ladders are not shown on drawings for clarity).
2. Ladders to be in accordance with OSHA 29 CFR Part 1910.27, Fixed Ladder.
3. Provide with a ladder safety device conforming to OSHA 29 CFR Part 1910.27 for ladders above six feet in height. Provide one personnel full body harness in conformance with OSHA 29 CFR Part 1926.104 and associated attachments for every two tanks provided. Ladder safety device shall be provided in addition to any cage or landing required or shown.
4. Ladder rungs to be nonskid of fiberglass on one foot centers, two foot wide.

G. Stands (for conical bottom tanks)
1. Stands shall be provided for conical bottom tanks. Stands shall be designed and certified by a structural engineer registered in the United States. Design shall conform to the most recent edition of the IBC code for seismic winds and loads.
2. Material: 304 SST

2.5 TANK SIGNAGE:

A. Provide signage for identifying for the chemicals contained in the tanks.
1. Provide two (2) signs per tank. Location to be determined in the field by the Engineer for proper visibility.
2. Letters to be 6-inches high, colors of letters and background to be submitted for acceptance. Signs to be vinyl and screen printed and UV resistant inks. No mechanical fasteners are allowed.

PART 3 - EXECUTION

3.1 INSTALLATION:

A. Install tanks in accordance with printed instructions of fabricators, as indicated and specified.
1. Do not use fittings for handling.
2. Install on concrete pads.
3. Provide pad as recommended by the tank supplier.
4. Assure there is no stress on tank nozzles.

3.2 FIELD PAINTING:

A. Specified in Division 09, Section “High Performance Coatings”.

3.3 ACCEPTANCE TESTING:

A. Tanks:
1. Supply all pipe, hose, pumps, water, power and other equipment required to convey the test liquids and carry out the tests.
2. After installation, clean tanks of loose debris and dry prior to tests.

3. Test tanks for leaks or damage prior to use. Certification to ASTM D-1998.
4. Test tanks with water first and then with specified chemical.
5. Do not test acid tanks with water; use air at pressure of 5 psig for one hour prior to test with acid.
6. Test tanks with each liquid for period of 24 hours during which no visible leakage is acceptable.
7. Where hydrostatic testing of tanks is specified, apply required hydrostatic test pressure in addition to pressures imposed by filling tank with required liquid. In order to simulate these conditions, attach standpipe to top of tank, and fill tank and standpipe assembly with water. Measure height of standpipe above highest point of tank. Provide standpipe of height equal to height of tank times difference between specified gravity of required liquid and specific gravity of water, plus additional height equal to hydrostatic test pressure specified. Leakage during four hour test not acceptable.
8. Repair leaks or damage by tradesman skilled in that type of work at no cost to the Owner.

3.4 CONTRACT CLOSEOUT:

A. Provide in accordance with Division 01, Section “Closeout Procedures”.

END OF SECTION 46 3393.01

RARWTP TANK SCHEDULE

A. Sodium Bisulfite ($NaHSO_3$)
   1. Day Tank
      a. Quantity: One (1)
      b. Volume (min): 100 gal
      c. Diameter (max): 1’-11”
      d. Height (max): 5’-7”
   2. Bulk Tank
      a. Quantity: Two (2)
      b. Volume (min): 2,750 gal
      c. Diameter (max): 8’-2”
      d. Height (max): 9’-3”

B. Antiscalant (A.S.)
   1. Day Tank
      a. Quantity: One (1)
      b. Volume (min): 30 gal
      c. Diameter (max): 1’-11”
      d. Height (max): 2’-2”

C. Sodium Hypochlorite (NaOCl)
   1. Day Tank
      a. Quantity: One (1)
      b. Volume (min): 685 gal
      c. Diameter (max): 5’-1”
      d. Height (max): 5’-4”
   2. Bulk Tank
      a. Quantity: Three (3)
      b. Volume (min): 6,100 gal
      c. Diameter (max): 10’-0”
      d. Height (max): 12’-8”

D. Sodium Hydroxide (NaOH)
   1. Day Tank
      a. Quantity: One (1)
      b. Volume (min): 280 gal
      c. Diameter (max): 2’-10”
      d. Height (max): 7’-1”
   2. Bulk Tank
      a. Quantity: Two (2)
      b. Volume (min): 3,000 gal
      c. Diameter (max): 7’-1”
      d. Height (max): 12’-0”

E. Corrosion Inhibitor (PHOS.)
   1. Day Tank
      a. Quantity: One (1)
      b. Volume (min): 155 gal
      c. Diameter (max): 2’-7”
      d. Height (max): 4’-9”

2. Bulk Tank
    a. Quantity: Two (2)
    b. Volume (min): 3,000 gal
    c. Diameter (max): 7’-1”
    d. Height (max): 12’-0”

F. Fluoride (FLUOR.)
1. Day Tank
    a. Quantity: One (1)
    b. Volume (min): 60 gal
    c. Diameter (max): 1’-11”
    d. Height (max): 3’-6”
2. Bulk Tank
    a. Quantity: Two (2)
    b. Volume (min): 1,150 gal
    c. Diameter (max): 5’-4”
    d. Height (max): 8’-6”

G. Membrane Cleaning System (MCS)
1. Stage 1- Conical Bottom, Closed-top
    a. Quantity: One (1)
    b. Volume (min): 3,600 gal
    c. Diameter (max): 8’-6”
    d. Height (max): 11’-3”
2. Stage 2- Conical Bottom, Closed-top
    a. Quantity: One (1)
    b. Volume (min): 2,500 gal
    c. Diameter (max): 7’-11”
    d. Height (max): 10’-5”

SECTION 46 4117

INLINE STATIC MIXERS

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section.

1.2 DESCRIPTION OF WORK

A. Provide and install in-line static mixers, where indicated on the drawings and specified in this section.

1.3 RELATED WORK SPECIFIED ELSEWHERE

A. Division 40 Section “Process Piping”.

B. Division 40 Section “Process Valves, Gates, and Accessories”.

1.4 QUALITY ASSURANCE

A. Manufacturer’s Qualifications
   1. Static Mixers shall be the product of one manufacturer
   2. Static Mixers shall be the Manufacturer’s standard product.
   3. The Manufacturer shall have been engaged in the production of the type of equipment being provided for the past five years.

B. Conform to the requirements of Division 01, General Requirements
   1. Manufacturer’s field services, if applicable, should be provided at no additional cost to the Owner.

1.5 SUBMITTALS

A. Provide technical submittals in accordance with Division 01 Section “Submittal Procedures”, demonstrating that all equipment provided conforms to the requirements.

B. Shop Drawings and Product data:
   1. Manufacturer's catalog information, descriptive literature, specifications and identification of materials of construction by ASTM reference and grade.
   2. Dimensional drawings and installation details.
   3. Operation and Maintenance Manual. O&M Manuals shall be in accordance with Division 01, Section “Operation and Maintenance Data”.

1.6 SPARE PARTS (NOT REQUIRED)

1.7 HANDLING, DELIVERY, AND STORAGE

A. Handling, delivery, and storage of the static mixing equipment shall be in compliance with the manufacturer's written instructions.

B. All equipment and parts shall be properly protected against any damage during storage at the site. Static mixers shall be stored in a dry sheltered environment, protected from weather.

PART 2 - PRODUCTS

2.1 MIXER DESIGN

A. The static mixers shall be of a compact ring body design for mounting between two standard pipe flanges.

B. The mixers shall be the static in-line orifice type for turbulent mixing with no moving parts. The mixer shall produce homogeneous mixing, blending, and dispersion of chemical in water.

C. Chemical injection points shall be provided upstream of the mixer per the injection quill detail on the drawings. Chemical injection quills are provided under Division 46, Section "Chemical Peristaltic Metering Pumps and Appurtenances." As an alternative, the mixer may be fitted with connections for the injection of chemical directly into the mixer body. If this option is chosen, General contractor shall coordinate mixer layout to ensure injection quills can be easily removed.

D. Manufacturers
   1. Kenics
   2. Westfall Mfg.
   3. Komax

E. Provide and install a 316 stainless steel nameplate on each static mixer with the following information as a minimum:
   1. Manufacturer.
   2. Model number.
   3. Design conditions.
   4. Number of mixing elements.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install mixers as indicated on the drawings and in accordance with the Manufacturer's recommendations.

