BUILDING CONSTRUCTION PROJECTS (does not include single family homes or apartments up to and including 4 stories).

Note: Under Executive Order (EO) 13658, an hourly minimum wage of $10.80 for calendar year 2020 applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2015. If this contract is covered by the EO, the contractor must pay all workers in any classification listed on this wage determination at least $10.80 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on the contract in calendar year 2020. If this contract is covered by the EO and a classification considered necessary for performance of work on the contract does not appear on this wage determination, the contractor must pay workers in that classification at least the wage rate determined through the conformance process set forth in 29 CFR 5.5(a)(1)(ii) (or the EO minimum wage rate,if it is higher than the conformed wage rate). The EO minimum wage rate will be adjusted annually. Please note that this EO applies to the above-mentioned types of contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but it does not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(2)-(60). Additional information on contractor requirements and worker protections under the EO is available at www.dol.gov/whd/govcontracts.

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave

for Federal Contractors applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their own illness, injury or other health-related needs, including preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at www.dol.gov/whd/govcontracts.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (ii)).

The body of each wage determination lists the classification and wage rates that have been found to be prevailing for the cited type(s) of construction in the area covered by the wage determination. The classifications are listed in alphabetical order of ""identifiers"" that indicate whether the particular rate is a union rate (current union negotiated rate for local), a survey rate (weighted average rate) or a union average rate (weighted union average rate).

Union Rate Identifiers

A four letter classification abbreviation identifier enclosed in dotted lines beginning with characters other than ""SU"" or ""UAVG"" denotes that the union classification and rate were prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2014. PLUM is an abbreviation identifier of the union which prevailed in the survey for this classification, which in this example would be Plumbers. 0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. 07/01/2014 is the effective date of the most current negotiated rate, which in this example is July 1, 2014.

Union prevailing wage rates are updated to reflect all rate changes in the collective bargaining agreement (CBA) governing this classification and rate.

Survey Rate Identifiers

Classifications listed under the ""SU"" identifier indicate that no one rate prevailed for this classification in the survey and the published rate is derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As this weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SULA2012-007 5/13/2014. SU indicates the rates are survey rates based on a weighted average calculation of rates and are not majority rates. LA indicates the State of Louisiana. 2012 is the year of survey on which these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. 5/13/2014 indicates the survey completion date for the classifications and rates under that identifier.

Survey wage rates are not updated and remain in effect until a new survey is conducted.

Union Average Rate Identifiers

Classification(s) listed under the UAVG identifier indicate that no single majority rate prevailed for those classifications; however, 100% of the data reported for the classifications was union data. EXAMPLE: UAVG-OH-0010 08/29/2014. UAVG indicates that the rate is a weighted union average rate. OH indicates the state. The next number, 0010 in the example, is an internal number used in producing the wage determination. 08/29/2014 indicates the survey completion date for the classifications and rates under that identifier.

A UAVG rate will be updated once a year, usually in January of each year, to reflect a weighted average of the current negotiated/CBA rate of the union locals from which the rate is based.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

* an existing published wage determination
* a survey underlying a wage determination
* a Wage and Hour Division letter setting forth a position on a wage determination matter
* a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour Regional Office for the area in which the survey was conducted because those Regional Offices have responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

==========

END OF GENERAL DECISION"

"General Decision Number: OH20200001 04/10/2020

Superseded General Decision Number: OH20190001

State: Ohio

Construction Types: Heavy and Highway

Counties: Ohio Statewide.

Heavy and Highway Construction Projects

Note: Under Executive Order (EO) 13658, an hourly minimum wage of $10.80 for calendar year 2020 applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2015. If this contract is covered by the EO, the contractor must pay all workers in any classification listed on this wage determination at least $10.80 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on the contract in calendar year 2020. If this contract is covered by the EO and a classification considered necessary for performance of work on the contract does not appear on this wage determination, the contractor must pay workers in that classification at least the wage rate determined through the conformance process set forth in 29 CFR 5.5(a)(1)(ii) (or the EO minimum wage rate,if it is higher than the conformed wage rate). The EO minimum wage rate will be adjusted annually. Please note that this EO applies to the above-mentioned types of contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but it does not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(2)-(60). Additional information on contractor requirements and worker protections under the EO is available at www.dol.gov/whd/govcontracts.

WELDERS - Receive rate prescribed for craft performing

operation to which welding is incidental.

==========

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave for Federal Contractors applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their own illness, injury or other health-related needs, including preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at www.dol.gov/whd/govcontracts.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (ii)).

The body of each wage determination lists the classification and wage rates that have been found to be prevailing for the cited type(s) of construction in the area covered by the wage determination. The classifications are listed in alphabetical order of ""identifiers"" that indicate whether the particular rate is a union rate (current union negotiated rate for local), a survey rate (weighted average rate) or a union average rate (weighted union average rate).

Union Rate Identifiers

A four letter classification abbreviation identifier enclosed in dotted lines beginning with characters other than ""SU"" or ""UAVG"" denotes that the union classification and rate were prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2014. PLUM is an abbreviation identifier of the union which prevailed in the survey for this classification, which in this example would be Plumbers. 0198 indicates the local union number or district council number

where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. 07/01/2014 is the effective date of the most current negotiated rate, which in this example is July 1, 2014.

Union prevailing wage rates are updated to reflect all rate changes in the collective bargaining agreement (CBA) governing this classification and rate.

Survey Rate Identifiers

Classifications listed under the ""SU"" identifier indicate that no one rate prevailed for this classification in the survey and the published rate is derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As this weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SULA2012-007 5/13/2014. SU indicates the rates are survey rates based on a weighted average calculation of rates and are not majority rates. LA indicates the State of Louisiana. 2012 is the year of survey on which these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. 5/13/2014 indicates the survey completion date for the classifications and rates under that identifier.

Survey wage rates are not updated and remain in effect until a new survey is conducted.

Union Average Rate Identifiers

Classification(s) listed under the UAVG identifier indicate that no single majority rate prevailed for those classifications; however, 100% of the data reported for the classifications was union data. EXAMPLE: UAVG-OH-0010 08/29/2014. UAVG indicates that the rate is a weighted union average rate. OH indicates the state. The next number, 0010 in the example, is an internal number used in producing the wage determination. 08/29/2014 indicates the survey completion date for the classifications and rates under that identifier.

A UAVG rate will be updated once a year, usually in January of each year, to reflect a weighted average of the current negotiated/CBA rate of the union locals from which the rate is based.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

* an existing published wage determination
* a survey underlying a wage determination
* a Wage and Hour Division letter setting forth a position on a wage determination matter
* a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour Regional Office for the area in which the survey was conducted because those Regional Offices have responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board

U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

==========

END OF GENERAL DECISION"

SECTION 01 1100

SUMMARY OF WORK

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other Sections.

1.2 PROJECT DESCRIPTION

A. The project consists of the construction of a membrane softening addition to the existing Richard A. Renneker Water Treatment Plant to treat 13.7 MGD (expandable to 22.0 MGD) of groundwater. Improvements include a new nanofiltration softening building complete with NF softening equipment, pumps, process piping, valves, deasifiers, chemical feed systems, and all associated architectural, structural, HVAC, plumbing, electrical, instrumentation and controls work shown on the plans.

B. The existing water treatment plant and wells must be kept in operation during construction. Temporary outages are permitted to allow for improvements but must have adequate notice provided to the Owner and must be kept to minimum duration.

1.3 WORK COVERED BY CONTRACT DOCUMENTS

A. The work of any one trade, Contractor or Subcontractor shall not be limited to the work listed in a Section under "Project Description". Such listings are intended as general guides to the contents of a Section, and not as a defined scope of work. Unless otherwise indicated, provide and pay for all labor, materials, equipment, tools, construction equipment and machinery, water, heat, utilities, transportation, test equipment, testing and other facilities and services necessary for the proper execution and completion of the work, whether temporary or permanent, and whether or not incorporated or to be incorporated in the work.

1.4 WORK SEQUENCE

A. Out-of-Sequence Work
   1. The work includes any out-of-sequence work required to meet job progress, such as work made necessary by removal of construction plant or temporary facilities, work necessitated by the special construction phasing requirements of the Project, or work caused or interrupted by the Owner's operations.
   2. Certain work may be required in order to provide occupancy of the Project prior to its final completion. Such work may not necessarily be in sequence with other work of the Contractor.
   3. Work omitted because of construction schedules, interference with construction facilities, sequence of operations, or job conditions shall be completed as set forth in the Contract Documents.
   4. In the event of out-of-sequence work, the Contractor shall perform his work in the areas designated and shall have no claims against Owner and does hereby release Owner from any claims for damages or extra cost by reason of any such requirements.
   5. Perform all such work at no extra cost to the Owner.

1.5 CONTRACTOR USE OF PREMISES

A. Access: At all times, provide the Engineer and Owner easy and safe access to the work wherever it is in preparation and progress. Provide such access so Engineer may perform his functions.

B. Use of Site
   1. Confine operations at the site to areas permitted by law, ordinances, permits and the Contract Documents and do not unreasonably encumber the Site with any materials or equipment.

C. Environmental Requirements: The following requirements are in addition to all applicable laws and regulations:
   1. No burning will be permitted on the Site.
   2. Control dust by water sprinkling, temporary enclosures, or other methods acceptable to the Owner. Comply with governing regulations.
   3. Provide proper ventilation for enclosed spaces during construction.
   4. In the generation of temporary power or heat, or in the operation of equipment of any kind, do not use fuels which leave deposits on building surfaces.

D. Interruption of Owner Activities
   1. Owner will continue operations of existing facilities at the Site during progress of the work.
   2. Maintain continuous service of utilities and telephone at all times.
   3. Do not work in occupied areas if not required.
   4. If it becomes necessary to temporarily disrupt Owner's operations or have access to occupied areas, make arrangements with Owner for proper timing.
      a. No additional compensation shall be allowed for shutdowns even though overtime work may be required.
      b. Contractor shall provide a minimum of 48 hours notice to Owner for shutdowns to be scheduled. Owner has the right to not allow a scheduled shut-down if conditions are not favorable.

E. Owner's Rules
   1. Conform at all times to Owner's requirements for protection of plant, materials, equipment and employees.
   2. Use designated routes of access through existing facilities and keep such routes clean and free of obstruction at all times.
   3. Do not use toilets and other functioning facilities in use by Owner.
   4. Do not discard trash, rubbish, cigarettes, or other items on Owner facilities.
   5. Do not pound, drill, use explosive fasteners, or perform other noisy operations, except within time periods coordinated with Owner in advance.
   6. Valve Operations: All existing valves shall be operated by the OWNER’S personnel only. Scheduling of valve operations shall be made with the OWNER at least two (2) days in advance of the actual valve operation.

1.6 OWNER FURNISHED PRODUCTS

A. Documents Furnished: Owner will furnish the following sets of Project Drawings and Manuals free of charge. Additional sets may be purchased by paying the cost of printing the Drawings and Project Manual.

1. Contractor: Three (3) full-size sets of drawings, (2) half-size sets of drawings, (3) sets of specifications, and one (1) CD with PDF files of all drawings and specifications.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION (NOT USED)

END OF SECTION 01 1100

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 01 2100

ALLOWANCES

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other sections.

1.2 DESCRIPTION OF WORK

A. The Contractor shall review the Allowance List for items affecting his portion of the Work. Include in the Contract Sum the amount listed.

B. Items covered by these Allowances shall be supplied by such persons as the Owner may direct, but the Contractor will not be required to deal with parties against whom the Contractor makes a reasonable objection.

C. Unless otherwise provided in the Contract Documents, these Allowances shall cover the cost to the Contractor of the materials and equipment required by the Allowance delivered at the Site, and all applicable taxes. Submit invoices for Allowance items.

D. The Contractor's costs for unloading and handling on the Site, labor, installation costs, overhead, profit, and other expenses contemplated shall be included in the Contract Sum, and not in the Allowance.

E. Whenever the cost is more than or less than the Allowance, the Contract Sum shall be adjusted accordingly by Change Order. Where there is an increase or decrease in quantity, the amount of any Change Order will include changes, if any, in handling costs on the site, labor, installation costs, overhead, profit, and other expenses.

1.3 CASH ALLOWANCES

A. Tools and Maintenance Equipment: $15,000
   1. This allowance shall be full compensation for all tools and maintenance equipment (above and beyond that which is specified) to be used during construction.

B. Office Furniture: $10,000
   1. This allowance shall be full compensation for all furniture (above and beyond that which is specified) to be used at RARWTP, selected by the Engineer and/or Owner during the shop drawing review process.

C. Materials Testing: $40,000
   1. This allowance shall be full compensation for only the reimbursement of soils and concrete testing. The Contractor shall be compensated for the actual invoice amount from those performing the Materials Testing.

D. Local Utility Company: $40,000
   1. This allowance shall be full compensation for only the Local Utility Company’s scope of work necessary to provide new electrical service to the project site as shown on the

drawings and as specified along with relocation of existing utilities as needed for the new work to be performed. The Contractor shall be compensated for the actual invoice amount from the Local Utility Compay for this work. Contact Greg Finley at (513) 287-1104 for coordination with Duke Energy.

E. Trailer Mounted Valve Operator: $15,000
   1. This allowance shall be full compensation for acquiring two (2) trailer mounted valve operators to be provided to the Owner.

F. Security System: $70,000
   1. This allowance shall be full compensation for the security system scope of work to provide new equipment relative to the NF Building and West access gate and also for modifications of existing buildings' systems as shown on the drawings and as specified. New equipment installation shall be provided under the Contractor's bid outside of this allowance. Modifications to existing buildings' systems shall be provided by the security system supplier under this allowance. The Contractor shall be compensated for the actual invoice amount from the security system supplier for this work.

G. NFC Cleanouts and CCTV: $45,000
   1. This allowance shall be full compensation for the installation of two (2) cleanouts on RARWTP's existing NFC discharge line and CCTV of the line. Location of cleanouts to be approved by the Engineer and/or Owner during installation. CCTV data to be provided to the Owner.

H. Lab Equipment: $5,000
   1. This allowance shall be full compensation for all laboratory equipment and accessory improvements (above and beyond that which is specified) to be used at the RARWTP lab, selected by the Engineer and/or Owner during the shop drawing review process.

I. SCADA: $20,000
   1. This allowance shall be full compensation for only the SCADA Allowance as specified in Section 40 9443.

END OF SECTION 01 2100

SECTION 01 2300

ALTERNATES

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other Sections.

1.2 DESCRIPTION OF WORK

A. Each Contractor shall read the descriptions of each Alternate listed and determine the extent to which his work is affected.

B. Submit for each Alternate, in the spaces provided on the Bid Form, an amount to be added to or deducted from the Base Bid.

C. Refer to Instructions to Bidders for a description of how Alternate prices affect award of the Contract.

D. The description of the work as listed herein is not intended to be a complete specification of all work included. Conform to the Technical Sections and the Drawings for requirements.

E. Each Alternate shall be complete in every detail and in conformance with the Contract Documents.

F. Include in the Alternate price the cost of all work including modification of other related items, overhead and profit.

1.3 LIST OF ALTERNATES

A. No Alternates.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION (NOT USED)

END OF SECTION 01 2300

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 01 2600

CONTRACT MODIFICATION PROCEDURES

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other Sections.

1.2 SUMMARY

A. Section includes administrative and procedural requirements for handling and processing Contract modifications.

B. Related Sections:
1. Division 01, Section “Allowances” for procedural requirements for handling and processing allowances.
2. Division 01, Section "Product Requirements" for administrative procedures for handling requests for substitutions made after Contract award.

1.3 MINOR CHANGES IN THE WORK

A. Engineer will issue supplemental instructions authorizing minor changes in the Work, not involving adjustment to the Contract Sum or the Contract Time.

1.4 PROPOSAL REQUESTS

A. Owner-Initiated Proposal Requests: Engineer will issue a detailed description of proposed changes in the Work that may require adjustment to the Contract Sum or the Contract Time. If necessary, the description will include supplemental or revised Drawings and Specifications.
1. Proposal Requests issued by Engineer are not instructions either to stop work in progress or to execute the proposed change
2. Within time specified in Proposal Request after receipt of Proposal Request, submit a quotation estimating cost adjustments to the Contract Sum and the Contract Time necessary to execute the change.
a. Include a list of quantities of products required or eliminated and unit costs, with total amount of purchases and credits to be made. If requested, furnish survey data to substantiate quantities.
b. Indicate applicable taxes, delivery charges, equipment rental, and amounts of trade discounts.
c. Include an updated Contractor's construction schedule that indicates the effect of the change, including, but not limited to, changes in activity duration, start and finish times, and activity relationship. Use available total float before requesting an extension of the Contract Time.

B. Contractor-Initiated Proposals: If latent or changed conditions require modifications to the Contract, Contractor may initiate a claim by submitting a request for a change to Engineer.
1. Include a statement outlining reasons for the change and the effect of the change on the Work. Provide a complete description of the proposed change. Indicate the effect of the

proposed change on the Contract Sum and the Contract Time.

2. Include a list of quantities of products required or eliminated and unit costs, with total amount of purchases and credits to be made. If requested, furnish survey data to substantiate quantities.
3. Indicate applicable taxes, delivery charges, equipment rental, and amounts of trade discounts.
4. Include an updated Contractor's construction schedule that indicates the effect of the change, including, but not limited to, changes in activity duration, start and finish times, and activity relationship. Use available total float before requesting an extension of the Contract Time.
5. Comply with requirements in Division 00 Section "General Conditions" if the proposed change requires substitution of one product or system for product or system specified.

C. Proposal Request Form: For Change Order proposals, use forms provided by Owner. Sample copies are included at end of this Section.

1.5 CHANGE ORDER PROCEDURES

A. On Owner's approval of a Proposal Request, Engineer will issue a Change Order for signatures of Owner and Contractor.

1.6 CONSTRUCTION CHANGE DIRECTIVE

A. Work Change Directive: Engineer may issue a Work Change Directive. Work Change Directive instructs Contractor to proceed with a change in the Work, for subsequent inclusion in a Change Order.
   1. Work Change Directive contains a complete description of change in the Work. It also designates method to be followed to determine change in the Contract Sum or the Contract Time.

B. Documentation: Maintain detailed records on a time and material basis of work required by the Work Change Directive.
   1. After completion of change, submit an itemized account and supporting data necessary to substantiate cost and time adjustments to the Contract.

PART 3 EXECUTION (NOT USED)

END OF SECTION 01 2600

SECTION 01 2973

SCHEDULE OF VALUES

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other sections.

1.2 SCOPE

A. This Section modifies the requirements of the General Conditions relating to the submittal of a Schedule of Values.

1.3 PURPOSE

A. It is necessary to breakdown the lump sum prices (either total contract or selected items) for contract administration purposes, i.e., scheduling and payment.

B. The items in the Schedule of Values shall be included in any schedule presented as a part of this Contract as applicable, and shall be included as the basis for determining periodic payments to the Contractor.

1.4 SCHEDULE PREPARATION

A. The Schedule of Values shall be prepared by the Contractor and submitted to the Engineer for approval. The Schedule of Values must be approved prior to the submittal of the first periodic payment request.

B. The Schedule of Values must be detailed enough to perform the intended function, but not so complicated as to make it cumbersome to work with. Depending on the project or the specific item, the following comments are offered for consideration:
   1. Mobilization and demobilization can be included.
   2. Bonds and insurance may be a separate item.
   3. Include reinforcing with the concrete.
   4. As much as possible, follow the specification titles as subjects.
   5. Separate similar items that will be installed at different times.
   6. Include auxiliary items with the main item, i.e., include motors with pumps, actuators with valves, etc.

AFFIDAVIT AND WAIVER OF LIEN
(PARTIAL OR PERIODIC PAYMENT)

STATE OF _____

COUNTY OF _____

(This document has important legal consequences: Consultation with an attorney is encouraged with respect to its completion or modification.)

_____ being first duly sworn says that he is
(Individual)
_____of _____
(Authorized Officer)
(hereinafter referred to as the "Company") and is familiar with the following facts stated herein:

1. The Company performed services, labor, and/or furnished material, machinery, equipment, and fuel (hereinafter referred to as "Work") on a Project for the construction of certain buildings and/or improvements known as _____ on property owned by _____ (hereinafter referred to as "Owner"), and located at _____ _____ (hereinafter called the "Property").

2. The Company has a contract with and has provided Work for _____ _____ as a _____
(Name of Owner, Contractor, Subcontractor) (Contractor, Subcontractor, Material Supplier)

3. All laborers, materialmen, and Subcontractors of the Company have been paid for Work furnished by them to the Company for the Project to the full extent that sums were due to said parties and for which the Company has previously received payment for Work so furnished by said parties.

4. The current invoice amount from the Company to _____ _____ is _____
(Name of Owner, Contractor, Subcontractor)
_____ Dollars ($_____)

The balance currently due and unpaid to the Company (including the current invoice amount) is

_____ Dollars ($_____)

Without waiving for mechanic's lien or other purposes the priority of the date that the Company first commenced performing Work for the Project, the Company agrees that upon the payment to it of said current invoice amount, the Company hereby waives and releases only to the extent of said current invoice amount (a) all liens and lien claims and rights against the property and funds of the Owner, and (b) all claims against the Owner with respect to amounts due from the Owner for the Company.

5. The Company represents that it is not aware of any mechanic's lien having been filed by or presently threatened to be filed by any party having provided Work for the Company against the Property or funds of the Owner.

6. The total amount invoiced to date (including the current invoice amount) by the Company is

SECTION 01 3113

COORDINATION

PART 1 GENERAL

1.1 REFERENCES

A. The requirements of Division 01 apply to the work of all other Sections.

1.2 PROJECT COORDINATION

A. This project is a single-prime contract. The General Contractor is responsible for coordination between any sub to the General Contractor (including but not limited to electrical, HVAC, plumbing, system integration, painting, etc.). This includes providing information and work as required so as not to delay other contractors or the project.

B. Failure to comply with these provisions may result in the Owner withholding payment to cover damages to the other contractors who have a contract with the Owner and/or could be cause for termination of the contract.

C. Cooperation and coordination includes, but is not necessarily limited to scheduling, attending meetings, preparation and submitted of coordination drawings in a timely manner, providing temporary facilities, cleanup, and other such items.

1.3 WORK SEQUENCING AND PLANT SHUT-DOWN

A. The existing water treatment plant is to remain operational during Construction. Temporary shut-downs are permitted to allow for operations such as tying into water lines or electrical outages, but must be coordinated with the Owner and Engineer.

B. Sequence of work shall be coordinated with the Engineer prior to work commencement if temporary plant-shut downs are required. Such work requiring sequence approval includes, but is not limited to:
   1. Any shut-down of raw water delivered from the well-field.
   2. Any shut-down of treated water delivered to the clearwells.
      a. The longest outage acceptable for the required tie-ins to the gravity filter effluent and existing clearwells is eight (8) hours. This work must be completed between November 1 and April 30. If more than one outage is required, sufficient time must be allowed for clearwell levels to return to normal levels before the next outage.
   3. Any shut-down of finished water delivered to distribution system.
      a. The longest outage acceptable for the required tie-ins within the high service pump building is eight (8) hours. This work must be completed between November 1 and April 30. If more than one outage is required, sufficient time must be allowed for distribution system tank levels to return to normal levels before the next outage.
   4. Work in existing chemical feed building.
      a. The longest outage acceptable for existing chemical feed facilities is eight (8) hours. This work must be completed between November 1 and April 30. All

existing chemical must be capable of being fed continuously and automatically (i.e. tied into SCADA system) while renovations are ocuring in this building.

5. Any shut-down of effluent from the red water filters.
    a. The longest acceptable outage for the required tie-ins to the existing red water filter system is sixteen (16) hours. If more than one outage is required, sufficient time must be allowed for backwashing before the next outage.
6. Any electrical outages.
    a. The longest electrical outage acceptable is eight (8) hours. If more than one outage is required, sufficient time must be allowed for clearwell and distribution system tank levels to return to normal levels before the next outage.

1.4 CUTTING AND PATCHING

A. Cutting and Patching
1. Cutting of new and existing work, including demolition of portions of structures (i.e., to install an item in an existing wall or floor), shall be performed by the Contractor or Subcontractor requiring access.
2. Openings in new work which can be pre-planned by the Contractor requiring the opening shall be built into the work by the proper trade for each material under his Contract. It is the responsibility of the Contractor requiring such openings or requiring the placement of built-in items, to coordinate the work with the proper trade for each material, sufficiently in advance for the work to be accomplished in the proper sequence and without delay, or pay the costs caused by the delay or for extra work required.
3. Do not damage or endanger any portion of the work of the Contract, of the Owner, or of any separate Contractors by cutting, patching or otherwise altering any such work, or by excavation.
4. Do not cut or otherwise alter the work of the Owner or any separate Contractor except with the written consent of the Owner and of such separate Contractor. Do not unreasonably withhold from the Owner or any separate Contractor, consent for cutting or otherwise altering the work.
5. Do not cut, weld to, drill, remove or otherwise alter any structural member, whether new or existing, without the written consent of Engineer, unless such condition is indicated in detail on the Drawings and reinforcing of members affected or new members to compensate for such cutting, drilling, removals or other alteration are indicated.

B. General Patching Requirements
1. Patching work shall be performed by the proper trade for each material to be patched.
2. Patch all materials, including finish materials, damaged in the performance of work under this Contract.
3. Where walls, partitions and ceilings are required to have a smoke or fire rating, they must be continuous through concealed spaces and sealed tightly against any penetrations of pipes, ducts, conduits, or other building components.
    a. Patching shall be required of any cracks, holes or defects whether existing or resulting from the work of this or any other Contract in this Project to achieve the required smoke or fire rating.
    b. Patching shall be performed to restore and to maintain the integrity of floor/ceiling assemblies and roof/ceiling assemblies that are required to have a fire rating.
4. Workmanship: If the wall or ceiling is painted, the final 2 coats of paint shall be applied to the entire wall, corner to corner.
5. Responsibility for patching and payment therefore shall be on the following basis:

a. Patching after cutting by a trade requiring access into construction shall be paid for by the trade requiring access.
b. Holes or other openings left by installation of mechanical or electrical items or by installation of cabinetwork or other equipment shall be paid for by the trade installing such item.

SECTION 01 3119

PROJECT MEETINGS

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other sections.

1.2 PRE-BID MEETING

A. Refer to Division 00, Section “Advertisement for Bids” for any information regarding the pre-bid meeting.

1.3 PRE-CONSTRUCTION MEEITNG

A. A pre-construction meeting will be scheduled by the Owner and Engineer after the award of contract.

B. The agenda will be prepared by the Owner. Items to be discussed will include those sections of the specifications preceding Division 02.

C. Items to be discussed will include those sections of the specifications preceding Division 02. The Engineer will prepare the agenda from the following items:
   1. Discussion of construction schedules
   2. Critical work sequencing
   3. Major equipment deliveries and priorities
   4. Project Coordination
      a. Designation of responsible personnel
   5. Procedures and process of:
      a. Field decisions
      b. Proposal requests
      c. Submittals
      d. Change orders
      e. Applications for payment
   6. Adequacy of distribution of Contract Documents
   7. Procedures for maintaining Record Documents
   8. Use of existing Premises
      a. Office, work, and storage areas
      b. Owner’s requirements
   9. Construction facilities, controls, and construction aids
   10. Temporary utilities
   11. Safety and first aid procedures
   12. Security procedures
   13. Housekeeping procedures

D. The Owner’s representative, the Engineer, and successful bidders shall attend. The Engineer’s Resident Project Representative and the Contractor’s Superintendent shall attend. Other interested personnel may also attend.

E. The meeting will be chaired by the Engineer who will take and distribute minutes.

1.4 PROGRESS MEETINGS

A. The Contractor shall, at a time and place approved by the Engineer, hold job meetings to coordinate the work and discuss problems that may arise concerning proper timing and execution of the work.
   1. Additional meetings may be called by the Owner, Engineer or Contractor as the need arises.
   2. Responsible representatives of the Contractors, Owner, and Engineer shall attend these meetings. Subcontractors may occasionally be asked to attend.
   3. Engineer shall preside and take minutes of each entire meeting and reproduce and distribute such minutes to all parties concerned.
   4. Suggested Agenda:
      a. Review and approval of minutes of previous meeting
      b. Review of work progress since previous meeting
      c. Field observations, problems, conflicts
      d. Problems which impede construction schedule
      e. Review of off-site fabrication, delivery schedules
      f. Corrective measures and procedures to regain projected schedule
      g. Revisions to Construction Schedule
      h. Progress, schedule, during succeeding work period
      i. Coordination of schedules
      j. Review submittal schedules; expedite as required
      k. Maintenance of quality standards
      l. Pending changes and substitutions
      m. Review proposed changes for:
         1) Effect on construction schedule and on completion date
         2) Effect on other contracts of the Project
      n. Other business

B. Responsible representatives of the Contractors, Owner, and Engineer shall attend these meetings.

C. Each Contractor shall be responsible for notifying his subcontractors of the time and place of job meetings if he wishes them present, or if their presence is requested of him by the Engineer.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION (NOT USED)

END OF SECTION 01 3119

SECTION 01 3300

SUBMITTAL PROCEDURES

PART 1 GENERAL

1.1 GENERAL

A. All submittals shall be made to the Engineer unless specifically noted otherwise or unless instructed in writing by the Owner.

B. Submit a complete list of required submittals.

C. Receive, check, approve as required, and submit all items listed herein by the time indicated, accompanied by a transmittal letter using the form attached at the end of this Section.

D. Keep an accurate record of the date of submittal and the date received on the Project.

E. Contractor shall supply all AIA forms. (One source of supply is the local AIA Chapter office.) The Engineer will supply a copy of all other forms.

F. Following is a general list of required submittals and the time frame for submittal.
   1. Within 30 Days after Contract Signing
      a. Progress schedule.
      b. Submittal schedule.
   2. Prior to First Progress Payment
      a. Progress Schedule.
      b. Submittal Schedule.
      c. Application and Certificate for Payment.
      d. Schedule of Values.
      e. Subcontractor and Material Lists.
   3. With Each Progress Payment.
      a. Affidavit and Waiver of Lien (see attached form) from each Contractor and sub-contractor.
      b. Submittal Schedule.
      c. Schedule of Values.
   4. As Work Progresses
      a. Monthly updated Progress Schedule.
      b. Wage Rate and Payroll Certificates.
      c. Notice of Furnishings.
      d. Materials Certifications.
      e. Test Reports.
      f. Shop Drawings.
      g. Maintenance Instructions.
      h. Operating Instructions.
      i. Product Data.
      j. Samples.
      k. Reference Submittals.
      l. Progress Photographs.
      m. Special Guaranties and Warranties.

n. Updated Subcontractor List.

5. With Request for Final Payment
   a. As-Built Drawings.
   b. Final Affidavits and Waivers of Lien (see attached form).
   c. Complete package of Shop Drawings and Product Data conforming reproducibles.
   d. Final Photographs.
   e. Keys and Keying Schedule.
   f. Certificate of Inspection.
   g. Certificate of Occupancy.

1.2 PROGRESS SCHEDULES

A. Preliminary Construction Schedule

1. At fourteen calendar days following written Notice to Proceed, a Contract Milestone date has been established which is the Contractor's submittal to the Engineer for review and approval of an electronic PDF of a bar-chart schedule covering the first 45 calendar days of work to be performed, while the Detailed Construction Network is being prepared. A copy will be returned to the Owner, Field Representative, and each Contractor.
2. The Contractor shall submit to the Engineer for review and approval, with the Preliminary Construction Schedule, a detailed breakdown of the costs for all work activities identified in the schedule. The cost for each work Activity shall include mobilization, materials, labor, equipment, overhead, and profit. The Contractor will include the cost projections as part of the CPM Schedule or as a separate document that corresponds to the CPM Schedule. Cost breakdown must be consistent with the Pay Items of the base bid schedule. After review, any necessary revision, and approval, this cost breakdown will be utilized as the basis for review of progress payment estimates during the initial 45 days of the Contract prior to use of the approved Schedule of Values.
3. The Contractor shall revise the schedule and cost breakdown according to the comments received from the Engineer and submit an electronic PDF of the revised schedule and cost breakdown to the Engineer within ten calendar days after receipt. The reviewed schedule will then be considered the "Approved 45 Day Preliminary Construction Schedule."

B. Detailed Construction Network

1. The Detailed Construction Network in precedence format shall be a computer-generated and computer-drawn schedule analysis.
2. A Detailed Construction Network represents the Contractor's best judgment of how it shall prosecute and complete the work in compliance with the Contract Milestone Dates and any other Specific Dates stipulated in the Contract Documents.
3. The identity and duration of all Activities to be included in this Construction Plan. Activities shall meet the following criteria:
   a. Activities shall be numbered, and their descriptions shall be clear and concise. Where applicable, descriptions shall include quantities of work.
   b. Activities shall be coded with sufficient detail to allow identification of the Activity as to type of work, work responsibility, interfacing of the activity with other contracts, and any other coding necessary to accurately describe the work Activity. All Activities associated with the preparation, submittal and approval of information required by the Engineer shall be coded so they may be readily identified.
   c. Resource requirements (manhours by craft, material, equipment, services, etc.) shall be described for each Activity, in the resources dialog box.

d. The quantity and cost component for each Activity shall be provided. The sum of the Activity cost components shall equal the Contract Price. If the Contract calls for pay items, the Activity shall also be coded to allow identification with its respective pay item(s). Fabrication of materials and/or equipment shall be described in a separate Activity. The cost component of any fabrication Activity shall be zero.

4. The identity of long lead items and delivery dates of all major pieces of equipment or materials.
5. The identity of any potential problems or constraints related to the implementation of the overall construction plan.
6. All Activities included in the Preliminary Construction Network shall be included in the Detailed Construction Network.
7. The plot of the Detailed Construction Network shall:
   a. Show the interdependencies of the work Activities and the major points of interface or interrelation with the activities of others, including Specific Dates for completion.
   b. Indicate conformance with the specific interim Milestone Dates specified in the Contract Documents.
   c. Include the description and quantity of work, by Activity.
   d. Allow for the time required for engineering, preparation, submission, and approval of submittals (including O & M Instructions), manufacturing, delivery, and installation of Contractor-furnished permanent plant materials.
   e. Indicate required dates of delivery of Owner-furnished material and equipment. (If applicable).
   f. Delineate the critical Path (or Paths).
   g. Indicate all erection and installation Activities.
   h. Indicate all testing of equipment and materials.
   i. Indicate startup, operational demonstration, and commissioning Activities.
   j. Be furnished in color, with necessary legend sheets, and on electronic 22-inch x 34-inch sheets.
8. The Detailed Construction Network shall indicate late completion date for the project that is no later than the Project's required date for final completion. All Activity durations shall be given in working days. The Network shall also indicate each of the following:
   a. Interfaces with the work of outside entities, e.g., utilities, power, any separate contractors.
   b. Description of Activity, including Activity numbers.
   c. Estimated duration for each Activity.
   d. Early start date for each Activity.
   e. Late start date for each Activity.
   f. Early finish date for each Activity.
   g. Late finish date for each Activity.
   h. Float available for each path of Activities.
   i. Actual start date for each Activity begun.
   j. Actual finish date for each Activity completed.
   k. The Critical Path for the project, with said path of Activities being clearly and easily recognizable on the time-scaled network diagram. The relationship between all non-critical Activities and Activities on the Critical Path shall be clearly shown on the plot of Detailed Construction Network by symbol.
   l. The dollar value and quantity of work for each Activity, corresponding with the Schedule of Values.

m. The responsibility, by Contractor, Subcontractor, or Supplier, for each Activity or portion thereof.
n. The percentage complete for each Activity in progress or completed.

C. The Contractor shall submit with the Detailed Construction Network, an electronic PDF a narrative description indicating anticipated allocation of the following resources and work shifts to be utilized on the project:
1. Labor resources by each craft, representatives of the equipment manufacturers, and all other personnel that have been retained by the Contractor.
2. Equipment resources.
3. Whether work will be performed on a one, two, or three-shift basis.
4. The Contractors specific understanding of the effects of seasonal weather conditions on the scheduled work, and the anticipated measures the Contractor and all sub-contractors will exercise to accommodate the known local weather conditions.

D. It is to be expressly understood and agreed to by the Contractor that the schedule is an estimate to be revised from time-to-time as progress proceeds. The Owner does not guarantee that the Contractor can start work activities on the "early start" or "late start" dates, nor complete work activities on the "early finish" or "late finish" date as shown in the schedule, or as same may be updated or revised. The Owner or Engineer does not guarantee that Contractor can proceed at all times in the sequence established by said schedule.

E. Within 21 calendar days following Notice to Proceed, the Contractor shall also submit an electronic PDF of its proposed Schedule of Values (using the breakdown of the computer listing of Activities) to the Engineer. The Schedule of Values shall allocate a dollar value (cost) for each Activity of the Detailed Construction Network. Each Activity cost allocation shall include labor, equipment, and material costs, including a pro rata contribution for overhead and profit. The sum of all Activity costs shall be equal to the total Contract Sum. Each Activity cost shall be coded by the Contractor, to show which subcontractor is responsible for performing the work so that subtotals for each coded activity of the work can be prepared. The Contract Pay Item for each Activity shall be indicated. The sum of costs for each Pay Item shall equal the value submitted with the Contractor's proposal.

F. The Engineer will review the Contractor's Detailed Construction Network and Schedule of Values. The review of the Detailed Construction Network, including logic diagrams and computer generated mathematical analysis will be for compatibility with the required Project Construction and Commissioning Schedule. The review of the Schedule of Values will verify that the Schedule of Values shall, in the best judgement of the Contractor, and the Engineer, represent a fair, and equitable dollar value for each Activity on the Detailed Construction Network. The Contractor shall revise its Detailed Construction Network and Schedule of Values as required to support the Project Construction and shall resubmit them to the Engineer within ten calendar days for re-review. The Contractor's resubmittal shall include the following:
1. Plot of the Detailed Construction Network (electronic PDF).
2. Computer disks of the Detailed Construction Network (1 set).
3. Schedule of Values (electronic PDF).
4. Computer listings/supporting data (electronic PDF).

G. Within 10 calendar days following submission of an acceptable Detailed Construction Network and Schedule of Values, the Engineer will return an electronic PDF to the Contractor. The Contractor shall review these returned items and within five calendar days following the receipt from the Engineer signify its agreement by signing one copy of each document and returning it

to the Engineer. Approval shall be signified by the Engineer also signing the copies of the documents which were signed and returned by the Contractor. The Contractor's approved Detailed Construction Network and Schedule of Values shall then be the documents which the Contractor shall use in planning, coordinating, and executing the work (including all activities of Subcontractors, equipment vendors and suppliers) and shall be the basis for evaluating the progress of the work and supporting requests for payment, subject to such revisions made in such schedule as are provided for in the Contract Documents.

H. Approval by the Engineer of the Contractor's Detailed Construction Network is advisory only and shall not relieve the Contractor of the responsibility for accomplishing the work within each and every Contract-required Milestone and Completion date. Omissions and errors in the approved Detailed Construction Network shall not excuse performance which is not in compliance with the Contract. Approval by the Engineer in no way makes the Owner, Engineer an insurer of the Detailed Construction Network's success or liable for resultant time or cost overruns attributable to its shortcomings. The Owner hereby disclaims any obligation or liability by reason of the Owner, or Engineer's approval of or acquiescence to the Detailed Construction Network.

I. Recovery Schedule

1. If certain activities shown on the Contractor's Detailed Construction Network fall behind schedule, to the extent that any of the mandatory specific or milestone or completion dates are in jeopardy, the Contractor shall prepare and submit to the Engineer a Supplementary Recovery Schedule, in a form and detail appropriate to the need, which explains and displays how the Contractor intends to reschedule those activities, in order to regain compliance with the Detailed Construction Network during the immediate subsequent pay period. Both the preparation of the Recovery Schedule, and all necessary acts under that Recovery Schedule required to recover compliance with the mandatory dates, shall be at no additional cost to the Owner.
2. The Contractor shall do the following after determination of the requirement for a Recovery Schedule:
    a. Within three calendar days, the Contractor shall prepare and complete the Recovery Schedule. The Contractor and major Subcontractors shall provide the Engineer with such information as is required to assist in review of the Recovery Schedule. The Recovery Schedule shall represent the Contractor's best judgment as to how it shall reorganize its work so that it may return to the Detailed Construction Network within the immediate subsequent pay period. The Recovery Schedule shall be prepared to a similar level of detail as the Detailed Construction Network and shall have a maximum duration of one month which shall coincide with the pay period.
    b. Within five calendar days, the Contractor shall participate in a conference with the Engineer to review and evaluate the Recovery Schedule. Any revisions necessary as a result of this review shall be resubmitted by the Contractor for approval within two calendar days of the conference. The approved Recovery Schedule shall then become the Schedule which the Contractor shall use in planning, coordinating, and executing the work (including all activities of subcontractors, equipment vendors, and suppliers) for its one month duration, to regain compliance with the Detailed Construction Network.
    c. Five calendar days prior to the expiration of the Recovery Schedule, the Engineer and the Contractor will meet at the job site for the monthly update and to evaluate the effectiveness of the Recovery Schedule, and shall determine whether the

Contractor has regained compliance with the Detailed Construction Network. At the direction of the Engineer, one of the following will occur:

1) If, in the opinion of the Engineer, the Contractor is still behind schedule, the Contractor shall prepare another Recovery Schedule, at the Contractor's expense, pursuant with this Paragraph, which will take effect during the immediate subsequent pay period. This schedule shall be prepared under the immediate review of the Engineer.
2) If, in the opinion of the Engineer, the Contractor has sufficiently regained compliance with the Detailed Construction Network, the use of the Detailed Construction Network will be resumed.

J. Requested Time Adjustment Schedule

1. The updated Detailed Construction Network and accompanying reports submitted by the Contractor shall not show a completion date later than the stipulated completion date, subject to any time extensions approved by the Owner. If the Contractor believes it is entitled to an extension of the Contract Time under the provisions of the Contract Documents, the Contractor shall submit to the Engineer, with each progress payment update, a separate schedule analysis (entitled "Requested Time Adjustment Schedule") indicating suggested adjustments in the Contract Time which should, in the opinion of the Contractor, be made in accordance with the Contract Documents for time adjustments, which are due to changes, delays, or conditions occurring during the past month or previously, or which are expected or contemplated by the Contractor (whether such conditions are excusable under the Contract or are alleged to be due to Contractor or Owner fault). This separate schedule, if submitted, shall be a computer-generated and computer-drawn schedule analysis, and shall be accompanied by a formal time extension request, as required by the Contract and a detailed narrative justifying the time extension requested.
2. The time extension request shall include forecasts of the actual Project Completion Date, completion of any sequences of Activities required by the Owner, and a forecast of the resultant actual achievement of Milestones listed in the Contract.
3. To the extent any time extension requests are pending at the time of any update of the Construction Schedule, the "Requested Time Adjustment Schedule" shall also be updated to reflect any adjustments made by Contractor in the logic, sequence, or duration of any Activities, any time extensions previously granted by the Owner, and to reflect actual or expected progress, in order that the "Requested Time Adjustment Schedule" shall clearly and accurately reflect the Contractor's actual intention and proposed time adjustments.
4. Neither the Engineer or the Owner have any obligation to consider any time extension request unless the requirements of the Contract Documents are complied with. The Owner shall not be responsible or liable to the Contractor for any constructive acceleration due to failure of the Owner to grant time extensions. The Contractor's failure to perform in accordance with the approved Detailed Construction Network shall not be excused, nor be chargeable to the Owner, simply because the Contractor has submitted time extension requests or the "Requested Time Adjustment Schedule."

K. Each request for payment submitted to Engineer for approval shall be accompanied by the individual Contractor's Progress Schedule. The Progress Schedule shall be that schedule required above. The schedule accompanying the request for payment shall indicate actual progress compared to that anticipated on each approved Contractor's Progress Schedule. If actual performance does not meet the performance as shown on the approved schedule in total or on individual line items, revise and submit evidence as to what efforts the individual Contractor will take to meet the approved schedule. Failure to submit the Progress Schedule

with each request for payment shall be cause for not processing the request for payment until receipt of schedule as required above.

1.3 PROGRESS REPORTS

A. Each Prime Contractor shall provide the Engineer with a detailed progress report showing work completed the last month. Provide at each monthly progress meeting.

1.4 SHOP DRAWINGS, PRODUCT DATA, SAMPLES AND REFERENCE SUBMITTALS

A. Definitions
   1. Shop Drawings are drawings, diagrams, schedules and other data specially prepared for the work by the Contractor or any Subcontractor to illustrate some portion of the work.
   2. Product Data are illustrations, standard schedules, performance charts, instructions, brochures, diagrams, and other information furnished by the Contractor to illustrate a material, product or system for some portion of the work.
   3. Samples are physical examples which illustrate materials, equipment or workmanship and establish standards by which the work will be judged.
   4. Reference Submittals are any technical data or submittals listed in the technical sections of the Specifications, under Reference Submittals including but not limited to test reports, surveys, special guaranties and warranties, maintenance and operating instructions, extra stock, installers' certification, material certification, and calculations.
   5. Shop Drawings, Product Data, Samples, and Reference Submittals are not to be construed as Contract Documents, they are to be used by the Contractor for his convenience only.

B. General Requirements
   1. There shall be no substitutions for specified products, equipment, or systems except as allowed in Division 01 Section “Product Requirements”.
   2. Shop Drawings and Product Data are solely the responsibility of the Contractor, and shall be checked by him. Engineer and Owner take no responsibility whatsoever for such documents submitted for review.

C. Shop Drawings
   1. Prepare project specific information, drawn accurately and to scale. Do not base shop drawings on reproductions of the contract documents or standard printed data, unless otherwise permitted.
   2. Only those Shop Drawings and Product Data will be reviewed:
      a. Where details of fabrication, installation or attachment are required to supplement the Contract Documents.
      b. Where there are deviations from the Contract Documents for any reason. (This procedure is not for the purpose of reviewing substitutions.)
      c. Where further documentation is required to show the proposed product or system is in conformance to every requirement of a performance Specification.
      d. Where listed under Submittals in each technical section.
   3. Shop Drawings and Product Data shall be submitted in sufficient detail to permit the Reviewer to review:
      a. That product or system is as specified or shown.
      b. Details of fabrication, installation or attachment.
      c. For complete conformance to each requirement of performance Specifications, line item by line item.

4. Shop drawings shall fully illustrate all requirements in the contract documents. Include the following information, as applicable:
    a. General arrangement of each product or assembly by necessary plans, elevations and sections.
    b. Dimensions, finishes, part numbers, location in the building and details of fabrication and installation.
    c. Any equipment with electric motors or wiring must show wiring diagram and schematics. Lack of either will be cause for automatic rejection of the submittal.
    d. Identification of products.
    e. Schedules.
    f. Compliance with specified standards.
    g. Notation of coordination requirements.
    h. Notation of dimensions established by field measurement.
    i. Relationship and attachment to adjoining construction clearly indicated.
    j. Seal and signature of professional engineer, if specified.
5. Sheet Size: Except for templates, patters, and similar full-size drawings, submit shop drawings on electronic sheets at least 8-1/2 by 11 inches, but no larger than 22 by 34 inches.
6. Format: Submit shop drawings in PDF electronic format. At the Engineer's request, submit up to 3 hard copies.

D. Product Data
1. Product Data shall include the following information, as applicable:
    a. Manufacturer's catalog cut sheets
    b. Manufactuerer's product specifications and details
    c. Performance characteristics
    d. Wiring diagrams
    e. Test data
    f. Installation instructions
    g. Standard color charts
    h. Statement of compliance with specified reference standards
    i. Testing by recognized testing agency
    j. Application of testing agency labels and seals
    k. Notation of coordination requirements
    l. Availablilty and delivery time information
2. Product Data shall be submitted with a cover letter stating exact product by name and number and how it complies with the Contract Documents.
3. Format: Submit product data in PDF electronic format. At the Engineer's request, submit up to 3 hard copies.

E. Samples
1. Submit 3 identical sets for each material, finish and color required.
    a. For unit materials (such as brick, floor or ceiling tile), provide standard size units in sufficient quantity to show the full range.
    b. For finishes applied over large areas (such as wall covering, carpet, ceramic tile, plywood), provide 12-inch x 12-inch minimum size samples or larger, as required, to show full range or repeat pattern.
    c. For linear products, such as door and window frames or trim pieces, submit 12-inch minimum lengths of the actual product.
2. Full-Size Samples: Where required, submit a full-size unit of a specified product as a sample. Such sample may be used in the finished work if:

a. It is approved for such use by Engineer.
b. It is protected and in first-class condition.
c. It matches the balance of the product used on the Project.

F. Reference Submittals
1. All calculations shall have the Professional Engineer's seal affixed, and shall be submitted prior to starting fabrication or installation. Engineer shall not be responsible for calculations of such other Professional Engineers. The Professional Engineer shall be registered in the State of Ohio.
2. Calculations, where required for the preparation of Shop Drawings, shall be submitted with those Shop Drawings and not as a separate submittal. Shop Drawings submitted without calculation backup sheets will be returned unreviewed.

G. Submittal Process
1. As soon as practical after executing the Contract, or as required by other Contract Documents, request from each Subcontractor and submit properly processed and identified items as required in the Specifications.
a. Late or untimely submittal of information shall not be cause to reduce Engineer's review time, to accept lower quality, or to delay the project completion.
2. Contractor shall be solely responsible for scheduling and coordinating of submittals among Subcontractors.
3. Allow a minimum of 14 working days for processing (from the date the Reviewer receives submittal until the date he sends it back) and sufficient time for proper handling, review, fabrication and delivery. If many items are submitted simultaneously, substantially more time for processing shall be required if Engineer so determines.
4. Send a separate Transmittal Letter with each submittal by specification number, using the form provided by the Engineer. List and identify each item on the Transmittal Letter. Include Engineer's project identification number and other requested information on the transmittal letter or on the submittal being sent.
5. When Shop Drawings are revised and resubmitted, all the revised, added and/or deleted items since the previous submittal must be circled by the submitter.
6. The entire submittal of Shop Drawings will be returned unreviewed when revised, added and/or deleted items have not been circled.
7. Shop Drawings that are submitted for reference as an aid to review another portion of the work will not be reviewed.

H. Form of Submittal
1. Shop Drawings shall be submitted in PDF electronic format. The sheet size of the electronic PDF shall generally be 22-inch x 34-inch or 11-inch x 17-inch and shall be filled completely to minimize the number of sheets.
2. Submittals for Product Data shall be submitted in PDF electronic format. The sheet size of the electronic PDF shall generally be 8-1/2-inch x 11-inch.
a. Provide minimum blank space of 3-inch x 8-1/2-inch on each submittal for review stamps of Contractor and Engineer.
b. When submitting product data, submit only catalog pages showing the item to be furnished and identify the item on the page and on a separate cover letter stating how it complies with the Contract Documents.
3. Where Samples are requested, submit three complete sets of the sizes indicated.
4. Mark each item with the same identifying number used on the Transmittal Letter and include the following information:
a. Project name and number

b. Contractor's name, address and telephone number
c. Subcontractor's name, address and telephone number
d. Supplier's name, address and telephone number
e. Date of submittal
f. Specification section number or Drawing number
g. Status (new or prior submittal date and number)

I. Contractor's Check
1. Upon receipt of submittals, check each item for:
a. Conformance to submittal requirements
b. Conformance of materials and details to the Contract Documents
c. Accuracy of all measurements
d. Field construction criteria related thereto
2. Reject items which do not conform to these requirements and return them to the originator with an explanation for the rejection. Do not submit rejected items to Engineer.
a. Do not submit Shop Drawings, Product Data, or Samples that are not requested in the Technical Sections.
3. For items approved by the Contractor, stamp each item "APPROVED" to warrant and represent approval.
4. Contractor is totally responsible for the following items which will not be reviewed by the Engineer or by Owner:
a. Deviations from Contract Documents.
b. Dimensions to be confirmed and correlated at the Site.
c. Fabrication process information
d. Means, methods, techniques, sequences, procedures of construction and construction safety.
e. Coordination of the work of all trades.
f. Reference Submittals

J. Engineer's Review
1. Deliver or send each item, shipping charges prepaid, to Engineer.
2. Engineer immediately will reject any item without further review if it is not:
a. Accompanied by a Transmittal Letter containing the required information
b. Submitted as a reproducible
c. Stamped "APPROVED" by the Contractor
3. If the submittal has been previously submitted and was marked "CONFORMS" or "CONFORMS AS NOTED" and the transmittal letter does not state that additional corrections or additions to the submittal have been made, then such submittal shall not be reviewed again.
4. Review will be for conformance to the design concept and compliance with information given in the Contract Documents. Engineer will make notations directly on the electronic PDF copy.
5. Review is intended to foresee unacceptable products and to minimize the possibility of their rejection at the Site. The review shall not be construed as:
a. Permitting a departure from the Contract Documents, unless specifically so noted.
b. Relieving the Contractor of responsibility for errors or omissions.
c. Acceptance of an assembly of which an approved item is a part.
d. Approval of variations from previously approved items.
e. Approval of dimensions.

6. Engineer will review all Samples. Such review will be for appearance only. Compliance with all other requirements of the Contract Documents is the responsibility of the Contractor.
7. Product Data: Only the cover letter will be stamped with the Shop Drawing stamp, and not the product data sheets.
8. Reference Submittals shall be sent to Engineer for informational purposes only.
    a. Refer to Technical Sections under Reference Submittals for required information to be submitted.
    b. The contents of such submittals and compliance with all other requirements of the Contract Documents shall be the responsibility of the Contractor.

K. Variations from Contract Documents
1. If Engineer determines a variation from the Contract Documents is in the best interest of the Owner, and it does not involve a change in the Contract price or time, he may permit such variation and stamp the item "CONFORMS".
2. Unless Engineer receives immediate written notification, he will assume the Contractor approves any variation shown.
3. If Contractor fails to mention variations from the Contract Documents, he will not be relieved of responsibility for executing the work in accordance with the Contract Documents.
4. When a variation from the Contract Documents is permitted and such variation involves corresponding adjustment in an adjacent or related item, responsibility for making and paying all costs for such adjustment rests with the Contractor requesting the original variation. Additional services required of Engineer, shall be paid for by Contractor. Payment for such additional services shall be made as follows:
    a. Owner shall compensate Engineer for such additional services and Owner shall deduct amount of such compensation from payments due to the Contractor.

L. Reviewer's Stamp and Letter of Acknowledgement
1. Each Shop Drawing, Product Data cover letter or Sample processed by Engineer (except reference submittals).
2. If the item conforms to all requirements of the Contract Documents or if the item contains permitted variations, it will be stamped "CONFORMS".
3. If the item is marked-up by the Contractor or Engineer to make it conform and such mark-ups are not extensive, it will be stamped "CONFORMS AS NOTED".
4. If the item does not conform to the Contract Documents and the variation is not permitted, or if the item is extensively marked-up, it will be stamped "DOES NOT CONFORM".
5. Except for field test reports, receipt of Reference Submittals will be acknowledged by Letter of Acknowledgement and no stamp will be placed on such submittals. Sample attached at the end of this Section.

M. Rejection and Resubmittal
1. Items which do not meet the requirements of this Section, or are stamped "DOES NOT CONFORM", will be returned for correction and resubmittal by the same process. Engineer will indicate reasons for the rejection and will retain one print or sample to check against resubmittal.
2. Any item not prepared as required by the Contract Documents or not prepared in a professional or workmanlike manner requiring excessive review time, including items that require more than 2 submittals, shall be assessed a back charge by Owner for such extra time. Payments for such additional services shall be made as follows:

a. Owner shall compensate Engineer for such additional services and Owner shall deduct amount of such compensation from payments due to the Contractor.

3. Make the indicated changes only, unless further change is required for conformance to the Contract Documents.
4. Direct attention on the item to all revisions. Explain all revisions, other than those requested, in detail on the transmittal form.
   a. All revised and/or added items since the previous submittal must be circled.
   b. The entire submittal will be returned unreviewed when revised or added items have not been circled.
5. Contractor shall be completely responsible for changes not indicated or specifically noted as revised.

N. Acceptance and Use
1. Items stamped "CONFORMS AS IS" or "CONFORMS AS NOTED" will be returned to Contractor.
2. Distribute electronic copies as required to transmit the information to all parties involved.
3. Engineer will retain conforming Shop Drawings and Product Data as well as one sample, for comparison with work installed.
4. Keep copies of each approved item on the job Site at all times for reference.
5. Retain the original electronic submittal until Final Completion of the work and turn them over to Engineer for the Owner's file.
6. Do not commence work requiring Shop Drawings, Product Data, Samples, and Reference Submittals until submittal has been processed by Engineer. Perform all work in accordance with such submittal.
7. No work shall be performed without a required submittal having the proper Engineer stamp stating "CONFORMS" or "CONFORMS AS NOTED".

1.5 QUALITY CONTROL SUBMITTALS

A. Certificates
1. Installer Qualification is required for all installers of product systems listed as requiring such in the "Submittals" paragraphs of the technical specifications. Installer Certification shall consist of written certification from the manufacturer of the product system listed certifying that the Installer is approved by the manufacturer for installing the specified product system. Submit an electronic PDF copy of certification with the Subcontractor and Material List prior to Contract signing.
2. Material Certification is required for all materials listed as requiring such in the "Submittals" paragraphs of the technical specifications. Material Certification shall consist of written certification from the manufacturer of the material listed certifying that all such material used in the work meets the requirements specified in the Contract Documents and is being utilized in conformance with the manufacturer's recommendations. Submit electronic PDF copy of certification as work progresses.
3. Surveyor's Certification
   a. A certification shall be a written statement certifying the correctness of the data reported and sealed by a surveyor registered in the state where the project is located. A report shall consist of reduced field notes, sketches, or dimensions marked on copies of the Construction Drawings.
   b. Contractor shall submit certifications during the construction of the Project from a registered surveyor that the critical locations and elevations of the construction are in accordance with the Contract Documents.

1) Items for certification shall include, but not be limited to, all structures, pipes, utilities, and other underground and aboveground construction, such as bottom of footings, top of footings, floor elevations, elevations of pipe centerline.
2) Report all deviations from the Contract Documents both critical and those that are not critical.

c. Report horizontal and vertical locations of underground utilities and appurtenances, referenced to permanent surface improvements.

d. Report location of internal utilities and appurtenances concealed in the construction, referenced to visible and accessible features of the structure.

e. Reports shall be submitted timely before and after construction. For example report and certify footing locations before and immediately after construction of the footings.

B. Manufacturer's Instructions

1. When Contract Documents require that installation of work shall comply with manufacturer's printed instructions, obtain and distribute copies of such instructions to parties involved in the installation, including a PDF electronic copy to the Engineer.
   a. Maintain 1 set of complete instructions at the jobsite during installation and until completion.
2. Handle, install, connect, clean, condition and adjust products in strict accordance with such instructions and in conformity with specified requirements.
   a. Should job conditions or specified requirements conflict with manufacturer's instructions, consult with the Engineer for further instructions.
   b. Do not proceed with work without clear instructions.
3. Perform work in accordance with manufacturer's instructions. Do not omit any preparatory step or installation procedure unless specifically modified or exempted by Contract Documents.

1.6 INFORMATION REQUESTS, AND PROPOSED DEVIATIONS

A. General: Questions which arise during construction concerning the Contract Documents and the interpretation thereof, shall be submitted in writing to Engineer for his comments. Questions that can be answered by review of the Contract Documents shall not be submitted to Engineer.

B. Proposed Deviation

1. Questions concerning proposed deviations from the Contract Documents to accommodate construction shall be documented and submitted to the Engineer for his review.
   a. Such documentation shall include a proposed solution with detailed drawings and written substantiation for the proposed deviation.
   b. This shall not be construed as a means of submitting substitutions of manufacturers, products, materials, equipment, or systems. Substitutions shall not be submitted except as permitted in Division 1 Section “Material and Equipment”.
2. Do not proceed with such deviations until written notice to proceed has been received from Engineer.
   a. Such written notice shall not relieve Contractor from conformance to the Contract Documents.
3. All reviews by Engineer of proposed deviations submitted by Contractor which would provide any benefit to Contractor and all reviews by Engineer of requests for deviations which are, in fact, requests for substitutions shall be paid by Contractor, even though the request may be denied, as follows:

a. Owner will compensate Engineer.
b. Owner will deduct the amount of such compensation from payments to Contractor.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION (NOT USED)

END OF SECTION 01 3300

SECTION 01 3543.13

ENVIRONMENTAL PROCEDURES FOR HAZARDOUS MATERIALS

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Contractor shall develop, implement, and maintain a Hazardous Materials management program (HMMP) throughout the Project, in accordance with Laws and Regulations.
   1. Hazardous Materials Brought to Site by Contractor: Transport, handle, store, label, use, and dispose of in accordance with this Section, and Laws and Regulations.
   2. Hazardous Material Generated by Contractor:
      a. Hazardous Material shall be properly handled, stored, labeled, transported and disposed of by Contractor in accordance with Laws and Regulations, and this Section.
      b. If Contractor will generate or has generated Hazardous Material at the Site, obtain a United States Environmental Protection Agency (EPA) identification number listing Contractor's name and address of the Site as generator of the Hazardous Material. Obtain identification number from state environmental agency or similar authority having jurisdiction at the Site. Submit identification number within time frame specified in Article 1.3 of this Section.
      c. Contractor shall be responsible for identifying, analysis of, profiling, transporting, and disposing of Hazardous Material generated by Contractor.
   3. Fines or civil penalties levied against OWNER for violations committed at the Site by Contractor, and costs to Owner (if any) associated with cleanup of Hazardous Materials shall be paid by Contractor.

B. Enforcement of Laws and Regulations:
   1. Interests of Owner are that accidental spills and emissions, Site contamination, and injury of personnel at the Site are avoided.
   2. When Owner is aware of suspected violations, Owner will notify Contractor, and authorities having jurisdiction if Owner reasonably concludes that doing so is required by Laws or Regulations.

C. Related Sections:
   1. Section 01 3544, Spill Prevention Control and Countermeasures Plan.

1.2 DEFINITIONS:

A. The following terms are defined for this Section and supplement the terms defined in the General Conditions:
   1. Hazardous Material: Material, whether solid, semi-solid, liquid, or gas, that, if not stored or used properly, may cause harm or injury to persons through inhalation, ingestion, absorption or injection, or that may negatively impact the environment through use or discharge of the material on the ground, in water (including groundwater), or to the air. Hazardous Material includes, but is not limited to, chemicals, Asbestos, Hazardous Waste, PCBs, Petroleum, Radioactive Material, and which is or becomes listed, regulated, or addressed pursuant to [a] the Comprehensive Environmental Response, Compensation and Liability Act, 42 United States Code (USC) §§9601 et seq. ("CERCLA"); [b] the

Hazardous Materials Transportation Act, 49 USC §§1801 et seq.; [c] the Resource Conservation and Recovery Act, 42 USC §§6901 et seq. ("RCRA"); [d] the Toxic Substances Control Act, 15 USC §§2601 et seq.; [e] the Clean Water Act, 33 USC §§1251 et seq.; [f] the Clean Air Act, 42 USC §§7401 et seq.; and [g] any other Law or Regulation regulating, relating to, or imposing liability or standards of conduct concerning, any hazardous, toxic, or dangerous waste, substance, or material.

1.3 QUALITY ASSURANCE:

A. Regulatory Requirements: Laws and Regulations applying to the Work under this Section include:
   1. Code of Federal Regulations (CFR), Title 29, Part 1910, Occupational Safety and Health Standards.
   2. CFR, Title 29, Part 1926, Safety and Health Regulations for Construction.
   3. CFR Title 40, Protection of Environment.
   4. CFR, Title 49, Transportation.
   5. Occupational health and safety requirements of state labor department or similar entity; environmental Laws and Regulations of state environmental agency, Laws and Regulations of state department of transportation.