B. Install mixers in a clean condition, free of dirt, chemical residue, or other deleterious substances.

C. Pigging of the static mixer is prohibited.

END OF SECTION 46 4117

RARWTP MIXER SCHEDULE

A. NF Feed (NFF)
   1. Pipe Size: 30-inches
   2. Ends: Suitable for flanged pipe, provide adaptor flange on one end
   3. Flow range: 1.8 to 17.5 MGD
   4. Working Pressure: < 100 psi
   5. Working Temperature: 55 Deg F +/-
   6. Body Ring: 316 SST
   7. Mixer Plate: Hastelloy C-276
   8. Gasket: Viton
   9. Chemicals: Antiscalant, 38% Sodium Bisulfite
   10. Beta Value: 0.7

B. NF Bypass (NFB)
   1. Pipe Size: 16-inches
   2. Ends: Suitable for flanged pipe, provide adaptor flange on one end
   3. Flow range: 0.8 – 8.0 MGD
   4. Working Pressure: < 30 psi
   5. Working Temperature: 55 Deg F +/-
   6. Body Ring: 316 SST
   7. Mixer Plate: Hastelloy C-276
   8. Gasket: Viton
   9. Chemicals: 23% Fluoride, 50% Sodium Hydroxide, 29% Orthophosphate, 12.5% Sodium Hypochlorite
   10. Beta Value: 0.8

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 46 6320

CARTRIDGE FILTRATION EQUIPMENT

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including but not limited to Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. Work of this Section includes furnishing and installation of all a complete cartridge filtration systems as shown on the drawings for pretreatment of the NF feed water. The cartridge filter housing shall be either stainless steel (SST) or fiberglass reinforced plastic (FRP).

1.3 QUALITY ASSURANCE

A. The manufacturers of the equipment specified under this section shall be a standard product of a Manufacturer who has been regularly engaged in the production of the equipment for a minimum of five years. The cartridge filter assemblies shall be of proven ability and shall be designed, constructed, and installed in accordance with best industry procedures and methods.

B. The owner requires that all cartridge filters on the entire job shall be from the same manufacturer.

1.4 SUBMITTALS

A. All submittals shall conform completely to the requirements of the Contract Documents, including all requirements set forth in Division 01 General Requirements.

B. Submit to the Engineer for approval, in accordance with the Contract Documents, shop drawings for the equipment to be furnished under this Section. The shop drawings shall include at least the following:
   1. Certified shop and erection drawings showing all details of construction, dimensions, and anchor bolt patterns.
   2. Descriptive literature and drawings, including parts list, bulletins and/or catalog cuts for the equipment, including all accessories, with the items to be furnished clearly marked in the submittal material.
   3. A list of the Manufacturer’s recommended spare parts, including gaskets and hardware.
   4. Make, model, and weight of each assembly.
   5. Headloss vs. flow projection throughout the operating ranges.
   6. Special shipping, storage and protection, and handling instructions.
   7. Manufacturer’s written/printed installation instructions.

C. Submit for the Engineer’s review the following:
   1. Routine maintenance requirements prior to plant startup.
   2. Operation and Maintenance manuals. O&M Manuals shall be in accordance with Division 01, Section “Operation and Maintenance Data”.

1.5 SPARE PARTS

A. Filter O-Rings: Supply one spare ethylene propylene rubber O-ring per cartridge filter pressure vessel.

B. Filter Elements: Supply two (2) complete replacement sets of filter elements for each vessel in addition to one (1) initial set (3 sets total).

1.6 HANDLING, DELIVERY, AND STORAGE

A. The cartridge filter shall be completely factory assembled, aligned, and securely crated for shipment.

B. When received at the site, the cartridge filter shall be stored in its shipping container until ready for installation.

C. When received at the site, the pressure vessels shall be stored in a clean, dry environment until ready for installation.

PART 2 - PRODUCTS

2.1 GENERAL

A. The vessels will filter chemically conditioned water with a pH between 2.0 and 12.0 and could have a Chlorine residual of up to 3 ppm.

2.2 OPTION NO. 1: STAINLESS STEEL CARTRIDGE FILTER VESSELS (SST)

A. General
1. Filter vessels shall be designed and constructed in accordance with OSHA code and ASME Boiler and Pressure Vessel Code Section VIII, Division I. The vessels shall be stamped and National Board registered. The vessels shall have a stainless steel nameplate stamped with the filter model number, the quantity and number of filter cartridges and the equipment number. The vessels shall be designed for use with cartridges that are of common size available from at least two or more manufacturers.
2. Cartridge Filter vessels shall be aligned horizontally and be constructed as generally shown on the drawings.
3. Exterior Finish on vessel: Pickeled and passivated.

B. Materials
1. Filter Vessel: 316L stainless steel.
2. Internal non-removable parts: 316L stainless steel.
3. Removable non-welded internal parts: 316 stainless steel.
4. External attachments welded to the vessel: 316 stainless steel.
5. All removable external parts including but not limited to the closure bolts and the cover davit assembly: 316 stainless steel.
6. Closure bolts, pivot pins, washer, and retaining pins: 316 stainless steel.
7. Hex nuts used on stainless steel bolting: Silicon bronze, aluminum bronze roll threaded nuts or xylan-coated steel nut.
8. Cover davit bushings: Bronze.
9. Compression Springs and Sealing Components: 316 stainless steel.

10. Vessel support legs: 316 stainless steel.

C. Design
1. Construction: Retaining plates welded in the domed cover shall have an access opening to allow for flushing behind the plate to prevent build-up of foreign matter. The closure bolt sets are to include four longer bolts to engage the cover before compressing the cartridge seal springs. The closure is to be designed for the proper number of stainless steel bolts sufficient for the design pressure rating.
2. Cartridge Supports: The bottom cartridge seat shall be a dual purpose type that will accept either double open end or 2-222 O-ring style cartridges. Guide posts are to be of 20 gauge material tri-fold type with no sharp edges or projections. Top seat spring assembly shall be provided for use with double open end cartridges.
3. The cover O-ring groove is to be a single dovetail-type to retain the O-ring in place during opening and closing of the cover.
4. Horizontal filter vessels are to have a removable internal cartridge alignment support plate located in a manner to prevent cartridge movement. If double open end cartridges are utilized, the spring assemblies must have extensions or supports to keep them in place prior to closing the cover.
5. Coordinate with manufacturer on the number of air release valves per cartridge filter.

D. Cartridge filter assembly (pressure vessel with elements) shall have a maximum clean element pressure differential of 2 psi at maximum flow rate.

E. Manufacturer
1. Fil-Trek.
2. Parker Hannafin.

2.3 OPTION NO. 2: FRP CARTRIDGE FILTER VESSELS (FRP)

A. General
1. Filter vessels shall be designed and constructed in accordance with OSHA code and ASME Boiler and Pressure Vessel Code Section X. The vessels shall be stamped and National Board registered. The vessels shall have a stainless steel nameplate stamped with the filter model number, the quantity and number of filter cartridges and the equipment number. The vessels shall be designed for use with cartridges that are of common size available from at least two or more manufacturers.
2. Cartridge Filter vessels shall be aligned horizontally and be constructed as generally shown on the drawings.

B. Materials
1. Filter Vessel: FRP.
2. Internal non-removable parts: FRP.
3. Removable non-welded internal parts: FRP.
4. External attachments attached to the vessel: FRP.
5. Lifting arm (hoist): 316 stainless steel.
6. Closure bolts, pivot pins, washer, and retaining pins: 316 stainless steel.
7. Hex nuts used on stainless steel bolting: Silicon bronze, aluminum bronze roll threaded nuts or xylan-coated steel nut.
8. Main body gaskets: EPDM
9. Vessel support legs: 316 SST.

C. Design
   1. Construction: Retaining plates welded in the domed cover shall have an access opening to allow for flushing behind the plate to prevent build-up of foreign matter. The closure bolt sets are to include four longer bolts to engage the cover before compressing the cartridge seal springs. The closure is to be designed for the proper number of stainless steel bolts sufficient for the design pressure rating.
   2. Cartridge Supports: The bottom cartridge seat shall be a dual purpose type that will accept either double open end or 2-222 O-ring style cartridges. Guide posts are to be of 20 gauge material tri-fold type with no sharp edges or projections. Top seat spring assembly shall be provided for use with double open end cartridges.
   3. The cover O-ring groove is to be a single dovetail-type to retain the O-ring in place during opening and closing of the cover.
   4. Horizontal filter vessels are to have a removable internal cartridge alignment support plate located in a manner to prevent cartridge movement. If double open end cartridges are utilized, the spring assemblies must have extensions or supports to keep them in place prior to closing the cover.

D. Cartridge filter assembly (pressure vessel with elements) shall have a maximum clean element pressure differential of 2 psi at maximum flow rate.

E. Manufacturer
   1. Piedmont

2.4 FILTER ELEMENTS

A. The filter elements shall be spiral wound fiber elements rigid, high-strength, cylindrical cartridges constructed from polypropylene microfibers which have a five (5) micron removal at a nominal 90% efficiency rating.
   1. Support layers and end caps shall be polypropylene. O-Rings shall be Buna-N.
   2. The filter elements used in all vessels in all systems shall be identical.
   3. Nominal OD: 2.5-inch
   4. Length: 40-inch
   5. The initial clean pressure drop shall be less than 4 psig, with the cartridge filter flowing at its rated capacity as measured between the inlet and outlet nozzles.
   6. The maximum pressure drop at exhaustion of the elements (at maximum dirty element headloss condition) shall be less than 30 psig, with the cartridge filter flowing at its rated capacity, as measured between the inlet and outlet nozzles.
   7. Provide two complete sets of elements for each vessel.

B. Manufacturer
   1. Parker Hannifin
   2. Vorex
   3. Engineer approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with the Manufacturer’s printed instructions.

3.2 START-UP AND TESTING

A. Conform to the requirements of Division 1 Section “Quality Control”, paragraph 1.8, Manufacturer's Field Services.

B. Follow the manufacturer's recommended procedures for testing, adjusting, and placing of equipment into proper operation.

C. After installation, conduct pressure and leakage tests for each unit as part of the piping tests for the pipe sections where the cartridge filters are installed in accordance with Division 40 Section “Process Piping”.

D. Pressure test according to the requirements of ASME Section VIII.

E. Provide at least one (1) qualified field representatives to be on-site to coordinate and supervise the installation (1 day), startup and testing (1 day) of the Cartridge Filters.

END OF SECTION 46 6320

RARWTP CARTRIDGE FILTER HOUSING SCHEDULE

A. NF Feed Cartridge Filters

1.	Number of units:	4
2.	Operating Pressure:	100 psi
3.	Maximum flow per 40” element:	14 gpm
4.	Design Flow:	2,547 gpm each
5.	Connections:	As shown on the drawings
6.	Orientation:	Horizontal

B. MCS Cartridge Filters

1.	Number of units:	1
2.	Operating Pressure:	100 psi
3.	Maximum flow per 40” element:	14 gpm
4.	Design Flow:	1,080 gpm each
5.	Connections:	As shown on the drawings
6.	Orientation:	Vertical

SECTION 46 6340

NANOFILTRATION MEMBRANE EQUIPMENT

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including but not limited to Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. OEM and Contractor Scope
   1. The OEM's scope shall include all work after the inlet flange connection on the skid and shall end at the flanged connections for the permeate, concentrate, and cleaning connections after the various control, isolation, and block and bleed valves. NF feed pumps will be provided by Contractor (off-skid).

B. The system provided under this specification shall be complete and operable in all respects including, but not limited to connections to other systems and facilities, component and system tests, calibration, alignment, and adjustments as necessary to place the system in operation to perform its intended function.

C. The Contractor shall coordinate scheduling, delivery, and shall unload, store, protect equipment, and install the equipment.

D. Connections of electrical, control, and instrumentation components shall be furnished and installed as specified in Division 26 and 409XXX.

1.3 RELATED WORK SPECIFIED ELSEWHERE

A. Division 09, Section "High Performance Coatings."

B. Division 26—Electrical.

C. Division 40—Process Integration.

1.4 QUALITY ASSURANCE

A. The skid components shall be manufactured from all new materials and equipment.

B. The Owner and/or Engineer shall be provided access at any time to inspect or observe all equipment prior to shipment to the site.

C. All valves, actuators, flow meters, and instrumentation shall be of the same type and from the same manufacturer.

1.5 SUBMITTALS

A. All submittals shall conform completely to the requirements of the Contract Documents, including all requirements set forth in Division 01 General Requirements.

B. Manufacturer shall submit P&IDs for all equipment furnished under this section to the Engineer for approval, prior to submittal of shop drawings. Once P&IDs have been approved, Manufacturer shall submit shop drawings to the Engineer for approval, in accordance with the Contract Documents, for equipment furnished under this section.

C. Manufacturer's product data including but not limited to valves pressure vessels, end assembly, piping, couplings, membrane elements, instrumentation, controls, and electrical components. Data sheets shall include materials of construction for all hardware used to assemble the skids.

D. Submit process design information detailing the number of stages, number of pressure vessels per stage, flux rate per stage and for the entire membrane train, design feed pressures, design product water quality parameters (based on the projected feed water quality), number of membrane elements per pressure vessel, general information on the proposed membrane element, specific instructions on membrane train construction based on membrane system configuration, piping plan and sections, wiring plan, wiring diagram, control panel layout, sample panel layout, and other relevant information.

E. Assembly and installation drawings including arrangement, layout, and dimensions of all components of the membrane trains, including the control panel, sample panel, piping connections and membrane element loading sequence.

F. Factory acceptance testing results.

G. The OEM's printed instructions for the handling, delivery, storage, and installation of the membrane system components.

H. Operations and Maintenance (O&M) Manual
   1. The OEM shall prepare a comprehensive operation and maintenance (O&M) manual for the system specified as part of this Contract. The manual shall include information on the operation and maintenance of the individual components of the system, and on the operation of the overall package. O&M Manual shall be in accordance with Division 01, Section "Operation and Maintenance Data".

I. The OEM shall also provide personnel training prior to startup, and field assistance during the system checkout, startup, and commissioning.

1.6 SPARE PARTS

A. Provide two spare grooved-end, flexible-type coupling assemblies for each size and type supplied on the membrane skid assembly.

B. Provide two pressure vessel repair kits, consisting of all O-rings and seals and clips required for the rebuilding of one end closure assembly.

C. Provide four permeate orifice plugs, sized to simulate hydraulic design of the membranes.

1.7 HANDLING, DELIVERY, AND STORAGE

A. The OEM shall fabricate and deliver all components of the NF System to the site.

B. All components shall be properly crated and stored at the job site until ready for installation. All components shall be kept clean, dry, and protected from freezing.

C. Weight, handling instructions, type of storage required, and instructions for protective maintenance during storage shall be included with each shipment to the job site.

1.8 WARRANTY

A. The membrane manufacturer shall guarantee the membrane performance as specified herein during the performance warranty period as described below:
   1. Performance Warranty Period: 1 year full warranty plus 2 additional year warranty pro-rated.

B. If the performance requirements specified (permeate water quality and feed pressure) are not met the OEM shall replace all membranes at no cost to the Owner until the requirements are met.

C. Performance Requirements:
   1. Performance Requirements are included in the NF Membrane Equipment Schedule.

PART 2 - PRODUCTS

2.1 GENERAL

A. NF Skid design information and dimensions are included the NF Membrane Equipment Schedule.

B. Membranes
   1. Provide interconnectors, O-rings, and brine seals required for installation in specified pressure vessels. Elements shall be non-telescoping, non-flexing, and leak-free.
   2. Spiral Wound Thin-Film Composite.
   3. Nominal Diameter: 8 inches.
   4. Nominal Length: 40 inches.
   5. Nominal Active Membrane Area: 400 square feet.
   6. Seal Materials: Brine seals and O-rings shall be manufactured from EPDM.
   7. Feed Brine Spacer Thickness: 34 mil.
   8. Manufacturer/Model:
      a. DOW/NF90.

C. Manufacturers
   1. Nanofiltration membrane equipment supplier is currently being determined by the Engineer. Selected supplier and pricing will be provided to the Contractor via addendum.

2.2 SKID ASSEMBLY

A. Material
   1. Base Bid: Epoxy Coated Carbon Steel or FRP
   2. Alternate Bid: 304 SST

B. Frame/Supports
   1. Fabricate frame and supports using material as noted above.
   2. If onsite erection or assembly of the frames is required, OEM shall certify that the skids have been constructed correctly.
   3. All other supports and hardware on the skids shall be either 304 SST or FRP.
   4. Frames shall be designed and stamped by registered professional engineer, and all calculations submitted in accordance with Division 1 Section “Submittals”.

C. Anchor Bolts
   1. Contractor shall provide 316 SST expansion bolts to anchor the skid to the equipment pad below. OEM to coordinate with Drawings to determine anchor bolt locations.

D. Accessories
   1. Locate control panel, sample panel, pressure transmitters, flow transmitters, conductivity meters, and other instruments for each skid where indicated on the drawings, and no less than 2.5 feet no more than 5 feet above floor level.

2.3 FEED, INTERSTAGE, CONCENTRATE, AND PERMEATE PIPING

A. All high pressure feed, interstate, and concentrate piping shall be 316 stainless steel, schedule 10S conforming to the requirements of Division 40, Section “Process Piping.”
   1. All stainless steel piping associated with the membrane skid shall be stress relieved and passivated. Passivation shall be continued to a bright metal finish.
   2. All stainless steel piping shall be thoroughly cleaned inside and out, disinfected, and all scale and welding slag removed.
   3. All piping shall be designed for a working pressure no less than the shutoff head of the NF Feed Pumps being provided (OEM to coordinate with Contractor and NF Feed Pump Supplier).
   4. All stainless steel spool pieces shall be pressure tested to 1.5 times the rated working pressure of the pipe. Pressure testing shall conform to the requirements set forth in Division 40 Section “Process Piping”. Cut or roll-groove as appropriate to the pipe material, wall thickness, pressure, size, and method of joining. Use Victaulic “RX” rolls for grooving Schedule 10 stainless steel pipe.

B. All other piping shall be Schedule 80 PVC conforming to the requirements of Division 40, Section “Process Piping.”

C. Vessel Connections
   1. Feed, Interstage, and Concentrate Connections: Side-ported pressure vessels shall be directly connected to their respective manifolds using grooved-end flexible pipe couplings.