1.4 SUBMITTALS:

A. Informational Submittals: Submit the following to the entity(ies) specified for each:
   1. Hazardous Materials (including Chemicals) Proposed for Use at the Site: Submit current (dated within the past two years) material safety data sheets (MSDS) in accordance with 29 CFR 1910.1200 (OSHA Hazard Communication Standard), manufacturer, Supplier (if different than manufacturer), container size(s) and number of containers proposed to be at the Site, minimum and maximum volume of material intended to be stored at the Site, and description of process or procedures in which Hazardous Material will be used. Furnish information in sufficient time to obtain Owner's acceptance no later than least three days before bringing Hazardous Material to the Site. Submit to Engineer and Owner's environmental representative.
   2. Hazardous Material Generated at the Site: Submit for each Hazardous Material generated at the Site identification number, analysis results, and number and size of storage containers at the Site. Furnish information not less three days of Contractor's receipt of analytical results. Submit to Engineer and Owner's environmental representative.
   3. Permits: Copies of permits for storing, handling, using, transporting, and disposing of Hazardous Materials, obtained from authorities having jurisdiction. Submit to Owner's environmental representative and Engineer.
   4. Other Documents required for the HMMP: Submit to Owner's environmental representative requested documents within three days of Contractor's receipt of request. HMMP documents may include emergency/spill response plan, communication plan, and other documents.
   5. Qualifications Statements:
      a. Contractor's Safety Representative: Submit qualifications of proposed safety representative, including summary of experience, training received, and valid certifications applicable to the Project.

1.5 HAZARDOUS MATERIALS MANAGEMENT:

A. Obtain Owner's environmental representative's acceptance before bringing each Hazardous Material to the Site.

B. Communication Plan: Contractor shall develop a Hazardous Materials communication plan. At minimum, maintain at the Site two notebooks containing: 1) Inventory of Hazardous Materials (including all chemicals); and, 2) Current (dated within the past two years) material safety data sheets (MSDS) for all materials being used to accomplish the Work, whether or not defined as Hazardous Material in this Section. Keep one notebook in Contractor's field office at the Site; keep second notebook at location acceptable by Owner's environmental representative. Keep notebooks up-to-date as materials are brought to and removed from the Site.

C. Emergency/Spill Response Plan: Develop, implement, and maintain an emergency/spill response plan, for each Hazardous Material or each class/group of Hazardous Materials as applicable. At minimum, response plan shall include the following:
   1. Description of equipment available at the Site to contain or respond to emergency related to or spill of the material.
   2. Procedures for notifying, and contact information for: authorities having jurisdiction, emergency responders, Owner, Engineer, the public as applicable, and other entities as required.
   3. Response coordination procedures between Contractor, Owner, and others as appropriate.
   4. Site plan showing proposed location of Hazardous Materials storage area and location of spill containment/response equipment, and location of storm water drainage inlets and drainage routes.
   5. Description of Hazardous Material handling and spill response training provided to Contractor's and Subcontractors' employees, in accordance with 29 CFR 1926.21(b) and other Laws and Regulations..
   6. Comply with Section 01 3544, Spill Prevention Control and Countermeasures Plan.

D. Storage of Hazardous Materials and Non-Hazardous Materials:
   1. Hazardous Materials containers shall bear applicable hazard diamond(s).
   2. Container Labeling:
      a. Properly label each container of consumable materials, whether or not classified as Hazardous Materials under this Section.
      b. Stencil Contractor's name and, as applicable, Subcontractor's name, on each vessel containing Hazardous Material and, for non-Hazardous Materials, on each container over five-gallon capacity. Containers shall bear securely-attached label clearly identifying contents. Label containers that are filled from larger containers.
      c. If Owner becomes aware of unlabeled containers at the Site, Owner's environmental representative will notify Contractor. Properly label container(s) within one hour of receipt of notification or remove container from the Site.
   3. To greatest extent possible, store Hazardous Materials off-Site until required for use in the Work.

E. Hazardous Materials Storage Area:
   1. Maintain designated storage area for Hazardous Materials that includes secondary containment. Storage area shall include barriers to prevent vehicles from colliding with storage containers and shall include protection from environmental factors such as weather.
   2. Provide signage in accordance with Laws and Regulations, clearly identifying the Hazardous Materials storage area.

F. Contractor's safety representative shall meet at least monthly with Owner's environmental representative to review Contractor's HMMP documents, procedures, and inspect storage areas and the Site in general, to verify compliance with this Section.

PART 2 – PRODUCTS (NOT USED)

PART 3 – EXECUTION (NOT USED)

END OF SECTION 01 3543.13

SECTION 01 3544

SPILL PREVENTION CONTROL AND COUNTERMEASURES PLAN

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Contractor shall provide all labor, materials, equipment, tools, professional engineering (when required), and incidentals as shown, specified, and required to comply with Laws and Regulations regarding spill prevention control and countermeasures (SPCC) planning and compliance, including 40 CFR Part 112.

B. Contractor shall determine whether a SPCC Plan is required. If SPCC Plan is required, Contractor shall prepare, implement and maintain SPCC Plan as required by Laws and Regulations.

C. Determination of Need for SPCC Plan:
   1. Contractor shall determine need for SPCC Plan.
   2. Professional Engineer:
      a. If the Site will include storage of more than 10,000 gallons of oil in above-ground storage, or if the Site does not comply with oil discharge history criteria specified in 40 CFR 112, Contractor shall retain a qualified professional engineer to determine need for SPCC Plan and, if SPCC Plan is required, professional engineer shall prepare or supervise preparation of SPCC Plan.
      b. If a professional engineer is not required to prepare the full SPCC Plan, but the SPCC Plan includes environmentally-equivalent SPCC measures, or impracticality determinations, Contractor shall retain a qualified professional engineer to prepare and certify those portions of the SPCC Plan dealing with environmentally equivalent measures and impracticality determinations; the balance of the SPCC Plan may be prepared by and self-certified by Contractor.
   3. Submit to Engineer letter presenting results of evaluation of whether a SPCC Plan is required for the Project in accordance with Laws and Regulations.

D. SPCC Plan is required if the Project activities at the Site meet the following criteria:
   1. The Site and activities thereon are not exempt from Laws and Regulations.
   2. Oil is stored, used, transferred, or otherwise handled at the Site.
   3. Maximum oil storage capacity at the Site equals or exceeds either of the following thresholds: 42,000 gallons of completely buried capacity, or 1,320 of above-ground capacity. Capacity includes total storage tank volume and operational storage volume at the Site for contractors and Subcontractors, including bulk storage tanks, containers with 55-gallon storage capacity and larger, mobile tanks located at the Site, and other containers covered by Laws and Regulations. Motive storage containers, such as those on construction equipment and vehicles, is not included. Oil includes petroleum products, fuel oil, hydraulic fluid, oil sludge, oil refuse, oil mixed with wastes other than dredged material, synthetic oil, vegetable oil, animal fats and oils, and other oils defined in Laws and Regulations.
   4. There is reasonable expectation, based on location of the Site, that oil spill would reach navigable waters of the United States or adjoining shorelines.

E. If SPCC Plan is not required, Contractor shall ensure that conditions that preclude the need for SPCC Plan, including the activities of all contractors and Subcontractors at the Site, are maintained throughout duration of the Project. Should changes that affect the storage, use, or handling of oil at the Site occur, reassess the need for SPCC Plan at no additional cost to Owner and provide to Engineer evaluation letter regarding need for SPCC Plan.

F. If SPCC Plan is required, develop SPCC Plan and submit for acceptance by Owner, with copy to Engineer. SPCC Plan shall be specific to the Site and shall include the following:

1. Stamp, original signature, and license number of Contractor'S professional engineer, when self-certification by Contractor is not allowed by Laws and Regulations.
2. Site plan identifying the name (or tag number) and location of each tank and container that will contain a substance regulated in 40 CFR 112 and other Laws and Regulations, including above-ground and buried tanks. Site plan shall indicate general directions of storm water runoff, including storm sewers and drainage inlets, and storm sewer outfall locations.
3. For each tank and container on the Site plan, provide a table that lists the tank or container's name and tag number, type of oil stored, and maximum storage capacity. List total storage capacity of all tanks and containers at the Site covered by SPCC Laws and Regulations.
4. Predictions of direction, rate of flow, and total quantity of oil that could be discharged from the Site as result of storage tank or container failure.
5. Operating procedures that prevent oil spills, including procedures for oil handling, details of secondary containment structures at fuel and oil transfer areas, and details and descriptions of equipment to be used for oil handling, including piping.
6. Details of and descriptions of control measures installed at the Site by Contractor to prevent spill from reaching navigable waters, including secondary containment and diversionary structures. For on-shore Sites, one of the following must be used, at minimum: dikes, berms, or retaining walls; curbing; culverts, gutters, or other drainage systems; weirs, booms, or other barriers; spill diversion ponds; retention ponds; sorbent materials. Where appropriate, the SPCC Plan shall clearly demonstrate that containment or diversionary structures or equipment are not practical. Include brittle fracture evaluation, where required, for field-constructed above-ground storage containers undergoing repair, alteration, construction, or change in service.
7. Plans for countermeasures to contain, clean up, and mitigate effects of oil spill that reaches navigable waters, including written commitment of manpower, equipment, and materials to quickly control and remove spilled oil. Include estimation of time required to contain spill after spill occurs.
8. Contact list and telephone numbers for facility response coordinator, National Response Center, cleanup contractors, and all appropriate federal, state, and local authorities having jurisdiction to be contacted in event of spill or discharge.
9. Program for monthly inspections of the Site by Contractor for SPCC Plan compliance. Notify Owner of each inspection at least 72 hours in advance.
10. Measures for Site security relative to oil storage.
11. Procedures for safely handling mobile containers such as totes, drums, and fueling vehicles and construction equipment that remain at the Site.
12 Procedures and schedules for periodic testing of integrity of tanks and containers, and associated piping and valves.
13. Plans for bulk storage container compliance.
14. Plans for personnel training and oil spill prevention briefings.
15. For SPCC Plans that do not follow the format listed in Laws and Regulations, provide cross-reference to requirements of Laws and Regulations, including 40 CFR 112.7.

G. Obtain acceptance of SPCC Plan by Owner, for coordination with Owner's Site-specific SPCC Plan, if any.

H. SPCC Plan shall be reviewed by Contractor's professional engineer (when professional engineer is required) and Owner every five years, as applicable.

I. Post a copy of accepted, certified SPCC Plan in conspicuous location at the Site and provide copies to Owner, Engineer, other contractors, and Subcontractors as appropriate. All contractors shall comply with SPCC Plan.

J. In event of violation of SPCC Plan or release of oils attributable to construction operations, Contractor shall:
   1. Immediately issue notifications in accordance with Laws and Regulations, including 40 CFR 110 and 40 CFR 112. When required by Laws and Regulations, report to National Response Center, US Environmental Protection Agency, and other authorities having jurisdiction, if any.
   2. Have spill clean-up performed in conformance with Laws and Regulations and the SPCC Plan.
   3. Pay fines or civil penalties (or responsible portion thereof) imposed on Owner by authorities having jurisdiction, and pay costs associated with clean-up of pills.

1.2 QUALITY ASSURANCE:

A. Qualifications:
   1. Professional Engineer:
      a. When required by Laws and Regulations, engage a registered professional engineer legally qualified to practice in the jurisdiction where the Site is located and experienced in providing engineering services of the kind indicated.
      b. Submit qualifications data.
      c. Responsibilities include but are not necessarily limited to:
         1) Carefully reviewing Laws and Regulations relative to SPCC.
         2) Preparing written requests for clarifications or interpretations of criteria specified in the Contract Documents for submittal to Engineer by Contractor, and obtaining from authorities having jurisdiction clarifications regarding Laws and Regulations as required.
         3) Preparing or supervising the preparation of letter-report evaluation of need for SPCC Plan in accordance with the Contract Documents. Evaluation shall include professional engineer's seal, registration number, and original signature.
         4) When SPCC Plan is required, preparing, supervising the preparation of, or reviewing the SPCC Plan (or designated portions thereof when oil storage at the Site will be 10,000 gallons or less) in accordance with the Contract Documents. SPCC Plan (or designated portions thereof) shall include professional engineer's seal, registration number, and original signature.
         5) Periodically re-evaluating the need for SPCC Plan and issuing findings as letter-reports with seal, license number, and signature. When SPCC Plan is required, periodically evaluating the SPCC Plan and providing recommendations for compliance with Laws and Regulations, in accordance with the Contract Documents.
         6) Certifying that:
            a) it is familiar with the Laws and Regulations, including 40 CFR 112, and

b) it has visited, examined, and is familiar with the Site, planned modifications to the Site under the Project as such modifications pertain to SPCC Laws and Regulations, and
c) it has performed the evaluations and prepared SPCC Plan in accordance with the Contract Documents, and
d) procedures for required testing and inspections have been established, and
e) the said evaluations and SPCC Plan are adequate for the Project, and
f) the said evaluations and SPECC Plan conform to all Laws and Regulations, applicable industry standards, and to prevailing standards of practice.

1.3 SUBMITTALS:

A. Informational Submittals: Submit the following:
1. Certifications: With each evaluation letter and SPCC Plan submittal, include certification signed by preparer of submittal that the submittal conforms to the Contract Documents and Laws and Regulations. Signature on all certifications shall be original.
2. Evaluations:
a. Submit letter presenting results of evaluation of whether a SPCC Plan is required for the Project. Submit evaluation no later than fourteen days after the Contract Times commence running, unless longer time is allowed by Engineer.
b. Submit updated evaluations as required when conditions at the Site change. Submit updated evaluation no later than seven days after the conditions at the Site change, or within seven days of Engineer's request, unless longer time is allowed by Engineer.
3. SPCC Plan: When SPCC Plan is required:
a. Submit jointly to Owner and Engineer. Submit within fourteen days of receipt of Engineer's acceptance of evaluation submittal.
b. Update and resubmit the SPCC Plan, or acceptable SPCC Plan amendments, as required when conditions at the Site change. Submit updated SPCC Plan or amendments no later than seven days after the change in conditions at the Site change giving rise to the SPCC Plan change or amendment, or within seven days of Engineer's request, unless longer time is allowed by Engineer.
4. SPPC Plan Distribution: When SPCC Plan is required, submit copies of letters transmitting SPCC Plan and amendments (if any) to contractors and Subcontractors working at the Site.
5. Qualifications Statements: Contractor's professional engineer, when requested by Engineer.

PART 3 – EXECUTION (NOT USED)

END OF SECTION 01 35 44

SECTION 01 4100

REGULATORY REQUIREMENTS

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other Sections.

1.2 STANDARDS, CODES AND REGULATIONS

A. Standards, codes, and regulations published by manufacturers' associations, governmental agencies and other regulatory authorities form a part of these Specifications as minimum requirements. Such references include the latest issue and all amendments up to 60 days prior to the date of the Contract Documents.

B. Where differences occur between the Contract Documents and such standards, the most strict requirements shall take precedence.

C. Supply all materials and perform all work in accordance with the manufacturer's Specifications and installation procedures, and in conformance with published trade and manufacturers' association standards, unless specifically noted otherwise herein.

1.3 PERMITS

A. Owner will or has secured and paid for all permits listed in Division 00, Section “Supplementary Conditions”.

B. Contractor shall secure and pay for all other permits and governmental fees, licenses and inspections necessary for the proper execution and completion of the work which are customarily secured after execution of the Contract and which are legally required at the time the Bids are received.

C. If required by governmental authority, Owner will make application for permits and licenses using forms obtained and prepared by the Contractor and with all costs paid by the Contractor.

1.4 TAXES

A. Materials and labor to be incorporated into permanent construction are exempt from Ohio state sales tax. Sales exemption certificate will be issued by the Owner to the Contractor. Contractor shall pay all other taxes required by law. The Bid Price, whether a unit price, lump-sum price, lot price, or a trade discount price, shall be exclusive of all exempt taxes and shall be so construed.

END OF SECTION 01 4100

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 01 4126

STORMWATER POLLUTION PREVENTION PLAN AND PERMIT

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Contractor shall comply with the Project's National Pollutant Discharge Elimination System (NPDES) Permit for The State of Ohio. Contractor shall be a co-permittee with Owner and is responsible for providing necessary materials and taking appropriate measures to comply with requirements of the permit and minimize pollutants in storm water runoff from the Site.

B. Documents: The following are part of the Work included under this Section:
   1. Storm Water Pollution Prevention Plan (SWPPP): Prepared by Owner and filed with authority having jurisdiction over storm water discharges during construction. The SWPPP is part of the Contract Documents.
   2. Sediment and Erosion Control Permit: Prepared by Owner and filed with the authority having jurisdiction over sediment and erosion control during construction. Sediment and erosion control permit is part of the Contract Documents.
   3. SWPPP Revisions: Prepared by Contractor and submitted to Engineer. At minimum, Contractor shall file a SWPPP Revision prior to starting Work at the Site, and as required by authorities having jurisdiction. SWPPP Revision shall include Contractor's proposed temporary means for storm water control during all phases of the Work and include plans for storm water conveyance and retention, as applicable. Coordinate with excavation plan submittals required in Division 31 of the Specifications. Should Contractor propose deviations to the SWPPP included in the Contract Documents, or if Project-specific modifications of the SWPPP are required to conform to field conditions, Contractor shall provide additional SWPPP Revisions as necessary, in accordance with requirements of authorities having jurisdiction and applicable permits. SWPPP Revisions shall use the SWPPP Revision form included in this Section, with supporting documents attached as required, or forms provided by authorities having jurisdiction. SWPPP Revisions that do not comply with the Contract Documents and are not required by authorities having jurisdiction will be regarded as substitutions, in accordance with the General Conditions and substitution procedures in the Specifications.
   4. Storm Water Certification Statement: To be provided by Contractor to Engineer on the form included with this Section, or on a form provided by authority having jurisdiction. Do not perform Work at the Site until the Storm Water Certification has been submitted to Engineer.
   5. Notice of Intent (NOI): Prepared by Owner or Engineer and submitted to authorities having jurisdiction following Engineer's receipt and acceptance of Contractor's SWPPP Revision and preliminary Progress Schedule. NOI will be filed with authorities having jurisdiction by Engineer within ten days of Engineer's acceptance of Contractor's SWPPP Revision and preliminary Progress Schedule. Do not perform Work at Site until NOI is submitted to authorities having jurisdiction.
   6. Co-permittee Agreement: Prepared by Contractor using forms included with the SWPPP, and submitted to Engineer within five days of the date the Contract Times commence running, for signature by Owner. Engineer will file co-permittee agreement with authorities having jurisdiction. Do not perform Work at the Site until co-permittee agreement is submitted to authorities having jurisdiction.

7. Storm Water Inspection Report: Prepared by Engineer's Resident Project Representative (RPR) using the form included with this Section, or a form provided by authority having jurisdiction. Storm water inspection reports will be filed in a log book kept at the Site by Engineer. Copy of each report will be furnished to Contractor upon request. Storm water inspection report will be completed for each of the following:
    a. Pre-construction: After placement of storm water management measures, including sediment and erosion controls, and temporary field offices and other temporary facilities, prior to starting other Work at the Site.
    b. During the Work: Every seven days until Notice of Termination is completed. When the Site is stabilized relative to storm water, erosion, and discharge of sediment, inspection frequency during temporary shutdowns and seasonal shutdowns is once per month until Notice of Termination is completed.
    c. Final: Final inspection report will be prepared prior to completion of Notice of Termination.
8. Notice of Termination (NOT): Prepared by Contractor on the form included with storm water permit and provided to Engineer for review and signature by Owner. Engineer will submit the NOT to authority having jurisdiction. Submit the NOT following completion of all Work that may result in pollution in storm water discharges, including landscaping Work. Final Payment will not be made until the NOT is filed with authority having jurisdiction.

C. Prevent discharge of sediment to and erosion from the Site to surface waters, drainage routes, public streets and rights-of-way, and private property, including dewatering operations. Prevent trash and demolition and construction debris from leaving the Site via storm water runoff. Provide berms, dikes, and other acceptable methods of directing storm water around work areas to drainage routes. Prior to starting the Work associated with such discharge, construction-related discharges to publicly owned conveyance or treatment systems shall be approved by owner of system to which the discharge will be directed.

D. Do not cause or contribute to a violation of water quality standards, Laws, or Regulations. Notify Engineer of revisions to the SWPPP necessary to protect receiving water quality and comply with applicable permits. Provide and implement measures to control pollutants in storm water runoff from the Site to prevent:
1. Turbidity increases that will cause a substantial visible contrast to natural conditions.
2. Increase in suspended, colloidal, and settleable solids that would cause sediment deposition or impair receiving water quality and use.
3. Presence of residue from oil and floating substances, visible oil, and globules of grease.

E. Contractor shall pay civil penalties and other costs incurred by Owner, including additional engineering, RPR, and inspection services, associated with non-complying with applicable permits related to storm water discharges associated with construction activity and sediment and erosion controls associated with the Work.

F. Contract Price includes all material, labor, and other permits and incidental costs related to:
1. Preparing SWPPP Revisions and other documents that are Contractor's responsibility, in accordance with this Section.
2. Installing and maintaining structural and non-structural items used in complying with the SWPPP and its revisions.
3. Clean-up, disposal, and repairs following wet weather events or spills caused by Contractor.

4. Implementing and maintaining “best management practices”, as defined in applicable permits and Laws or Regulations, to comply with requirements that govern storm water discharges at the Site.
5. Inspections of storm water, sediment, and erosion controls as specified.

G. Coordinate requirements of this Section with requirements for earthwork, erosion control, and landscaping in the Contract Documents, applicable permit requirements, and Laws and Regulations.

H. Implement SWPPP controls and practices prior to starting other Work at the Site. Each contractor and subcontractor identified in the SWPPP and SWPPP Revisions shall sign a copy of the storm water certification statement.

1.2 QUALITY ASSURANCE:

A. Regulatory Requirements: Comply with Laws and Regulations relative to environmental protection and restoration, including:
1. Storm water permit applicable to the Work and Site.
2. State and local erosion and sediment control guidelines and requirements,
3. State and local storm water regulations and guidance.

1.3 SUBMITTALS:

A. Informational Submittals: Submit the following:
1. Submit the following, in accordance with Article 1.1 and Article 1.4 of this Section; for Projects involving Work at multiple Sites, submit each of the following for each Site, as applicable:
a. SWPPP Revisions.
b. Co-permittee Agreement.
c. Storm Water Certification Statement.
d. Notice of Termination
2. Approval to Discharge to Publicly-owned Treatment Works: For storm water discharges associated with construction activity that are discharged to a publicly owned conveyance or treatment system, prior to commencing discharges, submit system owner’s written approval for such discharges.
3. Storm Water Site Plan Updates: Within three days after each storm water inspection, submit updated storm water site plan.

1.4 SWPPP REVISIONS:

A. Contractor shall prepare a SWPPP Revision in accordance with the Project’s storm water permit when:
1. There is a significant change in design, construction, operation, or maintenance of the Project that significantly affects the potential of discharging pollutants to Waters of the United States, and has not otherwise been addressed in the SWPPP.
2. SWPPP proves to be ineffective relative to:
a. eliminating or significantly minimizing pollutants from sources identified in the SWPPP required by this permit, or
b. achieving general objectives of controlling pollutants in storm water discharges from permitted construction activity.

3. Prepare and submit SWPPP Revision identifying contractors and subcontractor responsible for implementing part of the SWPPP.

PART 2 – PRODUCTS (NOT USED)

PART 3 – EXECUTION

3.1 INSPECTIONS AND REPAIRS:

A. Perform Site inspections and assessments as required in applicable storm water permit and this Section. Inspections and assessments shall be done by Contractor's site superintendent or project manager, together with Engineer's RPR.

B. Inspections:
   1. During the Work, Site inspections shall be performed:
      a. After SWPPP controls are provided and prior to starting other Work at the Site.
      b. During the Work: Every seven days until Notice of Termination is completed. When the Site is stabilized relative to storm water, erosion, and discharge of sediment, inspection required frequency during temporary shutdowns and seasonal shutdowns is once per month until Notice of Termination is completed
      c. Prior to Contractor submitting the Notice of Termination.
   2. During each inspection, verify sediment control practices and record approximate degree of sediment accumulation as percentage of acceptable sediment storage volume; inspect erosion and sediment control practices and record maintenance performed; observe and record deficiencies relative to implementation of the SWPPP. RPR or Engineer will complete Storm Water Inspection Reports and Contractor shall record and submit the following.
      a. Storm Water Site Plan: On a copy of the Site plan included in the Contract Documents or other map of the Site acceptable to Engineer, indicate extent of all disturbed areas and drainage pathways. Indicate areas expected to undergo initial disturbance or significant site work within the next fourteen days.
      b. Indicate on storm water site plan areas of Site that have undergone temporary or permanent stabilization.
      c. Indicate on storm water site plan all disturbed areas that have not undergone active site Work during the previous fourteen days.

C. Maintain at the Site a copy of storm water site plans from storm water inspection submit each storm water map to Engineer and RPR. RPR will maintain at the Site a log book with a copy of each Storm Water Inspection Reports.

D. Cooperate with representatives of authorities having jurisdiction during periodic visits to Site, and promptly provide information requested by authorities having jurisdiction.

E. Complete repairs to SWPPP controls in accordance with applicable requirements and to satisfaction of Engineer within two calendar days of each inspection.

3.2 ATTACHMENTS:

A. The documents listed below, following the "End of Section" designation, are part of this Specification Section. Notice of Intent (NOI) form, Co-permittee Agreement form, and Notice of Termination (NOT) form are included with storm water permit.

1. Storm Water Inspection Report form.
2. Storm Water Permit Certification form.
3. SWPPP Revision Form.
4. Storm Water Pollution Prevention Plan and Sediment and Erosion Control Plan.
5. Approval for Coverage under Oho EPA General Permit: OHC000004.

STORM WATER INSPECTION REPORT

Owner:
Site:
Project:
Contractor:

Date of Inspection:_____
Day of Week:

S	M	T	W	T	F	S

Sheet No. _____ of _____ Sheets

If pertinent to the Operation	
Weather	
Temperature	

This inspection and maintenance form is to be used when the Work is subject to a Storm Water General Permit for Construction Activity. Inspections must be performed at least once every seven calendar days; for sites that are stabilized and temporarily shut down inspections may be reduced to once per month. Each erosion and sediment control measure installed on the Site is to be inspected and the Contractor must complete all required maintenance within two calendar days from the date of inspection.

Reason for this inspection: ☐ Pre-construction Site assessment
☐ Seven calendar day inspection
☐ Monthly inspection (when Site is stabilized and shut down)
☐ Post-construction inspection prior to Notice of Termination

Key for erosion and sediment control measures to be inspected: [Use the following designations in the table below] (1) mulch, (2) seed and mulch, (3) check dams, (4) haybale/strawbales, (5) silt fence, (6) sediment trap, (7) turbidity curtains, (8) pipe slope drains, (9) drainage structure inlet protection, (10) rolled erosion control products, (11) soil stabilizers, (12) construction entrances, (13) pipe inlet/outlet protection, (14) water diversion structures, (15) sedimentation basins, (16) cofferdams, (17) Other _____.

STORM WATER PERMIT CERTIFICATION

Contract Number:_____ Project:_____

Owner:_____

Each Contractor and Subcontractor identified in the Storm Water Pollution Prevention Plan (SWPPP) must certify that they understand the permit conditions and their responsibilities. Every Contractor and Subcontractor performing an activity that involves soil disturbance shall sign this certification and submit it to the Engineer prior to performing the Work. This certification shall be signed by an owner, principal, president, secretary, or treasurer of the firm.

> I certify under penalty of law that I understand and agree to comply with the terms and conditions of the SWPPP for the construction Site identified in such SWPPP as a condition of authorization to discharge storm water. I also understand that my firm and its employees and Subcontractors shall comply with the terms and conditions of Owner's general permit for storm water discharges from construction activities and that it is unlawful for any person to cause or contribute to a violation of water quality standards, Laws, or Regulations.

SECTION 01 4500

QUALITY CONTROL

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other sections.

1.2 QUALITY ASSURANCE

A. General: The intent of the Contract Documents is to include all items necessary for the proper execution and completion of the Work. The Contract Documents are complementary, and what is required by any one shall be as binding as if required by all. Work not covered in the Contract Documents will be required if it is consistent therewith and is reasonably inferable therefrom as being necessary to produce the intended results. In case of a discrepancy between the Drawings and Specifications or among Drawings, the strongest, the larger quantity or better quality, as determined by the Interpreter shall govern. If an item is shown on the Drawings, but not specified, the Contactor shall provide the item of a quality similar to other items specified, as determined by the Interpreter. If an item is specified, but not shown on the Drawings, it shall be located as required by the Interpreter.

B. Wind Load: Provide products designed to withstand the indicated wind load; when requested, submit substantiating data.

C. Fire Resistance Rating: Provide materials and assemblies which have been tested and listed by UL, FM, IRI, OIA, or other recognized authority, for the assembly shown or specified; where specified, attach label of testing authority. For oversized assemblies or assemblies similar to those tested, provide Manufacturer's certification that the assembly has been constructed of materials and methods equivalent to the tested construction.

D. Flame Spread Rating: Provide products with the indicated flame spread rating or less; when requested, submit substantiating data. Provide materials with flame spread ratings required by code, unless a more strict requirements is specified.

E. Proprietary Products: Where systems or assemblies of materials or equipment are indicated, obtain all primary components from the same Manufacturer, unless specifically noted otherwise.

1.3 TESTING LABORATORY

A. The Owner shall coordinate and provide all testing services, including soil testing and concrete testing, except that which may be specifically specified otherwise in the technical sections.

1.4 INSPECTION SERVICES

A. Perform or arrange for all inspections, tests, and approvals required in each Technical Section or by governing authority.

B. Pay all costs unless specifically stated otherwise in the Technical Sections.

C. Notify each inspecting authority, Engineer, and Owner 24 hours in advance of each test, inspection and approval.

D. Keep records of each test, inspection and approval. Include the time, weather conditions, name of inspecting, testing, or approving authority, results of the test, and all other pertinent data.

E. Submit official reports showing dates performed, test methods, results, interpretations of results, and recommended actions. Submit required copies to governing authorities, Engineer, and Owner.

F. Provide required certificates to Engineer and Owner for the Owner's file.

G. If Engineer determines that any work requires special inspection, testing, or approval he will, upon written authorization from Owner, instruct Contractor to order such special inspection, testing, or approval. If such special inspection or testing reveals a failure of the work to comply with requirements of the Contract Documents, Contractor shall bear all costs thereof, including compensation for additional services of Engineer; otherwise, Owner shall bear such costs, and an appropriate Change Order shall be issued.

1.5 CONTRACTOR'S QUALITY CONTROL

A. Temperature and Humidity
   1. Maintain a daily log of outdoor and indoor high/low temperatures and general weather conditions. Such log shall be readily accessible to Engineer.
   2. Provide accurate outdoor and indoor thermometers at the Site.
   3. Do not install products in or on structures in temperatures or moisture conditions outside the recommended ranges.
   4. Maintain proper ambient and material temperatures and moisture conditions as required by product Manufacturers and other standards, by use of temporary heat, ventilation, construction of temporary structures, or by other approved means.
   5. If low temperatures make it impossible to continue operations safely, in spite of cold weather precautions, cease Work and notify Engineer.
   6. Where a substrate or product is recommended to be dry or a moisture content is listed for installation procedures, conform to the requirements. If actual conditions do not meet the standards, reduce moisture in products or substrate by approved artificial methods when natural processes would delay the progress of the Work.

B. Power Characteristics
   1. Refer to Division 26 for project power characteristics.
   2. Motors, starters, safety switches, pushbuttons, pull cords, internal wiring and operating devices, and low voltage wiring are the responsibility of each Contractor providing a product requiring electrical service.
   3. All conduit, wiring, and interlocking required to complete the installation are the responsibility of the Electrical Contractor.

1.6 MANUFACTURER'S FIELD SERVICES

A. General
   1. When indicated in the technical specifications, provide a qualified technical representative at the Site to advise on the proper installation of the product.

2. Representative shall check the installation of the equipment, supervise its initial operation and initial testing and instruct operating personnel in its operation and maintenance.
3. Representative shall supervise necessary adjustments to insure satisfactory operation.
4. Some of the technical sections require a minimum number of hours or days for the Representative to remain on the Site. This time must fall within the normal construction day. If a longer time or overtime is required it shall be provided at no increase in cost to the Owner.
5. Representative shall remain on the Site or make as many return visits as necessary to insure the equipment is operating properly.
6. If the service includes coordination, calibration, etc. with another Manufacturer's connecting equipment, the Contractor shall arrange for those Representatives involved to be on the Site at the same time.
7. Where the supervision of a Representative is not called for in the technical specifications, this shall in no way relieve the Contractor of his responsibility to properly construct or install equipment or material in accordance with the Contract Documents.
8. Contractor shall make arrangements with the Representative and notify Engineer at least five days in advance of each visit.
9. Report Form: Where a Report Form is required in the Technical Specifications, the Representative shall complete and submit a "Manufacturer's Service Representative's Report" using the form attached at the end of this Section. A separate Report shall be required for each piece of equipment and each visit. Contractor shall submit 3 copies of the signed Report Form within 5 days of the visit. Contractor shall furnish all necessary copies of the attached form.

B. Training
1. For major pieces of equipment and SCADA systems, there shall be training session(s) provided by the manufacturer or Contractor.
2. An outline shall be provided showing, as a minimum, basic function, start-up procedures, normal operating procedures, and normal maintenance.
3. The Contractor shall record video, with audio, each session. There shall be a separate DVD or other electronic video media for each piece of equipment, unless otherwise noted or approved.

1.7 CONTRACTOR DESIGN RESPONSIBILITIES

A. The design of all pre-engineered elements, assemblies, components and connections of all types not designed by the Engineer shall be the total responsibility of the Contractor. Such shall include, but shall not be limited to, structural steel, precast concrete, wall panels, windows, architectural items, mechanical items, and electrical items. Engineering required for such for which all or a portion of the necessary engineering services are performed by the Manufacturer shall be the total responsibility of the Contractor. Where the Contract Documents require the design of architectural, structural, mechanical, or electrical items by a supplier, or where a Contractor initiates a change in the design of a system or component thereof, such design shall be the total responsibility of the Contractor.

B. All Contractor design responsibilities shall be performed by a Registered Professional Engineer. Submit all calculations to Engineer for his records as a Reference Submittal prior to starting fabrication or installation of the Work. Engineer shall not review, check, or approve such submittals. Engineer will not be responsible for designs of others, including those of the Contractor, Subcontractors, and suppliers.

1.8 JOB CONDITIONS

A. Existing Conditions
   1. Condition of existing Structure and Site will be maintained as far as possible by the Owner up to the time the Work commences. However, variations may occur after inspection of the premises by the Bidder, due to Owner's removal and salvage operations. Owner assumes no responsibility for actual conditions at the time Work commences.
   2. Execute Work in connection with the existing building, as indicated. Report any marked discrepancy between the Drawings and actual conditions at the Building to Engineer or adjustment.
   3. All material removed by the Contractor unless otherwise specified, becomes his property and shall be removed from the premises promptly.

1.9 FAULTY AND NON-CONFORMING WORK

A. Faulty work or work not in conformance with the Contract Documents shall not be permitted.

B. Remove such work or propose a remedy by means of detailed drawings and written documentation and submit such documentation to the Engineer for his comments.

C. All costs for removal and reconstruction of such work, and additional services of the Engineer shall be paid by the Contractor. Payments for such additional services of the Engineer shall be made as follows:
   1. Owner will compensate Engineer.
   2. Owner will deduct the amount of such compensation from payments to the Contractor.

END OF SECTION 01 4500

SECTION 01 4516

FIELD QUALITY CONTROL PROCEDURES

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other sections.

1.2 FIELD MEASUREMENTS

A. Make field measurements wherever possible for accurate fabrication of built-in or attached products. Do not delay job progress. Allow for trimming where field measurements cannot be made prior to fabrication.

1.3 LAYOUT

A. Establish bench marks and layouts as required, from the information indicated on the Drawings. Extend these lines up through the Building as the work progresses. Each Subcontractor shall lay out his work from these references.

B. Protect control points prior to starting site work and preserve all permanent reference points during construction.
   1. Make no changes or relocations without prior written notice to Engineer.
   2. Report to Engineer when any reference point is lost or destroyed or requires relocation because of necessary changes in grades or locations.
   3. Require surveyor to replace project control points which may be lost or destroyed.
      a. Establish replacements based on original survey control.

1.4 PROJECT SURVEY REQUIREMENTS

A. Establish lines and levels, locate and lay-out, by instrumentation and similar appropriate means:
   1. Site Improvements such as utility alignment and elevations.
   2. Foundation locations and floor levels.

1.5 RECORDS

A. Maintain a complete, accurate log of all control and survey work as it progresses.

1.6 SUBMITTALS

A. On request of the Engineer, submit documentation to verify the accuracy of field engineering work.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION (NOT USED)

END OF SECTION 01 4516

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 01 4533

CODE-REQUIRED SPECIAL INSPECTIONS AND PROCEDURES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope
   1. Contractor shall provide labor, materials, tools, equipment, and incidentals as shown, specified, and required to cooperate with the Coordinating Special Inspector, individual special inspectors, and testing agencies employed by Owner, to facilitate Special Inspections.
   2. Supplement A, Statement of Special Inspections, included with this Section, lists testing and inspections required.

1.2 DEFINITIONS

A. Agencies and Personnel:
   1. Approved Agency: An established and recognized agency regularly engaged in conducting tests or furnishing inspection services. An approved agency shall provide all information necessary to the Building Official to determine that the agency meets the applicable requirements.
   2. Building Official: Officer or other designated authority having jurisdiction charged with the administration and enforcement of the governing building code, or a duly authorized representative.
   3. Coordinating Special Inspector: Professional Engineer or architect, hired by Owner, registered in the same state as the Site, responsible for coordinating and verifying the inspection and testing required by the Statement of Special Inspections included in this Section and reporting to the Building Official and the Registered Design Professional in Responsible Charge.
   4. Registered Design Professional in Responsible Charge: A registered design professional, registered in the same state as the Site, engaged by the Owner to review and coordinate certain aspects of the project, as determined by the Building Official, for compatibility with the design of the building or structure and the requirements of the contract documents, including submittal documents prepared by others, deferred submittal documents and phased submittal documents. The Registered Design Professional in Responsible Charge may serve as the Coordinating Special Inspector.
   5. Registered Design Professional: An individual who is registered or licensed to practice their respective design profession as defined by the statutory requirements of the professional registration laws of the state or jurisdiction in which the Project is to be constructed.
   6. Special Inspector: Qualified person employed or retained by an Approved Agency or Owner, and approved by the Building Official as having the competence necessary to inspect a particular type of construction requiring Special Inspection.

B. Special Inspection:
   1. Special Inspection: Owner furnished inspection of construction requiring the expertise of an approved Special Inspector to ensure compliance with approved Contract Documents and referenced standards as required by the IBC.

2. Special Inspection, Continuous: Full-time observation of work requiring Special Inspection by an approved Special Inspector who is present when and where the Work is being performed.
3. Special Inspection, Periodic: Part-time or intermittent observation of work requiring Special Inspection by an approved Special Inspector who is present in the area where the Work has been or is being performed.

C. Statement of Special Inspection:
1. Detailed written procedure contained in the Supplement to this Section establishing systems and components subject to Special Inspection, Observation, and Testing.

1.3 QUALITY ASSURANCE

A. Qualifications:
1. Owner will employ and pay for services of the Coordinating Special Inspector, who will have not less than five years of experience in managing, monitoring, and inspecting building construction.
2. Special Inspectors and Approved agencies will be qualified in their assigned Special Inspection in accordance with Supplement A, Statement of Special Inspections, of this Section or to the satisfaction of the Building Official.

B. Regulatory Requirements:
1. Special Inspections will be in accordance with applicable building code and other Laws and Regulations, and Supplement A, Statement of Special Inspections, of this Section.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
1. Samples: Representative Samples of materials when required by Engineer.

B. Informational Submittals: Submit the following:
1. Completed Supplement C, Fabricator's Certificate of Compliance, as attached to this Section, for fabrication of structural elements and assemblies.

1.5 CONTRACTOR'S RESPONSIBILITIES

A. Provide safe access to the Work to be tested and inspected.

B. Provide assistance in obtaining and handling test samples at the Site.

C. Facilitate inspections and tests.

D. Provide access to Suppliers' and Subcontractors' operations as required.

E. Notify Coordinating Special Inspector and Engineer no less than 48 hours in advance of the Work for the Coordinating Special Inspector and Engineer to coordinate their personnel at the Site. Do not cover the Work to be inspected until Special Inspection has been completed and the results thereof are acceptable.

F. Special Inspections required in this Section do not supersede or make unnecessary inspections and tests required under other Specification Sections or standard inspections required by Laws and Regulations.

1.6 COORDINATING SPECIAL INSPECTOR'S RESPONSIBILITIES

A. Coordinating Special Inspector will:
   1. Engage services of inspectors and testing agencies for Special Inspections in accordance with Supplement A, Statement of Special Inspections, of this Section and as required by Laws and Regulations.
   2. Coordinate activities of individual inspectors and testing agencies with Contractor.
   3. Provide interim reports of inspections and material testing to Building Official, Owner, Registered Design Professional in Responsible Charge, and Engineer.
   4. To obtain certificate of use and occupancy from the Building Official, complete, stamp, sign, and provide to the Building Official, Owner, Registered Design Professional in Responsible Charge, and Engineer Supplement B, Final Report of Special Inspections, of this Section, documenting completion of Special Inspections and correction of discrepancies noted in the Special Inspections.

1.7 INSPECTOR RESPONSIBILITIES

A. Perform specified inspections, sampling, and testing of materials and methods of construction; review and ascertain compliance with Laws and Regulations.

B. Promptly notify Coordinating Special Inspector, Owner, Engineer and Contractor of irregularities or deficiencies in the Work observed during Special Inspections. Corrective action, if required, will be determined by Engineer.

C. Promptly submit two copies of each report of inspections and tests to Coordinating Special Inspector, Engineer, and Contractor including:
   1. Date issued.
   2. Project title and number.
   3. Name and signature of inspector.
   4. Date of inspection or sampling and test.
   5. Record of temperature and weather.
   6. Identification of product and Specification Section.
   7. Location in Project.
   8. Type of inspection or test.
   9. Results of inspections and tests, and observations regarding compliance with Laws and Regulations, and standards.

D. At the end of construction, each inspector and testing agency shall prepare a Special Inspector Final Report which is included in Supplement B.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 SUPPLEMENTS

A. The supplements listed below, following the "End of Section" designation, are part of this Section:
   1. Supplement A – Statement of Special Inspections
   2. Supplement B – Final Report of Special Inspections
   3. Supplement C – Fabricator's Certificate of Compliance

END OF SECTION 01 4533

Supplement A
Statement of Special Inspections

Statement of Special Inspections Submittal Form

In compliance with 2015 IBC

Project: **Richard Renneker WTP Membrane Softening Upgrades**

Location: **Richard Renneker WTP 6193 Striker Rd, Maineville Ohio 45039**

Owner: **Warren County, Ohio**

Structural Engineer of Record: **Imelda Cauley, PE**

This *Statement of Special Inspections* is submitted as a condition for permit issuance in accordance with Special Inspection and Structural Testing requirements of the 2017 Ohio Building Code section 1704.
If applicable, *Statement of Special Inspections* includes *Requirements for Seismic Resistance* and/or *Requirements for Wind Resistance*:

Are *Requirements for Seismic Resistance* required to be included in the *Statement of Special Inspections*? – IBC 1704.6.1 ☐ Yes ☒ No

Are *Requirements for Wind Resistance* required to be included in the *Statement of Special Inspections*? – IBC 1704.6.2 ☐ Yes ☒ No

The Coordinating Special Inspector shall keep records of all inspections and shall furnish inspection reports to the Building Official and the Registered Design Professional in Responsible Charge. Discovered discrepancies shall be brought to the immediate attention of the Contractor for correction. If such discrepancies are not corrected, the discrepancies shall be brought to the attention of the Building Official and the Registered Design Professional in Responsible Charge. The Special Inspection program does not relieve the Contractor of his or her responsibilities.

A Final Report of *Special Inspections* documenting completion of all required Special Inspections, testing and correction of any discrepancies noted in the inspections shall be submitted to the Building official prior to issuance of a Certificate of Use and Occupancy.

Job site safety and means and methods of construction are solely the responsibility of the Contractor.

Statement of Special Inspection prepared by: Imelda Cauley, P.E.

Statement of Special Inspections

This statement of special inspections has been developed specifically for the RARWTP Membrane Softening Upgrades.

The Statement of Special Inspections provides project compliance with the provisions of the 2017 Ohio Building Code (OBC) Chapter for Special Inspection, Professional Observation, and Testing.

C INSPECTION IS DEFINED AS INSPECTION BY THE SPECIAL INSPECTOR OF ALL MATERIALS AND SYSTEMS, IN SOME CASES PERFORMED DURIN ENT AND IN ALL CASES PERFORMED UPON COMPLETION OF THEIR PLACEMENT. THE COMPLETION INSPECTION SHALL BE PERFORMED SO THA CORRECTED PRIOR TO OTHER RELATED WORK PROCEEDING.

Supplement B
Final Report of Special Inspections

Final Report of Special Inspections

Project: RARWTP Membrane Softening Upgrades

Location: Richard Renneker WTP 6193 Striker Rd, Maineville Ohio 45039

Owner: Warren County, Ohio

Structural Engineer of Record: Imelda Cauley, PE

To the best of my information, knowledge and belief, the Special Inspections required for this project, and itemized in the *Statement of Special Inspections* submitted for permit, have been performed and all discovered discrepancies have been reported and resolved other than the following:

Comments:

(Attach continuation sheets if required to complete the description of corrections.)
Interim reports submitted prior to this final report form a basis for and are to be considered an integral part of this final report.

Respectfully submitted,
Coordinating Special Inspector

SECTION 01 5000

CONSTRUCTION FACILITIES AND TEMPORARY CONTROLS

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 1 apply to the work of all other sections.

1.2 GENERAL

A. Provide and maintain as a minimum the temporary facilities described herein. Locate all facilities where approved by Engineer and remove same at completion of the work or when otherwise directed.

B. Comply with all laws, regulations, and safe practices.

C. Provide temporary utilities throughout construction period as required to facilitate progress of work, to protect work, to provide safe and adequate working conditions throughout Project, to provide for public safety, and to meet all construction needs.

D. Temporary utilities include, but are not limited to, temporary electricity, lighting, telephone, water, toilets, enclosures, signs, and traffic control.

E. Remove all temporary utilities, repair all damage caused in installation and restore to existing condition.

F. Codes and Standards
   1. National Electric Code (ANSI C1); National Electric Safety Code; Federal and State requirements; Utility company regulations; Ohio Department of Transportation.

1.3 TEMPORARY UTILITIES

A. Monitor Temporary Utilities
   1. Any party designated to provide a temporary utility shall be responsible for all damage to his work or to that of other Contractors caused by a defect in such utility.
      a. Enforce compliance with applicable codes and standards
      b. Enforce safe practices
      c. Prevent abuse of services and utilities
      d. Prevent damage to finishes
   2. Do not allow wasteful use of consumables
   3. Contractor to be responsible for cost of all cosumables used by Engineer during the project including copy/print paper, toner and ink cartridges.
   4. Contractor to be responsible for maintaining personal computer and printer during contract period. This includes all service, up to, and including, replacement of defective equipment. If the computer supplied for the Engineer’s use will be unavailable for more than two days due to repair/service, a comparable computer will be supplied by the Contractor for use.

PART 2 PRODUCTS

2.1 MATERIALS

A. May be new or used, but must be adequate for the intended purpose.

B. Must not create unsafe or unsanitary conditions nor violate requirements of applicable Codes.

C. Comply with applicable Federal and State regulations.

2.2 FACILITIES

A. Telephone
   1. Permanent type phone and/or cell phone.
   2. Number Required: One for the Engineer's field office on the same line.
   3. Directories
      a. Provide one alphabetical and one classified directory of telephone service company at each instrument.
      b. Provide project directory at Engineer's field office and General Contractor's field office listing name and business telephone number of:
         1) Each Contractor and Subcontractor
         2) Each Supplier
         3) Engineer
         4) Construction Manager
         5) Professional consultants
         6) Owner
         7) Testing laboratories
         8) Regulatory agencies, with inspector's names
         9) Medical services:
            a) Physicians
            b) Hospitals
            c) Ambulance service companies
         10) Fire Department
         11) Police Department

B. Temporary Toilets
   1. Equipment: Standard products, meeting code requirements.
   2. Toilet Facilities: Self ventilated portable toilets, either:
      a. Privies
      b. Chemical toilets
      c. Recirculating toilets, or
      d. Combustion toilets
   3. Toilet Tissue: Provide at each toilet, on suitable dispenser, with adequate reserve supply. Monitor daily.

C. Field Offices
   1. Contractor's Office: Provide a weathertight office of sufficient size and facilities to accommodate Contractor's field personnel, his subcontractors, job meetings, storage of field documents, layout space for Drawings, drafting table for production of As-Built Drawings.
   2. Engineer's Office: Provide a heated/air-conditioned office with a lockable door, desk (about 3' x 5'), chair, table (about 3' x 5'), and internet. This office can be a separate room in the Contractor's Office.

D. Project Sign
   1. Provide and install a project sign, or signs, with minimum requiremnts as noted below.
   2. The sign(s) supplied on the Project must meet the requirements of the funding agencies involved.
   3. The sign shall be 4'x8', weatherproof construction and in color. It shall be securely mounted and installed in a manner to last throughout the Contract period.
   4. Any permits required for the installation of the sign shall be obtained by the Contractor.
   5. The sign shall contain the information shown below with the actual layout and materials being approved.

Owner: _____
Project: _____
Engineer: _____
Contractor: _____
Funding Assistance: _____
Contract Amount: _____

E. Traffic Control Devices: Comply with the Manual of Uniform Traffic Control.

PART 3 EXECUTION

3.1 GENERAL

A. Comply with applicable Federal and State regulations.

B. Install work in neat and orderly manner.

C. Make structurally, mechanically, and electrically sound throughout.

D. Maintain to give safe, continuous services and to provide safe working conditions.

E. Modify and extend systems as work progress requires.

3.2 FACILITIES

A. Telephones
   1. Provide 2-way communication between Contractor and Engineer's field representative, either by phone or radio.

B. Temporary Toilets
   1. Erect securely, anchor to prevent dislocation.
   2. Service as often as necessary to prevent accumulation of wastes and creation of unsanitary conditions.
   3. Provide the following minimum number of approved enclosed combination toilet and urinal units for construction personnel:
      a. For less than 20 workers: 1.
      b. For 20 or more workers: 2 per 40 workers.
   4. Location
      a. Within the project site.
      b. Secluded from public observation.
      c. Obtain acceptance of locations by the Engineer.
   5. Enclosures for Toilet Facilities
      a. Weatherproof, sightproof, sturdy temporary enclosures.
      b. Ventilated to meet applicable Federal and State requirements.
      c. For enclosures accommodating two or more persons, provide privacy screens for each toilet fixture.

C. Field Offices
   1. General
      a. Locate as approved by Engineer.
      b. All offices must be tied down to resist high winds.
   2. Engineer's Office
      a. Provide parking space for vehicles.
      b. Sweep floors and dust at least once a week.
      c. Clean windows at least once a month.
      d. Maintain supplies, including drinking water.

D. Project Sign: Locate sign as directed by the Engineer.

E. Traffic Control Devices
   1. Contractor shall develop and submit for approval, a general traffic control plan for the project.
   2. Specifics of the traffic control plan shall conform to the Ohio Manual of Uniform Traffic Control Devices.
   3. It may be required to modify the specifics of the traffic control in order to safely protect the public

F. Computer and Internet connection
   1. Provide high speed broadband ISP.

G. Removal: Each installing Contractor shall remove his temporary utility, repair all damage caused in installation and restore to original conditions.

H. Cost of Installation, Operation and Maintenance
   1. Designated Contractor (below) will provide and maintain specified temporary utilities until Date of Substantial Completion unless otherwise indicated. Pay all costs of installation, operation and maintenance of temporary utilities.
      a. Temporary Heating: Geenral Contractor
      b. Temporary Ventilating: General Contractor
      c. Temporary Electricity: General Contractor

d. Temporary Lighting: General Contractor
e. Temporary Telephone: General Contractor
f. Temporary Water: General Contractor
g. Temporary Toilets: General Contractor
h. Temporary Enclosures: General Contractor

I. Cost of Consumables
1. Designated Contractor will pay all costs of consumables for temporary utilities unless otherwise indicated.
a. Temporary Heating
1) Heating Fuel: Each Contractor shall pay all costs of consumables for his own temporary heating requirements until the building is permanently enclosed.
b. Temporary Electricity
c. Electrical Energy: General Contractor.
d. Temporary Lighting
1) Lamps: General Contractor.
e. Temporary Water
1) Water: General Contractor.
f. Temporary Toilets
1) Toilet Supplies: General Contractor.

3.3 OTHER TEMPORARY FACILITIES

A. General: Contractor shall provide all other facilities necessary for the proper execution of the Project.

B. Water: Water used for pressure, leak and bacteria testing of the completed Plant tanks and lines is to be provided by the Contractor.

3.4 PAYMENT

A. Contractor's Cost: The Contractor shall pay for all temporary facilities.

B. Owner's Cost: None.

END OF SECTION 01 5000

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 01 5141

TEMPORARY PUMPING

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Scope:
1. This Section includes requirements for temporary pumping at facilities, such as treatment plants and pumping stations.
2. Contractor shall provide all labor, materials, tools, equipment, and incidentals shown, specified, and required for temporary pumping and handling of fluids during the Project.
3. Design, provide, and maintain temporary pumping systems, including plugs, bulkheads, and line stops as required; pumps; piping, supports, and valves; temporary instrumentation and control systems; fuel and electricity; personnel; and appurtenances. Comply with Laws and Regulations and requirements of authorities having jurisdiction. System shall be suitable for its service and operating environment.
4. Required capacity of temporary pumping systems is specified in Section 01 3113, Coordination. Provide temporary pumping system of required capacity with not less than the largest pump out of service.
5. Location of the temporary pumping system shall not affect Owner's or facility manager's operations and access at the Site, and public access to streets and drives, unless approved by Engineer and authorities having jurisdiction.

B. Coordination:
1. Review installation procedures under other Sections and coordinate Work that will be performed with or before Work specified in this Section.

C. Related Sections:
1. Section 01 3113, Coordination.
2. Section 01 3544, Spill Prevention Control and Countermeasures Plan.

1.2 QUALITYASSURANCE:

A. Qualifications:
1. Temporary Pumping System Supplier:
a. Supplier shall have not less than five years of experience providing temporary pumping systems similar in size or larger than those required for the Project.
b. Upon request, submit evidence of providing not less than five temporary pumping systems on other projects similar in size (or larger) and similar in service to temporary pumping systems required for the Project.

B. Component Supply and Compatibility:
1. Obtain each temporary pumping system from a single Supplier who shall be responsible for providing a complete system.

C. Regulatory Requirements:
1. Secondary containment for fuel tanks shall be in accordance with Laws and Regulations. Include temporary fuel tanks in spill prevention control and countermeasures evaluation and plan required in Section 01 3544, Spill Prevention Control and Countermeasures Plan.
2. Leakage from temporary pumping system or improper discharge is not allowed.

3. Quality of exhaust emissions from internal-combustion engines associated with temporary pumping systems shall comply with Laws and Regulations, including applicable air permits. Before furnishing temporary pumping system, verify compliance with air quality standards and provide temporary emissions controls to comply with such standards when required.

1.3 SUBMITTALS:

A. Timing: Furnish to Engineer submittals for temporary pumping system not less than 30 days prior to delivery of temporary pumping system to the Site.

B. Action Submittals: Submit the following:
   1. Temporary Pumping System Submittal: Submit the following for each temporary pumping system:
      a. System curve of flow plotted against total dynamic head, and calculations that substantiate the proposed temporary pumping system, including comparison of net positive suction head required and net positive suction head available.
      b. Manufacturer's data and specifications on each type and size of pump proposed and its capacity, including pump curves.
      c. Manufacturer's data and specifications for engines and other equipment required for temporary pumping system, including expected exhaust emissions data.
      d. Technical information and specifications on noise controls for noise-emitting equipment.
      d. Technical data on temporary piping, pipe joints, valves, pipe supports, controls, flow meter, secondary containment for fuel tanks, emissions controls when required, and other information pertinent to the temporary pumping system.
      e. Layout Drawings:
         1) Sketches showing proposed layout of temporary pumping system, including locations of temporary plugs, bulkheads, and line stops; suction and discharge locations; location of pumps and associated piping and valves; and source of power for temporary pumping system. Sketches shall be scale drawings acceptable to Engineer, and shall include site plans similar to those in the Contract Documents.
         2) Details of system suction and discharge locations. Discharge details shall include measures to protect the receiving structure and dissipate energy.
         3) Where temporary lines will be buried, submit trench details. Submit sketches and information on other types of protection proposed for temporary piping.
      f. Temporary Plugs, Bulkheads, and Line Stops: Manufacturer's literature and fabrication drawings showing type of plug, bulkhead or line stop as applicable, materials, and hydrostatic head the plug, bulkhead, or line stop is designed to withstand. Submit complete technical information for Contractor-proposed line stops, installation procedures, name of proposed line stop installer, and documentation of experience on at least five similar projects.
      g. Narrative describing proposed operation of temporary pumping system, including who will operate system, staffing, planned frequency of fueling, contingency plan in event of pump failure, and statement of existing systems that may be affected during operation of temporary pumping system.

C. Informational Submittals: Submit the following:
   1. Schedule for Temporary Pumping for Facilities:

a. Schedule for each temporary pumping system. Include dates of mobilizing each temporary pumping system, testing, starting and ending dates of temporary pumping, and demobilizing each temporary pumping system.
b. At Contractor's option, such information may be included on the Progress Schedule. When such option is exercised, however, upon request of Engineer break out as separate sub-schedule the schedule of temporary pumping in collection system and furnish to Engineer.
c. Maintain and update schedule for temporary pumping for collection system, and submit updated schedules in accordance with requirements for updating the Progress Schedule as indicated in Section 01 3300, Submittal Procedures.

2. Qualifications Statements:
a. Qualifications of temporary pumping system Supplier.

PART 2 – PRODUCTS

2.1 TEMPORARY PUMPING SYSTEM:

A. General:
1. System components shall be suitable for continuous operation with the fluid pumped.
2. Noise Controls: Provide noise controls for temporary pumping system. Noise emitted from temporary pumping system shall comply with Laws and Regulations and shall not exceed 70 db at a distance of thirty feet from noise source.
3. Fuel-consuming temporary pumping system components intended for use when Contractor is not present shall include fuel tanks sized for not less than 24 hours of uninterrupted operation at system's operating capacity, and means to automatically notify Contractor upon high and low suction water level and low fuel level.

B. Instrumentation and Controls:
1. Controls: Provide controls for temporary pumping system in accordance with Section 01 3113, Coordination.

C. Temporary Piping System:
1. Piping shall be steel, ductile iron, high density polyethylene, or other material accepted by Engineer, and suitable for system operating pressures. Aluminum piping and PVC piping not mechanically restrained are not allowed. Durable hoses can be used only for short sections and with acceptance by Engineer.
2. Piping system shall have watertight joints of the following types: fused joints, restrained couplings, flanged coupling adapters, quick-connects by Camlok or equal, flanged joints, grooved and shouldered end-type couplings, and other watertight joints accepted by Engineer.
3. Size discharge piping for flow velocity of not more than 10 feet per second.
4. Provide check valves or approved pump control valves as required.
5. Provide air valves on discharge piping as required. Air valves shall expel air upon pipe filling and admit air upon pipe dewatering, and release small quantities of entrained air during operation. Air valves shall be suitable for service with the pumped fluid.
6. Discharge from temporary pumping system shall not adversely affect the existing process or facilities. Provide energy-dissipating measures at discharge point as necessary.

D. Temporary Plugs, Bulkheads, and Line Stops:
1. Acceptable temporary plugs and bulkheads include inflatable dams specifically designed for such service, brick bulkheads, timber bulkheads, sandbags, and other bulkhead methods

suitable for the service and conduit conditions. Line stops, where required, are specified in Division 40 of the Contract Documents.

2. Each plug, temporary bulkhead, and line stop shall be suitable for the maximum pressure encountered.
3. Where temporary plugs and bulkheads are under pressure or surcharged, provide either two plugs or a plug and temporary bulkhead.

PART 3 – EXECUTION

3.1 PREPARATION:

A. General:
1. Temporary piping shall be located off of roads, driveways, and sidewalks. Piping shall not be located in environmentally-sensitive areas such as wetlands.
2. Where required for Owner's access to and operation of existing facilities, bury temporary piping that would otherwise inhibit access to processes, buildings, structures, streets, and driveways. In paved areas, provide temporary surfacing, sufficient for AASHTO H-20 wheel loads over buried temporary piping.
3. Hydrostatic Testing of Temporary Piping System:
   a. Perform successful hydrostatic testing of temporary piping system using clean water at pressure equal to 1.2 times highest expected system operating pressure, for one hour while maintaining test pressure within 3.0 psig of required test pressure.
   b. Engineer will witness hydrostatic test.
   c. Hydrostatic test criteria for acceptance: No leakage.
4. Verify that entire temporary pumping system is ready for operation before commencing shutdown of Owner's operations, facility, or systems. Verify that temporary pumping system controls and flow meter are properly connected and functional.

3.2 TEMPORARY PUMPING:

A. During Operation of the Temporary Pumping System:
1. Temporary pumping system shall operate continuously. In the event of equipment failure, immediately make repairs or replace equipment. Provide spare parts and redundant units as necessary for continuous operation.
2. Provide personnel to monitor, operate, and maintain temporary pumping system twenty-four hours per day when system is in service.

3.3 DEMOBILIZATION:

A. Upon Conclusion of Temporary Pumping:
1. Remove plugs, bulkheads, and line stops in manner that allows flow to slowly return to normal, without surging, surcharging, and adverse effects on existing system.
2. Flush out temporary pumping system with clean water discharged to an appropriate location.
3. Remove temporary pumping system and appurtenances from the Site.
4. When Contractor has obtained permit(s) for temporary pumping from authorities having jurisdiction, furnish written notice to such authorities that temporary pumping has been completed.

END OF SECTION 01 5141

SECTION 01 5705

TEMPORARY CONTROLS

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide and maintain methods, equipment, and temporary construction as required to control environmental conditions at the Site and adjacent areas.
2. Maintain controls until no longer required.
3. Temporary controls include, but are not limited to, the following:
a. Erosion and sediment controls.
b. Noise controls.
c. Dust control.
d. Pest and rodent control.
e. Control of water, including storm water runnoff.
f. Pollution control.

B. Related Sections:
1. Section 01 3544, Spill Prevention Control and Countermeasures Plan.
2. Section 01 4126, Stormwater Pollution Prevention Plan and Permit.
3. Section 01 3543.13, Environmental Procedures for Hazardous Materials.
4. Section 31 2305, Excavation and Fill.

1.2 QUALITY ASSURANCE:

A. Regulatory Requirements: Comply with applicable provisions and recommendations of the authorities having jurisdiction.

1.3 SUBMITTALS:

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Plan for construction staging and maintenance of the Site relative to erosion and sediment controls. Indicate on a Site plan approximate areas of planned disturbance of soils and soil cove over time during the Project. For areas not indicated in the Contract Documents as being disturbed and that Contractor proposes to disturb, Shop Drawing shall include proposed erosion and sediment control measures for the additional area.
b. Location and details of temporary settlement basin(s).
2. Product Data:
a. Silt fencing materials.