D. Grooved-End Flexible Pipe Couplings
   1. Housings: 304 SST
   2. Gaskets: EPDM rubber, suitable for hot and cold water service.
   3. Bolts / nuts: Round head, square neck, type 316 SST bolts and heavy hex type 316 SST nuts. Washers shall be heavy pattern 316 SST.
   4. Pressure Rating
      a. < 2-inches: 600 psi.
      b. 2-inches and larger: 300 psi.
   5. Manufacturer: Victaulic Style 489, Piedmont Style K, or Engineer Approved Equal.

a. All grooved components shall be of one manufacturer. Installation shall be in strict accordance with the coupling manufacturer's latest published instructions.

E. OEM shall carefully review drawings for coordination on skid connection locations. Skid connection locations have been located for coordination with the Architectural and Structural Layout of the Building. Alternate connection points may not be acceptable. No additional costs will be paid by the Owner for piping revisions that are required for alternate connection points.

F. Manifolds and piping shall be securely supported from the vessel support structure. Manifold support stanchions that are welded to the manifold must be the same material and finish as the manifold. For side-ported pressure vessels, provision must be made for either the feed or concentrate manifold of each stage to allow for movement of the manifold with the vessel side ports as vessel length expands under pressure. Manifolds shall not rely upon mechanical-type coupling joints to support coupled sections of manifolds.

2.4 SIDE PORTED PRESSURE VESSELS

A. Pressure vessels shall be as specified in Division 46 Section "Side Ported Pressure Vessels".

2.5 VALVES

A. Valves and actuators shall conform to the requirements of Division 40 Section "Process Valves, Gates and, Accessories."

2.6 INSTRUMENTATION

A. Flow Measurement
   1. Magnetic Flowmeters
      a. In accordance with Division 40, Section "Primary Sensors and Field Instruments."
   2. Paddlewheel Flowmeter
      a. Manufacturer/Model: Seametrics IP800 Series or Engineer Approved Equal.
      b. Materials: Cast Aluminum housing, PVC sensor, Viton O-ring, PVDF rotor, and Kynar shaft.
      c. Features: 4-20 mA output, loop powered.

B. Pressure Measurement
   1. Pressure Transmitters and Switches
      a. In accordance with Division 40, Section "Primary Sensors and Field Instruments".
   2. Pressure Switches
      a. In accordance with Division 40, Section "Primary Sensors and Field Instruments".
   3. Pressure Gauges
      a. In accordance with Division 40, Section "Process Valves, Gates, & Accessories".

C. Analyzers
   1. ORP
      a. In accordance with Division 40, Section "Primary Sensors and Field Instruments".
   2. Conductivity
      a. In accordance with Division 40, Section "Primary Sensors and Field Instruments".
   3. Temperature
      a. Moore Industries TDZ with D2LC housing or Engineer Approved Equal.

2.7 SAMPLE PANEL

A. There shall be a sample panel on each skid made of HDPE or FRP. The panel shall be mounted with corrosion resistant clamps (316 SST) similar to those used to attach the pressure vessels to the support structure.

B. The sample panel shall be fitted with angle-pattern, 1/4-inch-turn, black PVC valves, installed to panel with Swagelock backhead tube fitting SS-400-71-4 for 1/4-inch OD tubing or Engineer Approved Equal.

1. There shall be one sample valve for the permeate for each pressure vessel on the skid, plus valves for 1st stage feed, interstage, concentrate, 1st stage total permeate, 2nd stage total permeate, and total permeate. Provide a label for each sample valve corresponding to the location from which the sample is drawn.

C. The sample panel shall be equipped with a 6-inch deep x 6-inch wide trough for each row of sample valves, of the same material as the panel, which shall be drained by a 2-inch PVC pipe. Route drain pipe to trench drain located beneath each skid as shown on the drawings. Provide slope in trough to properly drain sample water. Provide adequate clearance for a one-gallon milk jug between the sample valves and the trough.

D. Sample tubing shall be 1/4-inch OD polyethylene, with a minimum working pressure of 300 psi at 75 deg F. Sample tubing shall be black. Tubing shall be Manufactured by Imperial Eastman Division, Imperial Clevite, Inc., or Engineer Approved Equal.

E. Tubing shall be neatly arranged and bundled where possible. Bundles shall be retained with nylon tywraps, or grouped in PVC conduit with properly arranged openings for tubing. Label sample taps according to stage and sequential number.

2.8 WET PANEL

A. A Wet Panel shall be provided for each skid made of HDPE or FRP board, floor-mounted where indicated by the Drawings, adjacent to each skid. The panel shall be mounted on FRP supports with corrosion resistant (316 SST) clamps similar to those used to attach the pressure vessels to the support structure. The Skid Wet Panel may be combined with the Skid Sample Panel.

B. The Wet Panel shall incorporate all instrumentation and control components local to each train except for those that must be installed inline, or otherwise indicated in the PID drawings. The panel shall include pressure gauges, transmitters, indicators, analytical instruments, and other components indicated on the Drawings. The panel shall consist of a flat panel for gauges, analytical sensor cells, and other surface mounted components; a NEMA 4X enclosure for mounting analytical transmitters, electronic displays, and components.

C. Skid shall include drain piping from the wet panel to the trench drain beneath each skid as shown on the drawings.

2.9 MCS SYSTEM

A. MCS Tanks(s)

1. MCS Tank(s) are specified in Division 46, Section "Polyethylene Chemical Storage Tanks and Appurtenances". These tanks to be provided by the Contractor. OEM to coordinate with Contractor and MCS Tank Supplier.

B. Piping
1. MCS Piping is specified in Division 40 Section "Process Piping". MCS piping shall be provided and assembled by the Contractor. Skidded MCS systems are not acceptable.

C. Valves
1. MCS valves are specified in Division 40, Section "Process Valves, Gates, and Accessories". MCS valves shall be provided by the Contractor. OEM to coordinate with Contractor and MCS Valve Supplier.

D. Pump(s)
1. MCS Pump(s) are specified in Division 43, Section "Horizontal End Suction Pumps". These pumps shall be provided by the Contractor. OEM to coordinate with Contractor and MCS Pump Supplier.

E. Cartridge Filter Housing(s)
1. MCS Cartridge Filter Housing(s) are specified in Division 44, Section "Cartridge Filters and Appurtenances". Cartridge filter housing(s) shall be supplied by the Contractor. OEM to coordinate with Contractor and Cartridge Filter Housing Supplier.

F. Instrumentation/Accessories
1. MCS System instrumentation and accessories shall be provided by the OEM. OEM to coordinate with Contractor and Instrumentation Supplier. Conduit and wiring between instrumentation and MCS shall be provided by OEM. Conduit and wiring shall comply with Division 26 and 409XXX series specifications.

G. Water Heaters:
1. OEM shall provide the heaters. OEM to coordinate with MCS Tank Supplier.
2. Sizes: Per the equipment schedule.
3. Material: 304 SST flange and Incoloy sheath.
4. Electrical Characteristics: 480V, 3 phase, cold section first 10 inches. Include thermostat.
5. The heater shall have a maximum temperature thermostat switch to prevent excessive heating and damage to the tank.
6. Installation: Per the manufacturer's recommendations.
7. Manufacturer: Indeeco, Chromalox, or Engineer Approved Equal.

2.10 PERMEATE FLUSH SYSTEM

A. Permeate Flush System (PFS): OEM shall provide the permeate flush system (where indicated) which shall include tank(s), pump(s), valves, meters, and controls as indicated on the drawings.

B. Permeate Flush Tanks(s)
1. Permeate Flush Tank(s) are specified in Division 46, Section "Polyethylene Chemical Storage Tanks and Appurtenances". These tanks to be provided by the Contractor. OEM to coordinate with Contractor and Permeate Flush Tank Supplier.

C. Piping

1. Permeate Flush Piping is specified in Division 40 Section “Process Piping”. MCS piping shall be provided and assembled by the Contractor. Skidded Permeate Flush systems are not acceptable.

D. Valves
1. Permeate Flush valves are specified in Division 40, Section “Process Valves, Gates, and Accessories”. Permeate Flush valves shall be provided by the Contractor. OEM to coordinate with Permeate Flush Valve Supplier.

E. Pump(s)
1. Permeate Flush Pump(s) are specified in Division 43, Section “Horizontal End Suction Pumps”. These pumps shall be provided by the Contractor.

F. Instrumentation/Accessories
1. Permeate Flush System instrumentation and accessories shall be provided by the OEM.

2.11 ACCESSORIES

A. SDI Test Apparatus
1. Provide and install one silt density index (SDI) test apparatus for each array at the sample panel.
2. SDI test apparatus shall conform to the requirements of ASTM D4189.
3. Provide 500 filters with each apparatus.

2.12 IDENTIFICATION

A. Identify all equipment per Division 40 Section “Process Valves, Gates, and Accessories”.

B. Identification Schedule
1. Identify all valves on each skid. Valve numbers are listed in the valve schedule.
2. Identify all piping using the language indicated on the drawings.
3. For cleaning connections, provide placards mounted on the piping showing and describing the valve settings for cleaning both stages.
4. Identify each pressure vessel. Locate the label on the side of the pressure vessel facing the sample sink and at the front of the skid. Pressure vessel numbering shall correspond to the sample valve numbering.
5. Identify each pressure gauge, transmitter, flow element, analytical element, and all other pieces of equipment. Tag shall be descriptive of the equipment, i.e. “1ST STAGE FEED PRESSURE”.

2.13 ELECTRICAL

A. Refer to Division 26 - Electrical for Electrical Requirements.

B. Conduit
1. All on skid electrical and control conduits shall be schedule 80 PVC conduit in accordance with Division 26, Section “Raceway.”

2.14 CONTROL PANELS

A. OEM shall provide the following control panels:

1. NF Skids Master Control Panel (NF-MCP)
2. NF Skid Control Panels (NF1, NF2, NF3, etc….)
3. NF MCS Control Panel (MCS-CP)

B. Control Panels and components shall be in accordance with Division 40, Section 409XXX series and as shown on the drawings.

C. MCS Control Panel (NF-MCSCP)
1. Provide VFDs for each MCS Pump (MCSP-1 and MCSP-2) and Permeate Flush Pump (PFP-1).
   a. VFDs shall be in accordance with Division 26, Section "Variable Frequency Drives".
2. Provide local on/off switches for operation of the heaters.

D. Provide spare parts for control panel components as specified in Section 409XXX series.

2.15 CONTROLS

A. Provide controls for all elements scope supplied. All instrumentation required to control and monitor the operation of the equipment shall be provided including all PLC and OIT programming for all supplied equipment.

B. OEM shall control the NF Feed Pumps (NFFPs).
1. There will be one (1) feed pump for each NF skid.
2. NF feed pumps are VFD driven.
3. NF-MCP shall control the VFD to slowly adjust the pump flow rate to desired setpoint.

C. Provide an electronic copy of the software on a USB jump drive to allow the customer to reconfigure the program. The software provided to the customer shall be the "As-Built" version of the operating program that includes all start up and on-site changes that were made to the original program.

D. Control components, where specified within this section, shall be provided under this section.

E. The equipment specified under this section shall operate manually/automatically as shown on the drawings and specified in Section 409XXX. Any additional materials of equipment required by this section's OEM, but not shown on the drawings or specified in sections 409XXX, to allow this equipment to function in the required manner, shall be furnished and installed under this section.

F. Provide all miscellaneous supports, brackets, fasteners, and fabrications required to mount and install equipment controls provided under this section.

2.16 NF CONTROL DESCRIPTION

A. The controls shall be designed to operate and control the NF Skids, NFFPs, MCS system, and Permeate Flush System.

B. The permeate flux and recovery shall be adjustable such that the skid can be programmed to make different amounts of permeate. OEM shall program the skids to operate at varying capacities by adjusting the permeate flux and recovery.

C. NF Flow Calculations
   1. Operator shall have the ability to enter the desired NF flux rate (gfd) and percent recovery (%) for each NF skid.
   2. Operator shall have the ability to enter the number of pressure vessels in the first stage (#PV1) and second stage (#PV2), number of elements per vessel (#EL), and square footage of membrane area per element (AEL) for each NF Skid. #EL and AEL shall be a common input at one location for all skids.
   3. Indicate the Total #PV (#PV1 + #PV2).
   4. Indicate NF Permeate Flow (NFP = #PV x AEL x Flux)
   5. Indicate NF Feed Flow (NFF = NFP / % recovery)
   6. Indicate NF Concentrate Flow (NFC = NFF – NFP)
   7. Indicate 2nd Stage NF Concentrate flow per pressure vessel:
      a. NFCPV2nd = NFC / #PV2nd
      b. If NFCPV2nd < 15, then provide alarm stating “Minimum 2nd Stage NFC flow per Pressure Vessel too low. Lower % recovery or raise flux.”

D. Communicate all parameters with the Plant SCADA system (PCS). Refer to Division 40, Section “Plant Control System” for a description of the plant operation.

E. General
   1. The following control function description is preliminary; final design, detailing, and implementation of control strategy will be performed by the OEM.
   2. All skids will be controlled by NF-MCP which will receive run/shutdown signals from the NF Building ACP (NF-ACP). NF-MCP will also receive the number of NF skids to be in service. Interface with NF-ACP must be coordinated with the System Integrator.
   3. All control functions on the skids shall have Local Automatic, Remote Automatic, Off, and manual override. Manual control shall be limited to authorized personnel only and shall not be selectable from the face of the control panel. Remote/local selection shall apply to the overall start and stop function only, and shall not interfere with manual/auto operation of individual components, except where necessary safeties apply.
      a. Remote position of selector permits the skid to receive the plant run signal from the NF-ACP.
      b. Local position of selector inhibits the skid from receiving the plant run signal from the PCS.
      c. All NF skid components must be capable of manual operation, but manual controls shall not be located individually at the NF Skid Control Panel (NF1, NF2, NF3, etc…)

F. Start Sequence
   1. Start signal will be sent from the NF-ACP to NF-MCP. The number of NF skids in service will be sent from the NF-MCP to NF-ACP. Only one skid shall start at a time. Only one skid shall shutdown at a time (except for alarm conditions).
   2. Pre-Flush
      a. Open the NF concentrate (NFC) throttling valve 100%.
      b. Close NF permeate (NFP) valve and open NF permeate dump (NFD) valve.
      c. Start the NF feed pump at 25% and increase speed to obtain pre-programmed concentrate flow rate.
      d. At the end of the pre-flush period, open the NF permeate (NFP) valve and close the NF permeate dump (NFD) valve. Valves shall be programmed to open/close slowly over 1 minute). Turn control over to the PID loops.
      e. If pre-flush continues beyond an operator adjustable duration, initiate alarm.

G. Permeate Flush System (if equipped)
   1. Permeate Flush system shall be operated as described below during permeate flushing:
      a. Permeate Flush tank fill shall be automatically controlled. Tank fill shall be accomplished using the Permeate Flush Tank fill valve, and the Permeate Flush Tank tank level sensor. The Permeate Flush System tank level sensor shall include operator adjustable setpoints for pump cut off, low water level, fill, and high water level.
      b. Flush shall be performed as described under normal shutdown sequence. NF PLC to control all valving on the skid being flushed as well as the Permeate Flush Pump on/off and speed.

H. MCS System
   1. MCS system shall be operated as described below during membrane cleaning:
      a. Skid to be cleaned shall be locked out from running via a HMI selector switch on any of the OITs. All automatic valves on the skid shall be automatically placed in the appropriate position for cleaning.
      b. MCS tank fill will be manually controlled.
      c. MCS tank water shall be automatically heated. Heating shall be accomplished using the heater. An operator adjustable setpoint shall be used to set the desired heated water temperature. An operator adjustable setpoint shall be included for a high temperature alarm. Heating is initiated using an operator controlled on/off/auto switch.
      d. Once the MCS tank water is heated, the operator will manually add chemical (either in the top of the tank or using the eductor) and manually start the MCS pump using the on/off/auto switch. Operator will manually throttle the flow by observing the flowrate and controlling the VFD speed on the MCS pump.

I. Normal Run Operation
   1. Start the selected skid (one at a time). NF-MCP shall automatically rotate the skids and shall display the accumulated skid runtime. If any skid has not ran for an operator selectable duration, provide an alarm indicating that the skids have to be rotated.
   2. The operator shall be able to exclude each skid from running using a selector switch on any of the OITs. Each skid shall be started at 50% of design capacity and ran for 60 seconds before increasing slowly to the desired flow rate setting.
   3. Permeate Flow Control: The feed flow meter controls the feed pump VFD to maintain the preset flowrate.
   4. Concentrate Flow Control: Concentrate flowmeter controls the concentrate control valve to maintain the pre-set concentrate flow rate.
   5. Flow rates, pressures, and conductivities shall be monitored by the NF skid system controller. If any parameter goes beyond pre-set limits for more than an allowable time, it will indicate on the control panel and send a general alarm to the plant control system.
   6. If ORP exceeds setpoint, shut down the skid.

J. Normal Shutdown
   1. Stop signal will be sent from the NF-ACP to NF-MCP. The number of NF skids in service will be sent from the NF-MCP to NF-ACP. Only one skid shall stop at a time.
   2. Post-flush
      a. System shall be set up for flushing with feed water (forward flush) or Permeate Flush (if equipped). If equipped, an operator adjustable selector switch shall indicate which flushing water source is to be used (forward flush or permeate flush).

b. Control the NF feed pump or the permeate flush pump and/or the NF concentrate (NFC) control valve speed to obtain operator adjustable concentrate flow rate during the flush.
c. Open NF permeate dump (NFD) valve and close NF permeate (NFP) valve.
d. Open NF concentrate (NFC) valve 100%.
e. Continue post-flush for an operator adjustable setpoint duration.
f. Stop the NF feed pump or the Permeate Flush Pump.
g. Close the NF feed valve.