B. Informational Submittals: Submit the following:
1. Procedural Submittals:
a. Proposed dust control measures, when submittal is requested by Engineer.

PART 2 – PRODUCTS

2.1 MATERIALS FOR TEMPORARY EROSION AND SEDIMENT CONTROLS:

A. Materials for temporary erosion and sediment controls shall be as shown or indicated on the Drawings.

B. Silt Fencing:
   1. Filter Cloth:
      a. Mirafi Envirofence, or equal.
      b. Height: Two feet, minimum.
      c. Securely fasten filter cloth to wire mesh using ties spaced at maximum intervals of two feet on centers at top and mid-height of wire mesh.
   2. Wire Mesh: Support filter cloth with wire mesh complying with the following:
      a. Woven wire mesh, 14-gauge steel wire, maximum mesh size six-inch by six-inch.
      b. Height: To match filter cloth height.
      c. Fasten wire mesh to fence supports with wire ties or staples.
   3. Fence Support Posts:
      a. Length: Three feet, minimum.
      b. Material: Metal or other acceptable material with "U" or "I" cross section, or minimum 1.25-inch by 1.25-inch hardwood.

C. Straw Bale Dike.
   1. Bales shall be firmly-packed, unrotted straw bound firmly with baling wire. Cross-sectional area on the small end of each bale shall be approximately 12 inches by 12 inches or larger.
   2. Posts shall comply with requirements for silt fencing support posts, or may be suitable reinforcing steel.

D. Mulch Materials and Soil Stabilization.
   1. Mulch shall be unrotted straw or salt hay.
   2. Soil stabilization emulsions, when used, shall be an inert, eco-friendly chemical manufactured for the specific purpose of erosion control and soil stabilization, applied with mulch or stabilization fibers.
   3. Wood-fiber or paper-fiber, when used, shall be 100 percent natural and biodegradable.
   4. Erosion control mat or netting shall be biodegradable. Acceptable materials include jute, excelsior, straw or coconut fiber, and cotton.

E. Protection of Storm Water Drainage Inlets and Catch Basins:
   1. Inlet Filter Bag:
      a. Product and Manufacturer: Provide one of the following for each drainage inlet or catch basin to be protected:
         1) Silt Sack, by Atlantic Construction Fabrics (ACF) Environmental
         2) Or equal.
      b. Inlet filter bag permeability shall be not less than 40 gallons per square foot of bag area exposed to the flow. Fabric shall be woven polypropylene with double stitching to prevent bursting.
      c. Inlet filter bags shall fit inside the drainage inlet or catch basin and shall be secured by the structure's grate or by other acceptable means.

d. Inlet filter bags shall have means of removing inlet filter bag and the silt and sediment collected in the bag, without dumping filter bag's contents into the drainage inlet or catch basin.

F. Temporary Settlement Basin.
1. Embankment Material: Comply with requirements for general fill in Division 31 Sections on earthwork, excavation, and fill.
2. Provide outfall structure consisting of overflow weir and discharge pipe, and provide emergency spillway.
3. Overflow Weir and Discharge Pipe: Suitably-sized piping of corrugated metal, high-density polyethylene, or other suitable material. Pipe may be new or used; if used, pipe shall be in good condition.

G. Filter Bag on Dewatering Pump Discharge:
1. Provide filter bag on discharge of each dewatering pump drawing from an excavation. Filter bag is not required on pumps associated with dewatering wells.
2. Products and Manufacturers: Provide one of the following:
a. UltraTech Dewatering Bag, by Interstate Products.
b. Filter Bag, by US Fabrics.
c. Dewatering (Filter) Bag, Indian Valley Industries.
d. DirtBag, by Atlantic Construction Fabrics (ACF) Environmental
e. Or equal.
3. Size filter bags for maximum flow of the pump. Filter bags shall be specifically fabricated for use as a dewatering pump filter bag.
4. Provide sufficient spare filter bags for continuous dewatering operations.

H. Temporary Stone Construction Entrance:
1. Stone: Tough, hard, durable stone complying with the following gradation requirements:

Sieve Size	Total Percent Passing
Four-inch (100 mm)	100
3.5-inch (90 mm)	90 to 100
2.5-inch (65 mm)	25 to 60
1.5-inch (37.5 mm)	Zero to 15

2. Geotextile: As recommended by geotextile manufacturer for separating stone from subgrade, for the vehicle weight and traffic frequency required.

PART 3 – EXECUTION

3.1 NOISE CONTROL:

A. Noise Control – General:
1. Contractor’s vehicles and equipment shall minimize noise emissions to greatest degree practicable. Provide mufflers, silencers, and sound barriers when necessary.
2. Noise levels shall comply with Laws and Regulations, including OSHA requirements and local ordinances.
3. Noise emissions shall not interfere with the work of Owner or others.

3.2 DUST CONTROL:

A. Dust Control – General:
1. Control objectionable dust caused by Contractor's operation of vehicles and equipment, clearing, and other actions. To minimize airborne dust, apply water or use other methods subject to acceptance of Engineer and approval of authorities having jurisdiction.
2. Contractor shall prevent blowing and movement of dust from exposed soil surfaces and access roads to reduce on- and off-Site damage, nuisances, and health hazards associated with dust emissions. Control may be achieved by irrigation in which the Site shall be sprinkled with water until the surface is moist. Apply dust controls as frequently as required without creating nuisances such as excessive mud and ponding of water at the Site.
3. Remove dust from roadways and access roads at maximum intervals of seven days by mechanical brooming or other method acceptable to Engineer.

B. Comply with Section 01 4127, Earthmoving Permit and Dust Control.

3.3 PEST AND RODENT CONTROL:

A. Pest and Rodent Control – General:
1. Provide rodent and pest control as required to prevent infestation of the Site and storage areas.
2. Employ methods and use materials that do not adversely affect conditions at the Site or on adjoining properties.
3. In accordance with Laws and Regulations, promptly and properly dispose of pests and rodents trapped or otherwise controlled.

3.4 WATER CONTROL:

A. Water Control – General:
1. Provide methods to control surface water and water from excavations and structures to prevent damage to the Work, the Site, and adjoining properties.
2. Control fill, grading, and ditching to direct water away from excavations, pits, tunnels and other construction areas and to direct drainage to proper runoff courses to prevent erosion, damage, or nuisance.

B. Equipment and Facilities for Water Control: Provide, operate, and maintain equipment and facilities of adequate size to control surface water.

C. Discharge and Disposal: Dispose of drainage water in manner to prevent flooding, erosion, and other damage to any and all parts of the Site and adjoining areas, and that complies with Laws and Regulations.

3.5 POLLUTION CONTROL:

A. Pollution Control – General:
1. Provide means, methods, and facilities required to prevent contamination of soil, water, and atmosphere caused by discharge of noxious substances from construction operations.
2. Equipment used during construction shall comply with Laws and Regulations.
3. Refer to Section 01 3543.13, Environmental Procedures for Hazardous Materials.

B. Spills and Contamination:

1. Provide equipment and personnel to perform emergency measures required to contain spills and to remove contaminated soils and liquids.
2. Excavate contaminated material and properly dispose of off-Site, and replace with suitable compacted fill and topsoil.
3. Refer to Section 01 3544, Spill Prevention Control and Countermeasures Plan

C. Protection of Surface Waters: Implement special measures to prevent harmful substances from entering surface waters. Prevent disposal of wastes, effluents, chemicals, and other such substances in or adjacent to surface waters and open drainage routes, in sanitary sewers, or in storm sewers.

D. Atmospheric Pollutants:
1. Provide systems for controlling atmospheric pollutants related to the Work.
2. Prevent toxic concentrations of chemicals and vapors.
3. Prevent harmful dispersal of pollutants into atmosphere.

E. Solid Waste:
1. Provide systems for controlling and managing solid waste related to the Work.
2. Prevent solid waste from becoming airborne, and from discharging to surface waters and drainage routes.
3. Properly handle and dispose of solid waste.

3.6 EROSION AND SEDIMENT CONTROL:

A. Installation and Maintenance of Erosion and Sediment Controls – General:
1. General:
   a. Provide erosion and sediment controls as shown and indicated on the Drawings and elsewhere in the Contract Documents. Provide erosion and sediment controls as the Work progresses into previously undisturbed areas.
   b. Installation of erosion and sediment controls shall be in accordance with the applicable regulatory requirements indicated in Article 1.2 of this Section, unless otherwise shown or indicated in the Contract Documents.
   c. Use necessary methods to successfully control erosion and sedimentation, including ecology-oriented construction practices, vegetative measures, and mechanical controls. Use best management practices (BMP) in accordance with Laws and Regulations, and regulatory requirements indicated in Article 1.2 of this Section, to control erosion and sedimentation during the Project.
   d. Plan and execute construction, disturbances of soils and soil cover, and earthwork by methods to control surface drainage from cuts and fills, and from borrow and waste disposal areas, to prevent erosion and sedimentation. Provide temporary measures for controlling erosion and sedimentation, as indicated in the Contract Documents and as required for the Project.
   e. Where areas must be cleared for storage of materials or equipment, or for temporary facilities, provisions shall be made for regulating drainage and controlling erosion and sedimentation, subject to the Engineer's approval.
   f. Provide erosion and sediment controls, including stabilization of soils, at the end of each workday.
2. Coordination:
   a. Coordinate erosion and sediment controls with this Section's requirements on water control and with Section 01 4126, Stormwater Pollution Prevention Plan and Permit.

b. Coordinate temporary erosion and sediment controls with construction of permanent drainage facilities and other Work to the extent necessary for economical, effective, and continuous erosion and sediment control.

3. Before commencing activities that will disturb soil or soil cover at the Site, provide all erosion and sediment control measures required by the Contract Documents for the areas where soil or soil cover will be disturbed.
4. In general, implement construction procedures associated with, or that may affect, erosion and sediment control to ensure minimum damage to the environment during construction. Contractor shall implement any and all additional measures required to comply with Laws and Regulations, and Section 01 4126, Stormwater Pollution Prevention Plan and Permit.
5. Vegetation Removal: Remove only those shrubs, grasses, and other vegetation that must be removed for construction. Protect remaining vegetation.
6. Access Roads and Parking Areas: When possible, access roads and temporary roads shall be located and constructed to avoid adverse effects on the environment. Provisions shall be made to regulate drainage, avoid erosion and sedimentation, and minimize damage to vegetation.
7. Earthwork and Temporary Controls:
   a. Perform excavation, fill, and related operations in accordance with Section 31 2305, Excavation and Fill.
   b. Control erosion to minimize transport of silt from the Site into existing waterways and surface waters. Such measures shall include, but are not limited to, using berms, silt fencing, baled straw silt barriers, gravel or crushed stone, mulching and soil stabilization, slope drains, and other methods. Apply such temporary measures to erodible materials exposed by activities associated with the construction of the Project.
   c. Hold to a minimum the areas of bare soil exposed at one time.
   d. Construct fills and waste areas by selectively placing fill and waste materials to eliminate surface silts and clays that will erode.
   e. In performing earthwork, eliminate depressions that could serve as mosquito pools.
   f. Contractor shall provide special care in areas with steep slopes, where disturbance of vegetation shall be minimized to maintain soil stability.
8. Inspection and Maintenance:
   a. Periodically inspect areas of earthwork and areas where soil or soil cover are disturbed to detect evidence of the start of erosion and sedimentation; apply corrective measures as required to control erosion and sedimentation. Continue inspections and corrective measures until soils are permanently stabilized and permanent vegetation has been established
   b. Inspect not less often than the frequency specified in Section 01 4126, Stormwater Pollution Prevention Plan and Permit.
   c. Repair or replace damaged erosion and sediment controls within 24 hours of Contractor becoming aware of such damage.
   d. Periodically remove silt and sediment that has accumulated in or behind sediment and erosion controls. Properly dispose of silt and sediment.
9. Duration of Erosion and Sediment Controls:
   a. Maintain erosion and sediment controls in effective working condition until the associated drainage area has been permanently stabilized.
   b. Maintain erosion and sediment controls until the Site is restored and site improvements including landscaping, if any, are complete with underlying soils permanently stabilized.

10. Work Stoppage: If the Work is temporarily stopped or suspended for any reason, Contractor shall provide additional temporary controls necessary to prevent environmental damage to the Site and adjacent areas while the Work is stopped or suspended.
11. Failure to Provide Adequate Controls: In the event Contractor repeatedly fails to satisfactorily control erosion and siltation, Owner reserves the right to employ outside assistance or to use Owner's own forces for erosion and sediment control. Cost of such work, plus engineering and inspection costs, will be deducted from monies due Contractor.

B. Silt Fencing:
1. Install and maintain silt fencing in a vertical plane, at the location(s) shown or indicated on the Drawings.
2. Locations of Silt Fencing:
   a. Where possible, install silt fencing along contour lines so that each given run fencing is at the same elevation.
   b. On slopes install silt fencing at intervals that do not exceed the maximum intervals indicated in the following table:

Slope (percent)	Maximum Length of Slope Above Each Silt Fence (feet)
2 and less	150
2.1 to 5	100
5.1 to 10	50
10.1 to 20	25
20.1 to 25	20
25.1 to 40	15
40.1 to 50	10

   c. Provide silt fencing around perimeter of each stockpile of topsoil, general fill material, and excavated material. Install silt fencing before expected precipitation and maintain until stockpile is removed.
   d. Do not install silt fencing at the following types of locations:
      1) Area of concentrated storm water flows such as ditches, swales, or channels.
      2) Where rock or rocky soils prevent full and uniform anchoring of silt fencing.
      3) Across upstream or discharge ends of storm water piping or culverts.
3. Installation:
   a. Securely fasten wire mesh to posts, and securely fasten filter cloth to wire mesh.
   b. When two sections of filter cloth abut each other, fold over edges and overlap by minimum of six inches and securely fasten to wire mesh.
   c. Embed posts in the ground to the depth necessary for proper controls; embed posts to at least 16 inches below ground.
   d. Filter cloth and wire mesh shall extend a minimum of eight inches below ground and a minimum of 16 inches above ground.
   e. Remove sediment accumulated at silt fencing as required. Repair and reinstall silt fencing as required.
4. Maintenance:
   a. Do not allow formation of concentrated storm water flows on slopes above silt fencing unless so shown or indicated in the Contract Documents. If unauthorized concentrated storm water flows occur, stabilize the slope via earthmoving and other stabilization measures as required to prevent flow of concentrated storm water flows toward silt fencing.

C. Straw Bale Dike.
   1. Install straw bale dikes where shown or indicated, including in swales, along contours, and along toe of slopes.
   2. Install bales in shallow excavation as wide as the bale and approximately four to six inches below surrounding grade.
   3. Ends of bale shall tightly abut ends of adjacent bales.
   4. Securely install straw bales using two support posts per bale, driven into the ground a minimum of 1.5 to two feet below bottom of bale. Top of post shall be flush with top of bale. Angle first post for each bale toward the previously-installed bale.
   5. Frequently inspect bales and repair or replace as required. Remove accumulated silt and debris from behind straw bales.

D. Mulching and Soil Stabilization:
   1. Use mulching to temporarily stabilize exposed soil and fill material.
      a. Immediately following final grading, provide mulch and stabilize with mats or netting, or sprayed soil stabilization emulsion with fiber additive.
      b. Application of mulching for soil stabilization shall be as follows.
         1) Unrotted Straw or Salt Hay: 1.5 to two tons per acre.
         2) Soil stabilization emulsions, when used, shall be applied in accordance with manufacturer's instructions, and shall be applied with mulch or stabilization fibers.
         3) Wood-fiber or Paper-fiber Application: 1,500 lbs. per acre, installed by hydroseeding.
      c. Where mats or netting are used:
         1) Cover entire area to be stabilized with mats or netting.
         2) Provide anchoring trenches at the top and bottom of slopes to receive mats or netting. Bury at least the top and bottom ends of mat or netting, four inches or more wide, at top and bottom of slope. Tamp trench full of soil. Four inches from trench, secure mat or netting with appropriate staples spaced at intervals of 10 inches.
         3) Overlap adjacent strips of mat or netting by at least four inches.

E. Protection of Storm Water Drainage Inlets and Catch Basins:
   1. Protect each drainage inlet and catch basin that has the potential to receive storm water runoff from exposed soils, and does not discharge into a storm water settlement basin.
   2. Install inlet filter bags inside of drainage inlet or catch basin in accordance with manufacturer's instructions. Secure inlet filter bag with the structure's grate or by other acceptable means.
   3. Inlet filter bags shall not pose any obstruction above the elevation of the drainage inlet or catch basin grate requiring barricades or flashers.
   4. When removing silt and sediment from inlet filter bag, do not dumpi filter bag's contents into the drainage inlet or catch basin.
   5. Remove silt and sediment from inlet filter bag, or replace inlet filter bag, when inlet filter bag is not more than half full.

F. Temporary Settlement Basin.
   1. For constructing embankments comply with requirements in Division 31 Sections on earthwork, embankments, excavation, and fill.
   2. Overflow Weir and Discharge Pipe:
      a. Install piping in accordance with manufacturer's instructions.

b. Install overflow weirs at elevations on shown or indicated on the Drawings or approved Shop Drawings, as applicable, to avoid overtopping and overfilling of settlement basin without short-circuiting the settlement basin's hydraulics.
c. Wrap geotextile material specified for silt fencing around discharge structures of temporary settlement basins

3. Crushed Stone and Riprap: Install in accordance with Division 31 Sections on crushed stone and riprap. Provide in areas of temporary settlement basin subject to erosion, and at upstream and downstream ends of discharge piping.
4. Remove sediment when required based on accumulation of material.
5. When temporary settlement basin is no longer required, remove the temporary settlement basin discharge weir , discharge pipe, and spillway, fill the temporary sediment basin to required grade in accordance with requirements of Division 31 Section on excavation and fill, and provide landscaping in accordance with Division 32 Sections on landscaping.

G. Filter Bag on Dewatering Pump Discharge:
1. Provide dewatering of excavations in compliance with Division 31 Sections on earthmoving, excavation, and fill.
2. Locate filter bags and temporary pump discharge lines to avoid interfering with the public, use of private property, and Owner's operations. Relocate filter bags and appurtenances when required.
3. Filter bag discharge shall be directed to appropriate storm water drainage route. Do not discharge into roadways, driveways, access roads, and overland. When temporary settlement basin is used, locate filter bags to discharge to temporary settlement basin when practicable.
4. Provide filter bag on discharge of each dewatering pump drawing from an excavation.
5. Securely attach filter bag to pump discharge pipe or hose.
6. Maintain, clean out, and replace filter bags as required.

H. Temporary Stone Construction Entrance:
1. Where shown on the Drawings, and where construction vehicles will regularly transit to paved surfaces from unstabilized surfaces, provide a temporary stone construction entrance. Contractor vehicles shall use temporary construction entrances.
2. Provide temporary stone construction entrances of the width, length, and thickness shown or indicated on the Drawings. When not shown or indicated on the Drawings, temporary stone construction entrance shall be not less than 50 feet long, by 20 feet wide, by eight inches deep.
3. Installation:
a. Ensure that subgrade under temporary stone construction entrance is suitably dense for the intended purpose. Suitably prepare subgrade as required for temporary construction entrance.
b. Provide on subgrade a layer of geotextile fabric, installed in accordance with geotextile manufacturer's recommendations for separation.
c. Provide stone on installed geotextile. Grade stone for passage of vehicles.
4. Maintenance:
a. Maintain temporary stone construction entrance at not less than the minimum required thickness. Add stone as required to maintain thickness.
b. When upper layer of temporary stone construction entrance becomes contaminated with soil, remove the contaminated material and replace with clean stone.
c. Using water to wash down temporary construction entrance or paved areas onto which soil material has been tracked is not allowed.

3.7 REMOVAL OF TEMPORARY CONTROLS:

A. Removals – General:
   1. Upon completion of the Work, remove temporary controls and restore Site to specified condition; if condition is not specified, restore Site to pre-construction condition.
   2. After soils are permanently stabilized, remove from the Site temporary erosion and sediment controls.

END OF SECTION 01 5705

SECTION 01 6000

PRODUCT REQUIREMENTS

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other sections.

1.2 FABRICATION

A. Fabricate all items in the shop insofar as possible. Where items cannot be completely shop-fabricated and assembled for shipment, assemble and fit in shop, disassemble and ship. Identify parts for field assembly. Fabricate items to be straight, square, in proper alignment, and with hairline joints where joints are necessary. Pre-plan field joints to be as inconspicuous as possible.

1.3 SHOP PRIMING

A. Shop prime or seal surfaces of all products to receive paint materials in accordance with requirements of the Contract Documents. Apply a primer or sealer compatible with the specified paint materials. If such primer is determined to be incompatible with the specified paint materials, provide a barrier coat or remove the primer and prime again as required.

1.4 DELIVERY, STORAGE AND HANDLING

A. Packing: Deliver products in properly identified original packages or other containers with unbroken seals and manufacturer's labels, grade marks and other means of identification in place.

B. Shipping/Delivery
   1. Protect products during shipment to maintain the product's original characteristics.
   2. Deliver materials and equipment which will require controlled storage conditions on Site after the controlled storage provisions have been made on Site.
   3. Deliver materials, supplies, or equipment to Project site during working hours.
   4. Deliveries made during other than normal working hours must be received by an authorized agent of Contractor involved or be received by other means which shall be the sole responsibility of that Contractor.
   5. No employee of the Owner or Engineer is authorized to receive any shipment designated for this Project.
   6. The Owner or Engineer assumes no responsibility for receiving any shipment designated for this Project.
   7. Any materials delivered in the presence of Owner's or Engineer's representative shall be accounted for by the respective Contractor.
   8. Under no circumstances may shipments be directed to, or in care of, the Owner.
   9. Each Contractor, Subcontractor, manufacturer, or supplier furnishing materials to the site shall identify, ship, address, consign, etc. all such materials to the Contractor who may be charged therewith by giving the name of the Contractor, the name and address of the Project.

C. Unloading and Acceptance
   1. Deliver products in properly identified original packages or other containers with unbroken seals and manufacturer's labels, grade marks and other means of identification in place.
   2. Check each item for completeness of order, physical condition and conformance to the Contract Documents. Reject products which do not conform to these requirements, or which have been damaged beyond repair or restoration to original condition as approved by Engineer.

D. Protection
   1. Protect products during shipment and on Site to maintain the original product characteristics.
   2. Protect all finished surfaces from damage during installation. Provide protective devices as required and as recommended by the manufacturer. Cover work subject to damage at the end of each day's work.
   3. Coat concealed surfaces of metal products with a bituminous or other approved coating to prevent contact between dissimilar metals or other material which can cause deterioration.
   4. Correct damage by repairing or replacing as required by Engineer. Repairing will be permitted only where the repair is undetectable and does not cause structural damage or interfere with proper functioning of the part.
   5. Protect finish of installed products until Substantial Completion of the Project by use of wrappings, covers, or other approved protective devices. Remove such protection immediately prior to final cleaning.

E. On-Site Storage
   1. Store hazardous products, such as paint materials, in well ventilated areas in accordance with applicable standards and governing laws.
   2. Store materials off the ground and in a manner to prevent damage or intrusion of moisture or other foreign matter.
   3. Cover materials which may be damaged by weather, allowing for proper circulation of air.
   4. When possible, store materials inside the building or in sheds.
   5. When storing materials in the building, stockpile materials in a manner which will not overload the structure.
   6. Store all materials in a manner immediately accessible for inspection.
   7. Store small items, such as finish hardware and other items easily stolen or vandalized, in a security area. Where possible, do not deliver such items until immediately prior to installation.

1.5 INSTALLATION STANDARDS

A. Examination of Substrate: Examine the substrate or structure to which a product is to be applied or installed. Check the substrate or structure for proper clearances and tolerances. Tolerances are listed in each Section. Do not proceed until unsatisfactory conditions have been corrected. Starting the work indicates acceptance of conditions and the installer assumes full responsibility for results.

B. Preparation
   1. Substrate: Where products are applied to a substrate, prepare the substrate as recommended by the product manufacturer, generally as follows:

a. Bring substrate to a uniform surface by smoothing uneven surfaces and filling holes, cracks and low places with recommended filler or parent material.
b. Remove substances, such as dust, oils and other foreign matter, not compatible with the product.
c. Surfaces shall be dry, unless a moisture content or wetting is specified.

2. Inserts and Anchorages
   a. Installer shall furnish built-in fastening devices for his product to the proper trade for installation as the work proceeds.
   b. If such devices are not furnished in time to be built in, installer shall provide alternate methods for attaching his product. Submit Drawings and other required data as Reference Submittals.
3. Templates: Provide templates, diagrams and other coordinating documents to the proper Contractor, manufacturer, or supplier of related items affecting the work.
4. Dimensions
   a. If the exact location of an item is not indicated by dimension on the Drawings or noted in the Specifications, Engineer reserves the right to determine such location in the field prior to roughing in.
   b. If the exact dimensions of a product are not indicated, Engineer reserves the right to determine dimensions prior to ordering or fabricating the product.
   c. Such dimensional changes shall not be a basis for changes in the Contract Sum.
   d. Where miscellaneous devices, such as thermostats, switches, controls, grilles, pipes, or outlets of any nature are not exactly located by the Contract Documents, request such location or obtain approval of the location prior to installation. If approval has not been obtained, Engineer may require the relocation of such devices at the expense of the installer.

C. Installation
1. Install products in accordance with the manufacturer's recommendations or the requirements of trade associations, listed standards, conforming Shop Drawings, and Contract Documents. Where a conflict exists between these references, the most strict requirements govern. If printed instructions are not available, consult with the manufacturer's field representative.
2. Provide hangers, auxiliary framing, and other means for installing ceiling suspension systems, lighting fixtures, diffusers, and other equipment in ceilings to avoid ducts, piping, etc.
   a. Suspend from structural members, such as joists or beams, and not from ducts or piping.
3. Install work in a manner which will not interfere with the proper installation of the work of other trades and to facilitate operating, servicing, and repairing.
4. Install products straight, plumb, level, and in line. Securely attach items to the substrate, using recommended adhesives, mechanical fasteners or other devices. Where holes are provided for attachment, do not field drill or cut new holes without approval of Engineer.
5. Match all finished work to the submitted Samples or Sample panels.
6. Conceal fasteners wherever possible, unless exposed fasteners are permitted or specified.
7. Weld in accordance with AWS standards for qualifications of operators and for workmanship.

1.6 PRODUCT OPTIONS AND SUBSTITUTIONS

A. Refer to Instructions to Bidders for requirements and approval process of substitute materials, products, and systems.

B. Manufacturers, Products, Materials, Equipment and Systems

1. General: Where more than one manufacturer, product, material, equipment item, or system is indicated as acceptable, provide any one named. No substitutions will be permitted after signing the Contract.
2. Contractor's Option
   a. In many instances this Project has been designed around a specific manufacturer with other manufacturers listed as acceptable.
      1) Products from such other listed manufacturers will be accepted contingent upon meeting the design, appearance and functional standards established by the specified items.
   b. If any changes to the Contract Documents or work are required to accommodate an acceptable product of one such other listed manufacturer, the Contractor whose product requires such changes shall pay all additional costs involved with no additional cost to the Owner or Engineer. Such additional costs to be paid by such Contractor shall include, but not be limited to, all additional costs required for changes in the work of such Contractor and of all other Contractors as well as all costs for additional services of the Reviewer to review such changes.
   c. Payments for such additional services of the Reviewer shall be made as follows:
      1) Owner will compensate Engineer.
      2) Owner will deduct the amount of such compensation from payments to the Contractor.
3. Unavailability of Product: When all of the products listed in the Contract Documents for a specified item are no longer being manufactured, or when products are not listed and all of the conforming products of manufacturers listed in the Contract Documents for a specified item are no longer being manufactured, then submit, through the Change Order process, the name of another product and manufacturer for review and approval by the Reviewer. Submit all documentation required elsewhere in the Contract Documents and as required by the Reviewer to show proof that the submittal is an equal in every respect to the item specified.
4. Performance Specification: Where a performance is specified and no manufacturer is listed, submit through the Shop Drawing procedure the name of the manufacturer, the product proposed, and detailed information showing its characteristics.
5. Color, Pattern, Texture: Where a choice of color, pattern, or texture is available for a specified product or item of equipment, the Reviewer will make a selection from the manufacturer's highest or best standards, unless noted otherwise in the technical sections of the Project Manual.

END OF SECTION 01 6000

SECTION 01 7500

STARTING AND ADJUSTING

PART 1 GENERAL

1.1 REFERENCE

A. The requirements of Division 01 apply to the work of all other sections.

1.2 SCOPE

A. Section includes initial testing and balancing of all process and electrical systems.

1.3 TESTING, ADJUSTING AND BALANCING SYSTEMS

A. Testing
   1. Contractor shall establish an orderly procedure for testing the project and portions of the project.
   2. Contractor shall test each individual system prior to final acceptance.
   3. Prior to starting any testing, Contractor shall submit, in writing, to the Owner and Engineer a tentative schedule of tests and a description of the test to be conducted on each system for approval.
   4. Engineer and/or Owner may observe any and all testing.
   5. Contractor shall be responsible for operation and maintenance of all systems until accepted by the Owner, at which time the Owner assumes responsibility for operation and maintenance.
   6. Test all systems or structures after they are complete, ready for operation, and the necessary arrangements have been made to provide testing media.
      a. Contractor shall provide all test media, unless otherwise indicated.
      b. Test with water all liquid systems, including liquid chemicals.
   7. Tests shall verify that all components of the system operate properly through the full design ranges.
   8. Test completion shall not, by itself, constitute acceptance of the system or any part of the system.
   9. Contractor shall provide all materials necessary to conduct tests, unless otherwise indicated.

B. Adjusting
   1. Contractor shall be responsible for making necessary adjustments and repairs to items he has installed.
   2. When testing indicates deficiencies in any portion of the work, Contractor shall make necessary adjustments and repairs immediately. Repeat the test until all deficiencies are corrected.

1.4 SYSTEMS DEMONSTRATIONS

A. Where required, instruct Owner's personnel in operating procedures, maintenance, safety precautions, and use of manuals and other literature.

END OF SECTION 01 7500

SECTION 01 7700

CLOSEOUT PROCEDURES

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 FINAL CLEANING

A. At completion of the work, prior to the Owner's occupancy and prior to submittal of Application for Final Payment, perform final cleaning.

B. Perform the following general cleaning:
   1. Remove from the Site all temporary facilities, fences, scaffolding, tools and equipment, and surplus materials.
   2. Remove all rubbish, loose plaster, mortar drippings, extraneous construction materials, dirt and dust from electrical closets, pipe and duct shafts, chases, furred spaces, and similar unfinished spaces.
   3. Remove all temporary protective devices.
   4. Repair, patch and touch-up damaged surfaces to specified finish to match adjacent surfaces. Replace damaged materials which cannot be satisfactorily repaired.
   5. Broom clean paved surfaces and rake clean other surfaces of the Site.

C. Perform the following cleaning and polishing:
   1. Clean all interior and exterior surfaces exposed to view:
      a. Remove paint spatters, stains, dirt, grease, finger smudges and other marks, soiling, and foreign matter.
      b. Remove all labels.
      c. Remove all dust and dirt by vacuuming and washing.
   2. Each Contractor shall do all cleaning of finish surfaces relative to its work prior to acceptance of their work. General Contractor shall do a subsequent final cleaning including, but not limited to all glass; remove stains, spots, marks, and dirt from decorated work and finished surfaces; clean all hardware; wash all concrete, ceramic tile finishes and clean all flooring materials in accordance with Specifications prior to final acceptance by the Owner. Each Contractor shall comply with all special cleaning instructions, contained in the Specifications.
   3. Clean and polish finished surfaces in accordance with the manufacturer's instructions or with the special cleaning instructions in the technical sections.
   4. Clean visible portions of mechanical and electrical equipment and fixtures. Clean inside lighting fixtures and lenses.

D. Perform and maintain specified cleaning of Project until the Owner's occupancy. Recleaning will not be required after the Owner's occupancy unless later operations of the Contractor make recleaning necessary.

1.3 PROJECT RECORD DOCUMENTS

A. As-Built Drawings

1. Maintain at the Site, for the Owner, one copy of all Drawings, Specifications, approved copies of Building Department Documents, Addenda, Change Orders, Modifications, Shop Drawings, Product Data and Samples in good order and marked currently to record all changes made during construction. These As-Built Drawings shall be available to Engineer.
2. Deliver to Engineer for the Owner's file, at the completion of the work, an accurate set of marked-up as-built documents, including a copy of the Project Manual and the Drawings, showing the Project, insofar as the actual construction or installation differs from the Documents. Final payment will not be made until receipt of complete As-Built documents.
    a. Engineer will provide one set of Drawings and Project Manual to be specifically used for this purpose.
3. Include Drawings for all Site, General, Plumbing, Heating, Ventilating and Air Conditioning, and Electrical Trades. Record all changes and information such as:
    a. Elevation at bottom of foundations in relation to finished first floor
    b. Horizontal and vertical locations of underground utilities and appurtenances, referenced to permanent surface improvements
    c. Location of internal utilities and appurtenances concealed in the construction, referenced to visible and accessible features of the structure
    d. Changes of dimensions plan arrangement, material, and details
    e. Changes made by Field Order or by Change Order
    f. Details not on original Contract Drawings
4. Note in each Specification Section the actual manufacturer's trade name, catalog number and supplier of each product incorporated into the work. Note changes made by Change Order.
5. Maintain all such documents at the Site during each step of the work.
6. While RFI’s and RFP’s can be taped to the back of the previous Drawing, the revised work must still be marked legibly on the Drawing.
7. Electronic copy of final site plan as prepared by professional surveyor shall be submitted to Engineer. All elevations of structures at catch basins and manholes, and invert elevations shall be noted. As-built elevation point files shall be provided.

1.4 WARRANTIES AND BONDS

A. Special Guaranties and Warranties

1. General
    a. Special guaranties and warranties are in addition to all other guaranties and warranties required elsewhere in the Contract Documents.
    b. Definitions
        1) A Guaranty is a separate Contract by a third party, covering responsibility if a principal fails to perform.
        2) A Warranty is a principal's own assurance that he will assume stipulated responsibilities.
    c. Submit certificates of these guaranties and warranties, properly dated and executed. Such warranty shall not preclude Contractor's liability under governing laws or the warranty specified in the General Conditions.
    d. In the written guaranties and warranties, indicate the products and performance covered, the remedy in the event of failure of the product or process to perform as specified, and the length of the warranty and guaranty period.
    e. Such guaranties and warranties shall run for the entire period specified to the

Owner and the then current Owner, regardless of any transfer of ownership of the Project, or portions thereof, by sale, assignment, act of law, or otherwise.

2. Manufacturer Special Warranty: Where a manufacturer's special warranty is required in the technical specifications, manufacturer shall warrant, to the Owner and Contractor, all of his work in accordance with the requirements of the technical specifications and this Section. Provide such in writing, signed by an officer of the manufacturer, for a period commencing at the date of substantial completion and as specified in the technical specifications. Contractor shall be jointly and severally liable with manufacturer for all requirements of manufacturer's special warranty.
3. Installer's Special Guaranty and Warranty: Where an Installer's special guaranty and warranty is required in the technical specifications, Installer shall comply with all of the requirements set forth in the Installer Special Guaranty and Warranty form at the end of this Section. Installer shall complete and submit such form. Contractor shall be jointly and severally liable with Installer for all requirements of Installer's special guaranty and warranty.

1.5 SPARE PARTS AND MAINTENANCE MATERIALS

A. Extra Stock: Where the basic unit of material supplied is in boxes, packages, cans or other containers, supply a minimum of one complete container. Where the material is yard goods, turn over all excess material (except small scraps) to the Owner for extra stock, in addition to specified amounts. In each case, supply at least one unit or item of each type, size, material and color used in the work from the same manufactured lot as the materials installed.

B. Submit a list of all spare parts provided in a Table with the description, number of parts, specification, related piece of equipment, and location stored.

1.6 RESTORATION OF SITE

A. Where portions of the Site, either inside or outside the Contract Limit Lines, are not designated for change or new work and become damaged during the course of construction due to operations arising from work under this Contract, repair or replace such damage in conformance with the Contract Documents for like or similar work. If the Contract Documents do not contain like or similar work, repair or replace such damaged areas as required to their original condition.

1.7 SUBSTANTIAL COMPLETION

A. When the work is substantially complete, submit:
   1. A written notice that the work, or designated portion thereof, is substantially complete
   2. A list of items to be completed or corrected. The failure to include any items on such list does not alter the responsibility of the Contractor to complete all work in accordance with the Contract Documents.

B. Engineer will then make an inspection to determine the status of completion.

C. If Engineer determines that the work is not substantially complete, he will notify the Contractor in writing, listing the reasons.
   1. Correct all items listed and send a second written notice of substantial completion to Engineer.
   2. Engineer will reinspect the work.

D. When Engineer determines that the work or designated portion thereof is substantially complete, he shall:
   1. Prepare a Certificate of Substantial Completion, accompanied by Contractor's list of items to be completed or corrected as verified and amended by the Engineer. Such certificate shall establish the Date of Substantial Completion, shall state the responsibilities of the Owner and the Contractor for security, maintenance, heat utilities, damage to the work, and insurance, and shall fix the time within which the Contractor shall complete the items on the above lists.
   2. Submit the Certificate of Substantial Completion to Owner and Contractor for their written acceptance of the responsibilities assigned to them in the Certificate.

E. When the Owner concurs that the work is substantially complete, he will accept the Contractor's list of items to be completed or corrected as amended by the Engineer and, under terms of the Contract Documents, occupy the Project or portion thereof.

1.8 FINAL INSPECTION

A. When the work or designated portion thereof is complete, submit written certification that:
   1. All items on the above list have been completed or corrected.
   2. Contract Documents have been reviewed
   3. Work has been inspected for compliance with Contract Documents
   4. Work has been completed in accordance with Contract Documents
   5. Equipment and systems have been tested in the presence of the Owner and are operational
   6. Work is completed and ready for final inspection

B. Upon receipt of written notice that the work is ready for final inspection and acceptance and upon receipt of a final Application for Payment, Engineer shall promptly make such final inspection.

C. If Engineer considers the work incomplete or defective, he will promptly notify the Contractor in writing, listing the incomplete or defective work.
   1. Contractor shall take immediate steps to remedy the stated deficiencies and shall send a second written certification to Engineer that the work is complete.
   2. Engineer will reinspect the work.

D. During the final inspection, demonstrate all operable equipment and other moving parts. Make all adjustments to the satisfaction of the Owner.

E. When Engineer finds that the work is acceptable under the Contract Documents, he will request the Contractor to make closeout submittals.

1.9 REINSPECTION FEES

A. Engineer will not be obligated for work beyond the scope of the Owner- Engineer Agreement. If Engineer is required to perform reinspection due to failure of the work to comply with the claims of status of completion made by the Contractor:
   1. Owner shall compensate Engineer for such Additional Services and Owner shall deduct the amount of such compensation from Final Payment to Contractor.

1.10 FINAL ADJUSTMENT OF ACCOUNTS

A. Submit a final statement of accounting with adjustments to the Contract Sum and include:
   1. The original Contract Sum.
   2. Additions and deductions resulting from:
      a. Previous Change Orders.
      b. Allowances.
      c. Unit Prices.
      d. Deductions for uncorrected work.
      e. Deductions for liquidated damages.
      f. Deductions for reinspection payments.
      g. Other adjustments.
   3. Total Contract Sum, as adjusted.
   4. Previous payments.
   5. Sum remaining due.

B. A final Change Order will be prepared reflecting adjustments to the Contract Sum not previously made by Change Orders.

1.11 FINAL APPLICATION FOR PAYMENT

A. Submit the final Application for Payment in accordance with requirements stated in the Conditions of the Contract.

1.12 DELIVERY OF DOCUMENTS

A. With the final Application for Payment and before the final Certificate of Payment will be issued, submit As-Built Drawings, Project Manual, and all O&M Manuals.

END OF SECTION 01 7700

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 01 7823

OPERATION AND MAINTENANCE DATA

PART 1 - GENERAL

1.1 REFERENCES

A. The requirements of Division 01 apply to the work of all other Sections.

1.2 GENERAL

A. Submittal of operation and maintenance data shall be made to the Engineer on specified product items as outlined herein.

1.3 OPERATION AND MAINTENANCE MANUALS

A. Required where specified in technical sections.

B. Submit written instructions for operating each piece of equipment and for maintaining equipment. At the time of inspection for substantial completion, Engineer will notify Contractor of any revisions, corrections or incomplete data required for the satisfactory completion of the Operation and Maintenance Data Reference Manual. Engineer will not recommend final acceptance of the work until the Operation and Maintenance Data Reference Manual is complete and satisfactory to him.

C. Submit Operations and Maintenance Manuals when the equipment is delivered to the Job Site. Failure to deliver manuals may be cause to withhold payment for equipment.

D. The Operation and Maintenance Data Reference Manual shall contain, but is not limited to, the following information on all equipment and accessories furnished and installed under these Specifications:
   1. Equipment function, normal operating characteristics and limiting conditions for all equipment furnished.
   2. Detailed assembly, installation, alignment, adjustment and checking instructions for all equipment furnished.
   3. Detailed operating instructions for start-up, calibration, routine and normal operations, regulation and control, shutdown and emergency conditions for all equipment furnished.
   4. Detailed lubrication instructions and schedules for all equipment furnished including identification of lubricant (description, specification and trade name of at least two manufacturers), and diagrams illustrating lubrication points.
   5. Detailed guide to "troubleshooting" for all equipment furnished.
   6. Detailed parts lists identified by generic title, materials of construction and part number (actual manufacturer's number, not supplier's), list of recommended spare parts identified as specified above, predicted life of parts subject to wear and an exploded view of each equipment assembly for all equipment furnished.
   7. Electrical and instrumentation schematics for all equipment furnished including motor control centers, control panels, instrument panels and analyzer panels.
   8. List of all special tools required and description of their use for all equipment furnished. Special tools include any tool not normally available in an industrial hardware store.

9. Detailed preventive maintenance procedures and schedules for all equipment furnished.
10. Detailed list of settings for relays, pressure switches, temperature switches, level switches, thermostats, alarms, relieve valves, rupture discs, etc.
11. List of names and addresses of nearest service centers for parts, overhaul service.
12. One copy of any instructions and parts lists attached to equipment when delivered.
13. Procedures for storing, handling and disposing of any chemicals or products used with the equipment or system.

E. Assembly of Operation and Maintenance Data Reference Manual
1. Submit 1 preliminary copy of each manual in electronic PDF format to Engineer prior to date of shipment of the equipment
2. Three (3) final copies of each O&M manual shall be submitted, directly to the Owner, using loose-leaf binders. Binders shall be three-ring, hardback type, with a transparent vinyl pocket on the spine for label.
3. Each copy of the data reference manual shall be assembled in one or more loose-leaf binders, each with title page, typed table of contents, typed list of tables, typed list of figures and heavy section dividers with copper or mylar reinforced holes and numbered plastic index tabs. All data shall be punched for binding and composition and printing shall be arranged so that punching does not obliterate any data. The binding edge of each manual shall have the project number and title, specification division number and title and manual title printed thereon, all as approved by the Engineer.
4. List for each product, the name, address, and telephone number of the Subcontractor, Maintenance Contractor and source of supply.
5. Products not installed shall be removed from the Manual.
6. Provide manufacturer's recommended cleaning materials and methods.
7. All copies of Shop Drawings, figures and diagrams shall be reduced to either 8 1/2 by 11 inches or to 11 inches in the vertical dimension and as near as practicable to 17 inches in the horizontal dimensions. Fold such sheets to 8 1/2 by 11 inches. Print the manual and other data on first quality paper, 8 1/2 by 11 inch size with standard three-hole punching. Reduce drawings and diagrams to 8 1/2 by 11 inches or 11 by 17 inches. Label binders Vol. 1, Vol. 2, etc., where more than one is required. The table of contents for the entire set, identified by volume number, shall appear in each binder. Text, figures and drawings shall be clearly legible and suitable for dry process reproductions.

F. Electronic Format
1. The Contractor shall provide a USB drive(s) containing all the elements of each approved O&M Manual.
2. The contents of the electronic format shall be the same as the approved O&M Manual.
3. All text based documentation (i.e., specs, O&M, MSDS sheets, data sheets, etc.) shall be delivered on the USB drive in PDF format.
4. All pictures, graphs, or anything that is not a drawing shall be delivered on the USB drive in either a TIFF, JPEG, or GIF format.
5. All CAD drawings shall be delivered on the USB in AutoCAD 2016 or higher format.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION 01 7823

SECTION 02 4100

DEMOLITION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Demolition within the existing Sodium Hypochlorite Room of the existing Chemical Feed Building.
   2. Demolition within the existing Poly Ortho Room of the existing Chemical Feed Building.
   3. Demolition of the existing Fluoride Room of the existing Chemical Feed Building.
   4. Demolition of existing structures that currently exist where the new NF building is proposed to be constructed.
   5. Disconnecting, capping or sealing, and abandoning in-place site utilities and process piping.

1.2 MATERIALS OWNERSHIP

A. Owner shall have right of first refusal on existing equipment.

B. Unless otherwise indicated, demolition waste becomes property of Contractor.

1.3 SUBMITTALS

A. Proposed Protection Measures: Submit informational report, including Drawings, that indicates the measures proposed for protecting individuals and property, for environmental protection, and for dust control. Indicate proposed locations and construction of barriers.
   1. Adjacent Buildings: Detail special measures proposed to protect adjacent buildings to remain.

B. Schedule of Demolition Activities: Indicate the following:
   1. Detailed sequence of demolition work, with starting and ending dates for each activity.
   2. Temporary interruption of utility services.
   3. Shutoff and capping of utility services.

C. Inventory: Submit a list of items to be removed and deliver to Owner prior to start of demolition.

D. Predemolition Photographs: Show existing conditions of adjoining construction and site improvements, including finish surfaces that might be misconstrued as damage caused by demolition operations. Submit before the Work begins.

E. Outage Request: Submit an Outage Request at least 72 hours before demolition is to begin.

1.4 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with governing EPA notification regulations before beginning demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.

B. Standards: Comply with ANSI/ASSE A10.6 and NFPA 241.

1.5 PROJECT CONDITIONS

A. Structures immediately adjacent to demolition area will be in service. Conduct demolition so operation of treatment plant will not be disrupted, unless an outage request has been approved by the Owner.
   1. Provide not less than 72 hours' notice of activities that will affect operations of adjacent structures and equipment.
   2. Maintain access to existing walkways, exits, and other facilities used by treatment plant operator.

B. Owner assumes no responsibility for structures to be demolished.
   1. Conditions existing at time of inspection for bidding purpose will be maintained by Owner as far as practical.

C. Hazardous Materials: It is not expected that hazardous materials will be encountered in the Work.

D. On-site storage or sale of removed items or materials is not permitted.

1.6 COORDINATION

A. Arrange demolition schedule so as not to interfere with Owner's on-site operations.

1.7 SCHEDULING

A. Demolition within the existing chemical feed building at RARWTP must take place from November 1 to April 30.

B. Conduct work so as to avoid interference with operations and work in the existing facilities.

C. Include provisions for temporary services, as required, to ensure no interruption of OWNER operations.

D. Before any demolition work begins, obtain approval of all necessary outage requests 72 hours prior to commencement of work. Do not start any equipment removal or demolition operations without the concurrence of the Owner.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that utilities have been disconnected and capped before starting demolition operations.

B. Review Project Record Documents of existing construction provided by Owner. Owner does not guarantee that existing conditions are same as those indicated in Project Record Documents.

C. Inventory and record the condition of items to be removed and salvaged. Provide photographs of conditions that might be misconstrued as damage caused by salvage operations.

D. Verify that hazardous materials have been remediated before proceeding with demolition operations.

E. Review with the Engineer, the exact areas where the existing railing is to be removed.

3.2 PREPARATION

A. Existing Piping and Utilities: Locate, identify, disconnect, and seal or cap off indicated piping and utilities serving buildings and structures to be demolished.
   1. Owner will arrange to shut off indicated utilities when requested by Contractor.
   2. If removal, relocation, or abandonment of services will affect treatment plant operations, then provide temporary services that bypass structures to be demolished and that maintain continuity of service to other structures.
   3. Cut off pipe or conduit a minimum of 24 inches below grade. Cap, valve, or plug and seal remaining portion of pipe or conduit after bypassing.

B. Existing Utilities: Do not start demolition work until utility disconnecting and sealing have been completed and verified in writing.

C. Temporary Shoring: Provide and maintain interior and exterior shoring, bracing, or structural support to preserve stability and prevent unexpected movement or collapse of construction being demolished.
   1. Strengthen or add new supports when required during progress of demolition.

D. Salvaged Items: Comply with the following:
   1. Clean salvaged items of dirt and demolition debris.
   2. Pack or crate items after cleaning. Identify contents of containers.
   3. Store items in a secure area until delivery to Owner.
   4. Transport items to storage area designated by Owner.
   5. Protect items from damage during transport and storage.

E. Sequence of Demolition
   1. Existing chemical feed facilities must remain fully operational at all times.
   2. Contractor to provide temporary feed systems, if required. Temporary feed systems must be fully automated (tied into SCADA).

3.3 PROTECTION

A. Existing Facilities: Protect adjacent walkways, building entries, and other facilities during demolition operations. Maintain exits from existing buildings.

B. Existing Utilities: Maintain utility services to remain and protect from damage during demolition operations.
   1. Do not interrupt existing utilities serving adjacent operating facilities unless authorized in writing by Owner and authorities having jurisdiction.
   2. Provide temporary services during interruptions to existing services, as acceptable to Owner and authorities having jurisdiction.

a. Provide at least 72 hours' notice to treatment plant operator if shutdown of service is required during changeover.

C. Temporary Protection: Erect temporary protection, such as walks, fences, railings, canopies, and covered passageways, where required by authorities having jurisdiction and as indicated.
1. Protect adjacent buildings and facilities from damage due to demolition activities.
2. Protect existing site improvements, appurtenances, and landscaping to remain.
3. Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.
4. Provide protection to ensure safe passage of people around building demolition area and to and from occupied portions of adjacent buildings and structures.
5. Protect walls, windows, roofs, and other adjacent exterior construction that are to remain and that are exposed to building demolition operations.

D. Remove temporary barriers and protections where hazards no longer exist. Where open excavations or other hazardous conditions remain, leave temporary barriers and protections in place.

E. Existing piping and equipment might be pressurized or contain various amounts of their original contents, sediments or grit, or might contain pockets of trapped gas, or other by-products common to the facilities. Exercise care in commencing the removal of any segments of piping or equipment and ventilate the pipes. Do not use cutting torches or abrasive cutting wheels until after ventilating the pipelines and verifying that they are free of volatile substance.

3.4 DEMOLITION, GENERAL

A. General: Use methods required to complete the Work within limitations of governing regulations and as follows:
1. Do not use cutting torches until work area is cleared of flammable materials. Maintain portable fire-suppression devices during flame-cutting operations.
2. Maintain fire watch during and for at least 2 hours after flame cutting operations.
3. Maintain adequate ventilation when using cutting torches.
4. Locate demolition equipment and remove debris and materials so as not to impose excessive loads on supporting walls, floors, or framing.

B. Site Access and Temporary Controls: Conduct demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.
1. Use water mist and other suitable methods to limit spread of dust and dirt. Comply with governing environmental-protection regulations. Do not use water when it may damage adjacent construction or create hazardous or objectionable conditions, such as ice, flooding, and pollution.

C. Explosives: Use of explosives is NOT permitted.

3.5 DEMOLITION BY MECHANICAL MEANS

A. Below-Grade Construction: Remove below-grade construction to at least 48 inches below existing grade.

B. Tank floors shall be adequately cracked and busted by means of jackhammer or other methods to prevent accumulation of water following abandonment of the tanks.

C. Debris from partial tank wall demolition may be placed in the bottom of the tank.

D. Remainder of tank void shall be filled with suitable soil. Additional construction waste and other unsuitable materials, such as boulders, wood, and piping shall not be used. Compact soil in lifts not to exceed 24-inches using mechanical soil compaction equipment. Refer to Paragraph 3.7 for additional site restoration requirements.

E. Existing Utilities: Demolish and remove existing utilities and below-grade utility structures.
   1. Piping: Disconnect piping at unions, flanges, valves, or fittings.
   2. Wiring Ducts: Disassemble into unit lengths and remove plug-in and disconnecting devices.

3.6 PIPE DEMOLITION/ABANDONMENT

A. Buried Piping shown to be demolished may be abandoned in place if it does not interfere with new construction.

B. Furnish and install 12-inch minimum plug at each end of abandoned pipe. For pipes larger than 2-inch diameter, provide concrete plug. For pipes 2-inch diameter and smaller, provide non-shrink grout plug. All pipes noted on the Drawings to be abandoned that are 8-inch in diameter and larger shall be plugged and have the internal void filled with controlled density fill mix.

3.7 SITE RESTORATION

A. Below-Grade Areas: Completely fill below-grade areas and voids resulting from demolition operations with satisfactory soil materials. The top 6 inches of fill shall consist of topsoil.

B. Site Grading: Uniformly rough grade area of demolished construction to a smooth surface, free from irregular surface changes. Provide a smooth transition between adjacent existing grades and new grades.

C. If noticeable settling of the soil in the demolition area occurs during a period of up to one year following final construction completion, the contractor shall provide additional soil fill and perform re-grading and seeding at no additional cost to the owner.

3.8 REPAIRS

A. Promptly repair damage to adjacent buildings caused by demolition operations.

3.9 DISPOSAL OF DEMOLISHED MATERIALS

A. Remove excess demolition waste materials from Project site and legally dispose of them in an EPA-approved landfill acceptable to authorities having jurisdiction.
   1. Do not allow demolished materials to accumulate on-site.
   2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.

B. Do not burn demolished materials.

3.10 CLEANING

A. Following demolition and site grading, clean adjacent structures and improvements of dust, dirt, and debris caused by building demolition operations. Return adjacent areas to condition existing before building demolition operations began.

END OF SECTION 02 4100

SECTION 02 6500

UNDERGROUND STORAGE TANK DEMOLITION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes the removal of an existing underground fuel storage tank.

1.2 QUALITY ASSURANCE

A. Permits and Regulations: The Contractor shall obtain all necessary permits and licenses required for underground storage tank removal.

B. Underground storage tank demolition shall be in compliance with applicable requirements of the following:
   1. American Petroleum Institute (API)
   2. United State Environmental Protection Agency (USEPA)
   3. State Fire Marshall
   4. Bureau of Underground Storage Tanks (BUSTR)
   5. Occupational Safety and Health Administration (OSHA)
   6. Any other governing authority having jurisdiction

1.3 STORAGE, HANDLING, AND REMOVAL

A. Title to Materials: All tanks, piping, and related items to be removed shall become the property of the Contractor after they have been removed from the site.

B. Salvageable Items: The Contractor shall carefully remove items to be salvaged, if any, and store them on site in an approved location. Items shall remain the property of the City.

C. Reused Materials: The Contractor shall remove and store material to be reused or retained in a manner which prevents damage to the material.

D. Marking Excavated Tanks: Prior to permanent disposal, the Contractor shall clearly mark the tanks by painting the outside with the following wording:

TANK HAS CONTAINED OIL (or other applicable name)
NOT OIL FREE
NOT SUITABLE FOR FOOD OR DRINKING WATER

E. Removal and Disposal of Tank Contents: Tank contents, cleaning solutions, rinse water, and contaminated clothing and equipment shall require a waste analysis, and shall be disposed of according to applicable regulations and General Specifications 02105 and 02316. The tank and all the other contents shall be removed from the site for disposal in accordance with the requirements of the local codes and regulations. Disposal shall be completed within 72 hours of obtaining analytical results.

1.4 FIELD CONDITIONS

A. Underground storage tank to be removed is located at the Richard A. Renneker WTP in Maineville, Ohio.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 PREPARATION

A. The Contractor shall pump out all remaining liquid in the tank. Following removal of the liquids, the tank shall be purged and tested to assure that no explosive gases are present. Any liquid present in underground piping shall be properly drained and piping purged prior to removal. The tank atmosphere shall be tested to determine if the tank is safe. The tank interior shall be tested for percent oxygen per volume and for percent of lower explosive limit (LEL). The tank atmosphere shall be greater than 19% oxygen and less than 25% LEL before the tank is considered safe. If the tank is not safe, then inerting and purging must be continued until the tank passes all testing.

B. Pipe Cleaning: After the tank is emptied, the tank and all connecting piping to the tank shall be cleaned and triple rinsed in accordance with all applicable local regulations regarding underground storage tank cleaning and API Accident Prevention Manual No. 1A. The Contractor shall dispose of all removed liquids in a method conforming to all applicable Federal, State, and local regulations. The Contractor shall provide protective measures around the excavation area to prevent water runoff.

C. Disconnecting Piping: The Contractor shall disconnect piping from all tank openings, and cap or plug all tank openings. All piping shall be removed and disposed of as specified.

D. Excess Liquid: Residual liquid remaining in the tank shall be absorbed by sawdust or fine sand introduced into the tank or other approved method. The Contractor shall dispose of absorbing material in accordance with all applicable State and local regulations. The tank shall not be moved if liquid is still present in the tank. Preventive measures shall be taken to avoid liquid leaking from the tank or associated piping into the excavation area.

E. Initial Tank Cleaning: Initial tank cleaning, prior to tank removal, shall be conducted as follows:
   1. Introduce water into the high end of the tank. Pump water, along with any remaining product or sediment, out of the lower end of the tank.
   2. During the initial cleaning operations, the following items shall be observed:
      a. The pumps or vacuum lift used in the operation shall be properly grounded and bonded.
      b. Vapors from the vacuum vent system shall be emitted a minimum height of 12 feet above grade and 3 feet above any adjacent structure in accordance with API standards.
      c. Explosive vapors may develop during cleaning procedures. The area in and around the tank site shall be monitored continuously with direct reading on-line meters for flammable or combustible vapor and total volatile vapor concentrations until the tank is removed from the excavation and the site.
   3. If the vapor concentration exceeds 25% LEL, all work shall be stopped until vapors disperse.

4. Response to any vapor concentration (total and LEL) condition shall be in accordance with the Contractor's Health and Safety Plan.
5. All smoking and other ignition sources are prohibited from the tank area at all times.
6. Maintain operable fire extinguishers on site at all times in accordance with the Health and Safety Plan.

F. Secondary Cleaning: Secondary cleaning procedure involves actual entry into the tank for manual cleaning.
1. Create a large opening into the tank as required by the confined space entry provisions of the Health and Safety Plan.
2. During secondary cleaning operations, the following items shall be observed:
   a. All confined space entry safety precautions and requirements shall be met.
   b. Enter tank only when UST is deemed safe based on monitoring information.
   c. Remove all remaining sludge, tar, scaling, etc., using a squeegee. All remaining residue shall be pumped from the bottom of the tank, or absorbed with suitable absorbent material.
   d. All residual material shall be recovered, characterized, drummed, labeled and disposed of in accordance with all local rules and regulations.
   e. Inspect the interior wall of the tank for holes or breaks.

G. Gas Freeing Tanks: USTs and piping shall be rendered vapor free before removal is initiated. All tanks and piping must be certified gas and vapor free by an approved marine chemist prior to requesting Hot Work Permits. The USTs shall be inerted below the specified State and local approved acceptable LEL in accordance with all applicable Federal, State and local codes and regulations and API recommended procedures. The Contractor shall dispose of any water used in the gas-freeing operation in accordance with applicable regulations and the Detailed Specifications. USTs and piping shall be adequately grounded so that buildup of any static charge is prevented. The Contractor shall remove the tank from the property immediately upon completion of the gas-freeing operation.

H. Gas-free the tank using one of the procedures described in API Bulletin 1604, Recommended Practice for Abandonment or Removal of Used Underground Service Station Tanks.

3.2 REMOVAL

A. Tank Excavation: The Contractor shall excavate to the tank and carefully remove tank from the ground. As much adhering soil as possible shall be removed from the tank, and the tank shall be placed on plastic sheeting in a secure location, covered with plastic sheeting, and blocked to prevent movement. Soil removed from the exterior of the tank, as well as during excavation, shall be tested and disposed of off-site in accordance with the NYS DEC STARS Memo No. 1, all applicable Federal, State, and local regulations, and General Specification 02105. Soil shall be excavated to facilitate tank removal only. Once tank is removed from the ground, all excavation shall cease.

B. Testing along Piping: The Contractor shall provide testing along piping for all tanks with odor or staining of soil. The Contractor shall take one soil sample for every 25 linear feet of product delivery piping.

C. Encountered Contamination: Contractor shall notify the Engineer, verbally, within one hour of any contamination encountered, and shall provide a follow-up notification to the Engineer, in writing, within 1 day. Any spills or drips shall be contained to the maximum extent possible to

minimize the spread of encountered contamination. Failure to notify the Engineer will subject the Contractor to additional liability if the encountered contamination spreads in any way.

3.3 REMOVAL

A. All accessible holes shall be plugged or capped. The tank shall be rendered unusable for further use in accordance with API Bulletin 1604. Immediately remove demolished material from site. In no case shall a removed tank remain on-site for a period of time exceeding 24 hours.

B. All UST systems being permanently removed shall comply with the cleaning, removal, and safety requirements of American Petroleum Institute Recommended Practice RP 1604-96 (reaffirmed 2010); "Closure of Underground Petroleum Storage Tanks" and National Institute for Occupational Safety and Health Publication 80-106 (1979); "Criteria for a Recommended Standard: Working In Confined Spaces".

C. The UST shall be maintained in a safe condition by regularly monitoring the UST to ensure that an accumulation of explosive vapors does not occur.

D. All liquid and residue shall be removed from the UST before the UST leaves the site and handled in accordance with the following:
   1. The handling, transportation, and disposal of any regulated substance removed from an UST system, regulated soil, backfill materials, groundwater, wash water, or other similar materials removed from the system or facility shall be managed in accordance with all applicable federal, state, and local regulations in effect for the type, volume, constituent concentration, and classification of the material.

E. The UST shall be rendered unusable and free of explosive vapors before the UST leaves the site by cutting up or crushing the UST or by perforating the UST with numerous holes using explosion-proof non-sparking tools. No UST shall be reused for any purpose unless written approval is obtained from the state fire marshal prior to the removal activity.

F. All backfill from the tank cavity excavation, piping trenches, dispensing unit areas, and remote fill pipe trenches shall be removed.

G. No more than twelve inches of native soil shall be removed from the side walls and bottom of the tank cavity excavation, piping trenches, dispensing unit areas, and remote fill pipe trenches. Where bedrock is encountered within the first twelve inches, remove native soil to bedrock. Further removal of soil from the tank cavity, piping trenches, dispensing unit areas, and remote fill pipe trenches for purposes of corrective action shall not be conducted without prior approval of the state fire marshal and the Engineer.

H. Backfill and native soil removed from the tank cavity excavation, piping trenches, dispensing unit areas, and remote fill pipe trenches may be stored on site in a stockpile for a period not to exceed one hundred twenty days, provided that it has been placed on a concrete pad, asphalt pad, or impermeable synthetic liner, covered to prevent infiltration of rain water, and has been surrounded with a berm to minimize the run off water. Storage on site beyond one hundred twenty days shall only occur if prior approval has been granted by the state fire marshal. Backfill and native soil shall be handled in accordance with the following:
   1. The handling, transportation, and disposal of any regulated substance removed from an UST system, regulated soil, backfill materials, groundwater, wash water, or other similar materials removed from the system or facility shall be managed in accordance with all

applicable federal, state, and local regulations in effect for the type, volume, constituent concentration, and classification of the material.

I. If free product is discovered during removal of any portion of an UST system, Contractor shall report a suspected release to the state fire marshal within twenty-four hours and proceed to conduct corrective action in accordance with paragraph (F) of rule 1301:7-9-13 of the Ohio Administrative Code.