K. Emergency Shutdown (Loss of Power): The emergency shutdown sequence shall be identical to the normal shutdown except that it is initiated by the shutdown logic rather than the operator.
1. All skids stop.
2. NFC valve fails open.
3. NFD valve fails open.
4. No automatic restart of feed pumps or skids.

L. Alarms and Shutdown (Internal Logic): There are a variety of conditions listed below which must be verified prior to proceeding with the next step in a start-up or shutdown sequence. These will be defined by the Engineer in conjunction with the OEM following contract award. Should any of these conditions be detected, the NF-MCP PLC shall issue an alarm indicating the failing equipment or permissive that caused the fault, and halt the sequence. If in automatic sequencing, the PLC shall shutdown the skid. If in manual sequencing, the PLC shall either proceed or shutdown the skid as directed by the operator via the OIT. The discrepancy alarm shall describe the condition which caused it in sufficient detail for the operator to investigate and correct the problem.
1. pH out of range: Alarm in main control system.
2. NF feed suction low pressure: alarm and skid shutdown with post-flush.
3. Antiscalant low tank level: Alarm and normal plant shutdown (in main control system).
4. Antiscalant no flow: Alarm and normal plant shutdown (in main control system).
5. High permeate pressure on each skid: Shut down skid with post-flush.
6. Cartridge filter high differential pressure: Alarm in main control system.
7. NF Feed pump high pressure: Alarm and shut down with post-flush.
8. Failure of valve to reach specified position: Alarm.
9. High permeate conductivity: Alarm.
10. Permeate valve and permeate dump valve both closed: Shutdown with post-flush.
11. Concentrate valve closed: Shutdown, no post-flush.
12. Low concentrate flow: Shutdown with post-flush.
13. NF skid rotation: Alarm.

M. Include a performance monitoring software system for purposes of:
1. Automatic data acquisition
2. Data trending
3. Report generation
4. Alarm management including notification and alarm archiving
5. Remote web access to view data trending and reports
6. Facilitating system performance analysis
7. Facilitating performance optimization
8. Refer to Part 3 “Service Agreement and Remote Monitoring”

PART 3 - EXECUTION

3.1 INSTALLATION OF MEMBRANE ELEMENTS

A. Conform to the requirements of Division 01, Section “Quality Control”, paragraph 1.8, Manufacturer's Field Services.

B. Installation work shall conform to the Membrane Manufacturer’s recommended procedures, instructions, and approved loading sequence.

C. Provide for the services of a factory trained service technician of the membrane manufacturer to be present to supervise the installation of the membranes.

3.2 FACTORY ACCEPTANCE TESTING

A. After final assembly is complete and prior to being shipped, each fully assembled skid shall undergo factor acceptance testing. All piping, pressure vessels, and associated appurtenances shall be testing to 150% of their maximum operating pressures. Any leaks, if discovered, shall be repaired, and factory acceptance testing shall be redone. OEM shall submit results of factory acceptance testing for approval. If desired by the Owner and/or Engineer, factory acceptance testing will be witnessed, in-person. OEM shall give written notice to Engineer no less than thirty (30) days prior to factory acceptance testing. OEM is not responsible for travel, lodging, or meal costs for the Owner or Engineer.

3.3 SPECIAL SERVICES

A. Conform to the requirements of Division 01, Section “Quality Control”, paragraph 1.8, Manufacturer's Field Services.

B. Follow the manufacturer's recommended procedures for testing, adjusting, and placing of equipment into proper operation.

C. Startup and Commissioning
   1. Functional Testing
      a. Functional testing of the membrane system shall be accomplished for each membrane skid with test orifices installed in the permeate ports of each vessel to simulate pressure drops. Skid to be operated at representative flows with automatic instrument control as required to confirm responsiveness over design operating range. Testing shall continue until each skid can be run for four consecutive hours without interruption. Two successful start-up and shutdown sequences shall be demonstrated prior to the start of the four-hour test. Demonstration of correct control loop operation in conjunction with CPI loop testing is also required.
      b. At the conclusion of the functional testing the vessels shall be disinfected, cleaned with a manufacturers recommended detergent, and flushed to ensure vessel cleanliness. Vessel interior surfaces shall be thoroughly wiped prior to the loading of the membranes. During membrane loading the brine seals, O-rings, connectors, anti-telescoping devices, and physical condition of the module wrap shall be inspected. Serial numbers and pressure vessel location of each membrane element shall be documented, tabulated and provided to the Engineer for review.
   2. Start-up Testing: Each membrane skid shall be started up, one at a time, and operated for a total of eight hours over a two-day period at design conditions. During this time two bacteriological samples (permeate) shall be taken and tested for heterotrophic plate count

(HPC). Acceptance shall be based upon bacteriological testing of permeate samples showing HPC less than 500 colony forming units per milliliter (CFU/ml). All samples shall be analyzed by an Ohio EPA certified laboratory.

3. Performance Testing
   a. Time of Performance Testing: The performance testing for the membrane system shall occur following completion of all facilities and equipment required for the testing. Final acceptance of the membrane system will be contingent upon successful performance testing. Performance testing of each train must be initiated within 60 days of bacteriological testing during startup.
   b. Testing Protocol: The OEM shall submit a proposed testing protocol 60 days prior to the initiation of the membrane system performance testing. The testing protocol shall have written approval by the Engineer prior to commencement of the testing program. The testing protocol shall include, but not be limited to, water quality sampling parameters, sampling locations, projected dates of the performance testing, Ohio EPA approved laboratory to be used for the water sample analysis, and time of sampling relative to time zero. Time zero for the membrane system performance testing is the time of the first sample.
   c. Duration of Performance Test: Each membrane skid shall be tested for four (4) consecutive days. Two (2) skids may be tested at a time. The OEM shall be fully responsible for every aspect of the performance test. Representatives of the OEM and shall be on site during the entire performance test. Representatives of the Engineer and Owner may also be present during the performance test.
   d. Performance Test Conditions: Each membrane skid shall be tested under design operating conditions.
   e. Data Collection During Performance Test: The following continuous data shall be collected hourly unless otherwise specified during the performance testing:
      1) Water Quality: feed water temperature, feed water conductivity, feed water pH, permeate temperature, permeate conductivity, permeate pH, concentrate conductivity, feed water SDI (twice daily), feed water turbidity, concentrate pH. Temperature, pH, and turbidity readings may be taken from the plant instrumentation provided the instrumentation is operable and calibrated at the time of the test.
      2) A Heterotrophic Plate Count sample shall be taken from the raw water, feed water, interstage feed, concentrate, and permeate within 4 hours after initial startup for each train and repeated just prior to the completion of the performance test. Samples and cultures of samples shall be in accordance with AWWA Standard Methods, current edition.
      3) Mechanical Data: feed water pressure, interstage pressure, permeate pressure, permeate flow, concentrate flow, flow control valve position, concentrate valve position, wells, operating, startup and shutdown times, chemical flow rates and dosages.
   f. Discrete Water Sampling: Samples shall be once per day during the four-day testing for a total of 4 sampling events. During a sampling event, the OEM shall take discrete water samples from the skid's feed, permeate, and concentrate streams for calcium, magnesium, total hardness, sodium, potassium, iron, manganese, barium, strontium, alkalinity, chlorides, sulfates, sulfides, nitrates, nitrites, fluoride, silica, pH, and total dissolved solids. The OEM shall submit samples to an Ohio EPA approved laboratory for analysis. All analytical results shall be transmitted to the OEM and Engineer.
   g. Test Report: A formal bound report shall be produced and submitted to the Engineer for all testing activities. Report shall contain detailed test plans and

results for all activities performed during testing. Results from all testing shall be tabulated, trended, and graphed as appropriate. Discussion of testing, along with conclusions and recommendations, shall be presented in the test report. All laboratory analyses shall be bound into the report as appendices.

4. Field Representative: The OEM shall provide the services of a qualified field representative for all startup and commissioning procedures. The representative shall perform all testing, operation, and debugging of the systems.
5. Training
    a. The OEM shall provide the services of a qualified representative for 5 days to instruct the Owner's personnel on proper operation, installation, sampling, cleaning, and maintenance for the membrane system.
        1) General Background: Ions, organics, bacteria, fungi, algae, sand, silt, clay, colloids, principles of diffusion, dissolved substances, and suspended substances. How nanofiltration works, Principles of net driving pressure. Semipermeable membranes, cellulosic and non-cellulosic. How membranes reject ions, organics, and particles. How NF elements are made and how they work.
        2) NF Skid Operation: The internal and external pieces of a nanofiltration skid. What happens inside the nanofiltration skid. Problems caused by dissolved substances. Why and how scaling and chemical attack occur. Problems caused by suspended substances. Why and how fouling by bacteria and inorganic particles occur. Pretreatment equipment and chemicals used to minimize operating problems. Monitoring techniques such as permeate flow normalization, percent salt rejection, pressure drops, and silt density index to detect problems.
        3) Maintenance: Issues involving the maintenance of the NF skids.
        4) Controls/operation of this specific installation including touch screens, logic, and operations.
6. The OEM shall provide at least two (2) qualified field representatives to be on-site to coordinate and supervise the installation (1 week) and startup and commissioning (3 weeks) of the NF system for each WTP facility. Some time may be combined with that required for the other equipment provided by the OEM.