J. Backfilling UST Excavations: Prior to backfilling, the Contractor shall provide the location and analytical results of all samples collected to the Engineer. The Contractor shall protect the excavation at all times by whatever means necessary to ensure that all safety requirements are met. Backfilling shall be in accordance with Division 31, Section "Excavation and Fill", and may not be commenced without approval of the Engineer.

END OF SECTION 02 6500

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 03 1100

CONCRETE FORMING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
1. Contractor shall provide all professional services, labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install concrete forming. The Work also includes:
a. Designing forming systems in accordance with requirements of ACI 347 and the Contract Documents.
b. Providing forming to accommodate the Work under this and other Sections and building into forming items such as sleeves, anchorage devices, inserts, pipe embedments, reinforcing, and all other items to be embedded in concrete for which placement is not specifically provided under other Sections.

B. Coordination:
1. Review installation procedures under this and other Sections and coordinate installation of items that must be installed with or before concrete forming Work.
2. Coordinate forming Specifications with requirements for finished surfaces specified in Section 03 3000, Cast-In-Place Concrete.

C. Related Sections:
1. Section 03 1500, Concrete Accessories.
2. Section 03 3000, Cast-In-Place Concrete.

1.2 REFERENCES

A. Standards referenced in this Section are:
1. ACI 117, Specifications for Tolerances for Concrete Construction and Materials and Commentary.
2. ACI 301, Specifications for Structural Concrete.
3. ACI 347, Guide to Formwork for Concrete.
4. ASTM C1074, Practice for Estimating Concrete Strength by the Maturity Method.

1.3 QUALITY ASSURANCE

A. Qualifications:
1. Professional Engineer:
a. Contractor or formwork Supplier shall retain a registered professional engineer legally qualified to practice in same state as the Site. Professional engineer shall have at least five years' experience designing formwork and falsework of the type required.
b. Responsibilities include:
1) Reviewing formwork and falsework performance and design criteria stated in the Contract Documents.

2) Preparing written requests for clarifications or interpretations of performance or design criteria for submittal to Engineer by Contractor.
3) Preparing or supervising preparation of design calculations verifying compliance of formwork and falsework with requirements of the Contract Documents.
4) Signing and sealing all calculations.
5) Certifying that:
    a) Design of formwork and falsework was performed in accordance with performance and design criteria stated in the Contract Documents, and
    b) Design conforms to all Laws and Regulations, and to prevailing standards of practice.
    c) In place falsework, prior to concrete placement, complies with the intent of the forming design and complies with the Contract Documents.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
    1. Samples:
        a. Plywood form material used for smooth form finish, four inches square minimum.

B. Informational Submittals: Submit the following:
    1. Shop Drawings: When requested by Engineer, submit Shop Drawings showing and indicating general construction of individual forms, including:
        a. Special formed joints or reveals.
        b. Location, pattern, and details of form tie placement, removal, and repair procedures.
        c. Location and details for temporary openings.
        d. Other items that would visually affect the finished concrete.
    2. Design of Temporary Measures: Design of formwork and falsework is Contractor's responsibility. Submit the following:
        a. Falsework layout drawings with the seal and signature of Contractor's or Supplier's professional engineer. Layout drawings shall show bracing details, waler arrangements, location of shores, joint forming details, and details at connections to previously placed concrete. Engineer's review will be for general conformance to the requirements of the Contract Documents and ACI 347, as indicated for delegated design in the General Conditions.
        b. Design calculations for formwork and falsework, when requested by Engineer.
        c. Certification letter from Contractor's or Supplier's professional engineer stating that in-place falsework was inspected and complies with the intent of the falsework design.
    3. Product Data: Manufacturer's data for proprietary materials, including form coatings, manufactured form systems, ties and accessories.
    4. Manufacturer's Instructions: Installation instructions for proprietary materials, including form coatings, manufactured form systems, ties and accessories.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery and Storage:
    1. Upon delivery to the Site, place materials in area protected from weather.
    2. Store materials in accordance with manufacturer's recommendations.

3. Store materials above ground on framework or blocking. Cover wood for forms and other accessory materials with protective, waterproof covering. Provide for adequate air circulation or ventilation under cover.

B. Handle materials in accordance with the manufacturers' recommendations. Do not damage materials during handling.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Design Criteria:
1. Design, erect, support, brace and maintain forming in accordance with ACI 347 so that forming safely supports vertical and lateral loads that might be applied, until such loads can be supported by the concrete structure. Carry vertical and lateral loads to ground by forming system or in-place construction that has attained adequate strength for the purpose. Construct forming so that concrete members and structures are of correct size, shape, alignment, elevation, and position.
2. Design forms and falsework to include values of live load, dead load, weight of moving equipment operated on forming, concrete mix, height of concrete drop, vibrator frequency, ambient temperature, foundation pressures, stresses, lateral stability, and other factors pertinent to safety of structure during construction.
3. Provide shores and struts with positive means of adjustment capable of taking up forming settlement during concrete placing operations, using wedges or jacks, or a combination thereof. Provide trussed supports when adequate foundations for shores and struts cannot be secured.
4. Support form facing materials by structural members spaced sufficiently close to prevent beyond tolerance deflection, in accordance with ACI 117. Fit forms placed in successive units for continuous surfaces to accurate alignment, free from irregularities and within allowable tolerances. For long-span members without intermediate supports, provide camber in forming as required for anticipated deflections resulting from weight and pressure of fresh concrete and construction loads.
5. Design and construct forming to be readily removable without impact, shock or damage to concrete surfaces and adjacent materials.
6. Provide forming sufficiently tight to prevent leakage of cement paste during concrete placing. Solidly butt joints and provide backup material at joints as required to prevent leakage and fins.
7. Omit side forms of footings and place concrete directly against excavation only when requested by Contractor in writing and accepted by Engineer in writing. When omission of forms is accepted, provide additional concrete required beyond minimum design profiles and dimensions of footings as shown or indicated on the Drawings. No additional compensation will be paid to Contractor for additional concrete required.

2.2 FORM MATERIALS

A. Forms for Smooth Finish Concrete:
1. Unless otherwise shown or indicated in the Contract Documents, construct forming for smooth concrete surfaces with plywood, metal, metal-framed plywood-faced, or other panel type materials acceptable to Engineer, to provide continuous, straight, smooth as-cast surfaces with no wood grain or other surface texture imparted by forming. Provide in largest practical sizes to minimize number of joints and to conform to joint system shown

or specified in the Contract Documents. Provide form material with sufficient thickness to withstand pressure of newly placed concrete without bow or deflection.

B. Forms for Standard Finish Concrete:
   1. Form concrete surfaces designated to have standard formed finish with plywood, lumber, metal, or other acceptable material. Provide lumber that is dressed on at least two edges and one side.

C. Cylindrical Columns and Supports:
   1. Form round-section members with paper or fiber tubes, constructed of laminated plies using water-resistant type adhesive with wax-impregnated exterior for weather and moisture protection. Provide units with sufficient wall thickness to resist loads imposed by wet concrete without deformation.
      a. Provide manufacturer's standard plastic-lined-interior units.
   2. Fiberglass or steel forms may be used for cylindrical columns if accepted by Engineer in writing.

D. Form Coatings:
   1. Provide commercial formulation form-coating compounds that will not bond with, stain, nor adversely affect concrete surfaces, and will not impair subsequent treatment of concrete surfaces requiring bond or adhesion, nor impede wetting of surfaces to be cured with water or curing compounds. For concrete surfaces that will be in contact with potable water or water that will be treated to become potable, form coating shall be a mineral oil base coating.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine substrate and conditions under which the Work will be performed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 FORM CONSTRUCTION

A. Construct forms in accordance with ACI 347; to the exact sizes, shapes, lines, and dimensions shown; as required to obtain accurate alignment, location, and grades; to tolerances specified; and to obtain level and plumb work in finish structures. Provide for openings, offsets, keyways, recesses, moldings, rustications, reglets, chamfers, blocking, screeds, bulkheads, anchorages and inserts, and other features required. Use selected materials to obtain required finishes. Finish shall be in accordance with approved mock-up or sample panel, when specified.

B. Allowable Tolerances:
   1. Construct forming to provide completed concrete surfaces complying with tolerances specified in ACI 117, ACI 301, and ACI 347.
      a. Architectural finish forming, and where shown or indicated on the Drawings, shall be Class A surface, 1/8-inch offset.
      b. Other surfaces exposed to view shall be Class B surface, 1/4-inch offset.
      c. Other surfaces shall be Class C surface, 1/2-inch offset.
   2. Tolerances apply to form offsets and to irregularities within the formed surface when measured with a straightedge over a five-foot distance.

C. Install forming and accessories for facilities in accordance with manufacturer's instructions, Laws and Regulations, and the Contract Documents.

D. Fabricate forms for easy removal without damaging concrete surfaces. Provide crush plates or wrecking plates where stripping may damage cast concrete surfaces. Provide top forms for inclined surfaces where the slope is too steep to place concrete with bottom forms only. Kerf wood inserts for forming keyways, reglets, recesses, and the like, to prevent swelling and assure ease of removal.

E. Provide temporary openings where interior area of forming is inaccessible for cleanout, for inspection before concrete placement, and for placing concrete. Brace temporary closures and set tightly to forms to prevent loss of cement paste. Locate temporary openings on forms in locations as inconspicuous as possible, consistent with requirements of the Work. Form intersecting planes of openings to provide true, clean-cut corners, with edge grain of plywood not exposed as form for concrete.

F. Falsework:
   1. Erect falsework and support, brace, and maintain falsework to safely support vertical, lateral, and asymmetrical loads applied until such loads can be supported by in-place concrete structures. Construct falsework so that adjustments can be made for take-up and settlement.
   2. Provide wedges, jacks or camber strips to facilitate vertical adjustments. Carefully inspect falsework and formwork during and after concrete placement operations to determine abnormal deflection or signs of failure; make necessary adjustments to produce finished Work of required dimensions.

G. Forms for Smooth Finish Concrete:
   1. Do not use metal cover plates for patching holes or defects in forms.
   2. Provide sharp, clean corners at intersecting planes, without visible edges or offsets. Back joints with extra studs or girts to maintain true, square intersections.
   3. Use extra studs, walers, and bracing to prevent bowing of forms between studs and to avoid bowed appearance in concrete. Do not use narrow strips of form material that will produce bow.
   4. Assemble forms so they may be readily removed without damage to exposed concrete surfaces.
   5. Form molding shapes, recesses, rustication joints and projections with smooth-finish materials, and install in forms with sealed joints to prevent displacement.

H. Corner Treatment:
   1. Form exposed corners of beams, walls, foundations, bases and columns to produce smooth, solid, unbroken lines, except as otherwise shown or indicated in the Contract Documents. Chamfer exposed corners.
   2. Form chamfers with 3/4-inch by 3/4-inch strips, unless otherwise shown or indicated in the Contract Documents, accurately formed and surfaced to produce uniformly straight lines and tight edge joints. Use rigid PVC chamfers for architecturally formed concrete. Extend terminal edges to required limit and miter chamfer strips at changes in direction.
   3. Reentrant or internal and unexposed corners may be formed either square or chamfered.

I. Joints:
   1. For joint treatment, comply with Section 03 1500, Concrete Accessories. Locate joints as shown and specified.

J. Openings and Built-In Work:
   1. Provide openings in concrete forming shown or required under other Sections or other contracts. Refer to Paragraph 1.1.B of this Section for coordination requirements.
   2. Accurately place and securely support items to be built into forms.

K. Sealing Forming:
   1. Forming joints shall be tight-fitting or otherwise sealed to prevent loss of cement paste.
   2. Provide forming resting against concrete surfaces with compressible gasket material between the concrete and edge of form, to fill irregularities and create tight seal.

L. Cleaning and Tightening:
   1. Thoroughly clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, and other debris just before concrete is placed. Retighten forms immediately after placing concrete, as required to eliminate cement paste leaks.

M. Tie Hole Repair:
   1. Repair tie holes in accordance with Section 03 3000, Cast-In-Place Concrete.

3.3 FORM COATINGS

A. Coat form contact surfaces with non-staining form-coating compound before installing reinforcing materials. Do not allow excess form coating material to accumulate in forms or come into contact with surfaces that will be bonded to fresh concrete. Apply in compliance with manufacturer's instructions.

B. Coat steel forms with non-staining, rust-preventative form oil, or otherwise protect against rusting. Do not use rust-stained steel forming.

C. For concrete surfaces that will be in contact with potable water or water that will be treated to become potable, form coating shall be mineral-oil base coating.

3.4 INSTALLATION OF EMBEDDED ITEMS

A. Set and build into forming anchorage devices and other embedded items, shown, specified, or required under other Sections. Refer to Paragraph 1.1.B of this Section for coordination requirements. Use necessary setting drawings, diagrams, instructions, and directions.

B. Edge Forms and Screeds Strips for Slabs:
   1. Set edge forms or bulkheads and intermediate screed strips for slabs to obtain required elevations and contours in finished slab surface. Provide and secure units to support screeds.

3.5 FIELD QUALITY CONTROL

A. Tests and Inspections:
   1. Before placing concrete, check ties, tie cones, tie waterstops, embedded items, form coatings, forming stability, alignment, and tolerances. Make corrections and adjustments to ensure forming complies with intent of the forming design, proper stability of forming systems, and accurate size and location of concrete members.
   2. During concrete placing, check forming and related supports to ensure that forms are not displaced and that completed Work will be within specified tolerances.

3. If forms are unsatisfactory in any way, either before or during concrete placing, stop or postpone placing of concrete until defects are corrected as required by Contractor's or Supplier's professional engineer and accepted by Engineer.

3.6 REMOVAL OF FORMS

A. Determination of time between placing concrete and removing forms is Contractor's responsibility. Requirements specified in this Section are minimum times and requirements intended to ensure that concrete will support its own weight, and do not consider additional effects of the construction. Additional effects of the construction shall be accounted for by Contractor when determining time for removing forming. Time for removing of forms is subject to Engineer's acceptance.

B. Comply with requirements of ACI 301 and ACI 347, except as indicated in the Contract Documents.

C. Removal of Forms for Walls, Columns, Sides of Beams and Girders, and Slab and Foundation Edges:
1. Comply with requirements of Table 03 1000-A of this Section:

TABLE 03 1000-A, REMOVAL OF FORMS

Component	Average Daily Ambient Air Temperature (deg F)				Min. Concrete Compressive Strength for Form Removal
	Over 70 F	60 F to 70 F	50 F to 60 F	Below 50 F	
Walls	One day	Two days	Three days	See Paragraph 3.6.C.2 of this Section	750 psi
Columns	Two days	Three days	Four days		1000 psi
Side of beams and girders	One day	One day	Two days		500 psi
Slab and foundation edges	One day	One day	Two days		500 psi

2. When average daily ambient air temperature is below 50 degrees F, do not remove forms until concrete attains minimum compressive strength indicated in Table 03 1000-A for form removal, and comply with Paragraph 3.8.C.3.b of this Section.
3. Concrete Strength Requirements for Form Removal:
   a. For other than beams and elevated slabs, do not remove forms until concrete attains minimum concrete compressive strength indicated in Table 03 1000-A for form removal.
   b. For beams and elevated slabs, do not remove supporting forms or shoring until concrete attains minimum of 90 percent of its specified compressive strength.

D. Alternative Criteria for Removing Forms for Walls, Columns, Sides of Beams and Girders, and Slab and Foundation Edges: Contractor has the option of submitting an alternative removal of

forms table, together with supporting data, for Engineer's acceptance. Supporting data shall include representative field data for each different placement ambient temperature condition and minimum of three tests per temperature condition to ensure that accurate correlation between concrete strength and placement temperature is obtained.

E. Determination of In-place Concrete Strength:
   1. Determine compressive strength of in-place concrete by compression test specimens cured at the Site under the same conditions of temperature and moisture as the concrete member under consideration.
   2. Alternately, determine compressive strength of in-place concrete by maturity factor procedure in accordance with ASTM C1074 and approved by Engineer. Location of embedded thermistors or thermocouples shall be as approved by Engineer.

F. When high-early strength concrete is used, time for removing the forms will be developed at the Site from the age/strength relationships established for the materials and proportions used by tests in accordance with ACI 301.

G. Continue curing, including bottom surfaces of slabs and beams, after form removal in accordance with Section 03 3000, Cast-In-Place Concrete.

3.7 PERMANENT SHORES

A. Provide permanent shores in accordance with ACI 347.

B. Reshores are not allowed.

3.8 RE-USE OF FORMS

A. Clean and repair surfaces of forms to be re-used in the construction. Do not use split, frayed, delaminated, or otherwise damaged form facing material. Apply form coating compound material to concrete contact surfaces as specified for forming.

B. When forms are extended for successive concrete placement, thoroughly clean surfaces, remove fins and laitance, and tighten forms to close all joints. Align and secure joints to avoid offsets. Do not use "patched" forms for exposed concrete surfaces. Form surfaces are subject to Engineer's approval.

END OF SECTION 03 1100

SECTION 03 1500

CONCRETE ACCESSORIES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install concrete accessories.

B. Related Sections:
   1. Section 03 1100, Concrete Forming.
   2. Section 03 6000, Grouting.
   3. Section 07 9200, Joint Sealants.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ACI 301, Standard Specifications for Structural Concrete.
   2. ASTM D1752, Standard Specification for Preformed Sponge Rubber Cork and Recycled PVC Expansion Joint Fillers for Concrete Paving and Structural Construction.
   3. CRD-C572, U.S. Army Corps of Engineers Specifications for Polyvinyl- Chloride Waterstop.

1.3 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Layout of construction and expansion joint locations. Submit and obtain approval prior to submitting concrete reinforcement Shop Drawings.
      b. For construction and expansion joints that require waterstops, submit layout of locations showing waterstop details. Indicate waterstop type, waterstop joint conditions, and details on how joint conditions will be handled.
   2. Samples:
      a. Submit Sample, at least six inches long each, of each type of waterstop proposed for use.
      b. Submit Sample of foam rubber and cork expansion joint fillers.
      c. Submit Sample of each type of prefabricated PVC waterstop joint.

B. Informational Submittals: Submit the following:
   1. Manufacturer’s Instructions: Manufacturer’s specifications and installation instructions for all materials required.

1.4 DELIVERY, STORAGE AND HANDLING

A. Transportation and Handling of Products:
   1. Deliver materials to Site to ensure uninterrupted progress of the Work.
   2. Comply with Section 01 6000, Product Requirements.

B. Storage and Protection:
   1. Store concrete joint materials on platforms or in enclosures or covered to prevent contact with ground and exposure to weather and direct sunlight. Comply with manufacturer's storage and protection requirements.
   2. Comply with Section 01 6000, Product Requirements.

PART 2 - PRODUCTS

2.1 WATERSTOPS

A. Polyvinyl Chloride (PVC):
   1. Material Requirements:
      a. Waterstops shall be extruded from elastomeric PVC compound containing plasticizers, resins, stabilizers, and other materials necessary to meet requirements of the Contract Documents and requirements of CRD-C572. Do not use reclaimed or scrap material.
      b. Tensile strength of finished waterstop: 1,400 psi, minimum.
      c. Ultimate elongation of finished waterstop: 280 percent, minimum.
      d. Minimum thickness shall be 3/8-inch over entire width of waterstop.
      e. Provide waterstops with minimum of seven ribs equally spaced at each end on each side. First rib shall be at the edge. Ribs shall be a minimum of 1/8-inch in height.
      f. Provide waterstops with hog rings or factory-installed grommets anchored to exterior ribs to facilitate tying waterstop in position.
   2. Split waterstops are not allowed.
   3. Construction Joints: Waterstops shall be flatstrip ribbed type, six-inch minimum width, unless otherwise shown or indicated in the Contract Documents.
   4. Expansion Joints: Waterstops shall be centerbulb ribbed type, nine-inch minimum width, unless otherwise shown or indicated in the Contract Documents. Centerbulb shall have minimum outside diameter of 7/8-inch.
   5. Product and Manufacturer: Provide one of the following:
      a. Durajoint Concrete Accessories.
      b. Greenstreak Plastic Products Company.
      c. Or equal.

B. Hydrophilic Waterstop Materials:
   1. General Material Properties:
      a. Bentonite-free, and expandable by minimum of 80 percent of dry volume in presence of water to form watertight joint seal without damaging concrete in which material is cast. Provide only where shown or indicated in the Contract Documents.
      b. Material shall be composed of resins and polymers that absorb water and cause an increase in volume in completely reversible and repeatable process. Waterstop material shall be dimensionally stable after repeated wet-dry cycles with no deterioration of swelling potential.
      c. Select materials that are recommended by manufacturer for type of liquid to be contained.
   2. Hydrophilic Rubber Waterstop:
      a. Minimum cross sectional dimensions shall be 3/16-inch by 3/4-inch.
      b. Product and Manufacturer: Provide one of the following:
         1) Hydrotite, by Greenstreak Plastic Products Company.
         2) Or equal.
   3. Hydrophilic Sealant:

a. Hydrophilic sealant shall adhere firmly to concrete, metal, and PVC in dry or damp condition. When cured sealant shall be elastic indefinitely.
b. Product and Manufacturer: Provide one of the following:
   1) Hydrotite, by Greenstreak Plastic Products Company.
   2) Or equal.

2.2 PREFORMED EXPANSION JOINT FILLER

A. Provide preformed expansion joint filler complying with ASTM D1752, Type I (sponge rubber) or Type II (cork).

2.3 CONCRETE CONSTRUCTION JOINT ROUGHENER

A. Provide water-soluble non-flammable, surface-retardant roughener.

B. Product and Manufacturer: Provide one of the following for the types of joints specified:
1. Rugasol-S, by Sika Corporation for horizontal joints only.
2. Concrete Surface Retarder-Formula S, by Euclid Chemical Company, for horizontal joints only.
3. Concrete Surface Retarder-Formula F, by Euclid Chemical Company, for vertical joints only.
4. TK-6100 Concrete Form Surface Retarder, by TK Products.
5. Or equal.

2.4 EPOXY BONDING AGENT

A. Provide a two-component epoxy-resin bonding agent.

B. Product and Manufacturer: Provide one of the following:
1. Sikadur 32 Hi-Mod LPL, by Sika Corporation.
2. Eucopoxy LPL, by the Euclid Chemical Company.
3. Resi-Bond J-58, by Dayton Superior.
4. Or equal.

2.5 EPOXY-CEMENT BONDING AGENT

A. Provide three component epoxy resin-cement blended formulated as bonding agent.

B. Product and Manufacturer: Provide one of the following:
1. Sika Armatec 110 EpoCem, as manufactured by Sika Corporation.
2. Duralprep A.C., as manufactured by the Euclid Chemical Company.
3. Emaco P24, as manufactured by MBT/ChemRex.
4. Or equal.

2.6 JOINT SEALANT AND ACCESSORIES

A. For joint sealants and accessories used on isolation joints, control joints, and expansion joints, refer to Section 07 9200, Joint Sealants.

2.7 CONCRETE BOND BREAKERS

A. Provide asphalt-saturated rag felt building paper, not less in weight than commercially known as 15 pound felt building paper, which weighs 15 pounds per 100 square feet.

B. Chemical Bond Breaker:
   1. Provide medium solids resin solution chemical concrete bond breaker complying with ASTM C309, Type I, Class B.

2.8 RUBBER BONDING AGENT

A. Product and Manufacturer: Provide one of the following:
   1. Scotch-Grip 1300 Rubber Adhesive, as manufactured by 3M Company.
   2. Or equal.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and installing Subcontractor, if any, shall examine substrate and conditions under which the Work is to be performed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 CONSTRUCTION JOINTS

A. Comply with requirements of ACI 301 and the Contract Documents.

B. Locate and install construction joints as shown or indicated on the Drawings. Where not shown or indicated, locate joints to not impair strength of the structure; position joints at points of minimum shear. Location of joints shall be approved by Engineer. In addition to joints shown or indicated on the Drawings, locate construction joints as follows:
   1. In foundation mats, locate joints at spacing of approximately 40 feet. Joints shall be located within middle third of element span, unless otherwise shown or indicated on the Drawings. Element span shall be considered distance between piles or, as determined by Engineer, distance between bearing elements, such as columns, exterior walls and interior walls. Place concrete in strip pattern, unless otherwise shown or indicated on the Drawings.
   2. In walls, locate joints at a maximum spacing of 40 feet. Locate joints away from wall intersections a minimum of one-quarter of the clear span distance between wall intersections measured horizontally.
   3. In structural slabs and beams, joints shall be located within middle third of element span and shall be located in compliance with ACI 301, unless otherwise shown or indicated on the Drawings.
   4. In slabs on grade, locate joints at spacing of approximately 40 feet. Place concrete in strip pattern, unless otherwise shown or indicated on the Drawings.

C. Horizontal Joints:
   1. Roughen concrete at interface of construction joints by abrasive blasting, hydroblasting, or using surface retardants and water jets to expose aggregate and remove accumulated concrete on projecting rebar immediately subsequent to form stripping, unless otherwise approved by Engineer. Immediately before placing fresh concrete, thoroughly clean

existing contact surface using stiff brush or other tools and stream of pressurized water. Surface shall be clean and wet, and free from pools of water at time of placing fresh concrete.

2. Remove laitance, waste mortar, and other substances that may prevent complete adhesion. Where joint roughening was performed more than seven days prior to concrete placing or where dirt or other bond reducing contaminants are on surface, perform additional light abrasive blasting or hydroblasting to remove laitance and all bond-reducing materials just prior to concrete placement.
3. Provide over contact surface of concrete a six-inch layer of Construction Joint Grout as specified in Section 03 6000, Grouting. Place fresh concrete before grout has attained its initial set. Placement of grout may be omitted if concrete mix has slump increased to at least six inches by addition of high range water reducer.

D. Vertical Joints:
1. Apply roughener to the form in thin, even film by brush, spray, or roller in accordance with manufacturer's instructions. After roughener is dry, concrete may be placed.
2. When concrete has been placed, remove joint surface forms as early as necessary to allow for removal of surface retarded concrete. Forms covering member surfaces shall remain in place as required under Section 03 1100, Concrete Forming. Wash loosened material off with high-pressure water spray to obtain roughened surface subject to approval by Engineer. Alternately, surface shall be roughened by abrasive blasting or hydroblasting to expose aggregate. Outer one-inch of each side of joint face shall be masked and protected from blasting to avoid damaging member surface.

E. Satisfactory Surface:
1. Roughen concrete surface so that amplitude between high and low point on any 2-inch square is at least 1/4 inch.
2. Remove all laitance, waste mortar or other substance, which may prevent complete adhesion.
3. Expose clean coarse aggregate.
4. Do not undercut edges of coarse aggregate particles.
5. After roughening, wash and rinse with potable water.
6. Continue rinsing as long as there is any trace of cloudiness of the rinse water.
7. Where the rinsing occurs more than 2 days prior to placing the next lift or where the work in the area subsequent to the cleaning causes dirt or debris to be deposited on the surface, the surface shall be rinsed again as the last operation prior to placing the next lift.

3.3 EXPANSION JOINTS

A. Comply with requirements of ACI 301 and this Section.

B. Locate and install expansion joints as shown and indicated in the Contract Documents. Install joint filler in accordance with manufacturer's instructions. Install sealants as specified in this Section.

3.4 CONTROL JOINTS

A. Provide control joints in non-water bearing slabs on grade as shown or indicated on the Drawings. Where control joints are not shown or indicated on the Drawings, space control joints at 24 to 36 times thickness of slab in both directions. Locate control joints only at places approved by Engineer.

B. A groove, with depth of at least 25 percent of the member thickness, shall be tooled, formed, or saw-cut in concrete. Groove shall be filled with joint sealant material in accordance with Section 07 9200, Joint Sealants.

C. Where control joint is formed by sawcutting, make sawcut in presence of Engineer immediately after concrete has set sufficiently to support the saw and be cut without damage to concrete. Keep concrete continually moist during cutting. Joints shall be approximately 1/8-inch wide.

D. Control joints may be formed with tool or by inserting joint forming strip. After concrete has achieved design strength, remove upper portion of joint forming strip and fill void with sealant.

3.5 ISOLATION JOINTS

A. Provide isolation joint where sidewalk or other slab on grade abuts a concrete structure and slab on grade is not shown doweled into that structure. Form isolation joint by 1/2-inch joint filler with upper 1/2-inch of joint filled with sealant.

3.6 WATERSTOPS

A. General:
1. Comply with ACI 301 and this Section. Make joints in accordance with manufacturer's instructions.
2. Provide PVC waterstops, except where otherwise shown or indicated on the Drawings.
3. Provide waterstops in all joints where concrete construction is below grade or intended to retain liquid. Install waterstop to the higher of: at least 12 inches above grade, or 12 inches above overflow liquid level in tanks.
4. Waterstops shall be fully continuous for extent of joint and with waterstops in intersecting joints. Maintain waterstop continuity at transitions between waterstops in joints at different levels and orientations.
5. In vertical joints in walls that are free at the top, waterstops shall extend no closer than six inches from top of wall.
6. In placing concrete around horizontal waterstops, with waterstop flat face in horizontal plane, work the concrete under waterstops by hand to avoid forming air and rock pockets.

B. Polyvinyl Chloride Waterstop:
1. Waterstops shall be positively held from displacement during concrete placing. Tie waterstops to reinforcement or other rigid supports at maximum spacing of 18 inches so that waterstop is securely and rigidly supported in proper position during concrete placing. Continuously inspect waterstops during concrete placing to ensure proper positioning.
2. Perform splicing in waterstops by heat sealing adjacent waterstop sections in accordance with manufacturer's printed recommendations. The following is required:
   a. Material shall not be damaged by heat sealing.
   b. Splices shall have tensile strength of not less than 60 percent of unspliced material's tensile strength.
   c. Maintain the continuity of waterstop ribs and of its tubular center axis.
3. Only butt-type joints of ends of two identical waterstop sections shall be made while material is in forms.
4. Prefabricated PVC Waterstop Joint:
   a. Joints with waterstops involving more than two ends to be jointed together, and joints that involve an angle cut, alignment change, or joining of two dissimilar

waterstop sections, shall be prefabricated by Contractor or manufacturer prior to placing in the forms.

b. Prefabricated joints shall have minimum of 2.0 feet of waterstop material beyond joint in each direction.

c. Install prefabricated joint assembly in the forms and butt-weld each two-foot end to a straight-run portion of waterstop in place in the forms.

5. Where centerbulb waterstop intersects and is jointed with non-centerbulb waterstop, seal end of centerbulb using additional PVC material as required.
6. Symmetrical halves of waterstops shall be equally divided between concrete placements at joints and centered within joint width, unless shown or indicated otherwise in the Contract Documents. Place centerbulb waterstops in expansion joints so that centerbulb is centered on joint filler material.
7. When waterstop is installed in the forms or embedded in first concrete placement and waterstop remains exposed to atmosphere for more than four days, implement suitable precautions to shade and protect exposed waterstop from direct rays of sun during entire exposure, until exposed portion of waterstop is embedded in concrete.
8. Protect waterstop placed in joints intended for future concrete placement from direct rays of the sun by temporary means until permanent cover is installed, so that waterstop is not exposed to direct rays of the sun for more than four days total.

C. Hydrophilic Rubber Waterstop and Sealant:

1. Where a hydrophilic rubber waterstop or sealant is required in accordance with the Contract Documents, or where approved by Engineer, install waterstop or sealant in accordance with manufacturer's instructions and recommendations; except, as modified in the Contract Documents.
2. When requested by Engineer, provide manufacturer's technical assistance at the Site.
3. Locate waterstop or sealant as near as possible to center of joint. Waterstop or sealant shall be continuous around entire joint. Minimum distance from edge of waterstop to face of the member shall be three inches.
4. Where hydrophilic rubber waterstop is used in combination with PVC waterstop, hydrophilic rubber waterstop shall overlap PVC waterstop for minimum of six inches. Fill contact surface between hydrophilic rubber waterstop and PVC waterstop with hydrophilic sealant.
5. Where wet curing methods are used, apply hydrophilic rubber waterstop and sealant after curing water is removed and just prior to closing up of the forms for concrete placement. Protect hydrophilic rubber waterstop and sealant from direct rays of sun and from becoming wet prior to concrete placement. If material becomes wet and expands, allow material to dry until material has returned to original cross sectional dimensions before placing concrete.
6. Install hydrophilic rubber waterstop in bed of hydrophilic sealant, before skinning and curing begins, so that irregularities in concrete surface are completely filled and waterstop is bonded to sealant. After sealant has cured, install concrete nails, with washers of a diameter equal to waterstop width, to secure waterstop to concrete at maximum spacing of 1.5 feet.
7. Prior to installing hydrophilic sealant, wire brush or sandblast the concrete surface to remove laitance and other materials that may interfere with bonding. Metal and PVC surfaces to receive sealant shall be cleaned of paint and any material that may interfere with bond. When sealant alone is shown or indicated in the Contract Documents, place sealant placed in built-up bead which has a triangular cross section with each side of triangle at least 3/4-inch long, unless otherwise indicated in the Contract Documents. Do not place concrete until sealant has cured as recommended by sealant manufacturer.

3.7 BONDING AGENT

A. Use epoxy bonding agent for bonding of fresh concrete to concrete that has been in place for at least 60 days, and for bonding to existing concrete.

B. Use epoxy-cement bonding agent for the following:
   1. Bonding toppings and concrete fill to concrete that has been in place for at least 60 days, and for bonding to existing concrete.
   2. For locations where bonding agent is required and concrete cannot be placed within open time period of epoxy bonding agent.
   3. Bonding of horizontal construction joints where joints are required in accordance with the Drawings or approved by Engineer for foundation mats that are five feet thick or greater.

C. Use cement-water slurry as bonding agent for toppings and concrete fill to new concrete. Cement water slurry shall be worked into surface with stiff bristle broom and place the concrete before cement-water slurry dries.

D. Handle and store bonding agent in accordance with manufacturer's printed instructions and safety precautions.

E. Mix bonding agent in accordance with manufacturer's instructions.

F. Before placing fresh concrete, thoroughly roughen and clean hardened concrete surfaces and coat with bonding agent not less than 1/16-inch thick. Place fresh concrete while bonding agent is still tacky (within its open time), without removing in-place bonding agent coat, and as directed by manufacturer.

END OF SECTION 03 1500

SECTION 03 2000

CONCRETE REINFORCING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install concrete reinforcing.
2. Extent of concrete reinforcing is shown and indicated in the Contract Documents.
3. Work includes fabrication and placement of reinforcing including bars, ties, and supports, and welded wire fabric for concrete, encasements, and fireproofing.

B. Related Sections:
1. Section 03 1500, Concrete Accessories.
2. Section 04 0505, Unit Masonry Construction.

1.2 REFERENCES

A. Standards referenced in this Section are:
1. ACI 315, Details and Detailing of Concrete Reinforcement.
2. ACI 318, Building Code Requirements for Structural Concrete.
3. ACI 350, Code Requirements for Environmental Engineering Concrete Structures.
4. ANSI/AWS D1.4, Structural Welding Code - Reinforcing Steel.
5. ASTM A82, Specification for Steel Wire, Plain, for Concrete Reinforcement.
6. ASTM A185, Specification for Steel Welded Wire Reinforcement, Plain, for Concrete.
7. ASTM A615, Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
8. ASTM A706, Specification for Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement.
9. ASTM E329, Specification for Agencies Engaged in Construction Inspection and/or Testing.
10. Concrete Reinforcing Steel Institute (CRSI), CRSI 1MSP, Manual of Standard Practice.
11. ICC Evaluation Service (ES) AC 308, Acceptance Criteria for Post-Installed Anchors in Concrete Elements.

1.3 QUALITY ASSURANCE

A. Qualifications:
1. Testing Laboratory: Shall meet requirements of ASTM E329 and shall have experience in the testing welded splices of reinforcing steel and tension testing of reinforcing bars set in adhesive in hardened concrete.
2. Installer of Adhesive Dowels: Installation shall be performed by personnel certified under an applicable certification program. Certification shall include written and performance tests in accordance with the ACI/CRSI Adhesive Anchors Installer Certification Program, or equivalent. Description of equivalent programs shall be submitted for Engineer's approval and acceptance by the building official having jurisdiction.

B. Certifications:
1. Weld Procedures: For types of splices and grades of reinforcing used in the Work, weld procedures for welded reinforcing steel splices shall be certified in accordance with ANSI/AWS D1.4.
2. Welders: For types of splices and grades of reinforcing used in the Work, welders shall be certified for welding reinforcing steel splices in accordance with ANSI/AWS D1.4.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Drawings for fabricating, bending, and placing concrete reinforcing. Comply with ACI 315, Parts A and B.
b. For walls, show elevations at minimum scale of 1/4-inch to one foot.
1) Elevations shall show all openings and reference details that identify additional reinforcing required around each opening.
2) Elevations shall denote each wall intersection and reference a detail that identifies additional reinforcing required at wall intersection. As an alternate to providing separate details for each wall intersection, provide overall plan detailing only the additional wall intersection reinforcing for each wall intersection.
c. For slabs and mats, show top and bottom reinforcing on separate plan views.
1) Plans shall show all openings and shall reference details that identify additional reinforcing around each opening.
d. Show bar schedules, stirrup spacing, diagrams of bent bars, location of bar splices, length of lap splices, arrangements, and assemblies, as required for fabricating and placing concrete reinforcing unless otherwise noted.
e. Provide plans and elevations detailing location, spacing, and lengths of masonry wall dowels, where masonry is required. Coordinate location of dowels with masonry openings and with standard modular spacing. Submit masonry wall dowels with reinforcing submittal for element into which masonry dowel will be embedded. Coordinate with Section 04 0505, Unit Masonry Construction.
f. Splices shall be kept to a minimum. Avoid, when possible, splices in regions of maximum tensile stresses.
g. Drawings detailing location of all construction and expansion joints, as required under Section 03 1500, Concrete Accessories, shall be submitted and approved before Shop Drawings for reinforcing are submitted.
h. Drawings detailing location, spacing, edge distance, and embedment depth of adhesive dowels. Adhesive system shall be submitted and approved before Shop Drawings with adhesive dowels are submitted.
2. Product Data:
a. Manufacturer's product data for adhesive, if not submitted under other Sections.
b. Adhesive manufacturer's test data and ICC ES report to verify specified capacity of adhesive dowels.

B. Informational Submittals: Submit the following:
1. Certificates:
a. Steel manufacturer's certificates of mill analysis, tensile, and bend tests for reinforcing steel.
b. Certification of welders and weld procedures for splices.

c. Adhesive manufacturer's certification verifying that installer is qualified and using proper installation procedures.

2. Manufacturer's Instructions:
   a. Installation instructions for adhesive systems.
3. Special Procedure Submittals; Description of reinforcing weld locations and weld procedures, only when allowed by Engineer.

1.5 DELIVERY, HANDLING, AND STORAGE

A. Deliver concrete reinforcing products to Site bundled, tagged, and marked. Use metal tags indicating bar size, lengths, and other information corresponding to markings on approved Shop Drawings.

B. Store concrete reinforcing products to prevent damage and accumulation of dirt and excessive rust. Store on heavy wood blocking so that reinforcing does not come into contact with the ground.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Reinforcing Bars: Shall be deformed in accordance with ASTM A615, and as follows:
   1. Provide Grade 60 for all bars, unless indicated otherwise.
   2. At beams and columns forming frames and wall boundary elements, where shown on the Drawings, provide ASTM A706 or ASTM A615, Grade 60, with tested actual maximum yield stress of 78,000 psi and ratio of actual tested tensile strength to tested yield strength not less than 1.25.

B. Mechanical Couplers: Reinforcement bars may be spliced with mechanical connection. Connection shall be full mechanical connection that shall develop in tension or compression, as required, at least 125 percent of specified yield strength (fy) of bar in accordance with ACI 318 and ACI 350. Where splices at the face of wall are shown or approved by Engineer, form saver-type mechanical couplers may be used. Form-saver couplers shall have integral plates designed to positively connect coupler to formwork.

C. Steel Wire: Shall be in accordance with ASTM A82.

D. Welded Smooth Wire Fabric: Shall be in accordance with ASTM A185.
   1. Furnish in flat sheets, not rolls.

E. Column Spirals: Hot-rolled rods for spirals, conforming to ASTM A615.

F. Supports for Reinforcement: Bolsters, chairs, spacers, and other devices for spacing, supporting and fastening reinforcing in place.
   1. Use wire bar type supports complying with CRSI 1 MSP recommendations, except as specified in this Section. Do not use wood, brick, or other unacceptable materials.
   2. For slabs on grade, use precast concrete blocks, four inches square in plan, with embedded tie wire as specified by CRSI 1 MSP. Precast concrete blocks shall have same or higher compressive strength as specified for concrete in which they are located.
   3. For concrete surfaces where legs of supports are in contact with forms, provide supports complying with CRSI 1 MSP as follows:

a. At formed surfaces in contact with soil, weather, or liquid, or located above liquid, supports shall be CRSI Class 1 for maximum protection. Plastic coating on legs shall extend at least 0.5-inch upward from form surface.
b. At interior dry surfaces (not located above liquid), supports shall be either Class 1 or Class 2 for moderate protection.

G. Adhesive Dowels:
1. Products and Manufacturers:
a. HIT-RE 500-V3 Injection Epoxy Adhesive Anchoring System, by Hilti Fastening Systems, Inc.
b. SET-XP Adhesive anchoring system, by Simpson Strong-Tie Company, Inc.
c. Or Equal.
2. Dowels:
a. Dowel reinforcing bars shall be deformed in accordance with ASTM A615, Grade 60.
3. Adhesive:
a. Adhesive system shall use two-component adhesive mix.
b. Adhesives shall have a current evaluation report by ICC Evaluation Service for use with steel reinforcing bars in both cracked and uncracked concrete with seismic recognition for SDC A through F as tested and assessed in accordance with ICC-ES AC308, which incorporates the requirements of ACI 355.4.
c. Adhesives shall have minimum bond strength and minimum design bond strength in accordance with Table 03 20 00-A.

TABLE 03 20 00-A: ADHESIVE BOND STRENGTH [1,2]

Bond Strength (psi)		
Dowel Size	**Uncracked Concrete**	**Cracked Concrete**
#4	1500	1080
#5	1460	1090
#6	1415	1015
#7	1370	835
#8	1330	760
#9	1560	850
#10	1240	475

Table Notes:
1. Bond strengths listed for hammer-drilled, dry hole.
2. Bond strengths listed for maximum short term concrete temperature of 130 degrees F and maximum long term concrete temperature of 110 degrees F.

2.2 FABRICATION

A. General: Fabricate reinforcing bars to conform to required shapes and dimensions, with fabrication tolerances complying with CRSI 1 MSP. In case of fabricating errors, do not re-bend or straighten reinforcing in manner that injures or weakens material.

B. Unacceptable Materials: Reinforcing with one or more of the following defects is not allowed:
1. Bar lengths, bends, and other dimensions exceeding specified fabrication tolerances.
2. Bends or kinks not shown on approved Shop Drawings.

3. Bars that do not meet or exceed their ASTM specification requirements when hand-wire-brushed, with respect to cross section, nominal weight, or average height of deformations.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine the substrate and conditions under which concrete reinforcing is to be placed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with Work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with applicable recommendations of Laws and Regulations, applicable standards, and CRSI 1 MSP for details and methods of reinforcing placement and supports, and as required below.

B. Clean reinforcing to remove loose rust and mill scale, earth, ice, and other materials that reduce or destroy bond with concrete.

C. Position, support, and secure reinforcing against displacement during formwork construction and concrete placing. Locate and support reinforcing by metal chairs, runners, bolsters, spacers, and hangers, as required. The use of dropped bars will not be allowed. Reinforcing bars intended as main reinforcing and temperature reinforcing shall remain in their intended plane.
   1. Place reinforcing to obtain minimum concrete coverages specified in ACI 318, AC I 350, and the Contract Documents. Arrange, space, and securely tie bars and bar supports together with 16-gage wire to hold reinforcing accurately in position during concrete placing. Set wire ties so that twisted ends are directed away from exposed concrete surfaces.
   2. Prior to placing concrete, using surveyor's level or string line, demonstrate to Engineer that specified cover of reinforcing has been attained.
   3. Do not secure reinforcing steel to forms with wire, nails, or other ferrous metal. Metal supports subject to corrosion shall not touch formed or exposed concrete surfaces.
   4. Bars may be moved as necessary to avoid interference with other reinforcing steel, conduits, or embedded items. If bars are moved more than 1-bar diameter, or enough to exceed the inspection tolerances, the resulting arrangement of bars shall be subject to review and acceptance by Engineer.
   5. Conduit placement within slabs/walls shall follow the location and minimum clearance requirements shown on the Contract Drawings.

D. Allowable Placing Tolerances: Comply with ACI 318, Chapter 7 - Details of Reinforcement, and ACI 350, Chapter 7 - Details of Reinforcement, except as specified in this Section:
   1. Concrete surfaces in contact with liquid shall have minimum of two inches of concrete over reinforcing steel.

E. Provide sufficient number of supports of strength required to carry reinforcing. Do not place reinforcing bars more than two inches beyond last leg of continuous bar support. Do not use supports as bases for runways for concrete conveying equipment and similar construction loads.

F. Lap Splices:

1. Provide standard reinforcing splices by lapping ends, placing bars in contact, and tying tightly with wire. Comply with requirements shown for minimum lap of spliced bars as shown on the Drawings.

G. Install welded wire fabric in lengths as long as practical. Lap adjoining pieces at least one full mesh and lace splices with 16-gage wire. Do not make end laps midway between supporting beams, or directly over beams of continuous structures. Offset end laps in adjacent widths to prevent continuous laps.

H. Mechanical Couplers:
1. Mechanical butt splices shall be in accordance with recommendations of mechanical splicing device manufacturer. Butt splices shall develop 125 percent of specified minimum yield tensile strength of spliced bars or of smaller bar in transition splices. Bars shall be flame-dried before butt splicing. Provide adequate jigs and clamps or other devices to support, align, and hold longitudinal centerline of bars being butt spliced in straight line.

I. Welded Splices:
1. When field welding of reinforcing is required on the Drawings or allowed by Engineer in writing, welding of reinforcing bars shall conform to ANSI/AWS D1.4. Preheating and rate of cooling requirements shall be based on bar steel chemistry and ANSI/AWS D1.4. Welded splices shall be sized and constructed to transfer minimum of 125 percent of specified minimum yield tensile strength of spliced bars or of smaller bar in transition splices. Unless otherwise allowed by ENGINEER in writing, welding of crossing bars (tack welding) for assembly of reinforcement is prohibited.
2. Welding of wire to wire, and of wire or welded wire fabric to reinforcing bars or structural steels, shall conform to applicable provisions of ANSI/AWS D1.4 and Engineer's requirements for the particular application.
3. After completing welding on coated reinforcing bars, repair coating damage as specified in this Section. Welds and steel splice members, when used to splice bars, shall be coated with same material used for repair of coating damage.

J. Adhesive Dowels:
1. Comply with manufacturer's written installation instructions and requirements of this Section.
2. Drill holes to adhesive system manufacturer's recommended drill bit diameter and to specified depth. Drill holes in hammering and rotation mode with carbide-tipped drill bits complying with tolerances indicated in ANSI B212.15. Core-drilled holes shall not be permitted.
3. Before setting adhesive dowel, hole shall be made free of dust and debris by method recommended by adhesive system manufacturer. Brush the hole with adhesive system manufacturer-approved brush and blow hole clean with clean, dry, oil-free compressed air to remove all dust and loose particles. Hole shall be dry as defined by adhesive system manufacturer.
4. Before injecting adhesive, obtain Engineer's concurrence that hole is dry and free of oil and other contaminants.
5. Prior to injecting adhesive into the drilled hole, dispense to an appropriate location for waste an initial amount of adhesive from the mixing nozzle until adhesive is a uniform color, indicating that product is properly mixed.
6. Inject adhesive into hole through injection system-mixing nozzle and extension tubes (as required) placed to bottom of hole. Withdraw nozzle's discharge end as adhesive is placed

while keeping nozzle immersed to prevent formation of air pockets. Fill hole to depth that ensures that excess material is expelled from hole during dowel placing.

7. Twist dowel during insertion into partially-filled hole to ensure full wetting of rod surface with adhesive. Insert rod slowly to avoid developing air pockets.
8. Provide adequate curing in accordance to adhesive system manufacturer's requirements prior to continuing with adjoining or adjacent Work that could impose or impart load on the dowels. Do not begin adjoining or adjacent Work until dowels are successfully tested or when approved by Engineer.
9. Limitations:
    a. Installation Temperature: Comply with manufacturer's instructions for installation temperature requirements. Provide temporary protection and other measures, such as heated enclosures, necessary to ensure that base material temperature complies with requirements of adhesive systems manufacturer during installation and adhesive system curing.
    b. Oversized Holes: Advise Engineer immediately if size of drilled hole is larger than recommended by adhesive system manufacturer. Cost of corrective measures, including but not limited to redesign of dowels due to decreased capacities, shall be paid by Contractor.

3.3 FIELD QUALITY CONTROL

A. Site Inspections and Tests:
    1. General:
        a. Do not place concrete until reinforcing is inspected, and permission for placing concrete is granted by Engineer. Concrete placed in violation of this provision will be rejected.
        b. Do not close up formwork for walls and other vertical members until reinforcing is inspected, and permission for placing concrete is granted by Engineer. Concrete placed in violation of this provision will be rejected.
        c. Correct defective Work by removing and replacing or correcting, as required by Engineer.
        d. Contractor shall pay cost of corrections and subsequent testing required to confirm integrity of post-installed anchors.
        e. Testing laboratory shall submit test results to Contractor and Engineer within 24 hours of completion of test.
    2. Site Tests:
        a. Owner will employ testing laboratory to perform field quality testing of adhesive dowels at the Site.
            1) Testing shall comply with ASTM E488.
            2) Test at least ten percent of each type of adhesive dowel. If one or more dowels fail the test, Contractor shall pay cost to test all dowels of same diameter and type installed on the same day as the failed dowel.
            3) Test dowels to 60 percent of specified yield strength. Engineer will direct which dowels are to be tested.
            4) Apply test loads with hydraulic ram.
            5) Displacement of dowels shall not exceed D/10, where D is nominal diameter of dowel.
    3. Inspection of Welded Splices: Owner will employ testing laboratory to perform field quality control testing of welded splices. All welded splices shall be visually inspected. Radiographically test minimum of five percent of butt splice welds. Repair defective welds so that welds are completely sound.

B. Manufacturer's Services:

1. Provide qualified adhesive manufacturer's representative at the Site during initial installation of adhesive dowel systems to train installing personnel in proper selection and installation procedures. Manufacturer's representative shall observe to verify that installer demonstrates proper installation procedures for adhesive dowels and adhesive material. Each installer shall be certified in writing by manufacturer as qualified to install adhesive anchors.

END OF SECTION 03 2000

SECTION 03 3000

CAST-IN-PLACE CONCRETE

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install cast-in-place concrete.
   2. Concrete shall be in accordance with requirements of ACI 301 and ACI 350.5 unless otherwise specified.
   3. The Work includes providing concrete consisting of Portland cement, fine and coarse aggregate, water, and approved admixtures; combined, mixed, transported, placed, finished, and cured. The Work also includes:
      a. Providing openings in concrete to accommodate the Work under this and other Sections, and building into the concrete all items such as sleeves, frames, anchorage devices, inserts, and all other items to be embedded in concrete Work.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate installation of items to be installed in the concrete Work.

C. Classifications of Concrete:
   1. Class “A” concrete includes the following:
      a. All concrete, unless otherwise shown or indicated.
   2. Class “AF” concrete may be used in lieu of Class “A” concrete for the following:
      a. Walls and foundations thicker than 16 inches.
   3. Class “B” concrete shall be placed without forms or with simple forms, with little or no reinforcing, and includes the following, unless otherwise shown or indicated:
      a. Concrete fill within structures.
      b. Duct banks.
      c. Unreinforced encasements.
      d. Curbs and gutters.
      e. Sidewalks.
      f. Thrust blocks.
   4. Class “D” concrete shall be unreinforced and used where required as concrete fill under foundations, filling abandoned piping, and where “lean concrete” or “mudmat” is shown or indicated in the Contract Documents.
   5. Class “SC” self-consolidating concrete shall be used at CONTRACTOR’s discretion.
   6. For the following locations, Class "A" and/or "AF" shall include the Crystalline Waterproofing Admixture and shall be designated Class "AW" and "AFW".
      a. Basement foundation slab (top of slab elevation 746.50).
      b. Break Tank perimeter walls from elevation 772.83 to elevation 746.50.

D. Related Sections:
   1. Section 03 1500, Concrete Accessories.
   2. Section 03 2000, Concrete Reinforcing.
   3. Section 03 6000, Grouting.

34. ASTM C1621, Test Method for Passing Ability of Self-Consolidating Concrete by J-Ring
35. ASTM D1042, Test Method for Linear Dimensional Changes of Plastics Caused by Exposure to Heat and Moisture.
36. ASTM D3574, Test Methods for Flexible Cellular Materials—Slab, Bonded, and Molded Urethane Foams.
37. ASTM E96/E96M, Test Methods for Water Vapor Transmission of Materials
38. ASTM E329, Specification for Agencies Engaged in Construction Inspection, Testing, and Special Inspection.
39. ASTM E1643, Practice for Selection, Design, Installation, and Inspection of Water Vapor Retarders Used in Contact with Earth or Granular Fill Under Concrete Slabs.
40. ASTM E1745, Specification for Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill under Concrete Slabs.
41. NSF/ANSI 61, Drinking Water System Components - Health Effects.
42. NRMCA, National Ready Mixed Concrete Association.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Concrete Testing Laboratory:
      a. Employ independent testing laboratory experienced in design and testing of concrete materials and mixes to perform material evaluation tests and to design concrete mixes. Employ different laboratories for design of concrete mixes and field testing.
         1) Testing agency shall be in accordance with ASTM E329 and ASTM C1077.
         2) Testing laboratory shall have been inspected and passed within previous two years by Cement and Concrete Reference Laboratory (CCRL) of NIST for: testing concrete aggregates, and for preparing and testing concrete trial batches with or without admixtures. Testing laboratory shall provide documentation indicating how deficiencies, if any, in most recent CCRL inspection report were corrected.
         3) Selection of testing laboratory is subject to Owner's acceptance.
         4) Submit written description of proposed concrete testing laboratory giving qualifications of personnel, laboratory facilities, and equipment, and other information requested by Engineer.
   2. Batch Plant: NRMCA Program for Certification of Ready-Mixed Concrete Production Facilities or approved equivalent program.
   3. Mix Designer: Person responsible for developing concrete mixture proportions certified as NRMCA Concrete Technologist Level 2 or DOT certified mix designer in jurisdiction of the Work. Requirement may be waived if individual is Contractor's Licensed Design Engineer.
   4. Flatwork Finisher: Unless otherwise permitted, at least one person on finishing crew shall be certified as an ACI Flatwork Finisher, or equivalent.
   5. Water Reducing Admixture Manufacturer:
      a. Water-reducing admixtures shall be manufactured under strict quality control in facilities operated under a quality assurance program. Submit copy of manufacturer's quality assurance handbook to document program existence.
      b. Manufacturer shall maintain a concrete testing laboratory approved by CCRL at NIST.

c. Manufacturer shall be capable of providing services of qualified field service representatives at the Site.

B. Laboratory Trial Batch:
1. Each concrete mix design specified shall be verified by laboratory trial batch, unless indicated otherwise.
2. For classes of concrete that require air-entrainment, test the trial batch at highest percentage of air (plus 1.5 percent) allowed for that class of concrete.
3. Perform the following testing on each trial batch:
   a. Aggregate gradation for fine and coarse aggregates.
   b. Fly ash testing to verify meeting specified properties, unless fly ash Supplier submits certification by an independent testing laboratory.
   c. Slump.
   d. Where mix is designed to be self-consolidating concrete: slump flow, passing ability, visual stability index, and static segregation.
   e. Air content.
   f. Compressive strength based on three cylinders each tested at seven days and at 28 days.
   g. Shrinkage test in accordance with this Section, for Class "A" concrete, Class "AF" concrete, and Class "SC" concrete.
4. Submit for each trial batch the following information:
   a. Project identification name and number (if applicable).
   b. Date of test report.
   c. Complete identification of aggregate source of supply.
   d. Tests of aggregates for compliance with the Contract Documents.
   e. Scale weight of each aggregate.
   f. Absorbed water in each aggregate.
   g. Brand, type, and composition of cementitious materials.
   h. Brand, type, and amount of each admixture.
   i. Amounts of water used in trial mixes.
   j. Proportions of each material per cubic yard.
   k. Gross weight and yield per cubic yard of trial mixtures.
   l. Measured slump. Where mix is self-consolidating concrete: measured slump flow, time to reach 20-inch diameter, passing ability, visual stability index, and static segregation.
   m. Measured air content.
   n. Compressive strength developed at seven days and 28 days, from not less than three test cylinders cast for each seven day and 28 day test, and for each design mix.
   o. Shrinkage test results where required and as specified in this Section. Report results and averages for original length and at zero, seven, 14, 21, and 28 days of drying.

C. Shrinkage Test:
1. Perform drying shrinkage tests for trial batch as specified in this Section.
2. Drying shrinkage specimens shall be four-inch by four-inch by 11-inch prisms with effective gage length of ten inches; fabricated, cured, dried, and measured in accordance with ASTM C157 modified as follows: remove specimens from molds at an age of 23 hours, plus-or-minus one hour, after trial batching; shall be placed immediately in water at 70 degrees F plus-or-minus three degrees F for at least 30 minutes; and shall be measured within 30 minutes thereafter to determine original length and then submerged in saturated lime water at 73 degrees F plus-or-minus three degrees F. Measurement to determine expansion expressed as percentage of original length shall be made at age of seven days.

Length at age of seven days shall be base length for drying shrinkage calculations (zero days drying age). Immediately afterward store specimens in humidity-controlled room maintained at 73 degrees F plus-or-minus three degrees F, and 50 percent (plus-or-minus four percent) relative humidity for remainder of test. Obtain measurements to determine shrinkage expressed as percentage of base length and report measurements separately for seven, 14, 21, and 28 days of drying after seven days of moist curing.

3. Determine drying shrinkage deformation of each specimen as the difference between base length (at zero days drying age) and length after drying at each test age. Determine average drying shrinkage deformation of specimens to nearest 0.0001-inch at each test age. If drying shrinkage of a specimen departs from average of that test age by more than 0.0004-inch, results obtained from that specimen shall be disregarded. Report results of shrinkage test to nearest 0.001 percent of shrinkage. Compression test specimens shall be taken in each case from same concrete used for preparing drying shrinkage specimens. Tests shall be considered part of normal compression tests for the Work. Allowable shrinkage limitations shall be as specified in Part 2 of this Section.

D. Component Supply and Compatibility:
   1. Provide a certificate of compatibility for all admixture materials.

E. Concrete Coordination Conference:
   1. Conduct concrete coordination conference to review detailed requirements of Contractor's proposed concrete design mixes, to discuss procedures for producing proper concrete construction, and to clarify roles of the parties involved. Contractor shall organize and schedule the conference, and prepare and distribute to all parties attending conference minutes of the conference.
   2. Conduct concrete coordination conference no later than 14 days after the date the Contract Times commence running. Conference shall be held at mutually agreed upon date and time; conference shall be held at the Site unless otherwise mutually agreed upon. Notify all parties to attend concrete coordination conference not less than five days prior to scheduled date of conference.
   3. Additional structure specific concrete construction conferences shall be held as required by the Engineer.
   4. All parties involved in the concrete Work shall attend concrete coordination conference including, but not limited to, the following:
      a. Contractor.
      b. Field testing services representative.
      c. Concrete Subcontractor (if any).
      d. Reinforcing steel Subcontractor (if any) and reinforcing steel Supplier and detailer.
      e. Concrete Supplier.
      f. Admixture manufacturer's representative.
      g. Engineer.
      h. Concrete special inspector.
      i. Resident Project Representative (if any).

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Mix Design:
         1) List of concrete materials and proportions for the proposed concrete mix designs. Include data sheets, test results, certifications, and mill reports to

qualify the materials proposed for use in the mix designs. Do not start laboratory trial batch testing until this submittal is approved by Engineer.

2) Laboratory Trial Batch Reports: Submit laboratory test reports for concrete cylinders, materials, and mix design tests.

b. Concrete Supply:

1) Ready-mixed Concrete: Submit the following information.

a) NRMCA plant certification.

b) Physical capacity of mixing plant.

c) Trucking facilities available.

d) Estimated average amount of the specified concrete that can be produced and delivered to the Site during a normal, eight-hour day, excluding output to other customers.

2. Product Data:

a. Manufacturers' specifications with application and installation instructions for proprietary materials and items, including admixtures and bonding agents.

3. Samples:

a. Submit Samples of materials as specified and as requested by Engineer. Include with each Sample names of product and Supplier, and description.

4. Curing and Protection Plans:

a. Submit detailed plan for curing concrete in water retaining and non-water retaining structures.

b. Submit detailed plan for curing and protection of concrete placed and cured in cold weather.

c. Submit detailed plan for curing and protection of concrete placed and cured in ambient temperatures over 80 degrees F.

B. Informational Submittals: Submit the following:

1. Certifications:

a. Notarized certification of conformance to reference standards used in this Section, when required by Engineer.

b. Flatwork finisher certification.

2. Delivery Tickets: Copies of all delivery tickets for each load of concrete delivered to or mixed at the Site submitted prior to unloading. Each delivery tickets shall contain the information in accordance with ASTM C94 requirements of sections 14.2.1 through 14.2.10 along with project identification name and number (if any), date, mix type, mix time, quantity and amount of water initially withheld and introduced on site.

3. Minutes of the Concrete Coordination Conference and other subsequent structure specific concrete construction conferences.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Transportation, Delivery, and Handling:

1. Materials used for concrete shall be clean and free from foreign matter during transportation and handling, and kept separate until measured and placed into concrete mixer.

2. Implement suitable measures during hauling, piling, and handling to ensure that segregation of coarse and fine aggregate particles does not occur and grading is not affected.

B. Storage:

1. For storage, provide bins or platforms with hard, clean surfaces.

PART 2 - PRODUCTS

2.1 GENERAL

A. All cementitious materials, admixtures, curing compounds, and other industrial-produced materials used in concrete, or for curing or repairing of concrete, that can contact potable water or water that will be treated to become potable shall be listed in NSF/ANSI 61.

2.2 CEMENTITIOUS MATERIALS

A. Cement:
   1. Portland cement shall be Type II(MH) ASTM C150. Type I or Type II may be used in lieu of Type II(MH) when approved by Engineer.
   2. Portland cement shall be produced by one manufacturer's facility. Cement from other facilities of the manufacturer shall be tested for similarity of properties. Tested cement with different properties or alternate cement sources of other manufacturers may be used provided that mix design has been approved and acceptable trial batch verifying performance has been made.
   3. Do not use cement that has deteriorated because of improper storage or handling.

B. Fly Ash:
   1. Fly Ash, when used, shall conform to the requirements of ASTM C618 Class F, except as follows:
      a. The loss on ignition shall be a maximum of four percent.
      b. The maximum percent of sulfur trioxide (SO3) shall be 4.0.
   2. Fly ash shall be considered to be a cementitious material.
   3. Laboratory trial batches shall be tested to determine compliance with strength requirements, times of setting, slump, slump loss, and shrinkage characteristics.

C. Slag Cement:
   1. Slag cement, when used, shall conform to ASTM C989, Grade 120.
   2. Slag cement shall be considered a cementitious material.
   3. Perform laboratory tests on trial batches to determine compliance with strength requirements, times of setting, slump, slump loss, and shrinkage characteristics.

D. For all classes of concrete, when Type II(MH) Cement is used, fly ash or slag cement may be used within the following percentages by weight. When Type II Cement is used, fly ash or slag cement shall be used within the following percentages by weight. When Type I Cement is used, in lieu of Type II(MH) Cement, fly ash or slag cement shall be used such that total tricalcium aluminate content (C3A) of the resulting cementitious material is not greater than eight percent. Class "SC" concrete shall contain fly ash or slag cement regardless of cement type used.
   1. When fly ash is used, material shall have minimum of 20 percent and maximum of 25 percent of total weight of cementitious material.
   2. When slag cement is used, material shall have minimum of 40 percent and maximum of 50 percent of total weight of cementitious material.

2.3 AGGREGATES

A. General:
   1. Aggregates shall conform to ASTM C33, Class Designation 4S, and as specified in this Section.

2. Do not use aggregates containing soluble salts or other substances, such as iron sulfides, pyrite, marcasite, ochre, or other materials, that can cause stains on exposed concrete surfaces.

B. Fine Aggregate:
   1. Provide clean, sharp, natural sand free of loam, clay, lumps, and other deleterious substances.
   2. Dune sand, bank run sand, and manufactured sand are unacceptable.

C. Coarse Aggregate:
   1. Provide clean, uncoated, processed aggregate containing no clay, mud, loam, or foreign matter, as follows:
      a. Crushed stone, processed from natural rock or stone.
      b. Washed gravel, either natural or crushed. Slag, pit gravel, and bank run gravel are unacceptable.

2.4 WATER

A. Water used in producing and curing concrete shall be clean and free of injurious quantities of oils, acids, alkalis, organic materials, and other substances that may be deleterious to concrete and steel.

2.5 CONCRETE ADMIXTURES

A. Provide admixtures in accordance with product manufacturer's published instructions. Admixtures shall be compatible with each other. Admixtures shall not contain thiocyanates, shall not contain more than 0.05 percent chloride ion, and shall be non-toxic in the concrete mix after 30 days. Do not use admixtures that have not been incorporated and tested in the accepted mixes, unless otherwise approved by Engineer.

B. Air entraining admixture shall meet the requirements of ASTM C260.

C. Water-Reducing Admixture: ASTM C494, Type A or D.
   1. Proportion Class "A", Class "AF", Class "AS", and Class "B" concrete with non-air entraining, water-reducing, aqueous solution of modified organic polymer. Admixture shall not contain lignin, nitrates, or chlorides added during manufacturing.

D. High Range Water-Reducing Admixture (HRWR): ASTM C494, Type F or G.
   1. Use high range water-reducing admixture in the concrete classifications so specified or indicated. Use of HRWR admixture is allowed at Contractor's option in all other classifications of concrete. Specific admixture formulation shall be as recommended by admixture manufacturer for Project conditions. HRWR admixture used for Class "SC" concrete shall be polycarboxylate-based.
   2. Products:
      a. Plastol Series by The Euclid Chemical Company.
      b. Glenium Series by BASF.
      c. Or equal.

E. Plasticizing Admixtures: ASTM C1017, Type I or Type II

1. Use plasticizing admixture as an alternate to high range water-reducing admixture. Specific admixture formulation shall be as recommended by admixture manufacturer for Project conditions.

F. Viscosity Modifying Admixture:
   1. Where necessary to control segregation of self-consolidating concrete, a viscosity modifying admixture shall be combined with a high range water reducing admixture either separately or in a combined admixture. Viscosity modifying and high range water reducing admixtures shall be from the same manufacturer and of the recommended types and dosages needed to produce the required concrete flowability and passing ability without segregation.

G. Set Control Admixtures: In accordance with ASTM C494. Use the following as required:
   1. Type B, Retarding.
   2. Type C, Accelerating.
   3. Type D, Water reducing and Retarding.
   4. Type E, Water reducing and Accelerating.
   5. Type F, Water-reducing, high range admixtures.
   6. Type G, Water-reducing, high range, and retarding admixtures.

H. Calcium Chloride: Do not use calcium chloride.

I. Shrinkage Reducing Admixture:
   1. Shrinkage reducing admixture may be used in mix design when necessary to conform to specified shrinkage limitations, provided that specified strength requirements are complied with and there is no reduction in sulfate resistance in the concrete and no increase in concrete permeability.
   2. Products:
      a. Conex or Eucon SRA by The Euclid Chemical Company
      b. MasterLife SRA 20 by BASF Corporation.
      c. Sika Control 40 by Sika Corporation.
      d. Or equal.

J. Hydration Controlling Admixture:
   1. Where extended concrete delivery times are authorized by the Engineer, one of the following hydration controlling admixtures shall be used.
   2. Products:
      a. SikaTard 440, manufactured by Sika Corporation.
      b. Eucon DS, manufactured by the Euclid Chemical Company.
      c. MasterSet DELVO, manufactured by BASF Corporation.
      d. Or equal

K. Crystalline Waterproofing Admixture:
   1. Use a cementitious, capillary waterproofing admixture which, when added at the dosage rate of 1% by weight of cement, will permanently fix a non-soluble crystalline structure throughout the capillary voids of the concrete and cause the concrete to become sealed against the penetration of liquids.
   2. Product and Manufacturer: Provide one of the following:
      a. Xypex Admix C-500, as manufactured by Xypex Chemical Corporation.
      b. Or equal.

2.6 PROPORTIONING AND DESIGN OF MIXES

A. Prepare concrete design mixes in accordance with Table 03 3000-A:

TABLE 03 3000-A
CONCRETE DESIGN MIX CRITERIA

Concrete Class	Coarse Aggregate[1]		Minimum	Max. W/CM[4]	Slump[2]	Air (%)	Min. Comp Strength[3] (psi)
	Size A	Size B	Cementitious (lbs/cu yd)				
Class "A" Class "AW"	No. 57	No. 8	535	0.42	4" max.	6 +/- 1.5	4,500
Class "AF" Class "AFW"	No. 467	No. 8	517	0.42	4" max.	5 +/- 1.5	4,500
Class "B"	No. 57 or No. 67		517	0.50	4" max.	6 +/- 1.5	3,000
Class "SC"	No. 57	No. 8	535	0.40	Slump flow[7]	6 +/- 1.5	4,500
Class "D"	Any ASTM C33		No requirements				2,000

Notes Applicable to Table 03 3000-A:

1. Coarse aggregate size numbers refer to ASTM C33. Where Size A and B are designated in Table 03 30 00-A, it is intended that the smaller Size B aggregate is to be added, replacing a portion of the coarse or fine aggregate, in the minimum amount necessary to make a workable and pumpable mix with sand content not exceeding 41 percent of total aggregate. For Class "SC" concrete, sand content shall not exceed 43 percent of total aggregate and No. 8 aggregate shall comprise a minimum of 10 percent of total aggregate.
2. Slumps indicated are prior to addition of high range water reducing admixture or plasticizing admixture.
3. Mix designs shall be made for all but Class "D", which does not require trial batch, so that the compressive strength achieved for laboratory trial batches will not be less than 125 percent of specified design strength.
4. Quantity of water to be used in the determination of water-cementitious materials (W/CM) ratio shall include free water on aggregates in excess of SSD and water portion of admixtures.
5. Minimum cementitious content shall be adjusted in accordance with the requirements of ACI 350.5 and ACI 301 if smaller maximum coarse aggregate size is used.
6. Required air content listed shall be adjusted in accordance with the requirements of ACI 350.5 and ACI 301 for cycles of freezing and thawing if a different maximum coarse aggregate size is used.
7. Class "SC" concrete is self-consolidating concrete. Design mix to meet required plastic properties.

B. Adjustment to Concrete Mixes: Mix design adjustments may be requested by Contractor when characteristics of materials, Site conditions, weather, test results, or other circumstances warrant; at no additional cost to Owner and as approved by Engineer. Before using adjusted concrete mixes, laboratory test data and strength results shall be submitted to and approved by Engineer.

C. Admixtures:
   1. Use air-entraining admixture in concrete, unless otherwise shown or indicated. Add air-entraining admixture at admixture manufacturer's prescribed rate to produce concrete at point of placement having air content within prescribed limits.
   2. Use water-reducing or high-range water-reducing admixtures in all class "A", class "AF", class "AW", class "AFW", and class "SC" concrete.

3. Use amounts of admixtures recommended by admixture manufacturer for climatic conditions prevailing at the Site at time of placing. Adjust quantities and types of admixtures as required to maintain quality.

D. If adding water at the Site is desired, withhold water at the batch plant so that specified water-cement (or cementitious material) ratio is not exceeded. Addition of water shall be accordance with ASTM C94. After high-range water-reducing admixture is incorporated into the batch, addition of water is not allowed. Additional high-range water reducing admixture may be added at the Site.

E. Slump Limits with High-Range Water Reducer:
1. Slump shall not exceed three inches prior to adding high-range water reducer and shall not exceed nine inches, measured at point of placement, after adding high-range water reducer, except where the mix is designed as self-consolidating concrete.

F. Plastic Properties Required for Self-Consolidating Concrete:
1. Class "SC", self-consolidating concrete, shall have the following plastic properties.
   a. Slump flow, as determined by ASTM C1611, shall be 26 inches +/- 2 inches with a visual stability index of 0 or 1 and time to reach 20-inch diameter of 3.5 seconds +/- 1 second.
   b. Passing ability of no greater than 1.5-inch difference between slump flow and J-Ring flow as measured by ASTM C1621.
   c. Static segregation of less than 5 percent when tested per ASTM C1610.

G. Shrinkage Limitation:
1. Concrete shrinkage for specimens cast in laboratory from trial batch with total water of 30.2 gallons per cubic yard or less, as measured at 21-day drying age and at 28-day drying age shall not exceed 0.035 percent and 0.005 percent, respectively. For trial batch with total water of 32.7 gallons per cubic yard or greater respective limits shall not exceed 0.030 percent and 0.036 percent. Limits in between shall be linear interpolated. Use mix design for construction that complies with trial batch shrinkage requirements. Shrinkage limitations apply to Class "A" concrete and Class "AF" concrete. Shrinkage limits for Class "SC" concrete shall meet the above requirements with an increase is allowable shrinkage of 0.003 percent for each category.
2. Trial Batch Does Not Comply with Shrinkage Limitation:
   a. If trial batch results do not comply with shrinkage limitation specified in the Contract Documents, redesign the mix to reduce shrinkage.
   b. After mix has been repeatedly redesigned and Engineer is satisfied that all reasonable means to provide concrete mix that complies with shrinkage requirement have been exercised; and mix design still fails to comply with shrinkage limitation in the Contract Documents, Engineer reserves the right to accept the higher-shrinkage mix, provided that the quantity of shrinkage reinforcing in structures is increased.
   c. "Reasonable means" will be construed as reducing the total water content to a maximum of 27 gallons per cubic yard, having the large aggregate blended so that eight percent to 18 percent of combined aggregate is retained on each sieve, using an alternate aggregate source, using a shrinkage reducing admixture, and a combination of these means.
   d. Basis for shrinkage reinforcing increase will be proportional to amount that shrinkage value is over the specified shrinkage limitation and will be determined by

Engineer. The cost of providing additional shrinkage reinforcement will be paid by the Owner.

2.7 BONDING AGENT

A. Provide epoxy and epoxy-cement bonding agents in accordance with Section 03 1500, Concrete Accessories.

2.8 CONCRETE CURING MATERIALS

A. Absorptive Cover: Burlap cloth made from jute or kenaf, weighing approximately 10 ounces per square yard and complying with AASHTO M 182, Class 3.

B. Curing Mats: Shall be heavy carpets or cotton mats, quilted at four inches on centers, and weighing minimum of 12 ounces per square yard when dry.

C. Moisture-Retaining Cover: Provide one of the following, complying with ASTM C171:
   1. Waterproof paper.
   2. Polyethylene film.
   3. White burlap polyethylene sheet.

D. Liquid Curing Compound: ASTM C309 Type 1-D (water retention requirements):
   1. Provide fugitive dye.
   2. Curing compound shall be applied by roller or power sprayer.
   3. Product shall be listed in NSF/ANSI 61.

2.9 FINISHING AIDS

A. Evaporation Retardant:
   1. Product and Manufacturer: Provide one of the following:
      a. Confilm, by Master Builders.
      b. Eucobar, by Euclid Chemical Company.
      c. SikaFilm, by Sika Corporation.
      d. Or equal.

2.10 CRACK INJECTION MATERIALS

A. Structural Crack Repair System:
   1. Epoxy for Injection: Low-viscosity, high-modulus moisture insensitive type.
   2. Products and Manufacturers: Provide one of the following:
      a. Sikadur 55 SLV or Sikadur 52 and Sikadur 31, Hi-Mod Gel, by Sika Corporation.
      b. Dural 335 by Euclid Chemical Company.
      c. Or equal.
   3. Product shall be listed in NSF/ANSI 61.

B. Non-structural Crack Repair System:
   1. Hydrophobic Polyurethane Chemical Grout:
      a. Provide hydrophobic polyurethane that forms a flexible gasket.
      b. Products and Manufacturers: Provide one of the following:
         1) SikaFix HH LV, by Sika Chemical Company.
         2) Hydro Active Flex SLV, by De Neef Construction Chemicals, Inc.

3) Or equal.
c. Shrinkage limit shall not exceed 4.0 percent in accordance with ASTM D1042.
d. Minimum elongation of 250 percent in accordance with ASTM D3574.
e. Minimum tensile strength of 150 psi in accordance with ASTM D3574.
f. Product shall be listed in NSF/ANSI 61.

2. Hydrophilic Acrylate-Ester Resin:
a. Hydrophilic crack repair system shall be acrylate-ester resin that forms a flexible gasket and increase in volume a minimum of 50 percent when in contact with water.
b. Products and Manufacturers: Provide one of the following:
1) Gelacryl Superflex AR manufactured by DeNeef Corporation.
2) AR870 manufactured by Prime Resins, Inc.
3) Or equal.
c. Product shall be listed in NSF/ANSI 61.

2.11 CONCRETE REPAIR MATERIALS

A. Concrete repair mortar shall be pre-packaged, polymer-modified cementitious repair mortar with the following minimum properties:
1. Compressive Strength at One Day: 2,000 psi (ASTM C109).
2. Compressive Strength at 28 Days: 6,000 psi (ASTM C109).
3. Bond Strength at 28 Days: 1,800 psi (ASTM C882 modified).
a. Material shall be listed in NSF/ANSI 61.

B. Products and Manufacturers: Provide one of the following:
1. Five Star Structural Concrete, by Five Star Products, Inc. Use formulation recommended by manufacturer for the specific application conditions.
2. SikaTop 122 Plus, SikaTop 123 Plus, SikaTop 111 Plus, or Sikacem 133, by Sika Corporation. Use formulation from among those listed in this paragraph recommended by manufacturer for specific application conditions.
3. Emaco S88-CA or S66-CR, by Master Builders Inc. Use formulation from among those listed in this paragraph recommended by manufacturer for specific application conditions.
4. Verticoat, Verticoat Supreme, or Euco SR-VO, by Euclid Chemical Company. Use formulation from among those listed in this paragraph recommended by manufacturer for specific application conditions.
5. Or equal.

C. Cement Mortar: Shall consist of mix of one part cement to 1.5 parts sand with sufficient water to form trowelable consistency. Minimum compressive strength at 28 days shall be 4,000 psi. Where required to match the color of adjacent concrete surfaces, blend white portland cement with standard portland cement so that, when dry, patching mortar matches the color of surrounding concrete.

2.12 VAPOR RETARDER

A. Vapor Retarder:
1. Vapor retarder membrane shall comply with the following.
a. Water Vapor Transmission Rate, ASTM E96: 0.04 perms or lower.
b. Water Vapor Retarder, ASTM E1745: Meets or exceeds Class C.
c. Thickness of Retarder (plastic), ACI 302 1R: Not less than 10 mils.
2. Products and Manufacturers: Provide one of the following:
a. Stego Wrap 10-mil Vapor Retarder, by Stego Industries LLC.

b. Griffolyn 10-mil, by Reef Industries.
c. Moistop Ultra, by Fortifiber Industries.
d. Or equal.

B. Accessories:
1. Provide accessories by same manufacturer as vapor retarder.
2. Seam Tape:
a. Tape shall have water vapor transmission rate (ASTM E96) of 0.3 perms or lower.
b. Products and Manufacturers: Provide one of the following:
1) Stego Tape by Stego Industries LLC.
2) Griffolyn Fab Tape by Reef Industries.
3) Moistop Tape by Fortifiber Industries.
4) Or equal.
3. Vapor Proofing Mastic:
a. Mastic shall have a water vapor transmission rate ASTM E96, 0.3 perms or lower.
4. Pipe Boots:
a. Construct pipe boots from vapor barrier material, pressure sensitive tape, mastic, or a combination thereof, in accordance with manufacturer's recommendations.

2.13 SOURCE QUALITY CONTROL

A. Concrete materials may require testing, as directed by Engineer, at any time during the Work if concrete quality is in question. Provide access to material stockpiles and facilities at all times. Tests shall be done at no expense to Owner.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine the substrate and conditions under which the Work will be performed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.2 CONCRETE MIXING

A. General:
1. Concrete may be produced at batch plants or by the ready-mixed process. Batch plants shall comply with requirements of ACI 301 and ACI 350.5 and have sufficient capacity to produce concrete of qualities required and in quantities required to comply with the accepted Progress Schedule. All plant facilities are subject to acceptance of Engineer.
2. Mixing:
a. Mix concrete with a rotating type batch machine, except where hand mixing of very small quantities is approved by Engineer.
b. Remove hardened accumulations of cement and concrete from drum and blades to ensure proper mixing action.
c. Replace mixer blades upon loss of ten percent of mixer blades' original height.

B. Site Mixing:
1. When Site mixing of concrete is approved by Engineer mix all materials for concrete in a drum-type batch mixer.

a. For mixers of one cubic yard or smaller capacity, continue mixing at least 1.5 minutes but not more than five minutes after all ingredients are in the mixer, before any part of batch is released.
b. For mixers of capacity larger than one cubic yard, increase minimum 1.5 minutes of mixing time by 15 seconds for each additional cubic yard or fraction thereof.

2. Do not exceed mixer manufacturer's published rating of the mixer, or mixer nameplate capacity, for total volume of materials used per batch.
3. Equip mixer with automatic controls for proportioning materials and proper, measured quantities.
4. Do not exceed 45 minutes total elapsed time between intermingling of damp aggregates and cement to discharge of completed mix.

C. Ready-Mix Concrete:
1. Comply with ASTM C94 and the Contract Documents.
a. Plant Equipment and Facilities: Conform to requirements of NRMCA certification.
b. Truck-Mixed Concrete: Mix concrete in revolving-type truck mixers that are in good condition and produce thoroughly-mixed concrete conforming to the Contract Documents. Truck shall operate at agitating speed after mixing is complete or 100 revolutions, whichever occurs first.
c. Central-Mixed Concrete: Truck shall operate at agitating speed while in transit.
d. Do not exceed rated capacity of mixer.
e. Mix concrete for minimum of two minutes after arrival at the Site, or as recommended by mixer manufacturer
f. Mix at proper speed until concrete is discharged from mixer.
g. Maintain adequate facilities at the Site for continuous delivery of concrete at required rates.
h. Provide access to mixing plant for Engineer upon request.

D. Maintain equipment in proper operating condition, with drums cleaned before charging each batch. Schedule rates of delivery to prevent delay of placing concrete after mixing, or holding dry-mixed materials too long in mixer before the adding water and admixtures.

3.3 TRANSPORTING CONCRETE

A. Transport and place concrete not more than 90 minutes after water has been added to the dry ingredients, unless a hydration controlling admixture is authorized by the Engineer.

B. Avoid spilling and separation of concrete mixture during transportation.

C. Do not place concrete in which the ingredients have separated.

D. Do not retemper partially set concrete.

E. Use suitable equipment for transporting concrete from mixer to forms.

3.4 PREPARATION FOR CONCRETING

A. Submit to Engineer laboratory trial batch test results for proposed mixes at least 15 days prior to start of Work. Do not begin concrete production until associated laboratory trial batch test result submittal has been approved by Engineer.

B. Notify Engineer a minimum of 24 hours in advance of placing concrete to allow for inspection of form work, joints, waterstops, reinforcement, embedded items, and vapor retarders. The section to be placed shall be fully prepared for concrete placement at the time of notice. Confirm inspection status with Engineer a minimum of 4 hours prior to concrete placement. Do not begin placing concrete until Work is in conformance with the Contract Documents.

C. Subgrade surfaces shall be thoroughly wetted by sprinkling, prior to the placing of concrete, and these surfaces shall be kept moist by frequent sprinkling up to the time of placing concrete thereon. The surface shall be free from standing water, mud, and debris at the time of placing concrete.

D. Reinforcing steel and embedded items shall be completely cleaned of mortar, loose rust, form release compounds, dirt, or other substances which would interfere with proper bonding with concrete. Protective coatings on embedded aluminum items shall continuously cover the surface to be in contact with concrete. Any defects in the coating shall be repaired.

E. Do not place concrete until flow of water entering space to be filled with concrete has been properly stopped or has been diverted by pipes, or other means, and carried out of the forms, clear of the Work. Do not deposit concrete underwater, and do not allow water to rise on concrete surfaces until concrete has attained its initial set. Do not allow water to flow over concrete surface in manner and or velocity that will injure concrete surface finish. Provide temporary pumping or other dewatering operations for removing water as required.

F. Prepare joint surfaces in accordance with Section 03 1500, Concrete Accessories.

G. Installation of Vapor Retarder:
   1. Provide vapor retarder under slabs-on-grade and outside walls to receive resilient floor finishes, carpet, ceramic and slate tile, chemical resistant coatings, and where shown or indicated on the Drawings.
   2. Install in accordance with manufacturer's instructions, ASTM E1643, and the following:
      a. Unroll vapor retarder with longest dimension parallel with direction of the pour.
      b. Lap vapor retarder over footings and seal to foundation walls.
      c. Overlap vapor retarder joints by six inches and seal with vapor retarder manufacturer's tape.
      d. Seal penetrations, including pipes, in accordance with vapor retarder manufacturer's instructions.
      e. Penetration of vapor retarder is not allowed except for reinforcing steel and permanent utilities.
      f. Repair damaged areas of vapor retarder by providing, for each damaged area, patch of vapor retarder material and overlapping damaged area with the patch by six inches on each side, and securely and continuously taping all four sides of patch to undamaged vapor retarder.

3.5 CONCRETE PLACEMENT

A. General:
   1. Place concrete continuously, so that no concrete will be placed on concrete that has hardened sufficiently to cause formation of seams or planes of weakness within the section. If section cannot be placed continuously, provide construction joints in accordance with Section 03 1500, Concrete Accessories.

2. Deposit concrete as nearly as practical in its final location to avoid segregation due to re-handling or flowing. Do not subject concrete to action that may cause segregation. This requirement does not apply to self-consolidating concrete.
3. Screed concrete that is to receive other construction to proper level to avoid excessive skimming or grouting.
4. Do not use concrete that becomes non-plastic and unworkable, or does not conform to required quality limits, or that has been contaminated by foreign materials. Do not use retempered concrete. Remove rejected concrete from the Site and dispose of it in conformance with Laws and Regulations.
5. Do not place concrete until forms, bracing, reinforcing, and embedded items are each in final position and secure.
6. Do not place footings in freezing weather unless adequate precautions are taken against frost action.
7. Do not place footings, piers or pile caps on frozen soil.
8. Unless otherwise instructed, place concrete only when Engineer is present.
9. Allow minimum of three days between adjoining concrete placements. At expansion joints, allow minimum of one day between adjoining concrete placements.

B. Bonding for Next Concrete Pour:
1. Prepare for bonding of fresh concrete to concrete that has set but is not fully cured, as follows:
   a. The surface must be saturated surface dry.
   b. For horizontal surfaces place a six-inch layer of Construction Joint Grout, as specified in Section 03 6000, Grouting, over the hardened concrete surface.
   c. Place fresh concrete before the grout has attained its initial set.
2. Accomplish bonding of fresh concrete to fully cured, hardened, existing concrete by using a bonding agent as specified in Section 03 1500, Concrete Accessories.

C. Concrete Conveying:
1. Handle concrete from point of delivery at the Site, transfer to concrete conveying equipment, and transfer to locations of final deposit as rapidly as practical by methods that prevent segregation and loss of concrete mix materials.
2. Provide mechanical equipment for conveying concrete to ensure continuous flow of concrete at delivery end of conveyor. Provide runways for wheeled concrete conveying equipment from concrete delivery point to locations of final deposit. Keep interior surfaces of conveying equipment, including chutes, free of hardened concrete, debris, water, snow, ice, and other deleterious materials.
3. Do not use chutes for distributing concrete, unless accepted by Engineer.
4. Pumping concrete is allowed, however do not use aluminum pipe for conveying concrete.

D. Placing Concrete into Forms:
1. Deposit concrete in forms in horizontal layers not deeper than 18 inches each and in manner that avoids inclined construction joints. Where placement consists of several layers, place concrete at such rate that concrete being integrated with fresh concrete while still plastic.
2. Do not allow concrete to free-fall within the form from height exceeding four feet. Where high-range water reducer is used to extend slump to at least six inches, maximum allowable free-fall of concrete is six feet. Use “elephant trunks” to prevent free-fall and excessive splashing of concrete on forms and reinforcing. Discontinue free-falls in excess of four feet if there is evidence of segregation.
3. Remove temporary spreaders in forms when concrete placing has reached elevation of such spreaders.

4. Consolidate concrete placed in forms by mechanical vibrating equipment supplemented by hand-spading, rodding, or tamping. Use equipment and procedures for consolidating concrete in accordance with requirements of ACI 301. Vibration of forms and reinforcing is not allowed unless otherwise accepted by Engineer.
5. Where height of concrete placement in walls exceeds 14 feet, provide temporary windows in formwork to facilitate vibration. Properly close temporary windows when height of concrete approaches windows. Determine location, size, and spacing of temporary windows to suit equipment used.
6. Do not use vibrators to transport concrete inside of forms. Insert and withdraw vibrators vertically at uniformly-spaced locations not farther than the visible effectiveness of the vibrator. Place vibrators to rapidly penetrate the layer of concrete and at least six inches into the preceding layer. Do not insert vibrators into lower layers of concrete that have begun to set. At each insertion, limit the duration of vibration to time necessary to consolidate concrete and complete embedment of reinforcing and other embedded items without causing segregation of concrete mix.
7. Do not place concrete in beam and slab forms until concrete previously placed in columns and walls is no longer plastic.
8. Prevent voids in the concrete. Force concrete under pipes, sleeves, openings, and inserts from one side until visible from the other side.
9. Self-Consolidating Concrete (SCC) may be used with prior approval of the Engineer.

E. Placing Concrete Slabs:
1. Deposit and consolidate concrete slabs in continuous operation, within limits of construction joints, until placing of a slab panel or section is completed.
2. Consolidate concrete during placing operations using mechanical vibrating equipment, so that concrete is thoroughly worked around reinforcing and other embedded items and into corners.
3. Consolidate concrete placed in beams and girders of supported slabs, and against bulkheads of slabs on ground, as specified in this Article for formed concrete structures.
4. Bring slab surfaces to correct elevation and level. Smooth the surface, leaving surface free of humps or hollows. Do not sprinkle water on surface while concrete is plastic. Do not disturb slab surfaces prior to commencing concrete finishing.
5. Where slabs are placed in conditions of high temperature or wind that could lead to formation of plastic shrinkage cracks, provide evaporation retardant applied in accordance with retardant manufacturer's recommendations, when required by Engineer.

F. Placing Self-Consolidating Concrete
1. Place concrete at a rate in locations such that the surface of placed concrete does not lose flowability and plasticity and newly placed concrete can fully integrate with previously placed fresh concrete.
2. Insert pump hose to the bottom of the form at one end such that concrete does not impact reinforcing steel or the sides of forms. Class "SC" concrete shall not be allowed to free fall into the forms. Allow the concrete to flow laterally to fill the form. Raise pump hose or elephant trunk as the concrete level rises keeping the discharge below the concrete surface taking care to avoid trapping air.
3. Alternately, formwork can be designed to allow pumping of self-consolidating concrete from the bottom of the form.
4. Remove temporary spreaders in forms when concrete placing has reached the elevation of such spreaders.
5. Prevent voids in the concrete. Force concrete under pipes, sleeves, openings, and inserts from one side until visible from the other side.

6. Do not place concrete in beam and slab forms until concrete previously placed in columns and walls is no longer plastic.
7. Self-consolidating concrete shall not be vibrated unless there is evidence of incomplete consolidation and when authorized by the Engineer.
8. Placement of self-consolidating concrete in slabs shall be as specified in this Article except that vibration is not required

G. Quality of Concrete Work:
1. Concrete shall be solid, compact, and smooth, and free of laitance, cracks, and cold joints.
2. Concrete for liquid-retaining structures, and concrete in contact with earth, water, or exposed directly to the elements shall be watertight.
3. Cut out and properly replace to extent directed by Engineer, or repair to satisfaction of Engineer, defects as defined in 3.12. Thin patches or plastering are unacceptable.
4. Leaks through concrete that exhibit flowing water, and cracks, holes, or other defective concrete in areas of potential leakage, shall be repaired and made watertight.
5. Repair, removal, and replacement of defective concrete as directed by Engineer shall be at no additional cost to Owner.

H. Cold Weather Placing:
1. Protect concrete Work from physical damage or reduced strength that could be caused by frost, freezing, or low temperatures, in compliance with ACI 306.1 and the Contract Documents.
2. When air temperature has fallen to or may be expected to fall below 40 degrees F, provide adequate means to maintain temperature in area where concrete is being placed between 50 degrees F and 70 degrees F for at least seven days after placing. Provide temporary housings or coverings including tarpaulins or plastic film. Maintain temporary heating and protection as necessary so that ambient temperature does not fall more than 30 degrees F in the 24 hours following the seven-day period. Avoid rapid dry-out of concrete due to overheating, and avoid thermal shock due to sudden cooling or heating.
3. When air temperature has fallen to or is expected to fall below 40 degrees F, uniformly heat water and aggregates before mixing for concrete as required to obtain concrete mixture temperature not less than 55 degrees F and not more than 85 degrees F at point of placement.
4. Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials. Before placing concrete, verify that forms, reinforcing, and adjacent concrete surfaces are entirely free of frost, snow, and ice.
5. Use only specified accelerating admixtures approved for use. Do not use salt or other materials containing antifreeze agents.

I. Hot Weather Placing:
1. When hot weather conditions exist that would impair the quality and strength of concrete, place concrete in compliance with ACI 305 and the Contract Documents.
2. When ambient air temperature is at or above 90 degrees F and rising, cool ingredients before mixing concrete to maintain concrete temperature at time of placement below 80 degrees F. When ambient air temperature is at or above 90 degrees F and falling, cool the ingredients before mixing concrete to maintain concrete temperature at time of placement below 85 degrees F. In no case shall the concrete temperature at time of placement exceed 90 degrees F.
3. Mixing water may be chilled, or chopped ice may be used to control concrete temperature provided the water equivalent of ice is calculated in total amount of mixing water. If

required, reduce the time from addition of mix water to placement, or use set-retarding admixture.

4. Cover reinforcing materials with water-soaked burlap if ambient air temperature becomes too hot, so that reinforcing material temperature does not exceed ambient air temperature immediately before embedment of reinforcing in concrete.
5. Wet forms thoroughly before placing concrete.
6. Do not place concrete at temperature that causes difficulty from loss of slump, flash set, or cold joints.
7. Use of set-control admixtures shall be as approved by Engineer.
8. Obtain Engineer's approval of substitute methods and materials proposed for use.

J. Underwater Placing:

1. Concrete placement in water will be allowed if conditions render it impossible or inadvisable to dewater excavations or liquid-retaining structures before placing concrete, and only when allowed by Engineer in writing.
2. Revise and submit concrete mix design to suit underwater placement, and obtain Engineer’s approval before commencing underwater placement of concrete. Deposit concrete by tremie method or other suitable means in continuous placement to prevent forming layers or intrusion of water.

3.6 FINISHING OF FORMED SURFACES

A. Standard Form Finish:

1. Standard form finish shall be basically smooth and even, but is allowed to have texture imparted by the form material used. Repair defects in accordance with the Contract Documents.
2. Use standard form finish for the following:
   a. Exterior vertical surfaces from foundation up to one foot below grade.
   b. Vertical surfaces not exposed to view.
   c. Other areas shown or indicated.

B. Smooth Form Finish:

1. Produce smooth form finish by selecting form materials that will impart smooth, hard, uniform texture. Arrange panels in orderly and symmetrical manner with minimum of seams. Repair and patch defective areas in accordance with the Contract Documents.
2. Use smooth form finish for the following:
   a. Exterior surfaces exposed to view.
   b. Surfaces to be covered with coating material. Coating material may be applied directly to concrete or may be a covering bonded to concrete such as waterproofing, dampproofing, painting, or other similar system.
   c. Interior vertical surfaces of liquid-containers.
   d. Interior and exterior exposed beams and undersides of slabs.
   e. Surfaces to receive abrasive blasted finish.
   f. Surfaces to receive smooth rubbed or grout cleaned finish.
   g. Other areas shown or indicated.

C. Grout Cleaned Finish:

1. Provide grout cleaned finish to concrete surfaces that have received smooth form finish and where defects have been repaired, as follows:
   a. Combine one part Portland cement to 1.5 parts fine sand by volume, and mix with water to consistency of thick paint. Blend standard Portland cement and white

Portland cement, in proportions determined by trial patches, so that final color of dry grout will closely match adjacent concrete surfaces.

b. Thoroughly wet concrete surface and apply grout uniformly by brushing or spraying immediately to wetted surfaces. Scrub surface with cork float or stone to coat surface and fill surface holes. Remove excess grout by scraping, followed by rubbing with clean burlap to remove visible grout film. Keep grout damp during setting period by using fog spray on surface for at least 36 hours after final rubbing. Complete each area the same day the area is started, with limits of each area being natural breaks in the finished surface.

2. Use grout cleaned finish for the following:
   a. Interior exposed walls and other vertical surfaces.
   b. Exterior exposed walls and other vertical surfaces down to one foot below grade.
   c. Interior and exterior horizontal surfaces, except exterior exposed slabs and steps.
   d. Interior exposed vertical surfaces of liquid-containing structures down to one foot below normal operating liquid level.
   e. Other areas shown.

D. Related Unformed Surfaces:
   1. At tops of walls, horizontal offsets, and similar unformed surfaces occurring adjacent to formed surfaces, strike off smooth and finish with texture matching adjacent formed surfaces. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces, unless otherwise shown or indicated.

3.7 SLAB FINISHES

A. Float Finish:
   1. After placing concrete slabs, do not work the surface further until ready for floating. Begin floating when surface water has disappeared or when concrete has stiffened sufficiently. Check and level the surface plane to tolerance not exceeding 1/4-inch in ten feet when tested with a ten-foot straightedge placed on surface at not less than two different angles. Cut down high spots and fill low spots. Uniformly slope surfaces to drains. Immediately after leveling, refloat surface to uniform, smooth, granular texture.
   2. Use float finish for the following:
      a. Interior exposed horizontal surfaces of liquid-containing structures, except those to receive grout topping.
      b. Exterior below-grade horizontal surfaces.
      c. Surfaces to receive additional finishes, except as shown or indicated.

B. Trowel Finish:
   1. After floating, begin first trowel finish operation using power-driven trowel. Begin final troweling when surface produces a ringing sound as trowel is moved over the surface.
   2. Consolidate concrete surface by the final hand troweling operation. Finish shall be free of trowel marks, uniform in texture and appearance, and with surface plane tolerance not exceeding 1/8-inch in ten feet when tested with a ten foot straight edge. Grind smooth surface defects that would otherwise project through applied floor covering system.
   3. Use trowel finish for the following:
      a. Interior exposed slabs, unless otherwise shown or indicated.
      b. Slabs that receive one of the following: resilient flooring, carpeting, or ceramic tile.

C. Non-Slip Broom Finish:

1. Immediately after float finishing, slightly roughen concrete surface by brooming in direction perpendicular to main traffic route. Use fine fiber-bristle broom, unless otherwise directed by Engineer. Coordinate required final finish with Engineer before applying finish.
2. Use non-slip broom finish for the following:
    a. Exterior exposed horizontal surfaces subject to lightweight foot traffic.
    b. Interior and exterior concrete steps and ramps.

D. Scratched Finish:
1. After providing float finish, roughen concrete surface with rake before concrete's final set. Amplitude of surface shall be minimum of 1/4-inch.
2. Provide scratched finish for the following:
    a. Horizontal surfaces that will receive grout topping or concrete equipment pad.
    b. Surfaces so indicated on the Drawings or elsewhere in the Contract Documents.

3.8 CONCRETE CURING AND PROTECTION

A. General:
1. Protect freshly placed concrete from premature drying, excessive cold or hot temperatures, and maintain without drying at relatively constant temperature for period necessary for hydration of cement and proper hardening of concrete.
2. Start curing after placing and finishing concrete, as soon as free moisture has disappeared from concrete surface. Keep surface continuously moist during entire curing period. Cure for a minimum of 10 days and in accordance with requirements of ACI 301 and ACI 308.1. For concrete sections over 30-inches thick, the curing period shall be for a minimum of 14 days. Avoid rapid drying at end of final curing period.
3. For curing, use water that is free of impurities that could etch or discolor exposed concrete surfaces.
4. Confine water for curing to area being cured.

B. Curing Methods: Curing methods are specified below. Curing methods to be used on each type of concrete surface are specified elsewhere in this Article.
1. Water Curing. Cure by one of the following methods:
    a. Keep concrete surface continuously wet.
    b. Ponding or immersion.
    c. Continuous water-fog spray.
    d. Covering concrete surface with curing mats, thoroughly saturating mats with water, and keeping mats continuously wet with sprinklers or porous hoses. Place curing mats to cover concrete surfaces and edges with four-inch horizontal lap over adjacent mats; provide eight-inch lap over adjacent mats at vertical surfaces. If necessary, weigh down curing cover to maintain contact with concrete surface.
2. Form Curing. Cure by one of the following methods:
    a. Forms shall be maintained and loosened during curing period.
    b. Immediately after forms are loosened or removed, continue with the required curing method as applicable, for remainder of curing period.
    c. Where wood forms are kept in place, apply water to keep forms wet.
3. Moisture Retaining Cover Curing. Cure as follows:
    a. Cover concrete surfaces with the required moisture retaining cover for curing concrete, placed in widest practical width with sides and ends lapped at least three inches and sealed using waterproof tape or adhesive. Immediately repair holes or tears during curing period using cover material and waterproof tape.

4. Liquid Compound Curing. Cure as follows:
    a. Unless otherwise approved by Engineer, provide water curing or form curing. Request to use liquid curing compound will be considered by Engineer on case-by-case basis. Construction joints, formed surfaces prior to receiving specified form finish, and concrete to receive surface treatment where surface treatment will be bonded to concrete surface (such as, but not limited to grout fill, hardener, coatings, lining, water repellent, painting, resilient flooring, terrazzo flooring, ceramic tile, quarry tile, chemical resistant coatings, or other applications) shall be water-cured or form-cured.
    b. In liquid-retaining structures, provide water curing or form curing, unless other curing method is approved by Engineer. Requests to use liquid curing compound will be considered by Engineer on case-by-case basis. Request shall provide valid construction reason or safety reason for using liquid compound curing including reason why other curing methods are not viable.
    c. Apply curing compounds immediately after final finishing or after terminating water curing. Apply curing compound in continuous operation by power spray equipment in accordance with curing compound manufacturer's directions. If areas are subjected to rainfall within three hours after completing curing compound application, area shall be recoated. Maintain coating continuity and repair areas damaged during curing period.
    d. When liquid curing compound is used, apply first coat of liquid curing compound at compound manufacturer's recommended coverage rate, and subsequently apply second coat at identical rate, thus providing twice the curing compound manufacturer's recommended coverage.
    e. At end of curing period, remove liquid curing compound where required.

C. Formed Surfaces: Use the following curing methods:
1. Walls That Will Retain Liquid or That are Under Ground Surface:
    a. If forms are wood, form curing is allowed for entire curing period. If forms are steel, form curing is allowed for maximum of three days after which forms shall be removed so that concrete is free of the forms for remainder of the curing process.
    b. Immediately after the forms are loosened or removed, continue with water curing for remainder of curing period.
    c. When wall surface will not receive surface treatment and when allowed by Engineer, use of liquid curing compound is allowed. Before using liquid compound curing, use water curing or form curing for at least the first three days of curing.
2. Formed Slab Underside and Beam Surfaces Where Will Retain Liquid:
    a. Form curing is allowed for the full curing period.
    b. Immediately after forms are loosened or removed, continue with water curing for remainder of curing period.
    c. When slab surface will not receive surface treatment and when allowed by Engineer, use of liquid curing compound is allowed.
3. Vertical Joint Surfaces and Surfaces to Receive Surface Treatment:
    a. Form curing is allowed for entire curing period.
    b. Immediately after forms are loosened or removed, continue with water curing for remainder of curing period.
4. Cure other formed surfaces using an appropriate curing method specified in the Contract Documents.

D. Unformed Surfaces: Treat with one of the following curing methods:
1. Slabs and Mats That Will Retain Liquid or are Below Ground Surface:

a. Water curing.
b. Moisture-retaining cover curing when allowed by Engineer.
c. When slab or mat surface will not receive surface treatment and when allowed by Engineer, use of liquid curing compound is allowed. Before using liquid compound curing, use water curing or form curing for at least the first three days of curing.

2. Construction Joint Surfaces and Slab and Mat Surfaces to Receive Surface Treatment.
   a. Water curing.
   b. Moisture-retaining cover curing.
3. Cure other formed surfaces using an appropriate curing method specified in the Contract Documents.

E. Temperature of Concrete During Curing:
1. When ambient temperature is 40 degrees F or less, continuously maintain concrete temperature between 50 degrees F and 70 degrees F throughout curing period. When necessary, before concrete placing provide for temporary heating, covering, insulation, or housing as required to continuously maintain specified temperatures and moisture conditions throughout concrete curing period. Provide cold weather protection in accordance with requirements of ACI 306.1.
2. When the ambient temperature is 80 degrees F and above, or during other climatic conditions that would cause too-rapid drying of concrete, before starting concrete placing, provide wind breaks and shading as required, and fog spraying, wet sprinkling, or moisture retaining coverings as required. Continuously protect concrete throughout concrete curing period. Provide hot weather protection in accordance with requirements of ACI 305.1, unless otherwise specified.
3. Maintain concrete temperature as uniformly as possible, and protect from rapid ambient temperature changes. Avoid concrete temperature changes that exceed five degrees F in one hour and 50 degrees F in 24-hour period.

F. Protection:
1. During curing period, protect concrete from damaging mechanical disturbances including load stresses, heavy shock, excessive vibration, and damage by rain and flowing water. Protect finished concrete surfaces from damage by subsequent construction operations.

3.9 Concrete installation Tolerances

A. Installation Tolerances:
1. Concrete placement tolerances, unless otherwise specified in the Contract Documents, shall be in accordance with ACI 117. Tolerances for concrete cover shall be as required by Section 03 2000, Concrete Reinforcing.
2. Notify Engineer in writing when concrete placement does not conform with required tolerances, as soon as the condition is known to Contractor.
3. When concrete installation does not conform to required tolerances, do not repair or correct by grinding unless specified in the Contract Documents or approved by Engineer in writing.
4. Verification Measurements:
   a. If surfaces where tolerances are in question, obtain measurements to verify conformance with tolerances in manner acceptable to Engineer.
   b. If surfaces tolerances are in question, cost of obtaining measurements shall be at no additional cost to the Owner.
   c. Before obtaining measurements, obtain Engineer's acceptance of method proposed for obtaining measurements.

d. After obtaining measurements, submit measurements to Engineer.

5. Submit with verification measurements submittal proposed method to rectify out-of-tolerance concrete. Do not start repair Work without obtaining Engineer's approval.

3.10 FIELD QUALITY CONTROL

A. Field Testing Services:
1. Owner will employ testing laboratory to perform field quality control testing for concrete. Engineer will direct the testing requirements.
2. Testing laboratory will make standard compression test cylinders and entrained air tests as specified in this Article, under observation of Engineer or Resident Project Representative.
3. Testing laboratory will provide all labor, material, and equipment required for sampling and testing concrete, including: scale, glass tray, cones, rods, molds, air tester, thermometer, and other incidentals required.

B. Quality Control Testing During Construction:
1. Perform sampling and testing for field quality control during placement of concrete, as follows:
   a. Sampling Fresh Concrete: ASTM C172.
   b. Slump: ASTM C143; one test for each concrete load at point of discharge. For Class "SC" concrete, determine slump flow and visual stability index per ASTM C1611, one test for every two concrete loads at point of discharge and when a change in the concrete is observed and determine passing ability per ASTM C1621 when directed by Engineer.
   c. Concrete Temperature: ASTM C1064; one for every two concrete loads at point of discharge, and when a change in the concrete is observed. Test each load when time from batching to placement exceeds 75 minutes.
   d. Air Content: ASTM C231; one for every two concrete load at point of discharge, and when a change in the concrete is observed.
   e. Unit Weight: ASTM C138; one for every two concrete loads at point of discharge, and when a change in the concrete is observed.
   f. Compression Test Specimens:
      1) In accordance with ASTM C31; make one set of compression cylinders for each 50 cubic yards of concrete, or fraction thereof, of each mix design placed each day. Each set shall be four standard cylinders, unless otherwise directed by Engineer.
      2) Cast, store, and cure specimens in accordance with ASTM C31.
      3) Test and record the following when cylinders are cast: slump, concrete temperature, air content, and unit weight. For Class "SC" determine slump flow and visual stability index per ASTM C1611 instead of slump.
   g. Compressive Strength Tests:
      1) In accordance with ASTM C39; one specimen tested at seven days, and two specimens tested at 28 days. Test fourth cylinder if needed to verify test results.
      2) Adjust mix design if test results are unsatisfactory and resubmit for approval.
      3) Concrete that does not comply with strength requirements will be considered as defective Work.
   h. Water/Cementitious Materials Ratio: Perform test when required by Engineer in accordance with AASHTO T318.
   i. Within 24 hours of completion of test, testing laboratory will submit certified copy of test results to Contractor and Engineer.

C. Evaluation of Field Quality Control Tests:
   1. Do not use concrete delivered to final point of placement having slump, concrete temperature, total air content or unit weight outside specified values.
   2. Water/Cementitious Materials Ratio:
      a. When water content testing indicates water/cementitious materials ratio to exceed specified requirements by greater than 0.02, remaining batches required to complete concrete placement shall have water content decreased in the mix and water reducing admixture dosage increased as required to bring subsequently-batched concrete within specified water/cementitious materials ratio.
      b. Perform additional testing to verify compliance with specified water/cementitious materials ratio.
      c. Do not resume concrete production for further concrete placement until Contractor has identified cause of excess water in the mix and revised batching procedures, or adjusted the mix design (and obtained Engineer's associated approval) to bring water/cementitious materials ratio into conformance with the Contract Documents.
   3. Compressive Strength:
      a. Compressive strength tests for laboratory-cured cylinders will be acceptable if the averages of all sets of three consecutive compressive strength tests results equal or exceed specified 28-day design compressive strength of the associated type or class of concrete, and no individual strength test falls below required compressive strength by more than 500 psi.
      b. Questionable Field Conditions During Concrete Placement:
         1) Where questionable field conditions exist during concrete placement or immediately thereafter, strength tests of specimens cured under field conditions will be required by Engineer to check adequacy of curing and protecting of concrete placed. Specimens shall be molded at the same time and from the same samples as laboratory-cured specimens.
         2) Provide improved means and procedures for protecting concrete when 28-day compressive strength of field-cured cylinders is less than 85 percent of companion laboratory cured cylinders.
         3) When laboratory-cured cylinder strengths are appreciably higher than minimum required compressive strength, field-cured cylinder strengths need not exceed minimum required compressive strength by greater than 500 psi even though the 85 percent criterion may not be met.
         4) If individual tests of laboratory-cured specimens produce strengths more than 500 psi below the required minimum compressive strength, or if tests of field-cured cylinders indicate deficiencies in protection and curing, provide additional measures to ensure that load-bearing capacity of the structure is not jeopardized or impaired. If likelihood of low-strength concrete is confirmed and evaluations indicate load-bearing capacity may have been reduced, perform tests of cores from the concrete in question at Contractor's expense.
      c. If compressive strength tests fail to indicate compliance with minimum requirements of the Contract Documents, concrete represented by such tests will be considered defective.

D. Testing Concrete Structure for Strength:
   1. When there is evidence that strength of in-place concrete does not comply with the Contract Documents, Contractor shall employ the services of concrete testing laboratory to obtain cores from hardened concrete for compressive strength determination. Cores and tests shall comply with ASTM C42 and the following:

a. Obtain at least three representative cores from each concrete member or suspect area of concrete at locations directed by Engineer.
b. Strength of concrete for each series of cores will be acceptable if average compressive strength is at least 85 percent of specified compressive strength and no single core is less than 75 percent of required 28-day required concrete compressive strength.
c. Testing laboratory shall submit test results to Engineer on same day that tests are completed. Include in test reports Project name and number (if any), date of sampling and testing, Contractor name, name of concrete testing laboratory, exact location of test core in the Work, type or class of concrete represented by core sample, nominal maximum size aggregate, design compressive strength, compression breaking strength, and type of break (corrected for length-diameter ratio), direction of applied load to core with respect to horizontal plane of concrete as placed, and moisture condition of the core at time of testing.

2. Fill core holes solid with non-shrink grout in accordance with Section 03 6000, Grouting, and finish to match adjacent concrete surfaces.
3. If results of core tests are unacceptable or if it is impractical to obtain cores, perform static load test and evaluations complying with ACI 318 and ACI 350, as directed by Engineer.

E. Concrete Tolerance Verification Measurements: Refer to Article 3.9 of this Section.

F. Supplier's Services:
1. Water-Reducing Admixture Manufacturer: Furnish services of qualified concrete technician employed by admixture manufacturer to assist in proportioning concrete for optimum use of admixture. Concrete technician shall advise on proper addition of admixture to concrete and on adjustment of concrete mix proportions to meet changing conditions at the Site.

3.11 MISCELLANEOUS CONCRETE ITEMS

A. Temporary Openings:
1. Openings in concrete walls and slabs required for passage of Work are allowed only upon approval of Engineer.
2. Temporary openings made in concrete shall be provided with waterstop in below-ground or liquid-retaining members and structures. Reinforcement going through and around the opening shall be made continuous to provide continuity and shall be approved by the Engineer.
3. Temporary openings that remain in concrete structures shall be filled with the same class of concrete as the adjoining construction, after the Work causing need for temporary opening is complete, unless otherwise shown or directed by Engineer. Mix, place, and cure concrete as specified in this Section to blend with in-place construction. Provide miscellaneous concrete filling shown or required to complete the Work.

B. Bases or Pads for Piping, Panels, and Equipment:
1. Unless specifically shown or indicated otherwise, provide concrete bases or pads for equipment, floor-mounted panels, and floor-mounted supports for piping and similar construction. Provide all concrete pad and base Work not specifically included under other Sections.
2. Dimensions and Elevations:

a. Coordinate and construct bases and pads to dimensions shown or indicated, or as required to comply with equipment, panel, or piping manufacturer's requirements and elevations indicated on the Drawing.
b. Unless otherwise shown or indicated, place concrete bases for equipment up to one-inch below the equipment manufacturer's base or mounting plate.
c. Where specific dimensions or elevations are not shown or indicated, bases and pads shall be six inches thick and extend three inches outside dimensions of the equipment, panel, or supports.

3. Finish: Bases and pads outside of areas to receive non-shrink grout shall have smooth trowel finish, unless special finish such as terrazzo, ceramic tile, quarry tile, or heavy-duty concrete topping is required. In such cases, provide appropriate concrete finish. Surfaces of bases and pads to receive non-shrink grout shall have broom finish.

C. Curbs:
1. Provide monolithic finish to interior curbs by stripping forms while concrete is still green followed by steel-troweling surfaces to hard, dense finish with corners, intersections, and terminations slightly rounded.
2. Exterior curbs shall have rubbed finish for vertical surfaces and broomed finish for top surfaces.

3.12 REPAIR OF CONCRETE PLACED UNDER THIS CONTRACT

A. Repair of Formed Surfaces:
1. Repair the following defects in all formed finishes:
a. Spalls, air bubbles, rock pockets, form depressions, and other defects that are more than 1/4-inch in depth.
b. Holes from tie rods and other form tie systems.
c. Fins, offsets, and other projections that extend more than 1/4-inch beyond designated concrete member surface.
d. Structural cracks, as defined by Engineer.
e. Non-structural cracks greater than 0.010-inch wide as defined by Engineer. In liquid-retaining structures, elevated slabs subject to the elements or washdowns, below-grade members, and cracks that evidence leakage. Where it is not possible to verify whether a crack is leaking, repair the crack.
2. Repair the following defects in smooth-finish surfaces, in addition to those listed above in this Section:
a. Spalls, air bubbles, rock pockets, form depressions, and other defects that extend to more than 1/2-inch in width in any direction, no matter how deep.
b. Spalls, air bubbles, rock pockets, form depressions, and other defects of any size that exceed three in number in a 12-inch by 12-inch area, or 12 in number in a three-foot by three-foot area.
c. Fins, offsets, and other projections shall be completely removed and smoothed.
d. Scratches and gouges in concrete surface.
e. Texture and color irregularities. In liquid-retaining surfaces, texture and color irregularities need not be repaired when greater than 12 inches below minimum normal operating liquid surface elevation, except where such defects are indicative of reduced durability.
3. Where smooth rubbed or grout cleaned finish is specified, minor surface defects repairable by the finishing process need not be repaired prior to finish application, when approved by Engineer.

B. Method of Repair of Formed Surfaces:
   1. Immediately after removing forms, repair and patch defective areas with cement mortar or concrete repair mortar as directed by Engineer. Make repairs made to liquid-retaining structures and below-grade surfaces with repair mortar only. Repair form tie holes in liquid-retaining or below-grade surfaces with non-shrink grout in accordance with Section 03 6000, Grouting.
   2. Honeycombs, Rock Pockets, and Holes Left by Tie Rods and Bolts:
      a. Cut out honeycomb, rock pockets, voids, and holes left by tie rods and bolts, down to solid concrete but, in no case, to depth less than one-inch for cement mortar and 1/2-inch for repair mortar. Make edges of cuts perpendicular to concrete surface.
      b. Before placing cement mortar, thoroughly clean and brush-coat area to be patched with specified bonding agent.
      c. When using concrete repair mortar, use of bonding agent is optional; prepare the surface and place mortar in accordance with mortar manufacturer's recommendations.
      d. Repairs at exposed-to-view surfaces shall match the color of surrounding concrete, except color matching is not required for interior surfaces of liquid-retaining surfaces up to one foot below typical minimum liquid level. Impart texture to repaired surfaces to match texture of existing adjacent surfaces. Provide test areas at inconspicuous locations to verify mixture, texture, and color match before proceeding with patching.
      e. Compact mortar in place and strike off slightly higher than the surrounding surface.
   3. Structural Cracks: Pressure-grout structural cracks using injectable epoxy installed using pressurized system. Apply in accordance with epoxy manufacturer's directions and recommendations.
   4. Non-structural Cracks: Shall be pressure-grouted using injection material specified in paragraph 2.10.B. Install in accordance with manufacturer's directions and recommendations.
   5. Determination of the crack type shall be made by the Engineer.
   6. Holes Through Concrete:
      a. Using plunger-type gun or other suitable device, fill holes extending through concrete from least-exposed face, using flush stop held at exposed face; completely fill the hole with specified repair material.
      b. At below-grade and liquid-containing members, fill holes with concrete repair mortar and use color-matched cement mortar for outer two inches at exposed-to-view surfaces.
   7. Where powerwashing or scrubbing is not adequate, abrasive blast exposed- to-view surfaces that require removal of stains, grout accumulations, sealing compounds, and other substances marring the surfaces. Use sand finer than No. 30 and air pressure from 15 to 25 psi.

C. Repair of Unformed Surfaces:
   1. Test unformed surfaces, such as monolithic slabs, for smoothness and to verify surface plane to specified tolerances for each surface and finish. Correct low and high areas in accordance with this Section.
   2. Test unformed surfaces sloped to drain for trueness of slope, in addition to smoothness, using template having the required slope. Correct high and low areas in accordance with this Section.
   3. Repair finish of unformed surfaces containing defects that adversely affect concrete durability. Surface defects include crazing, cracks in excess of 0.01-inch wide, spalling, popouts, honeycombs, rock pockets, and other objectionable conditions.

4. Repair structural cracks in all structures and non-structural cracks in liquid-retaining structures. In liquid-retaining structures, where dry face of concrete member can be observed, repair all cracks evidencing any rate of water flow through crack. Where dry face of member cannot be observed, repair all cracks.

D. Methods of Repair of Unformed Surfaces:
   1. Correct high areas in unformed surfaces by grinding, after concrete has cured sufficiently so that repairs can be made without damage to adjacent areas.
   2. Correct low areas in unformed surfaces, during or immediately after completion of surface finishing, by cutting out low areas and replacing with fresh concrete. Finish repaired areas to blend into adjacent concrete. Where repairs are required and concrete has already set, sawcut around perimeter of area to be repaired to depth of 1/2-inch and remove concrete so that minimum thickness of repair is 1/2-inch. Apply specified concrete repair mortar in accordance with repair mortar manufacturer's directions and recommendations.
   3. Repair defective areas, except random cracks and single holes not exceeding one-inch diameter, by cutting out and replacing with fresh concrete. Remove defective areas to sound concrete with clean, square cuts, and expose reinforcing steel with at least 3/4-inch clearance all around. Minimum thickness of repair shall be 1.5 inches. Dampen concrete surfaces in contact with patching concrete and brush with specified bonding agent. Place patching concrete while bonding agent is tacky. Mix patching concrete of same materials and proportions to provide concrete of same classification as original, adjacent concrete. Place, compact, and finish as required to blend with adjacent finished concrete. Cure in the same manner as adjacent concrete.
   4. Repair isolated, random, non-structural cracks (in members that are not below grade or liquid-retaining), and single holes not greater than one-inch diameter, by dry-pack method. Groove top of cracks, and cut out holes to sound concrete, and clean repair area of dust, dirt, and loose particles. Dampen all cleaned concrete surfaces and brush with the specified bonding agent. Place dry-pack before cement grout takes its initial set. Mix dry-pack, consisting of one part portland cement to 2.5 parts fine aggregate passing No. 16 mesh sieve, using only enough water as required for handling and placing. Compact dry-pack mixture in place and finish to match adjacent concrete. Keep patched areas continuously moist for at least 72 hours.
   5. Structural cracks shall be pressure-grouted using injectable epoxy. Apply in accordance with epoxy manufacturer's directions and recommendations.
   6. Non-structural cracks in below-grade and liquid-retaining structures shall be pressure-grouted using injection material specified in paragraph 2.10.B. Apply in accordance with resin manufacturer's directions and recommendations.
   7. Determination of crack type will be by Engineer.
   8. Ensure that surface is acceptable for flooring material to be installed in accordance with flooring manufacturer's recommendations.

E. Other Methods of Repair:
   1. Repair methods not specified in this Section may be used when approved by Engineer.

END OF SECTION 03 3000

SECTION 03 4113

PRECAST CONCRETE HOLLOW CORE PLANKS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to design, furnish, and install precast concrete hollow core planks.
   2. The Work also includes:
      a. Providing openings in precast concrete plank units to accommodate the Work under this and other Sections and building into precast concrete plank units items such as sleeves, anchor systems, and inserts.

B. Coordination:
   1. Review applicable installation procedures under other Sections and coordinate installation of items to be installed prior to or in precast concrete hollow core planks.

C. Related Sections:
   1. Section 03 3000, Cast-in-Place Concrete.
   2. Section 03 6000, Grouting.
   3. Section 09 9100, Painting.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ACI 211.3R, Guide for Selecting Proportions for No-Slump Concrete.
   2. ACI 318, Building Code Requirements for Structural Concrete and Commentary.
   3. ASTM A36/A36M, Specification for Carbon Structural Steel.
   4. ASTM A108, Specification for Steel Bar, Carbon and Alloy, Cold-Finished.
   5. ASTM A123/A123M, Specification for Zinc (Hot Dip Galvanized) Coatings on Iron and Steel Products.
   6. ASTM A416/A416M, Specification for Steel Strand, Uncoated Seven-Wire for Prestressed Concrete.
   7. ASTM C33/C33M, Specification for Concrete Aggregates.
   8. ASTM C150/C150M, Specification for Portland Cement.
   9. ASTM C494, Specification for Chemical Admixtures for Concrete.
   10. ANSI/AWS D1.1/D1.1M, Structural Welding Code – Steel.
   11. PCI TR-6, Interim Guidelines for the Use of Self-Consolidating Concrete.
   12. PCI MNL 116, Manual for Quality Control for Plants and Production of Precast Prestressed Concrete Products.
   13. PCI MNL 120, Design Handbook – Precast and Prestressed Concrete.
   14. PCI MNL 126, Manual for the Design of Hollow Core Slabs.
   15. PCI MNL 135, Tolerance Manual for Precast and Prestressed Concrete Construction.

1.3 QUALITY ASSURANCE

A. Qualifications:

1. Manufacturer:
    a. Manufacturer shall be regularly engaged in manufacturing precast concrete hollow plank units for not less than five years. Manufacturer shall participate in PCI's plant certification program, and facility producing materials for the Project shall be certified by PCI.
    b. Submit a current PCI certificate of compliance designating certification in PCI Category C2 or C2A – Prestressed Hollow-Core and Repetitive Products.
2. Professional Engineer:
    a. Contractor or precast concrete hollow plank units manufacturer shall retain a registered professional engineer legally qualified to practice in the jurisdiction where the Site is located. Professional engineer shall have not less than five years' experience designing precast concrete hollow plank units.
    b. Responsibilities shall include:
        1) Reviewing precast concrete hollow plank units performance and design criteria shown and indicated in the Contract Documents.
        2) Preparing written requests for clarifications or interpretations of performance or design criteria for submittal to Engineer by Contractor.
        3) Preparing or supervising preparation of design calculations verifying compliance of precast concrete hollow plank units with requirements of the Contract Documents.
        4) Signing and sealing all calculations.
        5) Certifying that:
            a) Design of precast prestressed hollow plank units was performed in accordance with performance and design criteria shown and indicated in the Contract Documents, and
            b) Design complies with Laws and Regulations, and prevailing standards of practice.
3. Installer:
    a. Retain a single installer trained and possessing a record of successful experience installing precast concrete hollow plank units in accordance with recommendations and requirements of manufacturer, or shall provide evidence of being acceptable to the manufacturer.
    b. Installer shall employ only tradesmen with specific skill and successful experience in the type of Work required.
    c. When requested by Engineer, submit name and qualifications of installer with the following information for not less than three successful, completed projects:
        1) Names and telephone numbers of owner and architect or engineer responsible for each project.
        2) Approximate contract cost of precast concrete hollow plank units for which installer was responsible.
        3) Quantity, in square feet, of precast concrete hollow plank units installed.
4. Welders and Welding Processes:
    a. Qualify welding processes and welding operators in accordance with ANSI/AWS D1.1/D1.1M, Section 5, Qualification.
    b. Submit certification that each welder employed on or to be employed for the Work possesses current AWS certification in the welding process with which welder will be working. Certifications shall be current and valid throughout the Work.

B. Component Supply and Compatibility:
    1. Obtain all materials included in this Section regardless of component manufacturer, from a single precast concrete hollow plank units manufacturer.