D. Remote Monitoring: The OEM shall provide two (2) years of monitoring of all of the system operating parameters. Owner to provide OEM will required data (VPN connection is not permitted). The OEM shall provide a monthly status report with a complete analysis of all normalized data with recommendations for operation and maintenance. The period of remote monitoring shall commence upon Substantial Completion of the project.

E. Field Service Agreement: The OEM shall provide a two (2) year service agreement to the Owner. Service agreement shall include all costs (including labor, travel, lodging, meals, and incidentals) for the following for each WTP facility:
    1. Two (2) trips for a qualified field representative to be on-site to assist the Owner in troubleshooting and/or operation of the Nanofiltration Membrane Equipment. Each trip shall consist of four (4) full days of service. Travel days excluded from number of days of service.
    2. Two (2) trips for a qualified field representative to be on-site to assist the Owner in performing membrane cleaning. Each trip shall consist of three (3) full days of service. Travel days excluded from number of days of service.

END OF SECTION 46 6340

RARWTP RO MEMBRANE EQUIPMENT SCHEDULE

A. Performance Requirements
   1. The raw water source is groundwater from wells which has been oxidized with sodium hypochlorite, filtered with gravity filters, and chemically conditioned to reduce ORP and provide antiscalant. Table 1 presents the water quality data which shall be used in the development of the RO system design.
   2. Each NF train shall meet the permeate quality requirements specified in Table 1 throughout the performance warranty period while operating at the design recovery and permeate flowrate.

Table 1 – RARWTP Water Quality Data

Parameter	Unit	Raw Water	Permeate Requirements
NH4+ +NH3	mg/L	0.00	
K	mg/L	2.9	
Na	mg/L	33	
Mg	mg/L	27	
Ca	mg/L	102	
TH	mg/L as CaCO3	366	< 15
Sr	mg/L	0.33	
Ba	mg/L	0.10	
CO3	mg/L	0.27	
HCO3	mg/L	310	
NO3	mg/L	0.56	
Cl	mg/L	63	< 10
F	mg/L	0.20	
SO4	mg/L	52.00	> 0.40
SiO2	mg/L	6.30	
Boron	mg/L	0.00	
TDS	mg/L	597.56	< 30
pH	s.u.	7.11	
Temperature	Degrees F	55-60	

B. NF Skid Design:
   1. No. of Skids: Six (6)
   2. Configuration: 2 Stage, 24:12
   3. No. of Elements per Vessel: 7
   4. Permeate Capacity: 1,030 gpm
   5. Recovery: 80% (adjustable from 70% to 83% to maintain min. concentrate flow of 15 gpm/vessel and a maximum membrane recovery of 19% per element)
   6. Flux: 14.7 gfd
   7. Permeate Backpressure after skid:
      a. Stage 1: 0-35 psig (adjustable)
      b. Stage 2: 0-15 psig

C. NF Skid Dimensions:
   1. Maximum Width: 95 inches (8’-0”)
   2. Maximum Length: 318 inches (26’-6”)
   3. Maximum Height: 150 inches (12’-6”)

D. MCS:
   1. Stage 1
      a. Heater: 120 kW
   2. Stage 2
      a. Heater: 75 kW

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 46 6342

SIDE-PORTED PRESSURE VESSELS

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including but not limited to Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. Work of this section includes furnishing and installation of all equipment necessary to provide the side-ported pressure vessels for the NF system.

B. Equipment specified under this section shall be provided by the ROEM as part of the membrane treatment system.

C. Equipment furnished and installed under this section shall be fabricated, assembled, erected and placed in proper operating condition in full compliance with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by the engineer.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: All pressure vessels specified under this section shall be manufactured and supplied by one manufacturer.

B. Reference Standards: The pressure vessel design must meet all the requirements of ASME Section X, entitled Fiber Reinforced Boilers and Pressure Vessels.

1.4 SUBMITTALS

A. The manufacturer shall provide instructions on installation, operation and maintenance and proper application of the vessels as well as a vessel drawing. Submittals shall conform to the requirements set forth by Division 01 Section "Submittal Procedures". The documents provided shall include the following:
   1. Operation and Maintenance Instructions: Step-by-step instructions for opening and closing the vessel along with precautions and recommended maintenance procedures. These instructions shall be written to inform a general mechanic unfamiliar with NF vessels.
   2. Installation Instructions: Detailed instructions for handling, mounting and connecting the vessel.
   3. Application Guide: General guidelines to assist the NF system engineer to apply vessels correctly to the specific requirements.
   4. Engineering Drawing: detailed drawings that specify all parameters necessary to incorporate the vessel component into the NF system, including dimensions, weights, materials of construction and port size.

1.5 SPARE PARTS

A. Spare parts shall be of the same manufacture and quality as those provided with the equipment. Spare parts shall be suitably packaged in accordance with the Manufacturer's recommendations, with labels indicating the contents of each package. Spare parts shall be delivered to the Owner with the equipment of this Section.

B. Provide the following spare parts:
   1. 2 complete pressure vessel heads.

1.6 HANDLING, DELIVERY, AND STORAGE

A. The pressure vessels shall be completely factory assembled and securely crated for shipment.

B. When received at the site, the pressure vessels shall be stored in a clean, dry environment until ready for installation.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Pressure vessels shall have a diameter and length designed specifically to contain a quantity of 7 standard eight-inch diameter by 40-inch long spiral-wound membrane elements. The feed and concentrate ports shall be located in the sidewall of the pressure vessel. Vessels with multiple ports per end for direct vessel-to-vessel connection are permitted and required in order to simplify system design, provide a smaller footprint and eliminate excessive manifolds.

B. Vessels shall have a maximum working pressure of not less than 200 PSI at a temperature up to 120 deg F (49 deg C) with a minimum operating temperature of not less than 20 deg F (-7 deg C).

C. Vessels shall be complete with end closures, hardware and membrane element end adapters. Membrane elements and membrane interconnectors shall be furnished by the membrane element manufacturer.

D. The adapters furnished shall be appropriate for the brand of membrane element specified. In addition, the vessel shall be designed to allow other makes of membrane elements to be easily accommodated by changing the adapters.

E. The materials used in the construction of the pressure vessel shall meet ASME code requirements, including material selection and required strength for the anticipated operating conditions. These materials shall also have the following characteristics:
   1. All wetted head components in continuous contact with the pressurized process water shall be made from plastics that are known to have long-term resistance to corrosion in the service intended.
   2. All wetted nozzles in continuous contact with the pressurized process water shall be made from wrought pipe that is known to have long-term resistance to corrosion in the service intended.
   3. All other materials of construction shall be of appropriate strength and corrosion resistance for the operating conditions. The use of an unanodized aluminum and plastic load bearing materials is strictly prohibited.

4. The materials of construction for each component part of the vessel shall be clearly and fully specified on the Engineering Drawing.

F. Manufacturer: Bekaert Progressive Composites, Codeline, Wave Cyber.

2.2 VESSEL SAFETY

A. Vessels shall be designed to meet the standards of ASME Boiler and Pressure Vessel Code, Section X. Vessels shall be certified by manufacturer. Code stamp is not required.
   1. The Manufacturer shall be qualified to produce Code Certifiable Pressure Vessels per Section X of the Code as verified by possession of a current Certificate of Authorization issued by the ASME.
   2. Vessels shall be built to a design that has been qualified for fabrication through ASME Design and Procedure Qualification Tests. The tests include destructive pressure tests of prototype vessels. To qualify, a prototype must not burst at less than six times (6X) its rated pressure after being pressure cycled 100,000 times at 150 deg F.
   3. Vessels shall be fabricated so as to duplicate the qualified design through compliance with the ASME approved Procedure Specification written for the prototype. Proof of conformance is established through the workings of the ASME approved Quality Control System.
   4. Vessels shall be tested to assure conformance with the qualified design through ASME Quality Control and Production Tests. Each vessel undergoes ASME Production Tests, which include a Hydrostatic Leakage Test, at a pressure of 1.1 times the rated pressure.
   5. A third party ASME Authorized Inspector shall inspect vessels during fabrication in order to assure conformance with the qualified design.
   6. The materials shall be approved for use in pressure vessel construction by the standards of the ASME Boiler and Pressure Vessel Code. Such materials shall meet the following criteria:
      a. Materials of construction shall be certified by the manufacturer to meet Code standards where applicable and shall be lot traceable to the vessel serial number.