2. Precast concrete hollow plank units manufacturer shall review and approve or prepare all Shop Drawings and other submittals (except for delegated design submittals, when professional engineer is retained by other than precast concrete hollow plank units manufacturer) for all components furnished under this Section.
3. Components shall be suitable for specified service conditions and shall be integrated into overall assembly by precast concrete hollow plank units manufacturer.

C. Regulatory Requirements:
1. Comply with Laws and Regulations, including applicable building code. Comply with building code requirements that are more stringent than ACI 318

D. Certifications:
1. Submit certification, signed by authorized officer of manufacturer and notarized, stating that precast concrete hollow plank units comply with the design prepared by the professional engineer.
2. Submit certification, signed by authorized officer of CONTRATOR and notarized, stating that all components are furnished by the same manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Complete details for fabricating and installing precast concrete hollow plank units. Indicate member locations, plans, elevations, dimensions, shapes, cross sections, camber, openings, headers, extent and location of each finish, if any, support conditions, bearing pads, and reinforcing.
b. Show or indicate location and details of anchorage systems to be embedded in or attached to precast concrete hollow plank units and other, related construction. Submit setting diagrams, templates, instructions, and directions, as required, for installation.
c. Indicate on plans the locations of each opening larger than eight inches in any dimension. Indicate each unit by same identification mark placed on the unit.
d. Clearly indicate welds using standard AWS notations and symbols, and clearly show or indicate size, length, and type of each weld. Detail loose and cast-in hardware, lifting and erection inserts, connections, and joints.
2. Product Data:
a. Manufacturer's literature, specifications, and load tables for materials to be used in precast concrete hollow plank unit Work.
3. Delegated Design Submittals:
a. Design Data:
1) Complete design computations of each precast concrete hollow plank unit, including the axial forces and diaphragm forces due to lateral loads and of the connections. Computations shall be signed and sealed by professional engineer. Professional engineer's seal shall be clearly legible, including jurisdiction of registration, registration number, and name on seal.
2) Certification by professional engineer that design of precast concrete hollow plank units was performed in accordance with performance and design criteria stated in the Contract Documents, and that design complies with Laws and Regulations and prevailing standards of practice.

B. Informational Submittals: Submit the following:

1. Certificates:
    a. Manufacturer's certification of compliance with professional engineer's design, as required in Article 1.3 of this Section.
    b. Contractor's certification on source of supply, as required in Article 1.3 of this Section.
2. Manufacturer's Instructions:
    a. Instructions and recommendations for handling, storing, protecting the products furnished.
    b. Installation instructions for the products furnished, including setting drawings, templates, and directions and tolerances for installing anchorage systems.
3. Source Quality Control Submittals:
    a. Laboratory test results, evaluation reports, and other data as required for the source quality control tests and inspections required in this Section to demonstrate compliance with the Contract Documents for the following materials:
        1) Concrete materials, cylinders, and mix design tests.
        2) Certified copies of mill reports covering chemical and physical properties of miscellaneous metal materials.
4. Supplier Reports:
    a. Submit written report of results of each visit to Site by Supplier's service personnel, including purpose and time of visit, tasks performed, and results obtained. Submit within two days of completion of visit to the Site.
5. Qualifications Statements: Submit qualifications for the following:
    a. Manufacturer, when requested by Engineer.
    b. Professional engineer.
    c. Installer.
    d. Welders' certifications.

1.5 DELIVERY, STORAGE AND HANDLING

A. Storage and Protection:
1. Store and support units adequately to prevent contact with soil, and to protect units from staining, cracking, distortion, warping or other physical damage.

B. Handling of Products:
1. Handle and transport units in a position consistent with their shape and design to avoid excessive handling stresses that could cause cracking or damage.
2. Lift and support units only at designated points shown on the Shop Drawings.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Design Criteria:
1. Design and fabricate precast concrete plank units to support superimposed dead loads and live loads, equipment loads, and diaphragm loads specified or indicated on the Drawings, in addition to the dead weight load of the precast concrete plank units and construction loads. Coordinate with manufacturer relative to required superimposed loads.
2. Prestressing with lateral eccentricity shall be considered in design of precast concrete plank units. Horizontal misalignment due to eccentricity shall be avoided.
3. Comply with ACI 318 and the design recommendations of PCI MNL 120 and PCI MNL 126, applicable to type of structural precast concrete units required.

2.2 MATERIALS

A. Concrete:
   1. Portland cement shall comply with ASTM C150/C150M, Types I, II, or III.
   2. Aggregate shall comply with ASTM C33/C33M, for fine to coarse gradation.
   3. Admixtures: Chemical admixtures shall comply with ASTM C494. Do not use calcium chloride.
   4. Water shall be free of foreign materials in quantities harmful to concrete.

B. Prestressing strands shall be uncoated, seven-wire, stress-relieved strands complying with ASTM A416/A416M, Grade 250 or Grade 270.

C. Bearing pads shall be an engineered, multipolymer plastic with compressive strength of not less than 6,000 psi.

D. Anchoring:
   1. Embedded connection plates and anchorage systems shall be as shown and as required for anchoring units.
   2. Plates shall have thickness of not less than 1/4 inch, unless otherwise shown, and shall comply with ASTM A36/A36M.
   3. Anchorage: Headed stud type shear connectors shall comply with ASTM A108.

E. Fabricate headers required to safely carry design loads of hot-dip galvanized steel complying with ASTM A36/A36M and ASTM A123/A123M. Headers shall be prime-coated in the shop in accordance with Section 09 9100, Painting.

F. Grout for joints shall be one part portland cement to 2.5 parts sand.

2.3 MIXES

A. Mix design shall be in accordance with ACI 211.3R.

2.4 FABRICATION

A. Type: Machine-made, precast prestressed concrete units with open voids running the full length of slabs, produced under a rigid factory-inspected process acceptable to Engineer.

B. Compressive Strength: Manufacture units of concrete materials that provide compressive strength of not less than 3,000 psi at time of initial prestress and a 28-day compressive strength of not less than 5,000 psi.

C. Construction, Texture, and Finish:
   1. Provide precast concrete plank units that are free of unplanned voids and honeycomb, with straight, true edges and surfaces.
   2. Provide units of uniform color, free of stains and discoloration. Top surface shall have a float-finish free of holes. Bottom surfaces shall have smooth-form finish in accordance with Section 03 3000, Cast-in-Place Concrete.
   3. Top surface of precast concrete hollow plank units to receive topping shall have a scratched finish (raked) in accordance with Section 03 3000, Cast-in-Place Concrete.

D. Pretension prestressing strands by either a dead weight system or a single-strand jacking system. Mark strands for slippage and, when slippage occurs, detention and restress strand. Check tension of strand to ensure accurate results.

E. Release strands when concrete reaches compressive strength of not less than 3,000 psi, as required by the design.

F. Adequately reinforce plank units to resist transporting and handling stresses.

G. Include cast-in weld plates, where required, for anchorage or lateral bracing to structural steel members.

H. Identification: Provide permanent markings as shown on the approved Shop Drawings. Markings shall not show in the finished Work.

I. Provide headers of structural steel shapes for openings larger than one plank width in accordance with hollow plank unit manufacturer's recommendations.

J. Curing: Precast concrete plank units may be wet- or steam-cured in accordance with PCI MNL 116.

2.5 SOURCE QUALITY CONTROL

A. Fabrication Tolerances: Fabricate hollow core plank units to comply with the following fabrication dimensional tolerances:
   1. Length: Plus or minus 1/2-inch.
   2. Width: Plus or minus 1/4-inch.
   3. Depth: Plus or minus 1/4-inch.
   4. Position of Weld Plates: Plus or minus one-inch.
   5. Differential Camber Between Adjacent Members from the Bottom Side of Plank: 1/4-inch in ten feet, and not greater than 1/2-inch.
   6. Horizontal Misalignment or Sweep: Plus or minus 1/8-inch in ten feet, but not greater than plus or minus 3/8-inch over entire length.

B. Tests and Inspections:
   1. Test and inspect precast concrete in accordance with PCI MNL 116.
   2. When using self-consolidating concrete, also test and inspect in accordance with PCI TR-6.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine the substrate and conditions under which the Work will be performed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Installation – General:

1. Lift, place, and secure precast concrete hollow plank units in accordance with manufacturer's printed instructions and recommendations, and approved Shop Drawings, the Contract Documents, and Laws and Regulations.
2. Keep precast concrete plank units tight and perpendicular to bearing supports.
3. Do not install hollow plank units until supporting members are in place and secured or have obtained their required design strength. When units rest on masonry block, ensure that voids in lintels and bond beams are filled with grout.
4. Comply with erection procedures and sequence of erection as recommended by precast concrete hollow plank unit manufacturer and as acceptable to Engineer.

B. Level and Alignment:
1. Level precast concrete planks accurately or set to uniform slope as shown.
2. Use bearing pads where precast concrete plank units bear on masonry or concrete surfaces. Set planks on solid, level bearings, with bearing surface of precast concrete plank units not less than three inches at steel supports and not less than 3.5 inches at other supports, unless otherwise acceptable to Engineer.
3. Align and level to tolerance in accordance with PCI MNL 135 by methods, procedures, and equipment as recommended by precast concrete hollow plank unit manufacturer.
4. Where adjacent precast concrete plank units are not in vertical alignment due to camber or other reason, level out variations between adjacent members by jacking, loading, or other feasible method as recommended by precast concrete planks manufacturer and professional engineer, and acceptable to Engineer.

C. Do not cut holes or install sleeves larger than size permitted by hollow plank unit manufacturer for pipe, conduits, duct or other penetrations after fabrication, except as otherwise shown or specified.

D. Do not cut reinforcing or prestressing strands without approval of manufacturer and Engineer.

E. Cast-in openings larger than eight inches in any dimension. Do not drill or cut openings or prestressing strand without approval of both the design professional engineer and Engineer.

F. Weld inserts and connections in precast concrete plank units, as shown and specified.

G. Grouting Joints:
1. Clean joints before grouting.
2. Fill joints between units with grout.
3. Before grout hardens, remove grout that seeped through to ceiling below.

H. Clean exposed surfaces of precast concrete hollow plank units after erection and completion of joint treatment, by removing weld marks, dirt and stains, and deleterious materials that could affect the bonding of the topping grout. Perform cleaning in accordance with precast concrete hollow plank units manufacturer's recommendations. Protect other work from staining and damage.

I. Provide topping grout in accordance with Section 03 6000, Grouting, in locations where slab is shown or specified to receive a topping grout.

J. Repair of Damaged Planks: Prior to repairing, submit and obtain Engineer's approval of proposed repair procedures. Submitted repair shall include approval from the professional engineer who

designed the precast concrete plank system and corresponding information or calculations required to substantiate the repair procedures.

END OF SECTION 03 4113

SECTION 03 6000

GROUTING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install grout and perform grouting Work.

B. Coordination:
1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before grouting Work.

C. Related Sections:
1. Section 03 1500, Concrete Accessories.
2. Section 03 3000, Cast-In-Place Concrete.

D. Application and Grout Material:
1. The following is a listing of grouting applications and the corresponding type of grout material to be provided for the associated application. Unless shown or indicated otherwise in the Contract Documents, provide grout in accordance with the following:

TABLE 03 6000-A, GROUT APPLICATIONS AND MATERIAL TYPES

Application	Required Grout Material Type
Beam and column (one- or two-story height) base plates and precast concrete bearing less than 16 inches in the least dimension	Class II Non-Shrink
Column base plates and precast concrete bearing (greater than two-story height or larger than 16 inches in the least dimension)	Class I Non-Shrink
Base plates for storage tanks and other non-motorized equipment, and motorized equipment or machinery less than 50 horsepower	Class I Non-Shrink (unless otherwise recommended by equipment manufacturer)
Motorized equipment or machinery equal to and greater than 50 horsepower, and motorized equipment or machinery equipment less than 50 horsepower subject to severe shock loads or high vibration	Class III Non-Shrink Epoxy (unless otherwise recommended by equipment manufacturer)
Filling blockout spaces for embedded items	Class II Non-Shrink (Class I where placement time exceeds 15 minutes)

Application	Required Grout Material Type
Grout fill or grout toppings less than four inches thick	Grout Fill
Grout fill greater than four inches thick	Class "B" Concrete in accordance with Section 03 3000, Cast-In-Place Concrete
Applications not listed above, where grout is indicated on the Drawings	Class I Non-Shrink, unless shown or indicated otherwise

1.3 QUALITY ASSURANCE

A. Qualifications:
1. Grout Testing Laboratory:
   a. Independent testing laboratory employed for design and testing of grout materials and mixes shall comply with testing laboratory requirements in Section 03 3000, Cast-in-Place Concrete and other applicable requirements in the Contract Documents.
2. Manufacturer: Shall have a minimum of five years' experience of producing products substantially similar to that required and shall be able to submit documentation of at least five satisfactory installations that have been in successful operation for at least five years each.
3. Manufacturer's Field Service Technician: When required, provide services of manufacturer's full-time employee, factory-trained in handling, use, and installing the

products required, with at least five years of experience in field applications of the products required.

B. Trial Batch:
   1. Each grout fill and construction joint grout mix proportion and design shall be verified by laboratory trial batch or field experience methods. Comply with ACI 211.1 and submit to Engineer a report with the following data:
      a. Complete identification of aggregate source of supply.
      b. Tests of aggregates for compliance with specified requirements.
      c. Scale weight of each aggregate.
      d. Absorbed water in each aggregate.
      e. Brand, type, and composition of cement.
      f. Brand, type, and amount of each admixture.
      g. Amounts of water used in trial mixes.
      h. Proportions of each material per cubic yard.
      i. Unit weight and yield per cubic yard of trial mixtures.
      j. Measured slump.
      k. Measured air content.
      l. Compressive strength developed at seven days and 28 days, from not less than three test specimens cast for each seven-day and 28-day test, and for each design mix.
   2. Laboratory Trial Batches: When laboratory trial batches are used to select grout proportions, prepare test specimens and conduct strength tests as specified in ACI 301.
   3. Field Experience Method: When field experience methods are used to select grout proportions, establish proportions as specified in ACI 301.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Schedule of Project-specific grout applications, installation locations, and the grout type proposed for each.
      b. List of grout materials and proportions for the proposed mix designs. Include data sheets, test results, certifications, and mill reports to qualify the materials proposed for use in the mix designs. Do not start laboratory trial batch testing until submittal is approved by Engineer.
      c. Trial Batch Reports: Submit laboratory test reports for grout materials and mix design tests.
   2. Product Data:
      a. Data sheets, certifications, and manufacturer's specifications for all materials proposed for use.

B. Informational Submittals: Submit the following:
   1. Manufacturer’s Instructions:
      a. Special instructions for shipping, storing, protecting, and handling.
      b. Installation instructions for the materials.
   2. Supplier Reports:
      a. Submit written report of results of each visit to Site by Supplier’s field service technician, including purpose and time of visit, tasks performed, and results obtained. Submit within two days of completion of visit to the Site.
   3. Qualifications Statements:
      a. Testing laboratory, when not submitted under other Sections.

b. Manufacturer, when submittal of qualifications is required by Engineer.
c. Manufacturer's field service technician, when submittal of qualifications is required by Engineer.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Storage of Materials: Store grout materials in a dry location, protected from weather and protected from moisture.

PART 2 - PRODUCTS

2.1 GENERAL

A. All grout materials, admixtures, cementitious materials, and other materials used in grout that contact potable water or water that will be treated to become potable shall be listed in NSF/ANSI 61.

2.2 NON-SHRINK GROUT MATERIALS

A. General: Non-shrink grout shall be a prepackaged, inorganic, flowable, non-gas-liberating, non-metallic, cement-based grout requiring only the addition of water. Manufacturer's instructions shall be printed on each bag or container in which the materials are packaged. Specific formulation for each type or class of non-shrink grout specified in this Section shall be that recommended by the grout manufacturer for the particular application.

B. Class I Non-Shrink Grout:
1. Class I non-shrink grouts shall have a minimum 28-day compressive strength of 7,000 psi. Use grout for precision grouting and where water-tightness and non-shrink reliability in both plastic and hardened states is critical, in accordance with Table 03 6000-A in this Section.
2. Products and Manufacturer: Provide one of the following:
   a. MasterFlow 928, by BASF, Inc.
   b. Five Star Grout, by Five Star Products, Inc.
   c. Hi-Flow Grout, by Euclid Chemical Company.
   d. Or equal.
3. Comply with ASTM C1107/C1107M, Grade C and B (as modified below) when tested using amount of water required to achieve the following properties:
   a. Fluid consistency (20 to 30 seconds) shall be in accordance with ASTM C939.
   b. At temperatures of 45, 73.4, and 95 degrees F.
4. Length change from placing to time of final set shall not have shrinkage greater than the expansion measured at three or fourteen days. Expansion at three or fourteen days shall not exceed the 28-day expansion.
5. Non-shrink property shall not be based on chemically-generated gas or gypsum expansion.
6. Fluid grout shall pass through the flow cone, with continuous flow, one hour after mixing.

C. Class II Non-Shrink Grout:
1. Class II non-shrink grouts shall have minimum 28-day compressive strength of 7,000 psi. Use grout for general-purpose grouting applications in accordance with Table 03 6000-A in this Section.
2. Products and Manufacturer: Provide one of the following:
   a. MasterFlow 100, by BASF, Inc.

b. EZ-Cure Contractor's Grout, by Five Star Products, Inc.
c. NS Grout, by Euclid Chemical Company.
d. Or equal.

3. Comply with ASTM C1107/C1107M and the following when tested using the quantity of water required to achieve the following properties:
   a. Flowable consistency (140 percent flow in accordance with ASTM C230/C230M, five drops in 30 seconds).
   b. Fluid working time of at least 15 minutes.
   c. Flowable for at least 30 minutes.
4. When tested, grout shall not bleed at maximum allowed water.
5. Non-shrink property shall not be based on chemically-generated gas or gypsum expansion.

D. Class III Non-Shrink Epoxy Grout:
1. Epoxy grout shall be a pourable, non-shrink, 100-percent solids system.
2. Products and Manufacturer: Provide one of the following:
   a. E3 Flowable, by Euclid Chemical Company.
   b. Sikadur 42 Grout Pak, by Sika Corporation.
   c. HP Epoxy Grout, by Five Star Products, Inc.
   d. Or equal.
3. Epoxy grout system shall have three components: resin, hardener, and specially blended aggregate, all pre-measured and prepackaged. Resin component shall not contain non-reactive diluents. Resins containing butyl glycidyl ether (BGE) or other highly volatile and hazardous reactive diluents are unacceptable. Variation of component ratios is not allowed without specific recommendation by manufacturer. Manufacturer's instructions shall be printed on each container in which products are packaged.
4. The following properties shall be attained with the minimum quantity of aggregate allowed by epoxy grout manufacturer.
   a. Vertical volume change at all times before hardening shall be between zero percent shrinkage and 4.0 percent expansion when measured in accordance with ASTM C827 (modified for epoxy grouts by using an indicator ball with specific gravity between 0.9 and 1.1).
   b. Length change after hardening shall be less than 0.0006-inch per inch and coefficient of thermal expansion shall be less than 0.00003-inch per inch per degree F when tested in accordance with ASTM C531.
   c. Compressive creep at one year shall be less than 0.001-inch per inch when tested under a 400-psi constant load at 140 degrees F in accordance with ASTM C1181.
   d. Minimum seven-day compressive strength shall be 14,000 psi when tested in accordance with ASTM C579
   e. Grout shall be capable of maintaining at least a flowable consistency for minimum of 30 minutes at 70 degrees F.
   f. Shear bond strength to portland cement concrete shall be greater than shear strength of concrete when tested in accordance with ASTM C882/C882M.
   g. Minimum effective bearing area shall be 95 percent.

2.3 GROUT MATERIALS OTHER THAN NON-SHRINK GROUT

A. General: Materials for grouts (other than non-shrink grouts) shall be in accordance with Section 03 3000, Cast-In-Place Concrete, except as otherwise specified in this Section.

B. Grout Fill:

1. Grout fill shall be comprised of cement, fine aggregate, coarse aggregate, water, and admixtures proportioned and mixed in accordance with this Section.
    a. Minimum Compressive Strength: 4,000 psi at 28 days.
    b. Maximum Water-Cement Ratio: 0.45 by weight.
    c. Coarse Aggregate: ASTM C33/C33M, No. 8 size.
    d. Fine Aggregate: ASTM C33/C33M, approximately 60 percent by weight of total aggregate.
    e. Air Content: Seven percent (plus or minus one percent).
    f. Minimum Cement Content: 564 pounds per cubic yard.
    g. Slump for grout fill shall be adjusted to match placing and finishing conditions, and shall not exceed four inches.

C. Construction Joint Grout:
1. Construction joint grout shall be comprised of cement, fine aggregate, coarse aggregate, water, and admixtures proportioned with similar cementitious characteristics as Class "A" concrete specified in Section 03 3000, Cast-In-Place Concrete. Mix design shall result in grout that is flowable with high mortar content. Mix requirements are:
    a. Minimum Compressive Strength: 4,500 psi at 28 days.
    b. Maximum Water-Cement Ratio: 0.42 by weight.
    c. Coarse Aggregate: ASTM C33/C33M, No. 8 size.
    d. Fine Aggregate: ASTM C33/C33M, approximately 60 percent by weight of total aggregate.
    e. Air Content: Seven percent (plus or minus one percent).
    f. Minimum Cement Content: 752 pounds per cubic yard.
    g. Slump for Construction Joint Grout: Seven inches (plus or minute one inch).

2.4 CURING MATERIALS

A. Curing materials shall comply with Section 03 3000, Cast-in-Place Concrete, and shall be as recommended by the manufacturer of prepackaged grouts.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine substrate and conditions under which grouting will be performed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. General:
1. Place grout as shown and indicated, and in accordance with Laws and Regulations and grout manufacturer's instructions. If manufacturer's instructions conflict with the Contract Documents, obtain clarification or interpretation from Engineer before proceeding.
2. Consistency of non-shrink grouts shall be as required to completely fill the space to be grouted for the particular application. Do not install grout for dry-packing without approval of Engineer. When dry-packing is approved by Engineer, dry-pack consistency shall be such that grout has sufficient water to ensure hydration and grout strength development, and remains plastic, moldable, and that does not flow.

3. Grouting shall comply with temperature and weather limitations in Section 03 3000, Cast-In-Place Concrete.
4. Cure grout in accordance with grout manufacturer's instructions for prepackaged grout and Section 03 3000, Cast-In-Place Concrete, for grout fill.

B. Columns and Beams:
1. After shimming columns and beams to proper elevation, securely tighten anchors. Properly form around base plates allowing sufficient room around edges for placing grout. Provide adequate depth between bottom of base plate and top of concrete base to assure that void is completely filled with non-shrink grout.

C. Equipment Bases:
1. Install equipment in accordance to manufacturer's recommendations, Laws, and Regulations, and the Contract Documents. After shimming equipment to proper elevation, securely tighten anchors. Properly form around base plates, allowing sufficient room around edges for placing grout. Provide adequate depth between bottom of equipment base and top of concrete base to ensure that voids are completely filled with non-shrink grout.

D. Construction Joints:
1. Place a six-inch minimum thick layer of construction joint grout over contact surface of concrete at interface of horizontal construction joints in accordance with Section 03 1500, Concrete Accessories, and Section 03 3000, Cast-In-Place Concrete.

E. Grout Fill:
1. All mechanical, electrical, and finish work shall be completed prior to placing grout fill. Base slab shall be provided with a scratched finish in accordance with Section 03 3000, Cast-In-Place Concrete. Roughen existing slabs shall by abrasive blasting or hydroblasting exposing aggregates to ensure bonding to base slab.
2. Minimum thickness of grout fill shall be one-inch. Where finished surface of grout fill is to form an intersecting angle of less than 45 degrees with concrete surface against which grout will be placed, form a key in the concrete surface at the intersection point. Key shall be minimum of 3.5 inches wide by 1.5 inches deep.
3. Thoroughly clean and wet base slab prior to placing grout fill. Do not place grout fill until slab is completely free of standing water. A thin coat of neat Type II cement slurry shall be broomed into surface of slab. Place grout fill while slurry is wet. Grout fill shall be compacted by rolling or tamping, brought to elevation, and floated. In tanks and basins where scraping-type equipment will be installed, grout fill shall be screeded by blades attached to revolving mechanism of equipment in accordance with procedures recommended by equipment manufacturer after grout is brought to elevation.
4. Grout fill placed on sloping slabs shall be installed uniformly from bottom of slab to top, for full width of placement.
5. Test grout fill surface with a straight edge to detect high and low spots; immediately correct high and low spots in grout fill. When grout fill has hardened sufficiently, grout fill shall be steel troweled to provide a smooth surface free of bug holes and other imperfections. While an acceptable type of mechanical trowel may be used in this operation, the last pass over the grout fill surface shall be by hand-troweling. During finishing, do not apply the following to the grout fill surface: water, dry cement, or mixture of dry cement and sand.
6. Cure and protect grout fill in accordance with Section 03 3000, Cast-In-Place Concrete.

3.3 FIELD QUALITY CONTROL

A. Field Testing Services:
   1. Owner will employ testing laboratory to perform field quality control testing for grout. Engineer will direct the testing requirements.
   2. Contractor shall provide all curing and necessary cube storage as specified in Section 01 4528, On-Site Facilities for Testing Laboratory.

B. Quality Control Testing During Construction:
   1. Grout Fill: Perform sampling and testing for field quality control during grout fill placing as follows:
      a. Sampling Fresh Grout Fill: ASTM C172.
      b. Slump: ASTM C143; one test for each load of grout at point of discharge.
      c. Air Content: ASTM C231; one sample for every two grout loads at point of discharge, and when a change in the grout is observed.
      d. Compression Test Specimens:
         1) In accordance with ASTM C109/C109M; make one set of compression cubes for each 50 cubic yards of grout, or fraction thereof, of each mix design placed each day. Each set shall be four standard cubes, unless otherwise directed by Engineer.
   2. Non-shrink Grout: Perform sampling and testing for field quality control during non-shrink grout placing as follows:
      a. Perform compression testing of non-shrink grout in accordance to ASTM C109/C109M at intervals during construction as selected by Engineer. Make a set of four specimens for testing compressive strength at a period of time selected by the Engineer.
      b. Perform compression tests on epoxy grout and fabricate specimens for epoxy grout testing in accordance with ASTM C579, Method B, at intervals during construction as selected by the Engineer. Make a set of four specimens for testing compressive strength at a period of time selected by Engineer.

C. Evaluation of Field Quality Control Tests:
   1. Do not use grout, delivered to final point of placement, having slump or total air content that does not comply with the Contract Documents.
   2. Compressive strength tests for laboratory-cured cubes will be acceptable if averages of all sets of three consecutive compressive strength test results equal or exceed the required 28-day design compressive strength of the associated type of grout.
   3. If the compressive strength tests do not comply with the requirements in the Contract Documents, the grout represented by such tests will be considered defective and shall be removed and replaced, or subject to other action required by Engineer, at Contractor's expense.

D. Manufacturer's Services:
   1. Manufacturers of proprietary materials shall make available upon 72 hours notification the services of qualified, full time employee, experienced in serving as a field service technician for the products required, to aid in assuring proper use of products under the actual conditions at the Site.

END OF SECTION 03 6000

SECTION 04 0505

UNIT MASONRY CONSTRUCTION

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install all unit masonry construction. The Work also includes:
      a. Providing openings in unit masonry construction to accommodate the Work under this and other Sections and building into unit masonry construction all items such as sleeves, anchorage devices, inserts, and other items to be embedded in unit masonry construction for which placement is not specifically included under other Sections.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate the installation of items to be installed with or before unit masonry construction Work.
   2. Remove and rebuild unit masonry construction advanced without built-in flashings and other built-in items at no additional cost to Owner, even after unit masonry construction has been completed.

C. Related Sections:
   1. Section 04 0511, Masonry Mortaring and Grouting.
   2. Section 04 0519, Masonry Anchorage and Reinforcing.
   3. Section 05 5013, Miscellaneous Metal Fabrications.
   4. Section 06 1053, Miscellaneous Rough Carpentry.
   5. Section 07 1113, Bituminous Dampproofing.
   6. Section 07 2105, Building Insulation.
   7. Section 07 6200, Sheet Metal Flashing and Trim.
   8. Section 07 9200, Joint Sealants.
   9. Section 09 9100, Painting.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ACI 530, Building Code Requirements for Masonry Structures.
   2. ACI 530.1, Specification for Masonry Structures.
   3. ASTM C67, Test Methods for Sampling and Testing Brick and Structural Clay Tile.
   4. ASTM C140, Test Methods for Sampling and Testing Concrete Masonry Units and Related Units.
   5. ASTM C387, Specification for Packaged, Dry, Combined Materials for Mortar and Concrete.
   6. ASTM C780, Test Method for Preconstruction and Construction Evaluation of Mortars for Plain and Reinforced Unit~~y~~ Masonry.
   7. ASTM C1091, Test Method for Hydrostatic Infiltration Testing of Vitrified Clay Pipe Lines.
   8. ASTM C1093, Practice for Accreditation of Testing Agencies for Unit Masonry.

9. ASTM C1314, Test Method for Compressive Strength of Masonry Prisms.
10. BIA, Technical Notes on Brick Construction.
11. NCMA, TEK Manual for Concrete Masonry Design and Construction.
12. UL, Design No. U 902, Bearing Wall Rating – 4 HR., Alternative Detail.
13. UL, Design No. U 904, Bearing Wall Rating – 3 HR.; Non-bearing Wall Rating – 3 HR.
14. UL, Design No. U 905, Bearing Wall Rating – 2 HR.; Non-bearing Wall Rating – 2 HR.
15. UL, Design No. U 906, Bearing Wall Rating – 2 HR.; Non-bearing Wall Rating – 2 HR.
16. UL, Design No. U 907, Nonbearing Wall Rating – 3 or 4 HR.
17. UL, Design No. U 909, Nonbearing Wall Rating – 3 or 4 HR.
18. UL, Design No. U 912, Bearing Wall Rating – 3 HR.; Non-bearing Wall Rating – 3 HR.
19. UL, Design No. U 913, Bearing Wall Rating – 2 HR.; Non-bearing Wall Rating – 2 HR.
20. UL, Design No. U 914, Bearing Wall Rating – 3 HR.; Non-bearing Wall Rating – 3 HR.

1.3 TERMINOLOGY

A. The following words or terms are not defined but, when used in this Section, have the following meaning:
   1. "Masonry control joint" is a joint in interior and exterior masonry walls that allows expansion and contraction to occur independently without damage to the masonry.
   2. "Masonry expansion joint" is a control joint in interior and exterior masonry walls, located at the separation between adjoining parts of a concrete or steel structure that is provided to allow movements transferred to the masonry to occur independently without damage to the masonry.

1.4 QUALITY ASSURANCE

A. Qualifications:
   1. Installer:
      a. Engage a single installer regularly engaged in preformed unit masonry installation and with successful and documented experience in erecting unit masonry of the scope and type of Work required; and who employs only tradesmen with specific skill and successful experience in the type of Work required. Submit name and qualifications with the following information for a minimum of three successful projects:
      b. Names and telephone numbers of owners, architects, or engineers responsible for projects.
         1) Approximate contract cost of unit masonry.
         2) Quantity (area) of unit masonry installed.
   2. Testing Laboratory:
      a. Employ independent testing laboratory experienced in design and testing of concrete materials and mixes to perform material evaluation tests and to design concrete mixes. Employ different laboratories for design of concrete mixes and field testing, in accordance with ASTM C1093.

B. Component Supply and Compatibility:
   1. Obtain each type of concrete masonry units from one manufacturer, cured by one process and of uniform texture and color or in an established uniform blend thereof.
   2. Use a single source and brand of mortar materials throughout the Work.

C. Regulatory Requirements:

1. Where fire-resistance classification is shown or indicated (e.g., four-hour rating, three-hour rating, and similar designations) for unit masonry construction, comply with applicable requirements for materials and installation established by UL tests referenced in this Section and requirements of authorities having jurisdiction.

D. Job Mock-up:
   1. Prior to installing unit masonry and after Engineer's approval of Samples, erect job mock-ups using materials, pattern bond, and joint tooling shown or specified. Build mock-up at the Site, at location acceptable by Engineer, of full required wall thickness. Mock-up shall be approximately four feet by 3.33 feet unless another size or location is shown or indicated for the job mock-up. Provide special features as directed, including finished opening 16 inches by 16 inches, finished end, and masonry control joint. Indicate proposed range of color, texture, and workmanship to be expected in the completed Work. Obtain Engineer's approval of visual qualities of mock-up before starting unit masonry construction. Retain and protect mock-up during construction as a standard for judging unit masonry Work. Do not alter, move, or destroy mock-up until given permission by Engineer.
   2. Build as many mock-up panels as required to obtain Engineer's approval.
   3. Masonry construction that does not comply with standards approved on mock-up panel shall be removed and rebuilt to conform to the Contract Documents. Provide mock-up panel for the following:
      a. Typical complete exterior walls, including metal cavity wall flashing, anchors and masonry wall ties, and other components of complete exterior wall system.
      b. Typical complete interior partition of concrete unit masonry where both sides will remain visually exposed upon completion of the Work.
      c. Typical interior partition of concrete unit masonry using all shapes and accessories shown or indicated on the approved Shop Drawings and other submittals.

E. Pre-Construction Masonry Conference:
   1. Prior to installing unit masonry construction, Contractor and Contractor's installer shall attend pre-construction masonry conference at the Site. Review foreseeable methods and procedures related to unit masonry construction including, but not limited to, the following:
      a. Requirements of the Contract Documents.
      b. Structural concept.
      c. Sequence of masonry construction.
      d. Special masonry details.
      e. Standard of workmanship.
      f. Prism and grout sampling, and unit masonry test results.
      g. Quality control requirements.
      h. Project organization and availability of materials, tradesmen, equipment, and facilities required to avoid delays.
      i. Masonry control and expansion joint locations and materials.
      j. Modular planning requirements.
      k. Weather and forecasted weather conditions, and procedures for coping with unfavorable conditions.
      l. Required inspection, testing, and certifying procedures.
      m. Requirements for complying with building codes.
   2. Attendance at the conference is mandatory for the following:
      a. Masonry Subcontractor's superintendent and foreman.
      b. Authorized representative of face brick and concrete unit masonry Suppliers.
      c. Engineer

d. Resident Project Representative, if any.
e. Coordinating Special Inspector.

3. If additional information is required to adequately cover items on agenda, reconvene conference as soon as possible.
4. Contractor shall record discussions of conference and decisions and agreements (or disagreements) and furnish a copy of the record to each person and entity attending.

1.5 SUBMITTALS

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Complete layout of all masonry walls showing modular planning and all special shapes to be used in the Work. Show all details for each condition encountered in the Work. Submit plan and elevation views drawn at scale of 1/4-inch equal to one foot, and details drawn at scale of 1.5-inch equal to one foot. Show all items included in the unit masonry construction.
b. Masonry control joint locations and details.
c. Drawings showing location, extent, and accurate configuration and profile of all items required by the Contract Documents, in this and other Sections, for unit masonry construction. Provide elevations drawn at scale of 1/4-inch equal to one foot, and details drawn at scale of 1.5-inch equal to one foot.
d. Drawings for fabricating, bending, and placing of reinforcing bars. Submit bar schedules, diagrams of bent bars, stirrup spacing, lateral ties, and other arrangements and assemblies required for fabricating and placing of reinforcing for unit masonry construction.
e. Job Mock-Up: Shop Drawings showing location, extent, and accurate configuration of items to be built-in to mock-ups. Provide elevations drawn at scale of 1.5-inch equal to one foot.
2. Samples:
a. Mock-ups.

B. Informational Submittals: Submit the following:
1. Field Quality Control Submittals:
a. Pre-installation test results in accordance with ASTM C140 and ASTM C1314, and the field quality control Article of this Section.
b. Post-installation quality control submittals in accordance with the field quality control Article of this Section.
2. Qualifications Statements:
a. Installer.
b. Testing laboratory.

C. Closeout Submittals: Submit the following:
1. Record Documentation:
a. Comply with Section 01 7700, Closeout Procedures.
b. Indication location of all masonry control joints and expansion joints.

1.6 DELIVERY, STORAGE AND HANDLING

A. General:
1. Comply with:
a. Section 01 6000, Product Delivery Requirements.

b. Section 01 6000, Product Storage and Handling Requirements.

2. Storage: Maintain temperatures in shelter so that masonry materials are above 20 degrees F when installed.

1.7 SITE CONDITIONS

A. Environmental Requirements:

1. General:
   a. Temporary Facilities and Temporary Utilities: Provide supplemental heat sources and energy as required for unit masonry construction in cold weather.
   b. Do not perform unit masonry construction when air temperature is below 28 degrees F for rising temperature, or below 36 degrees F for falling temperatures, without providing temporary enclosures and heat, or without heating materials or other measures necessary to prevent freezing as specified.
   c. Do not use frozen materials and do not build on frozen unit masonry construction.
   d. Remove and replace all unit masonry construction damaged by cold temperatures and freezing.
2. Protection:
   a. Cold Weather Protection: Protect unit masonry construction against freezing for at least 48 hours after placement, as follows:
      1) When anticipated minimum temperature will be between 40 degrees F and 25 degrees F, cover newly constructed masonry with weather-resistive membrane for 48 hours after installation.
      2) When anticipated minimum temperature will be between 25 degrees F and 20 degrees F, completely cover newly constructed masonry with weather-resistive insulating blankets, or equal protection, for 48 hours after installation.
      3) When anticipated minimum temperature will be below 20 degrees F, maintain newly constructed masonry at temperature above 32 degrees F for at least 48 hours after installation by using heated enclosures, electric heating blankets, infrared lamps, or other acceptable methods of supplementary heating.
   b. Hot Weather Protection: When mean daily temperature exceeds 100 degrees F, or exceeds 90 degrees F with wind velocity greater than eight miles per hour, fog-spray newly constructed masonry until damp at least three times per day until masonry is 72 hours old.
   c. When Work is not in progress, protect partially-completed unit masonry construction against rapid heat loss and from water entering the masonry by covering top of walls with strong, waterproof, non-staining membrane. Extend membrane at least two feet down both sides of wall and secure in place using wall cover clamps spaced at intervals of four feet and at each end, and at joints in the membrane.
   d. Do not apply floor or roof loading for at least 72 hours after completing masonry columns or walls.
   e. Do not apply concentrated loads for at least 168 hours after completing masonry columns or walls.
3. Cold Weather Unit Masonry Construction:
   a. When mean daily temperature is below 40 degrees F, mortar used in unit masonry construction shall be portland cement-lime-sand mortar using high-early strength portland cement. Use mortar within 1.5 hours of initial mixing. Use grout within 1.5 hours of initial mixing.
   b. Clay or shale unit masonry with suctions in excess of 20 grams of water per 30 square inches per minute shall be sprinkled with heated water just prior to installation. Provide water temperature above 70 degrees F when temperature of

masonry units is above 32 degrees F. Water temperature shall be above 120 degrees F when temperature of masonry units is below 32 degrees F.

c. For Air Temperatures of 40 degrees F to 32 degrees F: Water and aggregates used in mortar and grout shall not be heated above 140 degrees F. Heat mortar sand or mixing water to produce mortar temperatures between 40 degrees F and 120 degrees F at time of mixing. Heat water and aggregates for grout when water or aggregate temperature is below 32 degrees F.

d. For Air Temperatures of 32 degrees F to 25 degrees F: Comply with Paragraph 1.7.A.3.c of this Section and the following: Maintain mortar temperature above freezing until used in masonry. Heat aggregates and mixing water for grout to produce grout temperature between 70 degrees F and 120 degrees F at time of mixing. Maintain grout temperature above 70 degrees F at time of grout placement.

e. For Air Temperatures of 25 degrees F to 20 degrees F: Comply with Paragraphs 1.7.A.3.c and 1.7.A.3.d of this Section and the following: Heat masonry surfaces under construction to 40 degrees F. Provide temporary wind breaks or enclosures when wind velocity exceeds 15 miles per hour. Prior to grouting, heat the masonry to minimum of 40 degrees F.

f. For Air Temperatures of 20 degrees F and Below: Comply with Paragraphs 1.7.A.3.c, 1.7.A.3.d, and 1.7.A.3.e of this Section and the following: Provide temporary enclosures and auxiliary heat to maintain air temperature within temporary enclosure above 32 degrees F. Temperature of masonry units when laid shall not be less than 20 degrees F.

4. Hot Weather Unit Masonry Construction: Using methods acceptable to Engineer, protect unit masonry construction from direct exposure to wind and sun when ambient air temperature is 99 degrees F in shade with relative humidity less than 50 percent.

a. When ambient temperature exceeds 100 degrees F, or exceeds 90 degrees F with wind velocity greater than eight miles per hour, maintain temperature of mortar and grout below 120 degrees F. Flush mixers, mortar transport containers, and mortarboards with cool water before they come into contact with mortar ingredients or mortar. Maintain mortar consistency by re-tempering with cool water. Use mortar within two hours of initial mixing. Use grout within 1.5 hours of initial mixing. Maintain sand piles in damp, loose condition.

b. When ambient temperature exceeds 115 degrees F, or exceeds 105 degrees F with wind velocity greater than eight miles per hour, comply with Paragraph 1.7.A.4.a of this Section and the following: Use cool mixing water for mortar and grout. Use of ice will be allowed in mixing water prior to use; ice is not allowed in the mixing water when added to other mortar or grout materials. Shade materials and mixing equipment from exposure to direct sunlight.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Material requirements for masonry materials are in the following:
1. Section 04 0519, Masonry Anchorage and Reinforcing.
2. Section 04 2200, Concrete Unit Masonry.

B. Mortar, General:
1. Where question of compliance with or interpretation of requirements of this Section arises, mortar properties Specification will take precedence over mortar proportion Specifications.

2. Make no change in proportions established for mortar approved under property Specifications, and do not use materials with different physical characteristics in mortar unless compliance with requirements of property Specifications is re-established by Shop Drawing or submittal data.
3. Do not combine two air-entraining materials in mortar.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which unit masonry construction will be installed, and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 PREPARATION

A. Wetting of Masonry Units:
1. Concrete Masonry Units: Except for absorbent units specified to be wetted, lay masonry units dry. Do not wet concrete masonry units.

B. Cleaning of Reinforcing: Before placing, remove loose rust, mill scale, earth, ice, and other contamination from reinforcing materials. Do not use reinforcing bars with kinks or bends not shown or approved Shop Drawings, or bars with reduced cross-section due to rusting or other causes.

3.3 INSTALLATION, GENERAL

A. Thickness: Build walls, floors, and other unit masonry construction to thickness shown or indicated. Build single wythe walls to actual thickness of masonry units using units of nominal thickness shown or indicated.

B. Build chases and recesses as shown or required by others, as specified. Provide not less than eight inches of masonry between chase or recess and jamb of openings, and between adjacent chases and recesses.

C. Leave openings for equipment, piping, ducts, and other items to be installed subsequent to starting unit masonry construction. After installation of said items, complete unit masonry construction to match the Work immediately adjacent to openings.

D. Cut masonry units using motor-driven wet cutting saws to provide clean, sharp, unchipped edges. Cut units as required to provide pattern shown and to fit adjoining Work neatly. Use full-size units without cutting where possible. Provide special unit masonry shapes for transitions and intersections. Do not attempt to field-cut special shapes from regular unit masonry shapes, and do not use other options for special unit masonry shapes.

E. Build interior masonry walls visible from both sides in the finished Work using two wythes of masonry. Masonry shall be continuous over entire plane of wall, including walls that continue behind fixtures, equipment, furniture, lockers, and similar items

F. Matching Existing Masonry: Match with existing masonry the coursing, pattern bond, color, and texture of new unit masonry construction

3.4 LAYING MASONRY WALLS

A. General:
1. Mortar Types: Unless otherwise shown or indicated, use mortar specified in Section 04 0511, Mortar and Masonry Grout, as follows:
   a. Use Type S mortar for all exterior and interior load-bearing and non load-bearing walls.
   b. Use grout fill for structural requirements and for grouting reinforcing steel in unit masonry construction.
   c. Do not use mortar that has begun to set or if more than thirty minutes have elapsed since initial mixing. Re-temper mortar during the thirty-minute period only as required to restore workability.
2. Lay out walls in advance for accurate spacing of surface pattern bond with uniform joint widths and to properly locate openings, masonry control joints, returns, and offsets. Avoid using less than half-size units at corners, jambs, and where possible at other locations.
3. Lay up walls plumb and true to comply with specified tolerances, with courses level, accurately spaced, and coordinated with other work.
4. Pattern Bond:
   a. Lay all concrete unit masonry in running bond pattern with vertical joints in each course centered on units in courses above and below. Avoid using less than full-size units.
   b. Lay concrete unit masonry scheduled or shown to be concealed by finish materials, except paint, with units in wythe bonded by lapping not less than two inches.
   c. Bond and interlock each course of each wythe at corners.
   d. Do not use units with less than four-inch horizontal face dimensions at corners or jambs.
5. Color and Texture:
   a. Lay concrete unit masonry using mortar of natural color.

B. Construction Tolerances:
1. Variation from Plumb: For lines and surfaces of columns, walls and arises, do not exceed 1/4-inch in ten feet, or 3/8-inch in a story height (20 feet), maximum, nor 1/2-inch in 40 feet or more. Except for external corners, expansion joints and other conspicuous lines, do not exceed 1/4-inch in any story or 20 feet maximum, nor 1/2-inch in 40 feet or more.
2. Variation from Level: For lines of exposed lintels, sills, parapets, horizontal grooves, and other conspicuous lines, do not exceed 1/4-inch in any bay or 20 feet maximum, nor 3/4-inch in 40 feet or more.
3. Variation of Linear Building Line: For position shown and related portion of columns, walls and partitions, do not exceed 1/2-inch in any bay or 20 feet maximum, nor 3/4-inch in 40 feet or more.
4. Variation in Cross Sectional Dimensions: For columns and thickness of walls, from dimensions shown, do not exceed minus 1/4-inch nor plus 1/2-inch.

C. Mortar Bedding and Jointing:
1. Lay hollow concrete masonry units with full mortar coverage on horizontal and vertical face shells. Bed webs in mortar in starting course of piers, columns, and pilasters, and where adjacent to cells or cavities to be reinforced or filled with concrete or grout.
2. Maintain joint widths shown, except for minor variations required to maintain pattern bond alignment. If not shown, lay unit masonry to provide the following joint widths:
   a. Concrete Unit Masonry: 3/8-inch.
   b. Concrete Unit Masonry Patches: Match existing adjacent joint width.

3. Cut joints flush for masonry walls to be concealed or to be covered by other materials, except paint, unless otherwise shown.
4. Tool exposed joints slightly concave, when mortar is "thumbprint hard", unless otherwise required to match existing joint treatment. Rake out mortar 1/2-inch deep in preparation for application of calking or sealants and for epoxy pointing mortar for glazed structural tile where required.
5. Concave-tool exterior joints below grade.
6. Remove masonry units disturbed after laying; clean and reset in fresh mortar. Do not pound corners at jambs to fit stretcher units that have been set in position. If adjustments are required, remove units, clean off mortar and reset in fresh mortar.

D. Collar Joints:
1. Fill vertical space between wythes solidly with mortar by parging the in-place wythe and shoving units into the parging, for the following unit masonry construction:
   a. Exterior multi-wythe walls, except cavity walls, and interior multi-wythe walls and partitions.
   b. Load-bearing interior walls and partitions where metal ties or horizontal reinforcing are specified for structural bonding.
   c. Non-load-bearing interior walls or partitions where metal ties or horizontal reinforcing are specified for structural bonding and full thickness of wall or partition is required to comply with code requirements for thickness to height ratio.

E. Stopping and Resuming Work: Rake back one unit masonry length in each course; do not tooth. Clean exposed surfaces of set masonry, wet units lightly, if required, and remove loose masonry units and mortar prior to laying new masonry.

F. Built-in Work:
1. As the Work progresses, build-in the items shown, specified or required in the Contract Documents. Fill cores in one-block width solidly with mortar around built-in items.
2. Do not fill space between hollow metal frames and masonry solidly with mortar.
3. Where built-in items are to be embedded in cores of hollow masonry units, place layer of cavity fill mesh in the joint below and rod mortar or grout into core.
4. Where required by Laws or Regulations, or to comply with thickness-to-height ratio, or to provide required fire resistance, fill all cells of unit masonry construction solid with grout.
5. Use individual metal ties embedded in horizontal joints to bond wythes together Refer to Section 04 0519, Masonry Anchorage and Reinforcing, for type of ties required. Provide ties as shown, but not less than one metal tie for four square feet of wall area spaced not to exceed two feet on centers horizontally and vertically. Stagger ties in alternate courses. Provide additional ties within 12 inches of openings and space not more than three feet apart around perimeter of openings.
6. Use continuous reinforcing embedded in horizontal mortar joints for bond tie between wythes as specified in this Section.
7. Corners: Provide interlocking masonry unit bond in each course at corners, unless otherwise shown or indicated.
   a. For horizontally reinforced masonry, provide continuity at corners with prefabricated "L" units as specified in this Section, in addition to masonry bonding.
8. Intersecting and Abutting Walls: Unless vertical expansion or masonry control joints are shown at juncture, provide same type of bonding specified for structural bonding between wythes and space as follows:
   a. Provide masonry bond in alternate courses.
   b. Provide individual metal ties at not more than two feet on centers vertically.

c. Provide continuity with horizontal joint reinforcing using prefabricated “T” and “L” units.

G. Non-Load-Bearing Interior Partitions and Non-Load-Bearing Interior Cavity Wall Wythe:
1. Build full height of story to underside of structure above, unless otherwise shown or indicated.
2. Tie non-load-bearing partitions and non-load-bearing interior wythe of cavity walls at top and sides with masonry anchors at terminations. Build in end blocks as shown and specified to facilitate placing compressible filler. Insert compressible filler, specified in Section 04 0519, Masonry Anchorage and Reinforcing, in all horizontal and vertical joints where non-load-bearing masonry and non-load- bearing interior wythe of cavity walls terminate. Insert filler 3/4-inch from both faces of masonry. Use filler four times as thick as widest part of joint. Thickness of filler shall be a minimum of 1.5 times the compressed thickness. Compress filler to less than thickness of joint and insert. At splices, overlap strips by three inches and compress ends to form tight joint. Finish with backer rod and sealant.
3. At terminations of non-load-bearing masonry walls and non-load-bearing interior wythe of cavity walls requiring a fire rating, use fire-safing insulation specified in Section 07 2105, Building Insulation. Build in end blocks to facilitate placing fire-safing insulation. Insert insulation in a continuous, vapor-tight, solid blanket to 3/4-inch from both faces of masonry. Finish with backer rod and sealant.

H. Cavity Walls:
1. Verify that bituminous damproofing is installed; refer to Section 07 1113, Bituminous Dampproofing.
2. Position insulation as shown and in accordance with Section 07 2105, Building Insulation.
3. Install cavity drainage material.
4. Keep cavity clean of mortar droppings during construction by using continuous horizontal board of same width as cavity with lifting wires at each end. Lift board upward before placing horizontal joint reinforcing. Clean mortar droppings from board. Do not clean into cavity. Joints facing cavity shall be struck flush.
5. Tie exterior wythe to back-up with individual metal ties spaced not more than 16 inches on centers vertically and 16 inches on centers horizontally. Stagger in alternate courses.
6. Tie exterior wythe to back-up with rectangular box-tie sections, seismic clips and horizontal continuous wire embedded in mortar joints and anchored in slot created by double looped ties spaced not more than 16 inches on centers vertically and 16 inches on centers horizontally.
7. Tie exterior wythe to back up with continuous horizontal joint reinforcing, embedded in mortar joints at not more than 16 inches on centers vertically. Refer to Section 04 0519, Masonry Anchorage and Reinforcing, for type of reinforcing required.
8. Provide weep holes in exterior wythe of cavity wall located in wall foundation courses and immediately above ledges and flashing, spaced two feet on centers, unless closer spacing is shown or indicated. Install plastic weep tubes. Keep weep holes free of mortar and other obstructions.

I. Horizontal Joint Reinforcing:
1. Provide continuous horizontal joint reinforcing as shown and specified. Refer to Section 04 0519, Masonry Anchorage and Reinforcing, for reinforcing units required. Fully embed longitudinal side rods in mortar for entire length of rods with minimum cover of 5/8-inch on exterior side of walls and 1/2-inch at other locations. Lap reinforcing minimum of six inches at ends of units. Do not bridge masonry control joints and building expansion joints with reinforcing.

2. Reinforce walls with continuous horizontal joint reinforcing unless specifically indicated as being omitted.
3. Provide continuity at corners and wall intersections by using prefabricated “L” and “T” sections. Cut and bend units in accordance with manufacturer’s written instructions for continuity at returns, offsets, column fireproofing, pipe enclosures and other special conditions.
4. Space continuous horizontal reinforcing as follows:
    a. For multi-wythe walls, solid or cavity, that are structurally bonded by masonry headers or individual wire ties, space horizontal reinforcing two feet on centers vertically.
    b. For multi-wythe walls, solid or cavity, where continuous horizontal reinforcing also acts as structural bond or tie between wythes, space reinforcing as required by Laws and Regulations, but not more than 16 inches on centers vertically.
    c. For single-wythe walls, space reinforcing at 16 inches on centers vertically, unless otherwise shown.
    d. For parapets, space reinforcing at eight inches on centers vertically, unless otherwise shown.
5. Reinforce masonry openings greater than 12 inches wide, with horizontal joint reinforcing placed in two horizontal joints approximately eight inches apart, immediately above lintel and immediately below sill. Extend reinforcing a minimum of two feet beyond jambs of opening.
6. In addition to wall reinforcing, provide additional reinforcing at openings as required to comply with the above.

J. Structural Reinforced Unit Masonry Construction:
1. Comply with ACI 530, ACI 530.1 and Laws and Regulations for structural reinforced unit masonry construction.
2. Shape and dimension reinforcement as shown and required by applicable ACI standards and Laws and Regulations.
3. Position reinforcing accurately at spacing shown on approved Shop Drawings. Support and secure vertical bars against displacement using rebar positioners.
4. Where vertical bars are shown in close proximity, provide clear distance between bars of not less than the greater of the nominal bar diameter or one-inch.
5. For columns, piers, and pilasters, provide clear distance between vertical bars as shown, but not less than the greater of 1.5 times nominal bar diameter or 1.5 inches. Provide lateral ties.
6. Provide lapped splices with reinforcing steel placed in contact and wire tied. Provide minimum lap required by Laws and Regulations, unless requirements that are more stringent are shown or indicated. Do not splice reinforcing at points other than shown or as approved on Shop Drawings.
7. Provide substantial and tight formwork and shores as required for temporary support of reinforced masonry elements. Design, erect, support, brace, and maintain formwork.
8. Construct formwork to conform to shape, line and dimensions shown. Make sufficiently tight to prevent leakage of mortar grout. Brace, tie, and support as required for maintaining position and shape during construction and curing of reinforced masonry.
9. Do not remove forms and shores until reinforced masonry members have hardened sufficiently to carry their own weight and all other temporary loads that may be placed on them during construction.
10. Allow not less than the following duration to elapse after completing a member before removing shores or forms, provided suitable curing conditions have been obtained during the curing period:

a. Girders and Beams: Ten days.
b. Slabs: Seven days.
c. Reinforced Masonry Soffits: Seven days.

K. Grouting Structural Reinforced Unit Masonry Construction:
1. Limit extent of masonry construction to sections that do not exceed the maximum pour requirements specified. Provide temporary dams or barriers to control horizontal flow of grout at ends of wall sections. Build dams to full height of grout pour. If masonry units are used, do not bond into permanent masonry wythes. Remove temporary dams after completing grout pour.
2. Use fine grout for filling spaces less than four inches in both horizontal directions. Use coarse grout for filling spaces four inches or larger in both horizontal directions.
3. For spaces 10 inches and larger, use concrete fill.
4. Low-Lift Grouting:
a. Use low-lift grouting techniques using fine grout mix for the following:
1) Two-wythe walls with grout space of two inches or less in width.
2) Multi-wythe walls.
3) Columns, piers and pilasters where masonry units are shown in core areas enclosed by masonry units.
4) Grout spaces less than 2-inches in width at intervals not to exceed two feet in lifts of six to eight inches.
5) At Contractor's option, low-lift-grouting technique may be used for structural reinforced unit masonry construction with grout spaces wider than two inches, except use coarse grout mix and place in lifts not to exceed eight inches in height.
b. Construct low-lift structural reinforced unit masonry construction by placing reinforcing, laying masonry units and pouring grout as the Work progresses.
c. Place vertical reinforcing bars and supports prior to laying of masonry units. Extend above elevation of maximum pour height as required to allow for splicing. Horizontal reinforcing bars may be placed progressively with laying of masonry units.
d. Limit grout pours as required to prevent displacing masonry by grout pressure (blowout), but do not exceed 12-inch pour height.
e. Lay masonry units prior to each grout pour, but do not construct more than 12 inches above maximum grout pour height in one exterior wythe and four inches above in other exterior wythe. Provide metal wall ties, if required, to prevent blowouts.
f. Pour grout using container with spout and consolidate immediately by rodding or puddling; do not use trowels. Place grout continuously; do not interrupt pouring of grout for more than one hour. If poured in lifts, place from center-to-center of masonry courses. Terminate pour 1.5 inches below top of highest course in pour.
5. High-Lift Grouting:
a. High-lift grouting technique may be used for the following structural reinforced unit masonry construction:
1) Two-wythe walls with grout spaces of 2.5 inches or greater width.
2) Columns, piers, or pilasters when no unit masonry fill is shown to be placed in reinforced grout space.
b. Place reinforcing and support in proper position, prior to laying of masonry units, except if shown to be placed in mortar joints, place as masonry units are laid. Place horizontal bars in grout spaces on same side of vertical bars.
c. Construct high-lift structural reinforced unit masonry construction by laying masonry to full height and width prior to placing of grout. Provide cleanout holes in

first course of masonry, and use high-pressure water jet stream to remove excess mortar from grout spaces, reinforcing bars and top surface of structural members, which support wall. Clean grout spaces daily during construction of masonry.

d. Walls: Omit every other masonry unit in first course of one wythe to provide cleanout holes. Tie wythes together with metal ties as shown or required by Laws and Regulations, but provide not less than nine-gage wire ties spaced not less than two feet on centers horizontally and 16 inches on centers vertically for running pattern bond or 12 inches on centers vertically for stack bond.

e. Columns, Piers, and Pilasters: Omit every other masonry unit around perimeter of member to provide cleanout holes. Provide reinforcing bands placed in bed joints as the structural reinforced unit masonry construction progresses. Provide bands of the size and vertical spacing shown, or as required by Laws and Regulations, but not less than nine-gage wire spaced 12 inches on centers vertically.

f. Preparation of Grout Spaces: Prior to grouting, inspect and clean grout spaces. Remove dirt, dust, mortar droppings, loose pieces of masonry, and other foreign materials from grout spaces. Clean reinforcing and adjust to proper positioning. Clean top surface of structural members supporting masonry to ensure bond. After cleaning and inspection, close cleanout holes with matching masonry units and brace closures to resist grout pressures.

g. Place grout after entire height of masonry to be grouted has attained sufficient strength to resist grout pressure, but not less than three days curing time. Install shores and bracing, if required, before starting grouting operations.

h. Place grout by pumping into grout spaces, unless alternate methods are acceptable to Engineer.

i. Use coarse grout mix. Rod or vibrate each grout lift during placing and again after excess moisture has been absorbed, but before plasticity is lost. Do not penetrate or damage grout placed in previous lifts or pours.

j. Limit grout pours to sections that can be completed in one working day with not more than one-hour interruption of pouring operation. Limit pours to not exceed capacity of masonry to resist displacement or loss of mortar bond due to grout pressures.

   1) Do not exceed 12 feet pour height.
   2) Do not exceed 25 feet horizontal pour dimension.

k. Where pour height exceeds four feet place grout in series of lifts not exceeding four feet in height. Place each lift as continuous pouring operation. Allow at least 30 minutes and not more than 60 minutes between lifts of each pour.

l. When more than one pour is required to complete a section of masonry, extend reinforcing beyond masonry as required for splicing. Pour grout to within 1.5 inches of top course of first pour. After grouted masonry is cured, remove temporary dams, lay masonry units, and place reinforcing for second pour section before grouting.

L. Anchoring Masonry Work:

1. Provide anchoring devices as specified under Section 04 0519, Masonry Anchorage and Reinforcing. If not shown or indicated, provide standard type for facing and back-up involved in compliance with Laws and Regulations.
2. Anchor masonry to structural members where masonry abuts or faces such members to comply with the following:
   a. Provide an open space not less than a 1/2-inch or more than one-inch in width between masonry and structural members, unless otherwise shown. Keep open space free of mortar and other rigid materials.

b. Anchor masonry to cast-in-place concrete and structural steel members with metal ties embedded in masonry joints and attached to structure. Provide anchors with flexible tie sections.
c. Space anchors as shown, but not more than two feet on center vertically and three feet on centers horizontally.
d. Provide end blocks where masonry abuts structural support to facilitate installation of compressible filler, fire-safing insulation, backer rod, and sealant.

3. Anchor single-wythe masonry veneer to backing with metal ties as follows:
a. Anchor veneer to structural members with metal anchors embedded in masonry joints and attached to structure. Provide anchors with flexible tie section, unless otherwise shown.
b. Anchor veneer to concrete back-up with dovetail anchors and to structural steel back-up with slotted anchors.
c. Anchor veneer to concrete and structural steel members using continuous wire ties embedded in mortar and snap-locked into seismic clips with triangular ties, fitted with flexible dovetails for anchorage to cast-in-place concrete, snap-locked to seismic clip and attached to structural supports in accordance with Section 04 0519, Masonry Anchorage and Reinforcing.
d. Space anchors as shown, but not more than two feet on centers vertically and three feet on centers horizontally.

M. Masonry Control and Expansion Joints:
1. Provide vertical expansion and control joints in masonry where shown. Build in related items as unit masonry construction progresses. Rake out mortar in preparation for application of calking and sealants, in accordance with Section 07 9200, Joint Sealants.
2. Provide masonry control and expansion joints items specified under Section 04 0519 and Masonry Anchorage and Reinforcing,
a. Build-in compressible fillers as specified. Install in accordance with manufacturer's written instructions.
b. Build-in factory-premolded control joint strips into masonry. Build-in sash block and premolded control joint strips as the Work progresses.
c. Provide end blocks where masonry partitions abut structure to facilitate installation of compressible filler, fire-safing insulation, backer rod, and sealant.
3. Concrete Unit Masonry Control Joint Spacing: Locate masonry control joints as recommended by NCMA TEK Manual for Concrete Masonry Design and Construction.
4. Masonry Control and Expansion Joint Spacing: Provide masonry control and expansion joints as shown.

N. Lintels and Bond Beams:
1. Provide steel lintels where shown and as specified in Section 05 5013, Miscellaneous Metal Fabrications.
2. Provide masonry lintels and bond beams where shown and where openings of 16-inches or greater are shown without structural steel lintels. Provide formed-in-place masonry lintels and bond beams. Temporarily support formed-in-place lintels and bond beams.
a. Unless otherwise shown or indicated, provide one horizontal No. 4 deformed reinforcing bar for each four inches of wall thickness.
b. For hollow masonry unit walls, use specially formed U-shaped lintel and bond beam units with reinforcing bars placed as shown, filled with grout as specified in Section 04 0511, Masonry Mortaring and Grouting.
3. Provide minimum bearing at each jamb, of four inches for openings less than six feet wide, and eight inches for wider openings.

4. On concrete and clay unit masonry walls where pattern bond remains visually exposed, increase minimum bearing of masonry lintels to maintain joint pattern of wall and install to be indistinguishable from surrounding masonry.

O. Flashing of Masonry Work:
   1. Provide concealed flashings in masonry Work as shown or indicated. Refer to Section 07 6200, Sheet Metal Flashing and Trim, for flashing requirements. Prepare masonry surfaces smooth and free from projections that might puncture flashing. Place through-wall flashing on bed of mortar and cover with mortar. Seal flashing penetrations with mastic before covering with mortar. Terminate flashing 1/2-inch from face of wall, unless otherwise shown or indicated.
      a. Extend flashings beyond edge of lintels and sills at least four inches and turn up edge on sides to form pan to direct moisture to exterior.
      b. Interlock end joints of deformed metal flashings by overlapping deformations not less than 1.5 inches and seal lap with elastic sealant.
      c. For metal through-wall flashing, weld joints watertight.
      d. Install flashings in accordance with manufacturer's instructions and approved Shop Drawings and other submittals.
      e. Provide flexible flashings in accordance with manufacturer's instructions and approved Shop Drawings and other submittals.
   2. Provide weep holes in head joints of first course of masonry immediately above concealed flashings. Spacing is specified elsewhere in this Section.
   3. Install reglets and nailers for flashing and other related Work where shown to be built into unit masonry construction.
   4. Install flexible masonry flashing into cast-in-place elastic masonry flashing reglets with lead wedges and fill reglet with elastic flashing manufacturers recommended bonding rubber-based adhesive cement.

3.5 REPAIR, POINTING, AND CLEANING

A. Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or defective, or if units do not match adjoining units as intended. Provide new units to match adjoining units and install in fresh mortar or grout, pointed to eliminate evidence of replacement.

B. Pointing: During tooling of joints, enlarge any voids or holes, except weep holes, and completely fill with mortar. Point up all joints at corners, openings, and adjacent Work to provide a neat, uniform appearance, properly prepared for application of sealant compounds.

C. Cleaning Exposed, Unglazed Masonry Surfaces:
   1. Wipe off excess mortar as the Work progresses. Dry-brush at end of each day's work.
   2. Final Cleaning: After mortar is thoroughly set and cured, clean sample wall area of approximately 20 square feet as described below. Obtain Engineer's acceptance of sample cleaning before proceeding to clean remainder of masonry Work.
      a. Dry clean to remove large particles of mortar using wood paddles and scrappers. Use chisel or wire brush if required.
      b. Presoak wall by saturating with water and flush off loose mortar and dirt.
      c. Scrub down wall with stiff fiber brush and solution of half-cup of sodium hexameta phosphate and half-cup of household detergent dissolved in one gallon of water.
      d. Rinse walls, using clean, pressurized water, to neutralize cleaning solution and remove loose material.
      e. Acid cleaning of masonry is unacceptable.

D. Protection:
1. Protect the unit masonry construction from deterioration, discoloration, and damage during subsequent construction operations. At areas where items are installed that project from the finish plane of masonry walls, such as concrete curbs, precast concrete sills, and the like, immediately upon completion of the projecting portion of the Work, provide a minimum 3/4-inch thick plywood cover, cut to fit, to prevent damage from operations continuing above the work. Refer to Section 06 1053, Miscellaneous Rough Carpentry.

3.6 FIELD QUALITY CONTROL

A. Tests and Inspections:
1. Pre-construction Testing:
a. Engage independent testing laboratory to obtain samples and conduct the following tests prior to the start of installation of unit masonry construction:
1) Mortar Test: For each mix required: ASTM C780.
2) Grout Test: For each mix required: ASTM C1019 and ACI 530.1.
3) Prism Test: For each type of construction required: ASTM C1314 and ACI 530.1.
4) Compressive strength of completed concrete unit masonry walls shall be at least 1,500 psi as determined by methods in ACI 530.1.
b. Obtain Engineer's acceptance of tests results prior to commencing installation of materials.
c. After initial test, Engineer will require performance of up to five additional tests Engineer's discretion.
2. During and After Installation:
a. Comply with Section 01 4533, Special Inspections.
3. Repair masonry walls that do not comply with requirements of the special inspections in a manner acceptable to Engineer.

END OF SECTION 04 0505

SECTION 04 0511

MASONRY MORTARING AND GROUTING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install masonry mortaring and grouting for unit masonry construction.
   2. This Section includes masonry mortaring and grouting for masonry products specified in:
      a. Section 04 2200, Concrete Unit Masonry.
   3. Types of materials required under this Section include:
      a. Portland cement-lime mortars.
      b. Fire-resistant mortars.
      c. Ready-mixed mortar
      d. Fine grout.
      e. Coarse grout.
      f. Grout fill around reinforcement in masonry lintels and bond beams.
      g. Epoxy pointing mortar.
      h. Mortar waterproofing admixtures, inorganic pigments, and other miscellaneous mortar components and additives.

B. Related Sections:
   1. Section 04 0505, Unit Masonry Construction.
   2. Section 04 2200, Concrete Unit Masonry.

1.2 REFERENCES

A. Referenced Standards: Standards referenced in this Section are:
   1. ANSI A108/A118/A136.1, Installation of Ceramic Tile.
   2. ANSI/UL 263, Fire Resistance Ratings.
      a. BXUV U904, Bearing Wall Rating – 3 HR.; Nonbearing Wall Rating – 3 HR.
      b. BXUV U905, Bearing Wall Rating – 2 HR.; Nonbearing Wall Rating – 2 HR.
      c. BXUV U906, Bearing Wall Rating – 2 HR.; Nonbearing Wall Rating – 2 HR.
      d. BXUV U907, Nonbearing Wall Rating – 3 or 4 HR.

      f. BXUV U912, Bearing Wall Rating – 3 HR.; Nonbearing Wall Rating – 3 HR.
      g. BXUV U913, Bearing Wall Rating – 2 HR.; Nonbearing Wall Rating – 2 HR.
      h. BXUV U914, Bearing Wall Rating – 3 HR.; Nonbearing Wall Rating – 3 HR.
   3. ASTM C5, Specification for Quicklime for Structural Purposes.
   4. ASTM C144, Specification for Aggregate for Masonry Mortar.
   5. ASTM C150/C150M, Specification for Portland Cement.
   6. ASTM C207, Specification for Hydrated Lime for Masonry Purposes.
   7. ASTM C270, Specification for Mortar for Unit Masonry.
   8. ASTM C387/C387M, Specification for Packaged, Dry, Combined Materials for Mortar and Concrete.
   9. ASTM C404, Specification for Aggregates for Masonry Grout.

10. ASTM C1019, Test Method for Sampling and Testing Grout.

1.3 QUALITY ASSURANCE

A. Component Supply and Compatibility:
   1. Do not change source or brands of mortar materials during the Project.

B. Regulatory Requirements:
   1. Where fire-resistance classification is shown or indicated for unit masonry construction (four-hour, three-hour, and similar designations), proportion mortar and masonry grouts to comply with requirements established by fire rating designations of ANSI/UL 263 indicated in this Section, Laws and Regulations, and requirements of authorities having jurisdiction.

C. Job Mockup: Refer to Section 04 0505, Unit Masonry Construction.

D. Pre-submittal Meeting:
   1. Before submitting Samples of colored mortar for approval, Contractor and Supplier shall meet at the Site with ENGINEER to review existing mortar to be matched and to preview proposed materials and colors.
   2. Refer to Section 04 0505, Unit Masonry Construction.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Schedule of locations where each mortar type will be used in the Work.
      b. Grout mix design and material certification.
   2. Product Data:
      a. Manufacturer's specifications and instructions for each manufactured material or product.
      b. Compression test results of grout mix, for identical mix previously prepared and tested, in accordance with ASTM C1019, at maximum aggregate allowed. If no previously-prepared mix is identical, perform tests on the job mix design in accordance with ASTM C1019 and submit to ENGINEER.
      c. Product data and specifications for integral waterproofing admixture.
   3. Samples:
      a. Each type of colored mortar, showing range of color expected in the Work.
      b. Standard and custom colors of epoxy pointing mortar for final selection by ENGINEER.
      c. Label samples to indicate type and quantity of colorant used.
      d. ENGINEER's review will be for color only. Compliance with other requirements is Contractor's responsibility.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Portland Cement: Provide the following for portland cement-lime mortars:
   1. ASTM C150/C150M:
      a. Use Type I when installation temperature is 50 degrees F or higher.

b. Use Type III, high-early strength, when installation temperature is lower than 50 degrees F.

2. Products and Manufacturers: Provide one of the following:
   a. Type I and Type III Portland Cement, by Essroc Italcementi Group.
   b. Type I and Type III Portland Cement, by Lehigh Portland Cement Company.
   c. White Portland Cement Type I and Type III, by Federal White Cement Ltd.
   d. White Portland Cement Type I and Type III, by Lehigh Portland Cement Company.
   e. Or equal.
3. Provide non-staining portland cement of natural color or of color required to be compatible with required mortar pigment color selected by ENGINEER.

B. Hydrated Lime: ASTM C207, Type S, or lime putty ASTM C5.

C. Sand Aggregates:
1. Mortar Aggregates: ASTM C144, except for joints less than 1/4-inch use aggregate graded with 100 percent passing the No. 16 sieve.
2. Colored Mortar Aggregates: Provide ground marble, granite or other sound stone, as required to match the Sample approved by ENGINEER for portland cement-lime mortars.
3. Fine Aggregate for Grout: ASTM C404, Size No. 1.
4. Coarse Aggregate for Grout: ASTM C404, Size No. 8 or Size No. 89.

D. Colored Mortar Pigments: Provide the following for portland cement-lime mortars:
1. Commercial iron oxide, manganese dioxide, ultramarine blue, chromium oxide, or carbon black, compounded for use in mortar mixes.
2. Products and Manufacturers: Provide one of the following:
   a. True-Tone Mortar Colors, by Davis Colors, a Subsidiary of Rockwood Pigments, Inc.
   b. SGS Concentrated Mortar Colors, by Solomon Colors.
   c. Or equal.
3. Do not exceed pigment to cement ratios, by weight, of one-to-35 for carbon black, and one-to-seven for other pigments.
4. Submit complete selection of manufacturer's standard and custom colors for final selection by ENGINEER.

E. Ready-mixed Mortar: Cementitious materials, water, and aggregate complying with requirements specified in Article 2.1 of this Section, combined with set-controlling admixtures to produce a ready-mixed mortar complying with ASTM C270 and ASTM C387/C387M.

F. Water: Free of injurious amounts of oils, acids, alkalis, and organic matter, and clean, fresh, and potable.

G. Water-repellent Admixture for Exterior Masonry Mortar:
1. Provide cross-linked acrylic polymer integral waterproofing system.
2. Products and Manufacturers: Provide one of the following:
   a. DRY-BLOCK Mortar Admixture, by Grace Construction Products Division, W. R. Grace & Company.
   b. Eucon Blocktite Mortar Admixture, by Euclid Chemical Company.
   c. Or equal.
3. Proportion: In accordance with manufacturer's instructions.

2.2 MORTAR MIXES

A. General:
   1. Material Performance:
      a. Masonry Strength: Refer to Section 04 0505, Unit Masonry Construction.
      b. If questions of compliance with the Contract Documents arise, Specifications for mortar properties shall take precedence over Specification for mortar proportions.
   2. Do not change proportions established for mortar approved, and do not use materials with different physical characteristics in mortar used in the Work, unless compliance with the Contract Documents for mortar properties is re-established via submittals approved by ENGINEER.
   3. Do not combine in mortar different air-entraining materials.
   4. Anti-freeze Admixture or Agents: Not allowed.
   5. Calcium Chloride: Not allowed.

B. Fire-Resistant Mortar:
   1. Reference Standard: ANSI/UL BXUV U901 through BXUV U914.
   2. Proportion: Use one part portland cement, three parts clean sand, and 15 percent hydrated lime (by cement volume).

C. Mortar for All Unit Masonry: Comply with ASTM C270, Table 2, except limit materials to those specified in this Section. Limit cement-to-lime ratio by volume as follows:
   1. Type S:
      a. Provide the following proportions by volume:
         1) Portland Cement: One part.
         2) Hydrated Lime or Lime Putty: Over 1/4 to 1/2, maximum.
         3) Aggregate Ratio (measured in damp loose condition): Not less than 2-1/4 and not more than three times sum of volumes of cementitious materials.
      b. Properties:
         1) Average Compressive Strength, ASTM C270: 1,800 psi.
         2) Minimum Water Retention, ASTM C270: 75 percent.
   2. Maximum Air Content, ASTM C270: 12 percent.

D. Grout:
   1. Fine Grout:
      a. Provide the following proportions by volume:
         1) Portland Cement: One part.
         2) Hydrated Lime or Lime Putty: Zero to 1/10 part.
         3) Aggregate Ratio (measured in a damp loose condition): Sand; not less than 2-1/4 and not more than three times sum of volumes of cementitious materials.
      b. Mix grout to have slump of ten inches plus or minus one inch at time of placement.
   2. Coarse Grout:
      a. Provide the following proportions by volume:
         1) Portland Cement: One part.
         2) Hydrated Lime or Lime Putty: Zero to 1/10 part.
         3) Fine Aggregate Ratio (measured in a damp loose condition): Sand; not less than 2-1/4 and not more than three times sum of volumes of cementitious materials.
         4) Coarse Aggregate Ratio: Not less than one and not more than two times the sum of volumes of cementitious materials.
      b. Mix grout to have slump of ten inches plus or minus one inch at time of placement.

E. Grout Fill Around Reinforcement in Masonry Lintels: Portland cement, sand, gravel and water, to be proportioned as required to provide 28-day minimum compressive strength of 2,000 psi.

F. Colored Pigmented Cement Mortar: For portland cement-lime mortars proportion pigments with other ingredients as follows:
   1. Mix to match Sample approved by ENGINEER.

G. Colored Aggregate Mortar: For portland cement-lime mortars proportion colored aggregate with other ingredients to match Sample approved by ENGINEER.
   1. Proportion colored aggregate with other ingredients as follows:
   2. Mix to match Sample approved by ENGINEER.

H. Water-repellent Admixture: Add to mix in accordance with manufacturer's written instructions.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine conditions under which the Work will be performed and notify ENGINEER in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 PREPARATION

A. Measurement of Materials:
   1. Cement and Hydrated Lime: Batched by the bag.
   2. Sand: Batched by volume in suitably calibrated containers. Make allowance for bulking and consolidation, and for weight per cubic foot of contained moisture.
   3. Proportion of Volumetric Mixtures: One 94-pound sack of portland cement and one 50-pound sack of hydrated lime constitute nominal one cubic foot.
   4. Shovel measurement: Unacceptable.

B. Mortar Mixing:
   1. Type of Mixer: Machine mix in appropriate mixer in which quantity of water is accurately and uniformly controlled.
   2. While mixer is operating, add approximately three-quarters of required water, half the sand, all the cement, and then add remainder of sand.
   3. Allow batch to mix briefly and then add balance of water in small quantities until satisfactory workability is obtained.
   4. Mix for not less than five minutes after all materials have been added.
   5. Hydrated Lime for Mortar Requiring Lime Content: Use dry-mix method. Turn materials over together for each batch until even color of mixed, dry materials indicates that cementitious material has been thoroughly distributed throughout the mass, and then add water to obtain required plasticity.
   6. Prepare lime putty, if approved for use, in accordance with ASTM C5.
   7. Waterproofing Admixture: Add to mortar mix for all exterior masonry in accordance with manufacturer's instructions.
   8. Mixer drum shall be completely emptied before recharging the next batch.
   9. Limit batch size to avoid re-tempering. Re-tempering of mortar is not allowed.

3.3 INSTALLATION AND MORTAR AND GROUT TYPE LOCATION

A. For mortar and grout type, location, and installation requirements, refer to:
   1. Section 04 0505, Unit Masonry Construction.

3.4 FIELD QUALITY CONTROL

A. Site Tests:
   1. Refer to Section 04 0505, Unit Masonry Construction, for load-bearing masonry wall strength tests.

END OF SECTION 04 0511

SECTION 04 0519

MASONRY ANCHORAGE AND REINFORCING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install masonry anchorages and reinforcing.
   2. Section specifies masonry anchorages and reinforcing for Work specified in:
      a. Section 04 0505, Unit Masonry Construction.
   3. Types of products required include:
      a. Continuous horizontal wire reinforcing and ties.
      b. Individual wire ties.
      c. Anchoring and positioning devices.
      d. Miscellaneous masonry accessories, reinforcing bars, compressible filler, and premolded control joint strips.

B. Coordination:
   1. Provide masonry anchorages and reinforcing of sizes, dimensions and configurations coordinated with unit masonry construction system component sizes, dimensions and configurations.
   2. Where continuous horizontal cavity wall reinforcement is required for restraining cavity wall insulation, coordinate dimensions with specified thickness of cavity wall insulation for proper clearances. Refer to Section 07 2105, Building Insulation.

C. Related Sections:
   1. Section 05 1200, Structural Steel Framing.
   2. Section 07 2105, Building Insulation.
   3. Section 07 6200, Sheet Metal Flashing and Trim.
   4. Section 07 9200, Joint Sealants.
   5. Section 09 9100, Painting.

1.2 REFERENCES

A. Reference Standards: Standards referenced in this Section are:
   1. ACI 315, Details and Detailing of Concrete Reinforcement.
   2. ASTM A36/A36M, Specification for Carbon Structural Steel.
   3. ASTM A82/A82M, Specification for Steel Wire, Plain, for Concrete Reinforcement.
   4. ASTM A153/A153M, Specification for Zinc Coating (Hot Dip) on Iron and Steel Hardware.
   5. ASTM A167, Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.
   6. ASTM A240/A240M, Specification for Heat-Resisting Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
   7. ASTM A580/A580M, Specification for Stainless Steel Wire.
   8. ASTM A615/A615M, Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.

9. ASTM A663/A663M, Specification for Steel Bars, Carbon, Merchant Quality, Mechanical Properties.
10. ASTM A1008/A1008M, Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable.
11. ASTM A1011/A1011M, Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
12. ASTM D2240, Test Method for Rubber Property – Durometer Hardness.
13. ASTM D2287, Specification for Nonrigid Vinyl Chloride Polymer and Copolymer Molding and Extrusion Compounds
14. UL U904, Bearing Wall Rating – 3 HR.; Nonbearing Wall Rating – 3 HR (ANSI/UL 263).
15. UL U905, Bearing Wall Rating – 2 HR.; Nonbearing Wall Rating – 2 HR (ANSI/UL 263).
16. UL U906, Bearing Wall Rating – 2 HR.; Nonbearing Wall Rating – 2 HR (ANSI/UL 263).
17. UL U907, Nonbearing Wall Rating – 3 or 4 HR (ANSI/UL 263).
18. UL U909, Nonbearing Wall Rating – 3 or 4 HR (ANSI/UL 263).
19. UL U912, Bearing Wall Rating – 3 HR.; Nonbearing Wall Rating – 3 HR (ANSI/UL 263).
20. UL U913, Bearing Wall Rating – 2 HR.; Nonbearing Wall Rating – 2 HR (ANSI/UL 263).
21. UL U914, Bearing Wall Rating – 3 HR.; Nonbearing Wall Rating – 3 HR (ANSI/UL 263).

1.3 QUALITY ASSURANCE

A. Component Supply and Compatibility:
   1. Provide all metal sheet, wire, plate and bar stock masonry anchorages and reinforcing from same manufacturer.
   2. Miscellaneous masonry accessory items other than metal sheet, wire, plate and bar stock shall each be obtained from a single, manufacturer, which may be different from the manufacturer of other products specified in this Section.

B. Regulatory Requirements:
   1. Where fire-resistance classification (four-hour, three-hour, and similar designations) is shown or indicated for unit masonry construction, provide masonry anchorages and reinforcing complying with requirements established by UL tests referenced in this Section (UL U901 through UL U914, as applicable), Laws and Regulations, and requirements of authorities having jurisdiction.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Submit drawings and material schedules showing all dimensions and sizes of masonry anchorages and reinforcing coordinated with unit masonry Work and other Work in which masonry anchorages and reinforcing will be embedded, be supported from, or restrained.
      b. Submit schedule indicating type, location, and spacing of each masonry accessory in unit masonry construction and that type, location, and spacing are in compliance with code requirements.
   2. Product Data:
      a. Manufacturer's product literature and specifications for each masonry accessory required. Include data substantiating that materials comply with the Contract Documents.

3. Samples:
    a. One unit or one modular length of each item specified.

B. Informational Submittals: Submit the following:
1. Manufacturer's Instructions:
    a. Manufacturer’s instructions for handling, storing, and installing for each masonry accessory required.

1.5 DELIVERY, STORAGE AND HANDLING

A. Comply with:
1. Applicable requirements of standards referenced in this Section.
2. Section 01 6500, Product Delivery Requirements
3. Section 01 6600, Product Storage and Handling Requirements.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Continuous Horizontal Wire Reinforcing and Ties: Provide the following for all masonry walls unless otherwise shown or indicated:
1. General: Provide the following:
    a. Reinforcement, wire and ties of cold-drawn steel wire complying with ASTM A1064 and hot-dipped galvanized after fabrication with 1.5 ounces per square foot of zinc coating complying with ASTM A153.
    b. Welded wire units, prefabricated in straight lengths, at least ten feet long, with matching corner “L” and intersection “T” units, all with deformed continuous nine-gage side rods and plain nine-gage truss-type diagonal cross-rods, butt-welded to side rods, not more than 16 inches on centers, with unit width of 1.5 to two inches less than thickness of wall or partition.
    c. Rectangular boxes, pintles and ties fabricated of 3/16-inch diameter wire, unless otherwise specified.
2. Single-wythe and Multi-wythe Masonry Walls (except cavity wall):
    a. Wall reinforcement system with one horizontal rod beneath each unit masonry face shell wall.
    b. Products and Manufacturers: Provide products of one of the following:
        1) Truss Mesh Reinforcement with #120 Truss-Mesh, by Hohmann & Barnard, Inc.
        2) Series 300 Truss Mesh, by Wire-Bond.
        3) Or equal.
3. Multi-wythe Masonry Cavity Walls:
    a. Tab-type wall reinforcing and support system with single pair of side rods in interior wythe, four-inch wide boxes with restraint bar welded across box and adjustable rectangular pintle ties spaced not more than 16 inches on centers. Space side rods for embedment in each face shell wall of back-up wythe and extend box to allow engagement of rectangular pintle box tie for proper embedment in facing wythe.
    b. Products and Manufacturers: Provide one of the following:
        1) #165 Truss, by Hohmann & Barnard, Inc.
        2) Series 700 Truss Adjustable Tab, by Wire-Bond.
        3) Or equal.

4. Provide special, custom-fabricated shapes to accommodate curved cavity, multi-wythe and single-wythe wall construction.

B. Individual Wire Ties for Masonry: Provide the following where shown:
   1. General: Provide the following:
      a. Reinforcing, wire, and ties of Cold-drawn steel wire complying with ASTM A82, and hot-dipped galvanized after fabrication with 1.5 ounces per square foot of zinc coating complying with ASTM A153
      b. Crimped with vee-drip for use in cavity wall construction and of length required for proper embedment in outer-most face shell walls of wythes of masonry shown or indicated.
      c. Rectangular box ties and adjustable box ties fabricated of 3/16-inch diameter wire.
   2. Single-piece Ties (where facing and back-up joints align):
      a. For use with hollow masonry units laid with cells vertical and with solid masonry units or hollow units laid with cells horizontal, provide four-inch wide rectangular shaped box-ties.
      b. Products and Manufacturers: Provide one of the following:
         1) Rectangular Box Ties, by Hohmann & Barnard, Inc.
         2) No. 253 Rectangular Wire Ties, by Heckmann Building Products.
         3) Or equal.
   3. Adjustable Two-piece Ties (where facing and back-up joints do not align):
      a. For use with hollow masonry units laid with cells vertical, and with solid masonry units or hollow units laid with cells horizontal, provide four-inch wide adjustable rectangular shaped pintle and eye box-ties.
      b. Products and Manufacturers: Provide one of the following:
         1) Rectangular Adjustable Wall Ties, by Hohmann & Barnard, Inc.
         2) No. 265 Adjustable Box Anchor, by Heckmann Building Products.
         3) Or equal.

C. Anchoring Devices for Masonry: Provide the following, unless otherwise shown or indicated:
   1. General: Provide the following:
      a. Cold-rolled steel sheet complying with ASTM A1008; hot-rolled steel sheet and strip complying with ASTM A1011; plates and bars complying with ASTM A36; and cold-drawn steel wire complying with ASTM A82 all hot-dipped galvanized after fabrication with 1.5 ounces per square foot of zinc coating complying with ASTM A153
      b. Rectangular, corrugated, one-inch wide ties, fabricated of 12-gage sheet metal, unless otherwise specified.
      c. Size tie lengths to extend to within one-inch of outside face of outer wythe face shell of opposite face of masonry or to a maximum depth of 12 inches and between 1.5 to two inches less than width of masonry abutting webs and to maximum depth of 12 inches abutting flanges of structural supports. Provide wire crimped with a vee-drip for use in cavity wall construction.
      d. Flexible Anchors: Where masonry abuts structural walls or framework, provide flexible anchors that allow horizontal and vertical movement of masonry, but provides lateral restraint.
   2. Anchorage to Steel Columns and Steel Beam Webs: Provide the following for lateral restraint of unit masonry walls at structural steel framework:
      a. U-shaped, 7.5-inch long channels welded to steel structure, with 5.5 inches of vertical adjustment, fabricated from 11-gage steel with slotted ties.

b. Weld-on, 12-gage, 3/4-inch wide seven-inch long anchor straps providing four inches of vertical adjustment, welded to steel structure.
c. Products and Manufacturers: Provide one of the following:
1) #360 - Gripstay Channels and #364 - Corrugated Gripstay Anchor, by Hohmann & Barnard, Inc.
2) No. 130 Channel Anchor Slots and No. 134 Corrugated Anchor, by Heckmann Building Products.
3) Or equal.
d. Triangular-shaped ties fabricated of 3/16-inch diameter wire with parallel overlapping ends.
e. Rigid, polyvinylchloride or 22-gage steel seismic restraint clips, one for each triangular-shaped tie, 3/16-inches high with four horizontal snap-tight connection grooves, one accommodating nine-gage wire and three accommodating 3/16-inch diameter wire.
f. Continuous, nine-gage wire snap-locked into seismic restraint clips for embedment in outer veneer wythe of masonry.

3. Anchorage to Bottom of Concrete Beams and Slabs and Bottom of Steel Beam Flanges: Provide the following for lateral restraint of unit masonry walls at bottom of beam flanges and concrete slabs:
a. Products and Manufacturers: Provide one of the following:
1) #PTA - 420 - Partition Top Anchors with PTA Tube, by Hohmann & Barnard, Inc.
2) #419 Pin Type with #421 Plastic Tube, by Heckmann Building Products.
3) Or equal.
b. Factory-fabricated partition anchor assembly consisting of 1/4-inch thick plate welded to 3/8-inch diameter, eight-inch long rod at center of plate face. Provide plate with two holes to accept fasteners.
c. Clear acrylic tube with compressible polyethylene filler, one for each rod.

4. Lateral Supporting Masonry Wall Anchors: Provide the following for bracing freestanding walls exceeding allowable unbraced span:
a. Products and Manufacturers: Provide one of the following:
1) #344 Rigid Partition Anchor, by Hohmann & Barnard, Inc.
2) #140 Masonry Anchor, by Heckmann Building Products.
3) Or equal.
b. Plate, 1/4-inch thick by two inches wide fabricated with two-inch long bent legs at 90 degrees to flat face of anchor and of length to extend to center of each wythe of wall, but not less than 2.33 feet long. Cut to length as required.

5. Rebar Positioners: Provide the following:
a. Products and Manufacturers: Provide one of the following:
1) #RB Series and #RB-Twin Series Rebar Positioners, by Hohmann & Barnard, Inc.
2) Rebar Positioners, by Heckmann Building Products.
3) Or equal.
b. Nine-gage reinforcing bar positioners that accommodate both horizontal and vertical reinforcing steel.
c. Fabricate units as required for the Work.

D. Miscellaneous Masonry Accessories: Provide the following where shown:
1. Reinforcing Bars:
a. Deformed carbon steel, ASTM A615, Grade 60 for bars No. 3 to No. 18, except as otherwise shown.

b. Plain carbon steel, ASTM A663, Grade 80 where No. 2 bars are shown or required.
c. Provide galvanized steel reinforcing bars complying with ASTM A153, Class B-1, where shown.

2. Compressible Filler: Provide watertight joint filler where unit masonry construction abuts structural framework members, or as shown. Provide the following:
   a. Products and Manufacturers: Provide one of the following:
      1) Polytite Standard, by Polytite Manufacturing Corp.
      2) Polyseal, by Sandell Manufacturing Company, Inc.
      3) Or equal.
   b. Polyurethane foam strip saturated with polybutylene waterproofing material that, when installed at a compression ratio of two-to-one, is impermeable to water.
   c. Resilient to -40 degrees F with 100 percent movement recovery.
   d. Elongation of 140 percent with a tensile strength of not less than 53 pounds per square inch.
3. Masonry Control Joint Components: Provide the following:
   a. Premolded Control Joint Strips: Provide complete selection of solid extruded rubber and PVC strips with a Shore A durometer hardness of 80 to 90 complying with ASTM D2240 and ASTM D2287, designed to fit standard sash block and maintain lateral stability in masonry wall. Size and configuration shall be as shown.
      1) Products and Manufacturers: Provide one of the following:
         a) #RS12 - Control Joints, by Hohmann & Barnard, Inc.
         b) #2902 and #2903 Rubber Control Joints, by Wire-Bond.Or equal.
   b. Sealants: Refer to Section 07 9200, Joint Sealants.
4. Weep Holes: Provide the following:
   a. Products and Manufacturers: Provide one the following:
      1) #342 - Plastic Weep Holes, by Hohmann & Barnard, Inc.
      2) No. 330 Plastic Weepholes, by Heckmann Building Products
      3) Or equal.
   b. Rectangular 3/8-inch wide by 1.5 inches high, 3.5 inches long clear butyrate tubes.
5. Cavity Fill Mesh: Provide the following:
   a. Products and Manufacturers: Provide one of the following:
      1) #MGS - Mortar/Grout Screen, by Hohmann & Barnard, Inc.
      2) No. 267 Plastic Mesh Wall Ties, by Heckmann Building Products.
      3) Or equal.
   b. Monofilament screen of polypropylene polymers 1/4-inch mesh hardware cloth. Provide below all block courses that are to be filled with mortar.
6. Cavity Drainage Material:
   a. Manufactured of high density polyethelene or nylon strands woven into a 90 percent open mesh
      1) Product and Manufacturer: Provide one of the following:
         a) Mortar Net, by Hohmann and Barnard, Inc.
         b) Mortar Net, by Heckmann Building Products.
         c) Or equal.

2.2 FABRICATION

A. Weld-in-place all channel slots and other specified weld-on anchors at the shop. Field welding is unacceptable.

B. Coordinate location of weld-on anchors and show on structural steel Shop Drawings required under Section 05 1200, Structural Steel Framing.

C. Weld anchor slots and other required accessories in place before shop priming of structural steel.

D. Prime coat weld-on anchors and other accessories and passivate anchor coating in accordance with Section 09 9100, Painting.

E. Shop-fabricate reinforcing bars that are shown or required to be bent or hooked. Comply with ACI 315 for fabricating reinforcing steel for unit masonry Work.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Refer to the following:
   1. Section 04 0505, Unit Masonry Construction.

END OF SECTION 04 0519

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 04 2200

CONCRETE UNIT MASONRY

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install concrete unit masonry.
   2. Extent of each type of concrete unit masonry is shown and indicated.
   3. Types of materials and features required include:
      a. Hollow load-bearing units.
      b. Hollow non-load-bearing units.
      c. Solid load-bearing units.
      d. Split-face load-bearing units.
      e. Unit masonry complying with Section 01 4533, Code-Required Special Inspections.
      f. Integral waterproofing admixtures, lightweight aggregates, high recycle content, special and custom shapes required to complete the Work, complete selection of manufacturer's standard and custom colors and other special, and custom features.

B. Related Sections:
   1. Section 04 0505, Unit Masonry Construction.
   2. Section 07 2105, Building Insulation.
   3. Section 09 9100, Painting.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASTM C33, Specification for Concrete Aggregates.
   2. ASTM C90, Specification for Load bearing Concrete Masonry Units.
   3. ASTM C129, Specification for Non-load-bearing Concrete Masonry Units.
   4. ASTM C140, Test Methods for Sampling and Testing Concrete Masonry Units.
   5. ASTM C331, Specification for Lightweight Aggregates for Concrete Masonry Units.
   6. ASTM C426, Test Method for Drying Shrinkage of Concrete Masonry Units.
   7. ASTM C744, Specification for Prefaced Concrete and Calcium Silicate Masonry Units.
   8. ASTM C1093, Practice for Accreditation of Testing Agencies for Unit Masonry.
   9. ASTM C1262, Test Method for Evaluating the Freeze-Thaw Durability of Manufactured Concrete Masonry Units and Related Concrete Units.
   10. ASTM E84, Test Method for Surface Burning Characteristics of Building Materials.
   11. ASTM E119, Test Methods for Fire Tests of Building Construction and Materials.
   12. UL U 904, Bearing Wall Rating – 3 HR.; Nonbearing Wall Rating – 3 HR.
   13. UL U 905, Bearing Wall Rating – 2 HR.; Nonbearing Wall Rating – 2 HR.
   14. UL U 906, Bearing Wall Rating – 2 HR.; Nonbearing Wall Rating – 2 HR.
   15. UL U 907, Nonbearing Wall Rating – 3 or 4 HR.
   16. UL U 909, Nonbearing Wall Rating – 3 or 4 HR.
   17. UL U 912, Bearing Wall Rating – 3 HR.; Nonbearing Wall Rating – 3 HR.
   18. UL U 913, Bearing Wall Rating – 2 HR.; Nonbearing Wall Rating – 2 HR.
   19. UL U 914, Bearing Wall Rating – 3 HR.; Nonbearing Wall Rating – 3 HR.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Testing Laboratory: In accordance with ASTM C1093.

B. Component Supply and Compatibility:
   1. Obtain each type of concrete masonry units from one manufacturer, cured by one process and of uniform texture and color or an established uniform blend texture and color.

C. Regulatory Requirements:
   1. Where fire-resistance classification is shown (four-hour, three-hour, and similar designations) for concrete unit masonry construction, provide materials complying with requirements established by UL tests referenced in this Section (UL U901 through UL U914), Laws and Regulations including applicable building codes, and requirements of authorities having jurisdiction.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Complete layout of masonry walls showing modular planning, colors, patterns and all special shapes to be provided. Show details for each condition encountered in the Work. Provide plans and elevation at scale of 1/4-inch equals one foot, and details at scale of 1.5-inch equals one foot.
   2. Product Data:
      a. Manufacturer's specifications, manufacturing procedures, and test data for each material specified. Include instructions for handling, storage, installation, and protection of each type of concrete masonry unit.
      b. Laboratory test reports in accordance with ASTM C140.
   3. Samples:
      a. Submit Sample of each type of concrete masonry unit required. Select each type of concrete masonry unit to show range of color and texture that will be provided in finished Work.
      b. Complete selection of manufacturer's standard and custom colors.
      c. Engineer's review will be for color and texture only. Compliance with other requirements is responsibility of Contractor.

B. Informational Submittals: Submit the following:
   1. Source Quality Control Submittals:
      a. Submit test results as specified in this Section.
   2. Qualifications Statements:
      a. Testing laboratory, if not explicitly included in submittals furnished under other Sections.

1.5 DELIVERY, STORAGE AND HANDLING

A. At time of unloading at Site, concrete masonry units shall comply with ASTM C90, Table 2.

1.6 PROJECT CONDITIONS

A. Environmental Requirements: Maintain temperature in area of storage and installation so that masonry products are above 20 degrees F when installed.

PART 2 - PRODUCTS

2.1 GENERAL, CONCRETE UNIT MASONRY

A. General:
1. Unless specifically modified by other requirements of the Contract Documents, provide concrete unit masonry in compliance with classifications, weights, grades, colors, textures, scores, thermal resistance values, and other features specified in this Section.
2. Cure units by autoclave treatment at minimum temperature of 350 degrees F, and minimum pressure of 125 pounds per square inch.

B. Hollow and Solid Load-bearing Concrete Masonry Units: ASTM C90, with minimum of 15 percent coal fly ash and 50 percent recycle aggregate as part of concrete mix.
1. Minimum compressive strength: 1,900-psi average of three units.

C. Hollow Non-load-bearing Concrete Masonry Units: ASTM C129, with minimum of 15 percent coal fly ash and 50 percent recycle aggregate as part of concrete mix.

D. Size: Manufacturer's standard units with nominal face dimensions of 16 inches long by eight inches high (15-5/8 inches by 7-5/8 inches actual).

E. Moisture Control:
1. Limit total moisture absorption until time of installation to maximum percentage specified for the weight classification in ASTM C90, Table 2.
2. Total linear dry shrinkage at time of installation shall be less than 0.065 percent.

F. Special Shapes: Provide the following:
1. Lintels, bond beams, reinforcing units, and flush-end reinforcing units, interior and exterior corner shapes, solid jambs, sash block, coves, pre-molded control joint blocks, headers, and other special conditions.
2. Bullnose units for outside vertical corners including doors, windows, louvers and other openings, unless specifically shown on the Drawings indicating that such feature is not required.
3. End blocks at locations where masonry walls abut concrete, or steel columns, to facilitate installation of compressible filler, backer rod, and sealant or fire-rated fire stop sealant systems, if required.

G. Waterproofing Admixture: Manufacture all types of concrete unit masonry used for constructing exterior walls (including interior Wythe of cavity walls) with integral waterproofing admixture as follows:
1. Products and Manufacturers: Provide one of the following:
   a. DRY-BLOCK System, by Grace Construction Products Division, W. R. Grace & Company.
   b. Eucon Blocktite Integral Water-Repellent Masonry Admixture, by Euclid Chemical Company.
   c. Or equal.
2. Material: Cross-linking acrylic polymer.
3. Proportion: In accordance with manufacturer's instructions.

H. Weight: Provide the following:
   1. Provide lightweight concrete masonry units using aggregate complying with ASTM C331 producing dry net weight of not more than 105 pounds per cubic foot.
   2. Provide normal weight split-face concrete masonry units using concrete aggregates complying with ASTM C33 producing dry net weight of not less than 125 pounds per cubic foot.

I. Exposed Faces: Provide manufacturer's standard colors and textures as specified for type of concrete masonry unit.

J. Provide two-core concrete masonry units.

2.2 SPLIT-FACE CONCRETE MASONRY UNITS

A. In addition to requirements applicable to all concrete masonry units, split-face concrete masonry units shall comply with requirements of this Article.

B. Products and Manufacturers: Provide one of the following:
   1. Split-Faced Concrete Unit Masonry, by Oberfield's Inc.
   2. Split-Faced Concrete Unit Masonry, by by Wellnitz.
   3. Or equal.

C. Hollow Load-bearing Split-Face Concrete Masonry Units: Provide the following:
   1. ASTM C90 compliant.
   2. ASTM C426, Dry Shrinkage: 0.025 percent maximum average for five specimens.

D. Color and Texture: Provide the following:
   1. Manufacturer's complete selection of standard colors for selection by Engineer.
   2. Engineer will select maximum of 2 colors and textures for the Work.
   3. Custom Colors: Match Sample approved by Engineer.
   4. Color, surface texture, and aggregate uniform within normal range established by Sample approved by Engineer.

E. Where shown or indicated, provide custom split-face concrete masonry units matching existing in color, texture, and size.

2.3 SOURCE QUALITY CONTROL

A. Tests:
   1. Provide test data verifying total linear drying shrinkage based on tests of concrete masonry units made with same materials, concrete mix proportions, manufacturing process, and curing method, conducted in accordance with ASTM C426. Tests shall have been conducted within 24 months prior to delivery to Site.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Refer to Section 04 0505, Unit Masonry Construction.

END OF SECTION 04 2200

SECTION 04 2300

GLASS MASONRY UNITS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install glass masonry unit Work.
   2. Extent of glass masonry units is shown.

B. Related Sections:
   1. Section 04 0511, Masonry Mortaring and Grouting.
   2. Section 07 9200, Joint Sealants.

1.2 REFERENCES

A. Reference Standards: Standards referenced in this Section are:
   1. ASTM C1093, Practice for Accreditation of Testing Agencies for Unit Masonry.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Testing Laboratory: Per ASTM C1093.

B. Component Supply and Compatibility: Obtain each type of glass masonry unit from one manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following
   1. Samples:
      a. One unit of each type of glass masonry unit specified and 6-inch lengths of reinforcing, packing, anchors, and expansion material to be used in the Work.
      b. Engineer's review will be for color and texture only. Compliance with other requirements is responsibility of Contractor.
   2. Shop Drawings:
      a. Complete layout of all glass masonry Work showing modular planning and all shapes used in the Work. Show all details for each condition encountered in the Work. Provide plans and elevations drawn at 1/4-inch scale and details drawn at 1-1/2-inch scale. Show all items required to be built into or that penetrate glass masonry Work.
   3. Product Data:
      a. Copies of manufacturer's product data, specifications, and test data for glass masonry.

B. Informational Submittals:
   1. Certificates: Submit the following:

a. Certification that glass masonry complies with specified requirements.

2. Source Quality Control Submittals:
   a. Laboratory test reports.
3. Supplier Instructions:
   a. Manufacturer's instructions for handling, storing, installing, and protecting glass masonry.
4. Qualifications Data: Submit for approval the following:
   a. Testing Laboratory.

1.5 DELIVERY, STORAGE AND HANDLING

A. Comply with applicable requirements of referenced standards, Section 01 6500, Product Delivery Requirements, and Section 01 66 00, Product Storage and Handling Requirements.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Styles: Provide the following:
   1. Eight-inch by 8-inch by 4-inch modular units with wavy undulations and subtle distortions allowing maximum light transmission.

B. Size: Provide the following:
   1. Manufacturer's standard units, and thicker-faced and fire-rated versions of standard units with nominal face dimensions of eight inches long by eight inches high by four inches thick (7-3/4-inch by 7-3/4-inch by 3-7/8-inches actual).

C. Provide the following physical properties:
   1. U-value: 0.38
   2. Weight (installed with mortar):
      a. Eight-inch by 8-inch Units: Ten pounds per square foot.
   3. Heat Transmission: 0.51 Btu per hour per square foot per degree F.

D. Expansion Strips: White polyethylene, 3/8-inch thick, manufactured by glass masonry unit manufacturer.

E. Asphalt Emulsion: Water-based asphalt emulsion recommended by glass masonry unit manufacturer.

F. Panel Reinforcing: Panel reinforcing shall be hot-dipped galvanized steel double-wire mesh formed of two parallel nine-gage wires spaced at two inches on center with electrically welded cross ties at regular intervals, manufactured by glass masonry unit manufacturer.

G. Panel Anchors: Panel anchors shall be 20-gage perforated steel strips 24 inches long by 1.75 inches wide, galvanized after fabrication, manufactured by glass masonry unit manufacturer.

H. Mortar: Type S, white, portland-cement lime mortar, with an integral acrylic polymer waterproofing, as specified in Section 04 05 11, Masonry Mortaring and Grouting.

I. Sealant and Backer Rod: As specified in Section 07 92 00, Joint Sealants.

J. Products and Manufacturers: Provide products of one of the following:
   1. Premiere Standard Series Decora Glass Block and Thickset Vue and Decora Pattern Block with Decora Hedron Corner Units by Pittsburgh Corning Corp.
   2. Or equal.

2.2 SOURCE QUALITY CONTROL

A. Allowable Tolerances: Provide glass masonry units with all edges and face dimensions made to plus or minus 1/16-inch tolerance.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which glass masonry unit Work will be installed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 INSTALLATION

A. Installation:
   1. Coat sill areas to be covered by mortar with a heavy coat of asphalt emulsion. Allow emulsion to dry before placing mortar.
   2. Place expansion strips at jambs and head as recommended by glass masonry unit manufacturer. Expansion strips shall extend to sill.
   3. Provide full mortar bed joint on sill.
   4. Set lower course of glass masonry units. Mortar joints shall be full and not furrowed. Do not use steel tools to tap glass masonry units into position.
   5. Install panel reinforcing in horizontal joints 16 inches on centers maximum. Install horizontal joint reinforcing in joints immediately above and below openings within or discontinuities in glass masonry units even if this results in spacing less than 16 inches. Reinforcing shall run continuously from end to end of glass masonry unit panels and be lapped at least six inches when using more than one length is necessary.
   6. Install horizontal joint reinforcing after placing lower half of mortar in bed joint. Press panel reinforcing into place. Cover panel reinforcing with upper half of mortar bed and trowel smooth. Do not furrow mortar bed.
   7. Place full mortar bed for joints not requiring panel reinforcing. Do not furrow.
   8. Strike joints smooth while mortar is still plastic and before final set. At this time rake out all spaces requiring sealant to a depth equal to width of spaces.
   9. Remove surplus mortar from faces of glass masonry units and wipe dry. Tool joints smooth and concave before mortar takes final set.
   10. After final mortar set, install packing tightly between glass masonry unit panel jamb and head construction. Leave space for sealant.
   11. Apply sealant evenly to full depth of recesses and per sealant manufacturer’s written instructions. Refer to Section 07 9200, Joint Sealants.

3.3 PROTECTION AND CLEANING

A. Perform final cleaning of glass masonry units using techniques recommended by manufacturer of glass masonry units.

END OF SECTION 04 2300

SECTION 05 0533

ANCHOR SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all professional services, labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install anchor systems.
   2. This Section includes all anchor systems required for the Work, but not specified under other Sections.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before anchor systems Work.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ACI 318, Building Code Requirements for Structural Concrete.
   2. ACI 350, Code Requirements for Environmental Engineering Concrete Structures.
   3. ACI 355.2, Qualification of Post-Installed Mechanical Anchors in Concrete.

   7. ASTM A276, Specification for Stainless Steel Bars and Shapes.
   8. ASTM A493, Specification for Stainless Steel Wire and Wire Rods for Cold Heading and Cold Forging.
   9. ASTM A563, Specification for Carbon and Alloy Steel Nuts.
   10. ASTM A1011/A1011M, Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
   11. ASTM B633, Specification for Electrodeposited Coatings of Zinc on Iron and Steel.
   12. ASTM C307, Test Method for Tensile Strength of Chemical-Resistant Mortar, Grouts, and Monolithic Surfacings.
   13. ASTM C881/C881M, Specification for Epoxy-Resin-Base Bonding Systems for Concrete.
   14. ASTM E329, Specification for Agencies Engaged in Construction Inspection, Testing, or Special Inspection.
   15. ASTM E488, Test Methods for Strength of Anchors in Concrete and Masonry Elements.
   16. ASTM F593, Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
   17. ASTM F594, Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
   18. ASTM F1554, Specification for Anchor Bolts, Steel, 36, 55 and 105-ksi Yield Strength.
   19. FS A-A-1922A, Shield, Expansion (Caulking Anchors, Single Lead).
   20. FS A-A-1923A, Concrete Expansion Anchors.
   21. FS A-A-1925A, Shield, Expansion (Nail Anchors).

22. FS A-A-55614, Shield, Expansion (non-drilling expansion anchors).
23. ICC-ES AC01, Acceptance Criteria for Expansion Anchors in Masonry Elements.
24. ICC-ES AC58, Acceptance Criteria for Adhesive Anchors in Masonry Elements.
25. ICC-ES AC60, Acceptance Criteria for Anchors in Unreinforced Masonry Elements.
26. ICC-ES AC193, Acceptance Criteria for Mechanical Anchors in Concrete Elements.
27. ICC-ES AC308, Acceptance Criteria for Post-Installed Adhesive Anchors in Concrete Elements.
28. ISO 3506-1, Mechanical Properties of Corrosion-Resistant Stainless Steel Fasteners -- Part 1: Bolts, Screws and Studs.
29. NSF/ANSI 61, Drinking Water System Components – Health Effects.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Testing Laboratory: Shall comply with ASTM E329 and shall be experienced in tension testing of post-installed anchoring systems.
   2. Post-installed Anchor Installer:
      a. Mechanical Anchors: Installer shall be experienced and trained by post-installed anchor system manufacturer in proper installation of manufacturer's products. Product installation training by distributors or manufacturer's representatives is unacceptable unless the person furnishing the training is qualified as a trainer by the anchor manufacturer.
      b. Adhesive Anchors: Installation shall be performed by personnel certified under an applicable certification program. Certification shall include written and performance tests in accordance with the ACI/CRSI Adhesive Anchors Installer Certification Program, or equivalent. Description of equivalent programs shall be submitted for Engineer's approval and acceptance by the building official having jurisdiction.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Listing of all anchor systems products intended for use in the Work including product type, intended location in the Project, and embedded lengths.
   2. Product Data:
      a. Manufacturer's specifications, load tables, dimension diagrams, acceptable base material conditions, acceptable drilling methods, and acceptable bored hole conditions.
      b. When required by Engineer, copies of valid ICC ES reports that presents load-carrying capacities and installation requirements for anchor systems.
   3. Samples:
      a. Representative Samples of anchor systems proposed for use in the Work. Review will be for type and finish only. Compliance with all other requirements is Contractor's exclusive responsibility.

B. Delegated Design Submittals:
   1. Design Data: Submit the following:
      a. Design Calculations for delegated anchor systems. Structural calculations shall include all specified performance criteria. The magnitude of delegated system/anchorage reactions to supporting structure shall be clearly noted. Design calculations shall be signed, sealed and dated by Contractor's professional engineer.

C. Informational Submittals: Submit the following:
   1. Certificates:
      a. For each type of anchor bolt or threaded rod, submit copies of laboratory test reports and other data required to demonstrate compliance with the Contract Documents.
         1) Reports shall demonstrate compliance with ductile steel element definition of ACI 350, Appendix D, or ACI 318 Chapter 17.
      b. Post-installed anchor system manufacturer's certification that installer received training in the proper installation of manufacturer's products required for the Work.
      c. For each adhesive anchor installer, submit ACI/CRSI Adhesive Anchor Installer Certification.
   2. Manufacturer's Instructions:
      a. Installation instructions for each anchor system product proposed for use, including bore hole cleaning procedures and adhesive injection, cure and gel time tables, and temperature ranges (storage, installation and in-service).

1.5 DELIVERY, STORAGE AND HANDLING

A. Storage and Protection:
   1. Keep materials dry during delivery and storage.
   2. Store adhesive materials within manufacturer's recommended storage temperature range.
   3. Protect anchor systems from damage at the Site. Protect products from corrosion and deterioration.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. General:
   1. At locations where conditions dictate that Work specified in other Sections is to be of corrosion resistant materials, provide associated anchor systems of stainless steel materials, unless other corrosion-resistant anchor system material is specified. Provide anchor systems of stainless steel materials where stainless steel materials are required in the Contract Documents.
   2. Stainless Steel Nuts:
      a. For anchor bolts and adhesive anchors, provide ASTM A194/A194M, Grade 8S (Nitronic 60) stainless steel nuts for stainless steel anchors used for anchoring equipment, gates, and weirs, and other locations, if any, where the attachment will require future removal for operation or maintenance. Provide lock washer or double nuts on each anchorage device provided for equipment, as required by equipment manufacturer.
      b. For other locations, provide for each anchorage device a nut as specified or as required by anchor manufacturer. When ASTM A194/A194M, Grade 8S (Nitronic 60) nuts are not required for anchor bolts and adhesive anchors as specified in this Section, provide anti-seizing compound where stainless steel rods are used with stainless steel nuts of the same type.
   3. Materials that can contact potable water or water that will be treated to become potable shall be listed in NSF/ANSI 61.

B. Design Criteria
   1. Size, Length, and Load-carrying Capacity: Comply with the Contract Documents. When size, length or load-carrying capacity of anchor system is not otherwise shown or indicated, provide the following:

a. Anchor Bolts: Provide size, length, and capacity required to carry design load based on values and requirements of Paragraph 3.2.A of this Section. For conditions outside limits of critical edge distance and spacing in Paragraph 3.2.A of this Section, minimum anchor bolt embedment as shown or indicated in Paragraph 3.2.A of this Section apply and capacity shall be based on requirements of Laws and Regulations, including applicable building codes.

b. Adhesive Anchors, Expansion Anchors, or Concrete Inserts: Provide size, length, type, and capacity required to carry design load. Anchor capacity shall be based on the procedures required by the building code in effect at the Site. Where Evaluation Service Reports issued by the ICC Evaluation Service are required in this Section, anchor capacities shall be based on design procedure required in the applicable ICC Evaluation Service Report.

1) General: Determine capacity considering reductions due to installation and inspection procedures, embedment length, strength of base fastening materials, spacing, and edge distance, as indicated in the manufacturer's design guidelines. For capacity determination, concrete shall be assumed to be in the cracked condition, unless calculations demonstrate that the anchor system will be installed in an area that is not expected to crack under any and all conditions of design loading.

2) Adhesive Anchors: Unless otherwise shown or indicated in the Contract Documents or approved by Engineer, provide minimum embedment depth of the greater of the following: required to develop tensile strength of anchor, or a minimum embedment of 10 anchor diameters; and minimum anchor spacing and edge distance of 12 anchor diameters.

3) Masonry Adhesive Anchors: Unless otherwise shown or indicated in the Contract Documents or approved by Engineer, provide minimum anchor spacing and edge distance as indicated in anchor manufacturer's instructions.

4) Concrete Expansion Anchors: Unless otherwise shown or indicated in the Contract Documents or approved by Engineer, provide minimum embedment depth of six anchor diameters, and minimum anchor spacing and edge distance of seven anchor diameters.

5) Masonry Expansion Anchors: Unless otherwise shown or indicated in the Contract Documents or approved by Engineer, provide minimum anchor spacing and edge distance as indicated in anchor manufacturer's instructions.

6) Concrete Undercut Anchors: Unless otherwise shown or indicated in the Contract Documents, or approved by Engineer, provide minimum anchor spacing and edge distance as tabulated in anchor manufacturer's instructions.

2. Delegated Design: When anchor systems are used for supporting materials, equipment, or systems delegated to Contractor, Subcontractor, or Supplier, provide anchor system suitable for loads indicated in delegated design documents and consistent with the design intent expressed in the Contract Documents. Anchor system shall be designed by a professional engineer, retained by Contractor, Subcontractor, or Supplier, registered in the same state as the Site, with proper consideration of concrete strength, spacing and edge distance.

a. Design Loads. Comply with the Contract Documents. When design load of supported material, equipment, or system is not otherwise shown or indicated, provide the following:

1) Equipment Anchors: Use static and dynamic design loads recommended by equipment manufacturer. When equipment can be filled with fluid, use loads that incorporate equipment load and load imposed by fluid.

2) Pipe Hangers and Supports: Use full weight of pipe, and fluid contained in pipe that are tributary to the support plus the full weight of valves and accessories located between the hanger or support being anchored and the next hanger or support.

3) Hangers and Supports for Electrical Systems, and HVAC, Plumbing, and Fire Suppression Systems and Piping: Use the full weight of supported system that is tributary to the support plus the full weight of accessories located between the hanger or support being anchored and the next hanger or support. When piping or equipment is to be filled with fluid, anchor systems shall be sized to support such loads in addition to the weight of the equipment, piping, or system, as applicable.

C. Application:
1. Anchor Bolts:
   a. Where anchor bolt is shown or indicated, use cast-in-place anchor bolt unless another anchor type is approved by Engineer.
   b. Provide anchor bolts as shown or indicated, or as required to secure structural element to appropriate anchor surface.
2. Concrete Adhesive Anchors:
   a. Use where adhesive anchors are shown or indicated for installation in concrete.
   b. Suitable for use where subject to vibration.
   c. Suitable for use in exterior locations or locations subject to freezing.
   d. Suitable for use in submerged, intermittently submerged, or buried locations.
   e. Do not use in overhead applications, unless otherwise shown or approved by Engineer.
   f. Do not use for pipe hangers, unless otherwise shown or approved by Engineer.
3. Concrete Masonry Adhesive Anchors:
   a. Use where adhesive anchors are shown or indicated for installation in grout-filled or hollow masonry units.
   b. Suitable for use where subject to vibration.
   c. Suitable for use in exterior locations or locations subject to freezing.
   d. Do not use for pipe hangers, unless otherwise shown or approved by Engineer.
4. Concrete Wedge Expansion Anchors:
   a. Use where expansion anchors are shown or indicated for installation in concrete.
   b. Do not use where subject to vibration.
   c. Do not use in exterior locations or locations subject to freezing.
   d. Do not use in submerged, intermittently submerged, or buried locations.
   e. Suitable for use in overhead applications.
5. Grout-filled Concrete Masonry Wedge Expansion Anchors:
   a. Use where expansion anchors are shown or indicated for installation on the interior face of grout-filled unit masonry.
   b. Do not use where subject to vibration.
   c. Do not use in exterior locations or locations subject to freezing.
6. Hollow Concrete Masonry Sleeve Expansion Anchors:
   a. Use where expansion anchors are shown or indicated for installation in hollow concrete unit masonry or solid brick.
   b. Do not use for attaching safety-related systems, such as piping conveying hazardous or potentially hazardous materials, or fire suppression systems.
   c. Do not use where subject to vibration.
   d. Do not use in exterior locations or locations subject to freezing.
7. Drop-in Expansion Anchors:
   a. Use drop-in expansion anchors installed in concrete where light-duty anchors are required to support piping or conduit two-inch diameter or smaller.
   b. Do not use for attaching safety-related systems, such as piping conveying hazardous or potentially hazardous materials, or fire suppression systems.
   c. Do not use where subject to vibration.
   d. Do not use at submerged, intermittently submerged, or buried locations.

e. Do not use in exterior locations or locations subject to freezing.
f. Suitable for use in overhead applications.

8. Concrete Inserts:
   a. Use only where shown or indicated in the Contract Documents.
   b. Allowed for use to support pipe hangers and pipe supports for pipe size and loading recommended by the concrete insert manufacturer.
9. Drive-In Expansion Anchors:
   a. Use drive-in expansion anchors installed in concrete, precast concrete, grouted masonry units, or brick, where light-duty anchors are required to support piping or conduit one-inch diameter and smaller.
   b. Do not use for attaching safety-related systems, such as piping conveying hazardous or potentially hazardous materials, or fire suppression systems.
   c. Do not use in overhead applications.
10. For Use in Precast Concrete Planks:
    a. To support piping or conduit two-inch diameter and smaller, use low-profile drop-in anchors, hollow concrete masonry adhesive anchors, or through-bolts.
    b. For piping greater than two-inch diameter, or to support safety-related systems, use through-bolts. Each through-bolt shall consist of threaded rod, nuts, washers, and bearing plate.

2.2 MATERIALS

A. Anchor Bolts:
   1. Interior Dry Non-corrosive Locations: Provide straight threaded carbon steel rods complying with ASTM F1554, Grade 55, with heavy hex nuts complying with ASTM A563 Grade A, unless otherwise shown or indicated on the Drawings. Hooked anchor bolts are unacceptable.
   2. Exterior, Buried, Submerged Locations, or When Exposed to Wastewater: Provide stainless steel straight threaded rods complying with ASTM F593, AISI Type 316, Condition A, with ASTM F594, AISI Type 316, stainless steel nuts. Provide ASTM A194/A194M, Grade 8S (Nitronic 60) stainless steel nuts where required. Other AISI types may be used when approved by Engineer. Hooked bolts are unacceptable.
      a. Stainless steel straight threaded rod shall comply with ductility requirements of ACI 350 Appendix D or ACI 318 Chapter 17.
   3. Equipment: Provide anchor bolts complying with material requirements of this Section and equipment manufacturer's requirements relative to size, embedment length, and anchor bolt projection. Anchor bolts shall be straight threaded rods with washers and nuts as specified in this Section. Hooked bolts are unacceptable.
   4. Anchoring of Structural Elements: Provide anchor bolts of size, material, and strength shown or indicated in the Contract Documents.

B. Concrete Adhesive Anchors:
   1. General:
      a. Adhesive anchors shall consist of threaded rods anchored into hardened concrete using an adhesive system.
   2. Products and Manufacturers: Provide one of the following:
      a. HIT-RE 500-V3 Injection Epoxy Adhesive Anchoring System, by Hilti Fastening Systems, Inc.
      b. HIT-HY 200-A and HIT-HY 200-R Adhesive Anchoring System, by Hilti Fastening Systems, Inc
      c. SET-XP Adhesive anchoring system, by Simpson Strong-Tie Company, Inc.
      d. Or equal.

3. Adhesive:
    a. Adhesive system shall use two-component adhesive mix.
    b. Adhesives shall have a current evaluation report by ICC Evaluation Service for use in both cracked and uncracked concrete with seismic recognition for SDC A through F as tested and assessed in accordance with ICC-ES AC308, which incorporates the requirements of ACI 355.4-11
    c. Adhesives shall have minimum bond strength and minimum design bond strength in accordance with Table 05 0533-A:

TABLE 05 0533-A:
ADHESIVE BOND STRENGTH [1,2]

Bond Strength (psi)					
Rod Diameter	**Uncracked Concrete**	**Cracked Concrete**	**Dowel Size**	**Uncracked Concrete**	**Cracked Concrete**
1/2-inch	1670	880	#4	1500	1080
5/8-inch	1670	750	#5	1460	1090
3/4-inch	1670	665	#6	1415	1015
7/8inch	1525	610	#7	1370	835
1-inch	1360	595	#8	1330	760
-	-	-	#9	1560	850
1.25-inch	1070	595	#10	1240	475

Table Notes:
1. Bond strengths listed for hammer-drilled, dry hole.
2. Bond strengths listed for maximum short term concrete temperature of 130 degrees F and maximum long term concrete temperature of 110 degrees F.

4. Anchor:
    a. Provide continuously-threaded, AISI Type 316 stainless steel adhesive anchor rod. Threaded rods shall comply with the concrete adhesive anchor manufacturer's specifications as included in the ICC Service Evaluation Report for the anchor submitted. Nuts shall have specified proof load stresses equal to or greater than the minimum tensile strength of the stainless steel threaded rod used. Provide ASTM A194/A194M, Grade 8S (Nitronic 60) stainless steel nuts where required.
    b. Stainless steel threaded rod shall comply with ductility requirements of ACI 350 Appendix D or ACI 318 Chapter 17.

C. Concrete Masonry Adhesive Anchors:
1. General:
    a. Grout-filled concrete masonry adhesive anchors shall consist of threaded rods anchored into grout-filled concrete block masonry using an adhesive system.
    b. Hollow concrete masonry adhesive anchors shall consist of threaded rods with a cylindrical mesh steel or plastic screen tube anchored into hollow concrete block masonry using an adhesive system.
2. Products and Manufacturers: Provide one of the following:
    a. HIT-HY 270 Hybrid Adhesive Anchor System, by Hilti Fastening Systems, Inc.
    b. Acrylic-Tie Adhesive, by Simpson Strong-Tie Company, Inc.
    c. Or equal.
3. Adhesive:
    a. Adhesive system shall use two-component adhesive mix.

b. Adhesives shall have current ICC Evaluation Service Report for use in grout-filled concrete masonry, tested and assessed in accordance with ICC-ES AC58 and ICC-ES AC60.

4. Anchor:
   a. Provide stainless steel adhesive anchor rod complying with ASTM F593, AISI Type 316, Condition CW, with ASTM F594, AISI Type 316 stainless steel nuts. Provide ASTM A194/A194M, Grade 8S (Nitronic 60) stainless steel nuts where required.
5. Mesh Screen Tube (for hollow masonry applications):
   a. Provide with mesh size, length, and diameter as specified by adhesive anchor manufacturer.