2.3 VESSEL SHELL

A. Pressure vessels shall be designed for ease of use and fail-safe operation. The vessels shall include the following:
   1. In order to provide superior long-term strength, the locking ring groove shall be integrally filament wound into the I. D. of the vessel. In addition, each grove shall incorporate an integrally wound 316L stainless steel insert for added groove durability and improved corrosion resistance. Cutting or grinding of fibers to form the locking ring groove is not acceptable as this may weaken the shell and directly affect the safety and service life of the vessel.
   2. The shell bore shall be fabricated from a resin-rich epoxy barrier that has been cured to allow for superior corrosion resistance, minimal extractables, improved life and high temperature (176 deg F/80 deg C) operation. Winding over plastic pipe is not acceptable under any circumstance.
   3. The shell of the vessel shall be fabricated of filament-wound fiberglass reinforced plastic (FWFRP) using continuous glass roving, impregnated with an elevated temperature cure epoxy resin system to provide superior dimensional stability and long term service life. The use of single monomer resin such as polyester is strictly prohibited.
   4. Each shell inside diameter shall be free of pits or voids that may promote bacterial growth or corrosive attack of the resin-rich barrier and shall conform to level 1 criteria as

ASME Section X, section 6-100.1. The bore diameter shall be a mirror-like, smooth surface and meet the following measurement criteria throughout the membrane interface area:

Nominal 8-inch diameter 7.955 ± .005.

5. Each shell shall have an exterior surface that has been coated with a two-part polyurethane enamel for superior gloss retention, abrasion resistance and to block light that may promote biological growth. Each end-bell shall be free of any grinding or sanding marks. The length of the shell between the bells shall be straight without any lumpiness that may indicate filament-winding inconsistency that could affect performance.
6. The shell shall be fail-safe to prevent catastrophic failure while in service. The head retention system shall fail at a nominal value of not less than 6 times design pressure to prevent the possibility of catastrophic failure while in service.

2.4 VESSEL HEAD

A. Each vessel head shall be designed for removal by hand under normal operating conditions. In addition, each head shall feature a secondary removal means (such as female threads) to assist in head removal as required throughout the service life of the vessel.

B. Each vessel head shall be constructed from ASME approved metal materials for indirect load bearing applications. The use of thermoplastics for direct load bearing applications is strictly prohibited.

C. The primary means for head retention shall be a single retaining mechanism that provides ASME-required redundancy and is constructed of stainless steel for ease of use and long term reliability and shall be able to be removed by hand, without the use of any tools to reduce operation and maintenance costs.

D. Each head shall contain an integral stainless steel secondary interlock that requires a simple, yet specific sequence of events to remove the end closure and shall not require the use of separate components that may become separated from the vessel. The use of plastic secondary interlock mechanisms that may become damaged by wear or environmental exposure are prohibited.

E. The surfaces of the head that come in contact with the process fluid shall be constructed from PVC or other inert plastic to eliminate any problems with metal corrosion such as pitting or crevice corrosion.

F. Permeate Port
1. The permeate port shall be 1-1/2-inch NPT male or 1-1/2-inch grooved end, as recommended by the ROEM and as approved by the Engineer.
2. The permeate port shall be constructed from PVC.
3. Each permeate port shall be designed with an anti-rotation mechanism so that piping may be easily tightened.

G. Permeate Sampling Valve
1. The feed end permeate port of each pressure vessel shall be fitted with a 1/4-inch diameter thermoplastic ball valve that has been designed exclusively for membrane probing without excess permeate water loss.

2. The valve shall include a gripper nut that can be easily tightened and loosened by hand throughout the probing process.
3. The nut ferrule shall include an o-ring seal to prevent leakage during operation.
4. The valve shall be attached to the permeate port with a 1/4-inch 316 stainless steel nipple.

2.5 VESSEL SIDE PORTS

A. Each side-ported feed/concentrate port shall be 2-1/2-inch diameter and constructed of wrought stainless steel pipe and shall be designed to interface the flexible grooved coupling. The port shall be marked for complete traceability with the part number and the heat lot of the material that can be traced to batch related corrosion test performance. The use of investment cast materials is prohibited.

B. Each side-ported feed/concentrate port shall be designed so that they may be removed and replaced in the field by the end user without the use of special tools.

C. The use of multiple ported vessels that allow direct vessel to vessel connections is permitted providing the following provisions are met:
1. No more than three pressure vessels shall be connected to one feed/concentrate manifold connection without approval.
2. The pressure drop between each connected set of three vessels shall not have a pressure differential in excess of 3 PSI.
3. All multiple port connections shall be sized to limit feed water flow velocities to no more than 11 Feet per second. In addition membrane cleaning flow requirements must be considered when multiple porting is to be used.
4. The feed manifold and concentrate manifold shall be located on opposite sides of each set of pressure vessels to ensure correct flow balancing. Design layouts that locate the feed manifold and concentrate manifold on the same side of each set of pressure vessels shall not be used without prior approval of the Engineer.

D. Each side-ported feed/concentrate port shall be completely flush with the inside surface of the vessel so as to not interfere with membrane element loading. Ports that are in any way raised into the interior surface of the vessel shall not be acceptable.

E. Each side port shall feature a direct metal to composite interface. The compression loading of any non-code material, such as thermoplastic that may creep under pressure, is not permitted.

2.6 VESSEL SEALS

A. In order to assure field serviceability, all seals, whether in the shell or head, shall be visible so as to be directly accessible for replacement without the removal of any other components. Seal designs that do not eliminate dead space and may lead to biological growth are strictly prohibited.

B. All permeate connection seals shall be designed to prevent rolling that may lead to seal damage.

C. All permeate connection seals shall be peroxide-cured ethylene propylene (EPDM) rubber to increase seal life and reduce the effects of permanent compression set.

D. Vessels shall not leak when properly installed. If leaking occurs, the vessel supplier is responsible for the repair or replacement of the vessel. Such leaking must be remedied within 14 working days from the notification of the leak.

E. Each Head Seal shall be so designed to minimize cross sectional thickness to reduce the friction required for head installation and removal.

F. Each head seal gland shall be designed to eliminate dead space and to expose the seal surface to high-pressure fluid for flushing of the seal in order to minimize bacterial growth.

G. Each head seal gland shall be located on the head of the vessel and shall partially capture the seal, so that it remains on the head at all times, even during head removal, without becoming separated from the head, which may cause seal damage, misplacement or vessel leakage.

H. Each side-ported feed/concentrate port shall incorporate an elastomeric seal that seals to vessel shell so that edge laminate surfaces are not exposed. Side port designs that do not eliminate seal dead space and may lead to biological growth are strictly prohibited.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with the Manufacturer's printed instructions.

B. The NFEM shall provide documentation that the membrane skid piping design allows for expansion and contraction of the pressure vessels and that the system is designed in accordance with the vessels manufacturer's recommendations.

3.2 TESTING

A. After installation, conduct pressure and leakage tests for each vessel as part of the membrane skid tests in accordance with Division 46 Section "Nanofiltration Membrane Equipment".

B. Prior to membrane element installation, thoroughly clean, flush, and disinfect the pressure vessels. All disinfectant solution shall be completely flushed from the pressure vessels prior to membrane element installation.

DAVID G. YOUNG

ADVERTISEMENT FOR BIDS

Separate sealed bids will be received by the Clerk of the County Commissioners, Warren County, Ohio, 406 Justice Drive, Lebanon, Ohio 45036, until 11:00 AM, Thursday May 28, 2020, at the Office of the Warren County Commissioners, and then at said time bids will be opened and read aloud for the Richard A. Renneker Water Treatment Plant (RARWTP) Membrane Softening Upgrades Project.

Bid documents including terms, general conditions, supplemental conditions and specifications are available online at the Warren County's Website at
https://www.co.warren.oh.us/Commissioners/Bids/Default.aspx

Questions regarding the technical specifications shall be submitted electronically to the Engineer:
Miranda Scheitlin, EI
Miranda.scheitlin@aecom.com
614-600-5804

A non-mandatory pre-bid meeting has been scheduled for May 12, 2020 @ 10:00 a.m. at the Richard A. Renneker Water Treatment Plant, 6193 Striker Road, Hamilton Township, Ohio. The County will review the project requirements with potential bidders, and receive questions. A visit the project site will be conducted after the meeting. Contact the Warren County Commissioners Office at (513) 695-1250 should you need assistance in accessing the bidding information on the County web site.

The project generally consists of the construction of a membrane softening addition to the existing Richard A. Renneker Water Treatment Plant to treat 13.7 MGD (expandable to 22.0 MGD) of groundwater. Improvements include a new nanofiltration softening building complete with NF softening equipment, pumps, process piping, valves, degasifiers, chemical feed systems, al all associated architectural, structural, HVAC, plumbing, electrical, instrumentation and controls work shown on the plans.

The Engineer's opinion of probable construction cost is $26,856,000.

The Board of Warren County Commissioners reserve the right to accept the lowest and best bid, to reject all bids, and to waive any irregularities in bids.

By order of the Board of County Commissioners, Warren County, Ohio.