D. Concrete Wedge Expansion Anchors:
1. General:
   a. Concrete wedge expansion anchors shall consist of stud, wedge, nut, and washer.
2. Products and Manufacturers: Provide one of the following:
   a. Kwik Bolt TZ Wedge Anchor, by Hilti Fastening Systems, Inc.
   b. Strong Bolt 2 Wedge Anchor, by Simpson Strong-Tie Company, Inc.
   c. Or equal.
3. Anchors shall comply with physical requirements of FS A-A-1923A, Type 4. Provide concrete wedge expansion anchors suitable for use in cracked and uncracked concrete in accordance with ACI 318 Chapter 17 and ACI 350, Appendix D. Demonstrate suitability of cracked concrete wedge anchors in accordance with ACI 355.2 prequalification tests.
4. Interior Dry Non-corrosive Locations: Provide carbon steel anchors complete with nuts and washers, zinc plated, in accordance with ASTM B633.
5. Other Locations: Provide expansion anchors complete with nuts and washers, AISI Type 304 stainless steel anchor body, in accordance with ASTM A276 or ASTM A493.
6. Anchor shall comply with ductility requirements of ACI 350 Appendix D or ACI 318 Chapter 17.
7. Concrete wedge expansion anchors shall have a current ICC Evaluation Service Report for use in both cracked and uncracked concrete with seismic recognition in seismic design Categories A through F when tested and assessed in accordance with ICC-ES AC193.

E. Grout-filled Masonry Wedge Expansion Anchors:
1. General:
   a. Grout-filled masonry wedge expansion anchors shall each consist of stud, wedge, nut, and washer.
2. Product and Manufacturers: Provide one of the following:
   a. Kwik-Bolt 3 Expansion Anchors, by Hilti Fastening Systems, Inc.
   b. Wedge-All Wedge Anchors, by Simpson Strong-Tie Company, Inc.
   c. Or equal.
3. Anchors shall comply with physical requirements of FS A-A-1923A, Type 4. Anchors shall be non-bottom bearing type with single-piece steel expansion clip providing 360-degree contact with base material and shall not require oversized holes for installation.
4. Provide carbon steel anchors complete with nuts and washers, zinc plated, in accordance with ASTM B633.
5. Grout-filled masonry wedge expansion anchors shall have a current ICC Evaluation Service report for use in fully-grouted concrete masonry construction when tested and assessed in accordance with ICC-ES AC01.

F. Hollow Concrete Masonry Sleeve Expansion Anchors:
1. General:

a. Sleeve expansion anchors shall each consist of an externally threaded stud with full length expanding sleeve.

2. Products and Manufacturers: Provide one of the following:
   a. HLC Sleeve Anchors, by Hilti Fastening Systems, Inc.
   b. Dynabolt Sleeve Anchors, by ITW Red Head.
   c. Or equal.
3. Anchors shall comply with physical requirements of FS A-A-1922A. Anchors shall be non-bottom bearing type with single-piece steel expansion sleeve providing 360-degree contact with base material and shall not require oversized holes for installation.
4. Interior Dry Non-corrosive Locations: Provide carbon steel anchors complete with nuts and washers, zinc plated, in accordance with ASTM B633.
5. Other Locations: Provide expansion anchors complete with nuts and washers, Type 304 stainless steel, in accordance with ASTM A276 or ASTM A493.

G. Drop-in Expansion Anchors:
1. General:
   a. Drop-in expansion anchors shall each consist of an internally threaded, deformation-controlled expansion anchor with pre-assembled expander plug.
2. Products and Manufacturers: Provide one of the following:
   a. HDI Drop-In Anchors, by Hilti Fastening Systems, Inc.
   b. Drop-In Anchor, by Simpson Strong-Tie Company, Inc.
   c. Or equal.
3. Provide carbon steel anchors complete with nuts and washers, zinc plated, in accordance with ASTM B633, complying with physical requirements of FS A-A-55614, Type I. Anchors shall be flush or shell type. Provide low-profile anchors for use in precast concrete planks.

H. Concrete Inserts:
1. Manufacturers: Provide products of one of the following:
   a. Unistrut Corporation.
   b. Cooper B-Line, Inc.
   c. Anvil International, Inc.
   d. Or equal.
2. Spot Concrete Inserts:
   a. Provide inserts recommended by insert manufacturer for required loading. Inserts shall comply with ANSI/MSS SP-58, malleable iron, Type 18. Spot inserts shall allow for lateral adjustment and have means for attachment to forms. Provide nuts compatible with insert and to suit threaded hanger rod sizes.
3. Continuous Concrete Inserts:
   a. Provide inserts recommended by insert manufacturer for required loading. Inserts shall be continuous type and shall be manufactured from minimum 12-gage cold-formed channel sections, complying with ASTM A1011/A1011M, stainless steel, Grade 33, complete with styrofoam inserts, end caps, and means for attaching to forms. Provide channel nuts compatible with insert suitable for threaded hanger rod sizes.
4. Provide inserts with plain finish.

I. Drive-In Expansion Anchors:
1. General:
   a. Drive-In expansion anchors shall each consist of stainless steel drive pin and expanding alloy body.
2. Products and Manufacturers: Provide one of the following:
   a. Metal HIT Anchor, by Hilti Fastening Systems, Inc.

b. Zinc Nailon Anchor, by Simpson Strong-Tie Company, Inc.
c. Or equal.

3. Provide Type 304 stainless steel drive pin with zinc alloy body. Anchor shall comply with physical requirements of FS A-A-1925A, Type 1.

J. Unless approved by Engineer, do not use power-actuated fasteners or other types of bolts and fasteners not specified in this Section.

K. Anti-Seizing Compound:
1. Products and Manufacturers: Provide one of the following:
a. Pure Nickel Never-Seez, by Bostik.
b. Or equal.
2. Provide pure nickel anti-seizing compound.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine conditions under which materials will be installed and advise Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Anchor Bolts:
1. Provide anchor bolts as shown or indicated in the Contract Documents, or as required to secure structural element to the appropriate anchor surface.
2. Locate and accurately set anchor bolts using templates or other devices as required, prior to placing concrete. Wet setting of anchor bolts is unacceptable.
3. Protect threads and shank from damage during installation and subsequent construction operations.
4. Unless otherwise shown or approved by Engineer anchor bolts shall comply with Table 05 05 33-B:

TABLE 05 0533-B:
SINGLE ANCHOR ALLOWABLE LOADS ON ANCHOR BOLTS [1]

Bolt Diameter (inch)	F1554 Grade 36 F593 Type 316, Condition A				F1554 Grade 55			
	Minimum Embedment (inch)	Minimum Edge Distance and Spacing[2] (inch)	Shear[3,4] (lb)	Tension[3] (lb)	Minimum Embedment (inch)	Minimum Edge Distance and Spacing[2] (inch)	Shear[3] (lb)	Tension[3] (lb)
1/2	6	9	947	1,815	8.5	12.75	1,245	2,393
5/8	7.5	11.25	1,508	2,895	10.5	15.75	1,980	3,810
3/4	9	13.5	2,231	4,290	13	19.5	2,933	5,640
7/8	10.5	15.75	3,080	5,918	15	22.5	4,050	7,793
1	12	18	4,040	7,770	17	25.5	5,318	10,088
1 1/8	13.5	20.25	5,090	9,789	19	28.5	8,930	12,435
1.1/4	15	22.5	6,463	12,429	21	31.5	8,505	15,030

Table Notes:

1. Table is based on ACI 318 Chapter 17 and ACI 350, Appendix D, f'c = 4000 psi. Table 05 05 33-B is not applicable to anchor bolts embedded in grouted masonry.
2. Critical edge distance and spacing are indicated in the table. Capacity of anchor bolts for other combination of edge distances and spacing shall be evaluated in accordance with ACI 318 Chapter 17 and ACI 350, Appendix D.
3. Values for shear and tension listed are not considered to act concurrently. Interaction of tension and shear will be evaluated by Engineer in accordance with ACI 318 Chapter 17 and ACI 350, Appendix D.

B. Adhesive Anchors, Undercut Anchors, and Expansion Anchors – General:
   1. Prior to drilling, locate existing reinforcing steel in vicinity of proposed holes. If reinforcing conflicts with proposed hole location, obtain Engineer's approval of alternate hole locations to avoid drilling through or damaging existing reinforcing bars.

C. Adhesive Anchors:
   1. Installation conditions shall comply with all requirements of the approved product Evaluation Service Report (ESR), including "Conditions of Use." Comply with manufacturer's written installation instructions and the following.
   2. Drill holes to adhesive system manufacturer's recommended drill bit diameter to the specified depth. Drill holes in hammering and rotation mode with carbide-tipped drill bits that comply with the tolerances of ANSI B212.15. Core-drilled holes are unacceptable.
   3. Before setting adhesive anchor, hole shall be made free of dust and debris by method recommended by adhesive anchor system manufacturer. Hole shall be brushed with adhesive system manufacturer-approved brush and blown clean with clean, dry, oil-free compressed air to remove all dust and loose particles. Hole shall be dry as defined by adhesive system manufacturer.
   4. Before injecting adhesive, obtain Engineer's concurrence that hole is dry and free of oil and other contaminants.
   5. Prior to injecting adhesive into the drilled hole, dispense, to a location appropriate for such waste, an initial amount of adhesive from the mixing nozzle, until adhesive is uniform color.
   6. Inject adhesive into hole through injection system-mixing nozzle and necessary extension tubes, placed to bottom of hole. Discharge end shall be withdrawn as adhesive is placed but kept immersed to prevent formation of air pockets. Fill hole to depth that ensures that excess material is expelled from hole during anchor placement.
   7. Twist anchors during insertion into partially-filled hole to guarantee full wetting of rod surface with adhesive. Insert rod slowly to avoid developing air pockets.
   8. Provide adequate curing in accordance to adhesive system manufacturer's requirements prior to continuing with adjoining Work that could place load on installed adhesive anchors. Do not begin adjoining Work until adhesive anchors are successfully tested or when allowed by Engineer.
   9. Limitations:
      a. At time of anchor installation, concrete shall have compressive strength (f'c) of not less than 2,500 psi.
      b. At time of anchor installation, concrete shall have age of not less than 21 days.
      c. Installation Temperature: Comply with manufacturer's instructions for installation temperature requirements. Provide temporary protection and other measures, such as heated enclosures, necessary to ensure that base material temperature complies with anchor systems manufacturer's requirements during installation and curing of adhesive anchor system.
      d. Oversized Holes: Advise Engineer immediately if size of drilled hole is larger than recommended by anchor system manufacturer. Cost of corrective measures, including but

not limited to redesign of anchors due to decreased anchor capacities, shall be paid by Contractor.

e. Embedment depths shall be based on installation in normal-weight concrete with compressive strength of 2,500 psi when embedded in existing concrete, and 4,000 psi when embedded in new concrete.

D. Expansion Anchors:
   1. Comply with expansion anchor manufacturer's written installation instructions and the following:
   2. Drill holes using anchor system manufacturer's recommended drill bit diameter and to the specified depth. Drill holes in hammering and rotation mode with carbide-tipped drill bits complying with tolerances of ANSI B212.15. Core drilled holes are unacceptable.
   3. Before installing anchor, hole shall be made free of dust and debris by method recommended by anchor system manufacturer. Hole shall be brushed with anchor system manufacturer-approved brush and blown clean with clean, dry, oil-free compressed air to remove all dust and loose particles.
   4. Before installing anchor, obtain Engineer's concurrence that hole is dry and free of oil and other contaminants.
   5. Protect threads from damage during anchor installation. Drive anchors not less than four threads below surface of the attachment. Set anchors to anchor manufacturer's recommended torque using a torque wrench.

E. Concrete Inserts:
   1. Comply with concrete insert manufacturer's installation instructions.
   2. Inserts shall be flush with slab bottom surface.
   3. Protect embedded items from damage during concrete placing. Ensure that embedded items are securely fastened to prevent movement during concrete placing, and ensure that embedded items do fill with concrete during concrete placing.
   4. Inserts intended for piping greater than four-inch diameter shall be provided with hooked rods attached to concrete reinforcing.

F. Anti-Seizing Compound:
   1. Provide anti-seizing compound in accordance with anti-seizing compound manufacturer's installation instructions, at locations indicated in Paragraph 2.1.B of this Section.
   2. Do not use anti-seizing compound at locations where anchor bolt or adhesive anchor will contact potable water or water that will be treated to become potable.

3.3 CLEANING

A. After embedding concrete is placed, remove protection and clean bolts and inserts.

3.4 FIELD QUALITY CONTROL

A. Site Tests:
   1. Owner Will employ testing agency to perform field quality tensile testing of production adhesive anchors at the Site, unless otherwise specified.
      a. Testing shall comply with ASTM E488.
      b. Test at least ten percent of all types of adhesive anchors. If one or more adhesive anchors fail the test, Contractor shall pay cost of testing all anchors of the same type installed in the Work. Contractor shall be responsible for retesting costs.

c. Engineer will direct which adhesive anchors are to be tested and indicate test load to be used
d. Apply test loads with hydraulic ram.
e. Displacement of post-installed anchors shall not exceed D/10, where D is nominal diameter of anchor being tested.

B. Manufacturer's Services:
1. Provide at the Site services of qualified adhesive manufacturer's representative during initial installation of adhesive anchor systems to train Contractor's personnel in proper installation procedures. Manufacturer's representative shall observe to confirm that installer demonstrates proper installation procedures for adhesive anchors and adhesive material.

END OF SECTION 05 0533

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 05 1200

STRUCTURAL STEEL FRAMING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
1. Contractor shall provide professional services, labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install structural steel framing, including surface preparation and shop priming.
2. Structural steel framing is the Work defined in AISC 303, Section 2, and as shown or indicated in the Contract Documents. The Work also includes:
   a. Providing openings in and attachments to structural steel framing to accommodate the Work under this and other Sections, and providing for structural steel framing items such as anchorage devices, studs, and all items required for which provision is not specifically included under other Sections.

B. Coordination:
1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before structural steel framing Work.

C. Related Sections:
1. Section 03 6000, Grouting.
2. Section 05 0533, Anchor Systems.
3. Section 09 9100, Painting.

1.2 REFERENCES

A. Standards referenced in this Section are:
1. AISC 303, Code of Standard Practice for Steel Buildings and Bridges.
2. AISC 325, Steel Construction Manual.
3. AISC 360, Specification for Structural Steel Buildings.
4. ASME B46.1, Surface Texture (Surface Roughness, Waviness and Lay).
5. ASTM A6/A6M, Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling.
6. ASTM A36/A36M, Specification for Carbon Structural Steel.
7. ASTM A53/A53M, Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
8. ASTM A108, Specification for Steel Bar, Carbon and Alloy, Cold-Finished.
9. ASTM A194/A194M, Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both.
10. ASTM A325, Specification for Structural Bolts, Steel, Heat-Treated, 120/105 ksi Minimum Tensile Strength.
11. ASTM A490, Specification for Structural Bolts, Alloy Steel, Heat Treated, 150 ksi Minimum Tensile Strength.
12. ASTM A500/A500M, Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
13. ASTM A563, Specification for Carbon and Alloy Steel Nuts.

14. ASTM A572/A572M, Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel.
15. ASTM A992/A992M, Specification for Structural Steel Shapes.
16. ASTM A1085/A1085M, Specification for Cold-Formed Welded Carbon Steel Hollow Structural Sections (HSS).
17. ASTM E329, for Agencies Engaged in Construction Inspection, Special Inspection, or Testing Materials Used in Construction.
18. ASTM F436, Specification for Hardened Steel Washers.
19. ASTM F593, Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
20. ASTM F959, Specification for Compressible-Washer-Type Direct Tension Indicators for Use with Structural Fasteners.
21. ASTM F1852, Specification for "Twist off" Type Tension Control Structural Bolt/Nut/Washer Assemblies, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.
22. AWS D1.1/D1.1M, Structural Welding Code-Steel.
23. RCSC Specification for Structural Joints Using ASTM A325 or ASTM A490 Bolts.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Steel Fabricator:
      a. Structural steel fabricating plant shall possess current certificate from AISC stating that the fabrication facility complies with requirements for "Certified Building Fabricator" (BU) of AISC's quality certification program. Fabricating plant shall maintain this certification throughout time of fabrication for this Project.
   2. Welders and Welding Processes:
      a. Qualify welding processes and welding operators in accordance with AWS D1.1/D1.1M, Section 5, Qualification.
      b. Each welder employed on or to be employed for the Work shall possess current AWS certification in the welding process with which welder will be working. Certifications shall be current and valid throughout the Work.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Complete details and schedules for fabrication and shop assembly of members and details, schedules, procedures, and diagrams showing proposed sequence of erection. Shop Drawings shall not be reproductions of Contract Drawings.
      b. Include complete information for fabrication of the structure's components, including but not limited to location, type, and size of bolts, details of blocks, copes and cuts, connections, camber, holes, member sizes and lengths, and other pertinent data. Clearly indicate welds using standard AWS notations and symbols, and clearly show or indicate size, length, and type of each weld.
      c. Setting drawings, templates, and directions for installing anchorage devices.
   2. Product Data:
      a. Manufacturer's specifications and installation instructions for products listed below.
         1) High-strength bolts of each type, including nuts and washers.
         2) Welding electrodes and rods.
         3) Load indicator bolts and washers.

B. Informational Submittals: Submit the following:

1. Certificates.
    a. Fabricator's AISC quality certification.
    b. Welders' certifications.
    c. Certified reports of laboratory tests on previously-manufactured, identical materials, and other data as necessary, to demonstrate compliance with the Contract Documents for the materials listed below:
        1) Structural steel of each type, including certified mill reports indicating chemical and physical properties.
        2) High-strength bolts of each type, including nuts and washers.
2. Supplier Instructions:
    a. Installation data, handling, and storage instructions.
3. Source Quality Control Submittals:
    a. When performed or when required by Engineer, submit results of source quality control testing and inspections performed at the mill or shop.
4. Field Quality Control Submittals:
    a. Written field survey reports for all bearing surfaces surveyed, verifying tolerance requirements, areas out of tolerance, and corrective measures required.

1.5 DELIVERY, STORAGE AND HANDLING

A. Storage:
1. Protect steel members and packaged materials from corrosion and deterioration.
2. Do not store materials in or on the building or structure in manner that may cause distortion or damage to structural steel members, building, or supporting structures.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Steel Types:
1. W-Shapes and WT-Shapes: ASTM A992/A992M.
2. S-shapes and Channels: ASTM A572/A572M, Grade 50.
3. Hollow Structural Sections: ASTM A1085 or ASTM A500/A500M, Grade C.
4. Angles, Plates, and Bars: ASTM A36/A36M.
5. Steel Pipe: ASTM A53/A53M, Grade B.

B. Anchorages, Fasteners, and Connectors:
1. Anchorage Devices: Refer to Section 05 0533, Anchor Systems.
2. High-Strength Threaded Fasteners: Heavy hexagonal structural bolts, heavy hexagon nuts, and hardened washers, as follows:
    a. Unless otherwise indicated, fasteners shall be quenched and tempered medium-carbon steel bolts, nuts and washers, complying with ASTM A325, Type I, nuts complying with ASTM A563C, A563DH or A194/A194M 2H, and hardened washers complying with ASTM F436. Bolts, nuts and washers shall be hot-dip galvanized where shown or indicated.
    b. Tension control bolts, when used, shall comply with ASTM F1852.
    c. Compressible washer-type direct-tension indicators, when used, shall comply with ASTM F959, Type 325.
3. Threaded Rod: Provide threaded rods with heavy hexagon nuts, and hardened washers, as follows:

a. Interior and Dry Locations: Provide threaded carbon steel rods complying with ASTM A36, with heavy hex nuts complying with ASTM A563A, unless otherwise shown or indicated on the Drawings.
b. Exterior, Buried, or Submerged Locations, or When Exposed to Wastewater: Provide stainless steel threaded rods complete with washers complying with ASTM F593, AISI Type 316, Condition A, with ASTM A194/A194M, Grade 8S (nitronic 60) stainless steel nuts. Other AISI types may be used when approved by Engineer.

C. Electrodes for Welding: E70XX complying with AWS D1.1/D1.1M.

2.2 FABRICATION

A. Shop Fabrication and Assembly:
1. General:
a. Fabricate and assemble structural assemblies in the shop to greatest extent possible. Fabricate items of structural steel in accordance with AISC 325, the Contract Documents, and as shown on approved Shop Drawings. Provide camber in structural members as shown or indicated.
b. Properly mark and match-mark materials for field assembly. Fabricate for delivery sequence that will expedite erection and minimize handling of materials for storage and minimize handling at the Site.
c. Where finishing is required, complete the assembly, including welding of units, before commencing finishing operations. Provide finish surfaces of members exposed-to-view in the completed Work that are free of markings, burrs, and other defects.
2. Connection design:
a. The design of connections for any part of the structure not indicated on the Contract Drawings shall be completed by the Contractor, under the supervision of a professional engineer registered in the same state as the Site. Professional engineer shall sign/seal all calculations and shop drawings related to connection design.

B. Connections:
1. Shop Connections:
a. Unless otherwise shown or indicated, shop connections may be welded or high-strength bolted connections. Welds shall be 3/16-inch minimum.
b. Where reaction values of beam are not shown or indicated, connections shall be detailed to support 70% of the total uniform load capacity tabulated in tables contained in part 10 of the AISC Manual for allowable loads on beams for the associated shape, span, and steel specified for the beam. Reaction used for design shall not be less than 6 kips.
c. Shop-welded connections shall be detailed to eliminate or minimize eccentricity in the connection.
d. End-connection angles fastened to webs of beams and girders, and the thickness of angles, size, and extent of fasteners or shop welds, shall comply with tables of "Framed Beam Connections" in AISC 325. Connections shall be two-sided, unless otherwise shown or indicated.
2. Field Connections:
a. Field connections, unless otherwise shown or indicated, shall be made with high-strength bolts, and shall be bearing-type connections.
b. Use field welding only where shown or indicated or where approved by Engineer.
3. High-Strength Bolted Construction:

a. Provide high-strength threaded fasteners in accordance with RCSC Specifications for Structural Joints using ASTM A325 or ASTM A490 Bolts.
b. High-strength bolt design shear values shall be as specified in AISC 325 for bolts with threads in the shear plane for bearing type connections, or as specified in this Section for slip-critical connections.
c. Bolted connections shown or indicated as "SC" shall comply with slip-critical connection requirements in RCSC Specifications for Structural Joints Using ASTM A325 or ASTM A490 Bolts.
1) Faying surfaces shall have a Class A surface condition.
2) Slip-critical bolts shall be fully pre-tensioned to 70 percent of minimum specified tensile strength of the bolt using one of the following methods:
a) Turn of nut with matchmarking.
b) Twist-off tension control bolt (ASTM F1852).
c) Direct tension indicator washer (ASTM F959).
d. Minimum bolt diameter shall be 3/4-inch, unless otherwise shown or indicated.

4. Welded Construction: Comply with AWS D1.1/D1.1M for procedures, appearance, and quality of welds, and methods used in correcting defective welding Work.
5. Where rigid connections are required by stresses shown or indicated, provide web shear reinforcement and stiffeners in accordance with AISC 360.

C. Bracing:
1. Bracing for which stress is not shown or indicated shall have minimum two-bolt connection, or shop-welded connection of equivalent strength.
2. Vertical bracing and knee braces connecting to columns shall be on the centerline of columns, unless otherwise shown or indicated.
3. Knee braces shall be at 45-degree angle, unless otherwise shown or indicated.
4. Gussets shall be not less than 3/8-inch thick, unless otherwise shown or indicated.

D. Columns: Column shafts shall have finished bearing surface roughness not greater than 500 micro-inch in accordance with ASME B46.1, and ends shall be square within tolerances for milled ends in accordance with ASTM A6/A6M at the base and at splice lines.

E. Structural Tubing: Properly seal structural tubing to protect internal surfaces.

F. Holes and Appurtenances for Other Work:
1. Provide holes required for securing other work to structural steel framing, and for passage of other work through steel framing members, as shown on the approved Shop Drawings. If large block-outs are required and approved, reinforce the webs to develop specified shears. Provide threaded nuts welded to framing and other specialty items as shown or indicated to receive other work.
2. Cut, drill, or punch holes perpendicular to metal surfaces. Do not flame-cut holes or enlarge holes by burning. Drill holes in bearing plates.

2.3 FINISHING

A. All exterior steel shall be hot-dip galvanized and painted.

B. Surface Preparation and Shop Priming: Structural steel shall be primed in the shop. For surface preparation and shop priming requirements refer to Section 09 9100, Painting.

2.4 SOURCE QUALITY CONTROL

A. Inspection and Testing at the Mill or Shop:
   1. Perform fabricator's standard procedures for source quality control, including inspections and testing.
   2. Materials and fabrication procedures shall be subject to inspection and tests in mill and shop, conducted by a qualified inspection laboratory. Such inspections and tests do not relieve Contractor of responsibility for providing the Work in accordance with the Contract Documents.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which the Work will be performed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 ERECTION

A. General: Comply with AISC 303, AISC 360, and the Contract Documents.

B. Temporary Shoring and Bracing: Provide temporary shoring and bracing members with connections of sufficient strength to bear imposed loads. Remove temporary members and connections when permanent members are in place and final connections are made. Provide temporary guy-lines to achieve proper alignment of structures as erection proceeds.

C. Temporary Planking: Provide temporary planking and working platforms as necessary to effectively complete the Work. Provide sufficient planking to comply with Laws and Regulations, and provide tightly-planked substantial floor within two stories or 30 feet, whichever is less, below each tier of steel beams on which work is performed.

D. Anchorage Devices:
   1. Provide anchorage devices, including anchor bolts, and other connectors required for securing structural steel to foundations and other in-place construction.
   2. Provide templates and other devices necessary for presetting anchorage devices to accurate locations.
   3. Refer to Section 05 0533, Anchor Systems, for anchorage requirements.

E. Setting Bases and Bearing Plates:
   1. Clean concrete and masonry bearing surfaces of bond-reducing materials and roughen to improve bond to surfaces. Clean bottom surface of base and bearing plates.
   2. Set loose and attached base plates and bearing plates for structural members on steel wedges or other adjusting devices.
   3. Tighten anchorage devices after supported members are positioned and plumbed. Do not remove wedges or shims, but if protruding, cut off flush with edge of base or bearing plate prior to packing with grout.
   4. Place grout between bearing surfaces and bases or plates in accordance with Section 03 6000, Grouting. Finish exposed surfaces, protect installed materials, and allow to cure in accordance with grout manufacturer's instructions, and as otherwise required.
   5. Do not use leveling plates or wood wedges.

F. Field Assembly:
   1. Set structural frames accurately to the lines and elevations shown and indicated. Align and adjust the various members forming part of a complete frame or structure before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
   2. Level and plumb individual members of structure within tolerances as specified in AISC 325. For members requiring accurate alignment, provide clip angles, lintels, and other members, with slotted holes for horizontal adjustment at least 3/8-inch in each direction, or more when required.
   3. Splice members only where shown or indicated.

G. Erection Bolts: On exposed-to-view, welded construction, remove erection bolts, fill holes with plug welds, and grind smooth at exposed surfaces.

H. Connections:
   1. Comply with AISC 325 for bearing, adequacy of temporary connections, alignment, and the removal of paint on surfaces adjacent to field welds.
   2. Do not enlarge inadequate holes in members by burning or by using drift pins, except in secondary bracing members. Ream holes that must be enlarged to admit bolts.

I. Gas Cutting: Do not use gas-cutting torches for correcting fabrication defects in structural framing. Cutting will be allowed only on secondary members that are not under stress, as approved by Engineer. Finish gas-cut sections equal to a sheared appearance, when allowed.

J. Touch-up Painting:
   1. Unless otherwise specified, comply with touch-up painting requirements in Section 09 9100, Painting.
   2. Immediately after erection, clean field welds, bolted connections, and damaged or abraded areas of shop-applied paint. Apply paint to exposed areas with the same paint or coating material applied in the shop. Apply by brush or spray to provide not less than the dry film thickness specified in Section 09 9100, Painting.

3.3 FIELD QUALITY CONTROL

A. Site Tests and Inspections: Materials and erection procedures shall be subject to inspection and tests at the Site conducted by qualified inspection laboratory. Such inspections and tests do not relieve Contractor of responsibility for providing the Work in accordance with the Contract Documents.
   1. Owner will engage independent testing and inspection laboratory to inspect high-strength bolted connections and welded connections and to perform tests and prepare test reports.
      a. Testing laboratory shall conduct and interpret tests, prepare and state in each report of results whether test specimens comply with the Contract Documents and specifically indicate all deviations.
      b. High-strength Bolted Connections: Each high-strength bolted connection shall be visually inspected. Inspection shall identify whether the Work complies with Sections 2, 3, and 8 of RCSC Specifications for Structural Joints Using ASTM A325 or A490 Bolts.
         1) For connections that are slip-critical or subject to axial tension, inspector shall verify proper pre-tensioning.

2) For connections that are not slip critical and not subject to direct tension, bolt does not need to be inspected for bolt tension, but shall be visually inspected to verify that plies of connected elements are in snug contact.
3) Where bolts or connections are defective, correct defective workmanship, remove and replace, or correct as required defective bolts and connections. Contractor shall pay for correcting defective Work and tests required to confirm integrity of corrected Work.

c. Welds: Each weld shall be visually inspected.
1) Where visually defective welds are evident, further test welds using non-destructive methods. If welds are determined to be acceptable, Owner will pay for non-destructive testing. When welds are defective, Contractor shall pay for non-destructive testing.
2) Correct, or remove and replace, defective Work as directed by Engineer.
3) Contractor shall pay for corrections and subsequent tests required to determine weld compliance with the Contract Documents.

END OF SECTION 05 1200

SECTION 05 1400

STRUCTURAL ALUMINUM FRAMING

PART 1 – GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all professional services, labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install structural aluminum framing.
   2. The Work also includes:
      a. Providing openings in and attachments to structural aluminum framing to accommodate the Work under this and other Sections, and providing for structural aluminum framing items such as anchorage devices, studs, and all items required for which provision is not specifically included under other Sections.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before structural aluminum framing Work.

C. Related Sections:
   1. Section 03 6000, Grouting.
   2. Section 05 0533, Anchor Systems.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. AA ADM-1, Aluminum Design Manual – Specifications for Aluminum Structures.
   2. AISC Specifications for Structural Joints using ASTM A325 or ASTM A490 Bolts, approved by RCSC.
   3. ASTM A325, Specification for Structural Bolts, Steel, Heat-Treated, 120/105 KSI Minimum Tensile Strength.
   4. ASTM A563, Specification for Carbon and Alloy Steel Nuts.
   5. ASTM B209, Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
   6. ASTM B211, Specification for Aluminum and Aluminum-Alloy Bar, Rod, and Wire.
   7. ASTM B221, Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
   8. ASTM B308/B308M, Specification for Aluminum-Alloy 6061-T6 Standard Structural Profiles.
   9. ASTM B429/B429M, Specification for Aluminum-Alloy Extruded Structural Pipe and Tube.
   10. ASTM F436, Standard Specification for Hardened Steel Washers.
   11. ASTM F593, Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
   12. ASTM F594, Specification for Stainless Steel Nuts.
   13. AWS D1.2/D1.2M, Structural Welding Code - Aluminum.
   14. NAAMM AMP 500, Metal Finishes Manual for Architectural and Metal Products.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Welders and Welding Processes:
      a. Qualify welding processes and welding operators in accordance with AWS D1.2/D1.2M.
      b. When requested by Engineer, provide certification that all welders employed on or to be employed on the Work have satisfactorily passed AWS qualification tests within previous 12 months. Ensure that all certifications are current.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Complete details and schedules for fabrication and shop assembly of members and details, schedules, procedures, and diagrams showing proposed sequence of erection. Shop Drawings shall not be reproductions of Contract Drawings.
      b. Include complete information for fabrication of the structure's components, including location, type, and size of bolts, details of blocks, copes and cuts, connections, camber, holes, member sizes and lengths, and other pertinent data. Clearly indicate welds using standard AWS notations and symbols, and clearly show or indicate size, length, and type of each weld.
      c. Provide setting drawings, templates, and directions for installing anchorage devices.
   2. Product Data:
      a. Copies of manufacturer's specifications and installation instructions for products listed below.
         1) Welding electrodes and rods.

B. Informational Submittals: Submit the following:
   1. Certificates.
      a. Welders' certifications, when requested by Engineer.
   2. Test Reports.
      a. Laboratory test reports and other data required to show compliance with the Contract Documents for the following:
         1) Mill test report documenting chemical and physical properties of each type of aluminum framing material.
         2) Mill test report documenting chemical and physical properties of stainless steel connection bolts, nuts, and washers.

1.5 DELIVERY, STORAGE AND HANDLING

A. Deliver materials to the Site at such intervals to ensure uninterrupted progress of the Work.

B. Storage:
   1. Do not store materials in a manner that could cause distortion or damage to the members. Repair or replace damaged materials as directed by Engineer.

PART 2 – PRODUCTS

2.1 MATERIALS

A. Aluminum Types:
   1. Aluminum Shapes: ASTM B308/B308M, Alloy 6061-T6, ASTM B221, Alloy 6061-T6.
   2. Aluminum Tubes and Pipes: ASTM B429, Alloy 6061-T6.
   3. Aluminum Bars and Rods: ASTM B211, Alloy 6061-T6.
   4. Aluminum Plates: ASTM B209, Alloy 6061-T6.

B. Anchorages, Fasteners, and Connectors:
   1. Anchorage Devices: Refer to Section 05 0533 Anchor Systems.
   2. Threaded Fasteners: Stainless steel bolts, ASTM F593, AISI Type 303, and stainless steel nuts and washers, ASTM F594, AISI Type 303.
   3. Bolts used in slip-critical connections shall comply with ASTM A325; nuts shall comply with ASTM A563 Grade DH; and washers shall comply with ASTM F436. Bolts, nuts, and washers shall be zinc-coated by the hot-dip process in accordance with ASTM A325.

C. Electrodes for Welding: ER 5356 complying with AWS D1.2/D1.2M.

D. Finish: Provide mill finish as specified in NAAMM AMP 500.

2.2 FABRICATION

A. Shop Fabrication and Assembly:
   1. General:
      a. Fabricate and assemble structural assemblies in the shop to greatest extent possible. Fabricate items of structural aluminum in accordance with AA ADM-1, the Contract Documents, and as shown on approved Shop Drawings. Provide camber in structural members as shown.
      b. Properly mark and match-mark materials for field assembly. Fabricate for delivery sequence that will expedite erection and minimize handling of materials for storage and minimize handling at the Site.
      c. Where finishing is required, complete the assembly, including welding of units, before commencing finishing operations. Provide finish surfaces of members exposed-to-view in the completed Work that are free of markings, burrs, and other defects.

   2. Connection Design:
      a. The design of connections for any part of the structure not indicated on the Contract Drawings shall be completed by the Contractor, under the supervision of a professional engineer registered in the same state as the Site. Professional engineer shall sign/seal all calculations and shop drawings related to connection design.

B. Connections:
   1. Shop Connections:
      a. Unless otherwise shown or indicated, shop connections may be welded or stainless steel bolted. Unless shown otherwise, welds shall be 1/4-inch minimum.
      b. Where reaction values of a beam are not shown or indicated, connections shall be detailed to support the total uniform load capacity tabulated in AA ADM-1 tables for

allowable loads on beams for the given shape, span, and aluminum specified for beam in question.

c. Shop-welded connections shall be detailed to eliminate or minimize eccentricity in the connection.

d. End connection angles fastened to webs of beams and thickness of angles, size and extent of fasteners or shop welds, shall comply with design standards in AA ADM-

1) Details shown on the Drawings are typical; similar details apply to similar conditions, unless otherwise shown or specified.

2. Fabrication Considerations Regarding Field Connections:

a. Unless otherwise specified below or indicated, make field connections using stainless steel bolts.

b. Field welding is not allowed.

3. Bolted Construction:

a. Stainless steel design shear values shall be based on bolts with bearing type connections with threads in the shear plane.

b. Bolted connections shown or indicated as "SC" shall comply with slip-critical connection requirements in AISC Specifications for Structural Joints using ASTM A325 or ASTM A490 Bolts.

1) Faying surfaces shall have a Class B surface condition.

2) Slip-critical bolts shall be fully pre-tensioned as indicated in AISC Specifications for Structural Joints using ASTM A325 or ASTM A490 Bolts.

c. Minimum bolt diameter shall be 3/4-inch, unless otherwise shown or indicated.

4. Welded Construction: Comply with AWS D1.2/D1.2M for procedures, appearance, and quality of welds, and methods used in correcting defective welding Work.

C. Bracing:

1. Bracing for which stress is not shown or indicated shall have minimum two-bolt connection, or shop-welded connection of equivalent strength.

2. Vertical bracing and knee braces connecting to columns shall be on the centerline of columns, unless otherwise shown or indicated.

3. Knee braces shall be at 45-degree angle, unless otherwise shown or indicated.

4. Connection plates shall be minimum 3/8-inch thick, unless otherwise shown.

D. Columns: Fabrication tolerances shall be as required by AA ADM-1 and AWS D1.2/D1.2M for welded members.

E. Holes and Appurtenances for Other Work:

1. Provide holes required for securing other work to structural aluminum framing, and for passage of other work through framing members, as shown on the Shop Drawings and the Contract Documents. If large block-outs are required and approved, reinforce the webs to develop specified shear strength. Provide threaded nuts welded to framing, and other specialty items as shown to receive other work.

2. Cut, drill, or punch holes perpendicular to metal surfaces. Do not frame cut holes or enlarge holes by burning. Drill holes in bearing plates.

PART 3 – EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which structural aluminum Work will be performed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with Work until unsatisfactory conditions are corrected.

3.2 ERECTION

A. Comply with AA ADM-1 and the Contract Documents.

B. Anchorage Devices:
   1. Provide anchorage devices, including anchor bolts, and other connectors required for securing structural aluminum to foundations and other in-place Work.
   2. Provide templates and other devices necessary for pre-setting anchorage devices to accurate locations.
   3. Refer to Section 05 0533, Anchor Systems, for anchorage requirements.

C. Setting Bases and Bearing Plates: Clean concrete and masonry bearing surfaces of bond-reducing materials and roughen to improve bond to surfaces. Clean bottom surface of base and bearing plates.
   1. Set loose and attached base plates and bearing plates for structural members on stainless steel wedges or other adjusting devices.
   2. Tighten anchorage devices after positioning and plumbing supported members. Do not remove wedges or shims, but if protruding, cut off flush with edge of the base or bearing plate prior to packing with grout.
   3. Place non-shrink grout between bearing surfaces and bases or plates in accordance with Section 03 6000, Grouting. Finish exposed surfaces, protect installed materials, and cure in compliance with grout manufacturer's instructions.
   4. Leveling plates and wood wedges are not allowed.

D. Field Assembly: Set structural frames accurately to lines and elevations indicated. Align and adjust various members forming part of complete frame or structure before permanently fastening. Clean bearing surfaces and other surfaces that will be in permanent contact before assembly. Perform adjustments to compensate for discrepancies in elevations and alignment.
   1. Level and plumb individual members of structure within tolerances specified in AA ADM- For members requiring accurate alignment, provide clip angles, lintels and other members shall be with slotted holes for horizontal adjustment at least 3/8-inch in each direction, or more when required.
   2. Splice members only where shown or indicated.

E. Erection Bolts: On exposed, welded construction, remove erection bolts, fill holes with plug welds, and grind smooth at exposed surfaces.

F. Gas Cutting: Do not use gas-cutting torches at the Site for correcting structural framing fabrication errors. Field-cutting will be allowed only on secondary members that are not under stress, as approved by Engineer. Finish gas-cut sections equal to sheared appearance when allowed.

G. Protection of Aluminum from Dissimilar Materials:

1. Coat surfaces of aluminum that will contact dissimilar materials such as concrete, masonry, and steel, in accordance with Section 09 9100, Painting.

3.3 FIELD QUALITY CONTROL

A. Owner will engage an independent testing and inspection agency to inspect stainless steel bolted connections and welded connections as follows:
   1. Visually inspect all welds. Test wells that appear to be visually deficient using non-destructive methods by qualified testing laboratory. Contractor shall correct improper workmanship by removing and replacing, or repairing, as instructed by Engineer, welds that are defective. Pay for all corrections and subsequent retesting to confirm integrity of welds.
   2. Visually inspect all bolted connections.
      a. Visually inspect connections to verify that plies of connected elements are in snug contact.
      b. For connections that are slip-critical or subject to axial tension, inspector shall verify proper pre-tensioning in accordance with Paragraph 2.2.B.3.b of this Section.
      c. Where bolts or connections are defective, correct improper workmanship and materials by removing defective bolts and connections and replacing or repairing as directed by Engineer. Pay for corrections and subsequent tests required to confirm integrity of connection.
   3. Independent testing and inspection agency shall prepare a report on each structure. Report shall summarize observations made by inspector and be submitted to Engineer.

B. Correct defecctive structural aluminum Work. Perform additional tests, at Contractor's expense, necessary to confirm non-compliance of the original Work and to demonstrate compliance of corrected Work.

+ + END OF SECTION + +

SECTION 05 4000

COLD-FORMED METAL FRAMING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
1. Contractor shall provide all professional services, labor, materials, equipment and incidentals as shown, specified and required to design, furnish and install cold-formed metal framing.
2. The extent of cold-formed metal framing work is generally shown on the Contract Drawings.
3. This Section includes the following:
   a. Load-bearing wall framing
   b. Non-load-bearing wall framing

B. Coordination:
1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before cold-formed metal framing Work.

C. Related Sections:
1. Section 05 0533, Anchor Systems
2. Section 09 2216, Non-Structural Metal Framing.

1.2 REFERENCES

A. Standards referenced in this Section are:
1. AISI D100, Cold-Formed Steel Design Manual.
2. AISI D110, Cold-Formed Steel Framing Design Guide.
3. AISI D112, Brick Veneer Cold-Formed Steel Framing Design Guide.
4. AISI S100, North American Specification for the Design of Cold-Formed Steel Structural Members.
5. AISI S240, North American Standard for Cold-Formed Steel Structural Framing.
6. AISI S400, North American Standard for Seismic Design of Cold-Formed Steel Structural Framing.
7. ASCE 7, Minimum Design Loads for Buildings and Other Structures
8. ASTM A36/A36M, Standard Specification for Carbon Structural Steel.
9. ASTM A123/A123M, Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
10. ASTM A780, Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
11. ASTM C1513, Standard Specification for Steel Tapping Screws for Cold-Formed Steel Framing Connections.
12. ASTM E119, Standard Test Methods for Fire Tests of Building Construction and Materials.
13. ASTM E329, Specification for Agencies Engaged in Construction Inspection, Testing, or Special Inspection.

14. ASTM E1190, Standard Test Methods for Strength of Power-Actuated Fasteners Installed in Structural Members.
15. AWS D1.3, Structural Welding Code-Sheet Steel.

1.3 QUALITY ASSURANCE

A. Qualifications:
1. Manufacturer shall have a minimum of five years' experience producing substantially similar products and shall be able to show evidence of at least five installations in satisfactory operation for at least five years.
2. Professional Engineer:
   a. Engage a registered professional engineer legally qualified to practice in the same jurisdiction as the Site and experienced in providing engineering services of the kind indicated.
   b. Submit qualifications data.
   c. Responsibilities include:
      1) Carefully reviewing cold-formed metal framing performance and design criteria stated in the Contract Documents.
      2) Preparing written requests for clarifications or interpretations of performance or design criteria for submittal to Engineer by Contractor.
      3) Preparing or supervising preparation of design calculations and related drawings, Shop Drawings, and comprehensive engineering analyses verifying compliance of cold-formed metal framing with requirements of the Contract Documents.
      4) Signing and sealing all calculations, design drawings, and Shop Drawings.
      5) Certifying that:
         a) it has performed the design of cold-formed metal framing in accordance with performance and design criteria stated in the Contract Documents, and
         b) said design conforms to all applicable local, state, and federal Laws and Regulations, and to prevailing standards of practice
3. Installer:
   a. Engage a single installer skilled, trained and with documented experience in the erection of cold-formed metal framing systems with specific skill and successful experience in the erection of the types of components required.
4. Testing Laboratory:
   a. Retain the services of independent testing laboratory to perform testing and determine compliance with the Contract Documents of the materials specified in this Section.
   b. Testing laboratory shall comply with the requirements of Section 01 45 29.13, Testing Laboratory Services Furnished by Contractor, and demonstrate to Engineer's satisfaction, based on evaluation of criteria submitted by testing agency, that it has the experience and capability to satisfactorily conduct the testing indicated, in accordance with ASTM E329.
5. Welders and Welding Processes:
   a. Qualify procedures and personnel according to AWS D1.3.
   b. Submit certification that each welder employed on or to be employed for the Work possesses current AWS certification in the welding process with which welder will be working. Certifications shall be current and valid throughout the Work

B. Component Supply and Compatibility:

1. Obtain all products included in this Section regardless of the component manufacturer from a single cold-formed metal framing manufacturer.
2. The cold-formed metal framing manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.
3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the cold-formed metal framing manufacturer.

C. Product Tests: Mill certificates or data from a qualified independent testing agency or in-house testing with calibrated test equipment indicating steel sheet complies with requirements, including base-metal thickness, yield strength, tensile strength, total elongation, chemical requirements, and metallic-coating thickness.

D. Fire-Test-Response Characteristics: Where indicated, provide cold-formed metal framing identical to that of assemblies tested for fire resistance per ASTM E119 by a testing and inspecting agency acceptable to authorities having jurisdiction.

E. Regulatory Requirements: Comply with applicable requirements of Laws and Regulations, including governing building codes. Fabricate and label structural cold-formed metal framing to comply with material verification and special inspection requirements of the governing Building Code and Authorities Having Jurisdiction at the Site.

F. Pre-installation Conference:
1. Prior to erection of cold-formed metal system components and associated Work, Contractor shall schedule and meet at the Site with installer of each component of associated Work, the installers of substrate construction to receive the cold-formed metal systems Work, the installers of other Work around cold-formed metal system that follows the cold-formed metal system Work, Engineer and other representatives directly concerned with performance of the Work. Review foreseeable methods and procedures related to the cold-formed metal system Work, including but not necessarily limited to, the following:
   a. Review Project requirements and the Contract Documents.
   b. Review required submittals, both completed and yet to be completed.
   c. Review status of mock-ups.
   d. Review construction schedule and availability of materials, tradesmen, equipment and facilities needed to make progress and avoid delays.
   e. Review regulations concerning code compliance, environmental protection, health, safety, fire and similar considerations.
   f. Review procedures needed for protection of cold-formed metal systems during the remainder of the construction period.
   g. Review required inspection, testing, and certifying procedures.
2. Record the discussions of the conference and the decisions and agreements or disagreements reached, and furnish a copy of the record to each party attending.
3. Record all revisions or changes agreed upon, reasons therefore, and parties agreeing or disagreeing with them.
4. Reconvene the meeting at the earliest opportunity if additional information must be developed in order to conclude the subjects under consideration.

1.4 SUBMITTALS

A. Action Submittals:
1. Shop Drawings:

a. Detailed Shop Drawings for fabrication and erection showing in plan the location of products, elevations, and details for the cold-formed metal framing Work. Show all accessory items to provide a complete installation; reinforcing channels, opening framing, supplemental framing, strapping, bracing, bridging, splices, accessories, connection details, and attachment to adjoining work. Include details of all connections between all materials.
b. Show layout, spacings, sizes, thicknesses, and types of cold-formed metal framing; fabrication; and fastening and anchorage details, including mechanical fasteners.

2. Product Data:
a. Supplier's published literature for cold-formed metal framing proposed for each type of cold-formed metal framing product and accessory proposed.

B. Delegated Design Submittals:
1. Design Data: Submit the following:
a. Design Calculations:
1) Complete calculations for the cold-formed metal framing systems as one package with the Shop Drawings. Structural calculations shall include all specified performance criteria, required load cases and load combinations used in the design and resulting member forces, reactions, deflections, and other anticipated movements in the cold-formed metal framing system. The magnitude of reactions on supporting structures from all critical load combinations shall be tabulated separately. Critical load combinations used in the final sizing of members shall be emphasized. All calculations and assumptions shall be presented so that Engineer can easily follow the progress and logic of Contractor's professional engineer. The design analysis shall include the name and office phone number of the designer to answer questions during the shop drawing review.
2) Design calculations shall be signed, sealed, and dated by Contractor's professional engineer. State of professional engineer's registration, registration number, and name on seal shall be clearly legible.

C. Informational Submittals:
1. Certificates:
a. Certification by professional engineer that metal building system design is in accordance with performance and design criteria stated in the Contract Documents, and that design conforms to applicable local, state, and federal Laws and Regulations, and to prevailing standards of practice.
b. Tests and Evaluation Reports:
1) Material test reports: From a qualified testing laboratory indicating and interpreting material test results of cold-formed metal framing system components, for compliance with requirements specified, including but not limited to:
a) Steel sheet
b) Mechanical fasteners
c) Power-actuated fasteners
d) Vertical deflection clips.
e) Horizontal drift deflection clips
f) Structural clips and accessories
2) Research/Evaluation Reports: For cold-formed metal framing.
2. Manufacturer's instructions:
a. Indicate preparation requirements and assembly sequence.
b. Installation data.

3. Qualification Statements:
    a. Manufacturer
    b. Professional Engineer
    c. Installer
    d. Testing Laboratory
    e. Welders and welding processes

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect cold-formed metal framing from corrosion, deformation, and other damage during delivery, storage, and handling.

B. Store cold-formed metal framing, protect with a waterproof covering, and ventilate to avoid condensation.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. System description, general:
1. Cold-formed metal systems include complete, integrated sets of components and assemblies capable of withstanding structural and other loadings and thermally induced movements, without failure. The system includes all components necessary to complete the Work in a manner that provides a completely functioning system, complying with requirements shown and specified, all requirements of manufacturer, and governing authorities having jurisdiction at the Site.
2. Comply with AISI's "North American Specification for the Design of Cold-Formed Steel Structural Members" and its "Standard for Cold-Formed Steel Framing - General Provisions."
3. In some cases, incidental accessories necessary to the proper functioning of the specified system may not be mentioned in the Specifications. Contractor shall follow the recommendations of the approved manufacturer and provide systems and components with all required incidental accessories and component items necessary for the proper functioning of the systems, at no additional expense to Owner. Provide materials matching the specified material and finish of similar items.
4. Provide specified material gages, or heavier gages, if calculations based on performance criteria indicate the need for heavier gage material. Where compliance with performance criteria indicates that materials of lesser gage, or size, may be adequate, provide specified gages and sizes as minimum acceptable standard.
5. Requirements for interior, non-load bearing, metal stud framing are in Section 09 2216, Non-Structural Metal Framing.

B. Design Criteria:
1. Provide cold-formed metal framing systems capable of withstanding controlling effects of gravity and lateral loads per the basic load and load combinations in accordance with Laws and Regulations. Comply with 2017 Ohio Building Code, ASCE 7, applicable AISI standards, specifications, and publications, except to the extent more stringent requirements are specified or required by governing authorities having jurisdiction at the Site.
2. Design Loads:

a. As indicated in the Drawings and in accordance with all governing building codes.
b. Site specific load factors for Snow, Wind and Seismic loads are indicated in the Contract Drawings.

3. Deflection Limits: Design framing systems to withstand design loads without deflections greater than the following:
   a. Exterior wall framing or framing supporting masonry: Horizontal deflection of 1/600 of the wall height.
   b. Design exterior wall framing to accommodate horizontal deflection without regard for contribution of sheathing materials.

2.2 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide cold-formed metal framing by one of the following:
   1. ClarkDietrich
   2. Or equal.

2.3 MATERIALS

A. Steel Sheet: ASTM A 1003/A 1003M, Structural Grade, Type H, metallic coated, of grade and coating weight as follows:
   1. Grade: Minimum ST33H; 33,000 ksi or as required by structural performance.
   2. Coating: G60.

2.4 LOAD-BEARING WALL FRAMING

A. Steel Studs: Manufacturer's standard C-shaped steel studs, of web depths indicated, punched, with stiffened flanges, and as follows:
   1. Minimum Base-Metal Thickness: 0.0538 inch.
   2. Flange Width: Minimum 1-5/8 inches.

B. Steel Track: Manufacturer's standard U-shaped steel track, of web depths indicated, unpunched, with straight flanges, and as follows:
   1. Minimum Base-Metal Thickness: 0.0538 inch**.**
   2. Flange Width: Manufacturer standard.

C. Steel Box or Back-to-Back Headers: Manufacturer's standard C-shapes used to form header beams, of web depths indicated, punched, with stiffened flanges, and as follows:
   1. Minimum Base-Metal Thickness: 0.0538 inch.
   2. Flange Width: 1-5/8 inches.

2.5 NON-LOAD-BEARING WALL FRAMING

A. Steel Studs: Manufacturer's standard C-shaped steel studs, of web depths indicated, punched, with stiffened flanges, and as follows:
   1. Minimum Base-Metal Thickness: 0.0428 inch.
   2. Flange Width: 1-3/8 inches.
   3. Depth: As required by manufacturer design and as indicated in the Drawings.

B. Steel Track: Manufacturer's standard U-shaped steel track, of web depths indicated, unpunched, with unstiffened flanges, and as follows:

1. Minimum Base-Metal Thickness: Matching steel studs.
2. Flange Width: Manufacturer standard.

C. Vertical Deflection Clips: Manufacturer's standard head clips, capable of accommodating upward and downward vertical displacement of primary structure through positive mechanical attachment to stud web.

D. Single Deflection Track: Manufacturer's single, deep-leg, U-shaped steel track; unpunched, with unstiffened flanges, of web depth to contain studs while allowing free vertical movement, with flanges designed to support horizontal and lateral loads and transfer them to the primary structure, and as follows:
1. Minimum Base-Metal Thickness: 0.0538 inch.
2. Flange Width: 1 inch plus the design gap where applicable.

E. Drift Clips: Manufacturer's standard bypass or head clips, capable of isolating wall stud from upward and downward vertical displacement and lateral drift of primary structure.

2.6 FRAMING ACCESSORIES

A. Fabricate steel-framing accessories from steel sheet, ASTM A1003/A1003M, Structural Grade, Type H, metallic coated, of same grade and coating weight used for framing members.

B. Provide accessories of manufacturer's standard thickness and configuration, unless otherwise indicated, as follows:
1. Supplementary framing.
2. Bracing, bridging, and solid blocking.
3. Web stiffeners.
4. Anchor clips.
5. End clips.
6. Gusset plates.
7. Stud kickers, knee braces, and girts.
8. End closures.
9. Backer plates.

2.7 ANCHORS, CLIPS, AND FASTENERS

A. Steel Shapes and Clips: ASTM A36/A36M, zinc coated by hot-dip process according to ASTM A123/A123M.

B. Expansion Anchors: Refer to Specification Section 05 0533, Anchor Systems.

C. Power-Actuated Fasteners: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with capability to sustain, without failure, a load equal to 10 times design load, as determined by testing per ASTM E1190 conducted by a qualified independent testing agency.

D. Mechanical Fasteners: ASTM C1513, corrosion-resistant-coated, self-drilling, self-tapping steel drill screws.
1. Head Type: Low-profile head beneath sheathing, manufacturer's standard elsewhere.

E. Welding Electrodes: Comply with AWS standards.

2.8 MISCELLANEOUS MATERIALS

A. Galvanizing Repair Paint: SSPC-Paint 20, ASTM A780.

B. Shims: Load bearing, high-density multimonomer plastic, nonleaching.

2.9 FABRICATION

A. Fabricate cold-formed metal framing and accessories plumb, square, and true to line, and with connections securely fastened, according to referenced AISI's specifications and standards, manufacturer's written instructions, and requirements in this Section.
   1. Fabricate framing assemblies using jigs or templates.
   2. Cut framing members by sawing or shearing; do not torch cut.
   3. Fasten cold-formed metal framing members by welding, screw fastening, clinch fastening, or riveting as standard with fabricator. Wire tying of framing members is not permitted.
      a. Comply with AWS D1.3 requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
      b. Locate mechanical fasteners and install according to Shop Drawings, with screw penetrating joined members by not less than three exposed screw threads.
   4. Fasten other materials to cold-formed metal framing by welding, bolting, or screw fastening, according to Shop Drawings.

B. Reinforce, stiffen, and brace framing assemblies to withstand handling, delivery, and erection stresses. Lift fabricated assemblies to prevent damage or permanent distortion.

C. Fabrication Tolerances: Fabricate assemblies level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet and as follows:
   1. Spacing: Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.
   2. Squareness: Fabricate each cold-formed metal framing assembly to a maximum out-of-square tolerance of 1/8 inch.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine supporting substrates and abutting structural framing for compliance with requirements for installation tolerances and other conditions affecting performance.
   1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Before sprayed fire-resistive materials are applied, attach continuous angles, supplementary framing, or tracks to structural members indicated to receive sprayed fire-resistive materials.

B. After applying sprayed fire-resistive materials, remove only as much of these materials as needed to complete installation of cold-formed framing without reducing thickness of fire-resistive materials below that are required to obtain fire-resistance rating indicated. Protect remaining fire-resistive materials from damage.

C. Install load bearing shims or grout between the underside of wall bottom track or rim track and the top of foundation wall or slab at stud or joist locations to ensure a uniform bearing surface on supporting concrete or masonry construction.

D. Install sealer gaskets to isolate the underside of wall bottom track or rim track and the top of foundation wall or slab at stud or joist locations.

3.3 INSTALLATION, GENERAL

A. Cold-formed metal framing may be shop or field fabricated for installation, or it may be field assembled.

B. Install cold-formed metal framing according to AISI's "Standard for Cold-Formed Steel Framing - General Provisions" and to manufacturer's written instructions unless more stringent requirements are indicated.

C. Install shop- or field-fabricated, cold-formed framing and securely anchor to supporting structure.
   1. Screw, bolt, or weld wall panels at horizontal and vertical junctures to produce flush, even, true-to-line joints with maximum variation in plane and true position between fabricated panels not exceeding 1/16 inch.

D. Install cold-formed metal framing and accessories plumb, square, and true to line, and with connections securely fastened.
   1. Cut framing members by sawing or shearing; do not torch cut.
   2. Fasten cold-formed metal framing members by welding, screw fastening, clinch fastening, or riveting. Wire tying of framing members is not permitted.
      a. Comply with AWS D1.3 requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
      b. Locate mechanical fasteners and install according to Shop Drawings, and complying with requirements for spacing, edge distances, and screw penetration.

E. Install framing members in one-piece lengths unless splice connections are indicated for track or tension members.

F. Install temporary bracing and supports to secure framing and support loads comparable in intensity to those for which structure was designed. Maintain braces and supports in place, undisturbed, until entire integrated supporting structure has been completed and permanent connections to framing are secured.

G. Do not bridge building expansion and control joints with cold-formed metal framing. Independently frame both sides of joints.

H. Install insulation, specified in Division 7, in built-up exterior framing members, such as headers, sills, boxed joists, and multiple studs at openings, that are inaccessible on completion of framing work.

I. Fasten hole reinforcing plate over web penetrations that exceed size of manufacturer's standard punched openings.

J. Erection Tolerances: Install cold-formed metal framing level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet and as follows:

1. Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.

3.4 LOAD-BEARING WALL INSTALLATION

A. Install continuous top and bottom tracks sized to match studs. Align tracks accurately and securely anchor at corners and ends, and at spacings as follows:
   1. Anchor Spacing: To match stud spacing.

B. Squarely seat studs against top and bottom tracks with gap not exceeding of 1/8 inch between the end of wall framing member and the web of track. Fasten both flanges of studs to top and bottom tracks. Space studs as follows:
   1. Stud Spacing: 12 inches, or as required to coordinate and align with masonry and stone anchors.

C. Set studs plumb, except as needed for diagonal bracing or required for non-plumb walls or warped surfaces and similar configurations.

D. Align studs vertically where floor framing interrupts wall-framing continuity. Where studs cannot be aligned, continuously reinforce track to transfer loads.

E. Align floor and roof framing over studs. Where framing cannot be aligned, continuously reinforce track to transfer loads.

F. Anchor studs abutting structural columns or walls, including masonry walls, to supporting structure as indicated.

G. Install headers over wall openings wider than stud spacing. Locate headers above openings as indicated. Fabricate headers of compound shapes indicated or required to transfer load to supporting studs, complete with clip-angle connectors, web stiffeners, or gusset plates.
   1. Frame wall openings with not less than a double stud at each jamb of frame as indicated on Shop Drawings. Fasten jamb members together to uniformly distribute loads.
   2. Install runner tracks and jack studs above and below wall openings. Anchor tracks to jamb studs with clip angles or by welding, and space jack studs same as full-height wall studs.

H. Install supplementary framing, blocking, and bracing in stud framing indicated to support fixtures, equipment, services, casework, heavy trim, furnishings, and similar work requiring attachment to framing.
   1. If type of supplementary support is not indicated, comply with stud manufacturer's written recommendations and industry standards in each case, considering weight or load resulting from item supported.

I. Install horizontal bridging in stud system, spaced 48 inches or as indicated in the Drawings**.** Fasten at each stud intersection.
   1. Bridging: Cold-rolled steel channel, welded or mechanically fastened to webs of punched studs with a minimum of 2 screws into each flange of the clip angle for framing members up to 6 inches deep.
   2. Bridging: Combination of flat, taut, steel sheet straps of width and thickness indicated and stud-track solid blocking of width and thickness to match studs. Fasten flat straps to stud flanges and secure solid blocking to stud webs or flanges.

3. Bridging: Proprietary bridging bars installed according to manufacturer's written instructions.

J. Install steel sheet diagonal bracing straps to both stud flanges, terminate at and fasten to reinforced top and bottom tracks. Fasten clip-angle connectors to multiple studs at ends of bracing and anchor to structure.

K. Install miscellaneous framing and connections, including supplementary framing, web stiffeners, clip angles, continuous angles, anchors, and fasteners, to provide a complete and stable wall-framing system.

3.5 EXTERIOR NON-LOAD-BEARING WALL INSTALLATION

A. Install continuous tracks sized to match studs. Align tracks accurately and securely anchor to supporting structure as indicated.

B. Fasten both flanges of studs to top and bottom track, unless otherwise indicated. Space studs as follows:
1. Stud Spacing: 16 inches, maximum, or as required to coordinate and align with masonry and stone anchors.

C. Set studs plumb, except as needed for diagonal bracing or required for non-plumb walls or warped surfaces and similar requirements.

D. Isolate non-load-bearing steel framing from building structure to prevent transfer of vertical loads while providing lateral support.
1. Install single-leg deflection tracks and anchor to building structure.
2. Install double deep-leg deflection tracks and anchor outer track to building structure.
3. Connect vertical deflection clips to studs and anchor to building structure.
4. Connect drift clips to cold formed metal framing and anchor to building structure.

E. Install horizontal bridging in wall studs, spaced in rows indicated on Shop Drawings but not more than 48 inches apart. Fasten at each stud intersection.
1. Top Bridging for Single Deflection Track: Install row of horizontal bridging within 12 inches of single deflection track. Install a combination of flat, taut, steel sheet straps of width and thickness indicated and stud or stud-track solid blocking of width and thickness matching studs. Fasten flat straps to stud flanges and secure solid blocking to stud webs or flanges.
   a. Install solid blocking at 96-inch or as required by manufacturer design.
2. Bridging: Cold-rolled steel channel, welded or mechanically fastened to webs of punched studs.
3. Bridging: Combination of flat, taut, steel sheet straps of width and thickness indicated and stud-track solid blocking of width and thickness to match studs. Fasten flat straps to stud flanges and secure solid blocking to stud webs or flanges.
4. Bridging: Proprietary bridging bars installed according to manufacturer's written instructions.

F. Install miscellaneous framing and connections, including stud kickers, web stiffeners, clip angles, continuous angles, anchors, fasteners, and stud girts, to provide a complete and stable wall-framing system.

3.6 FIELD QUALITY CONTROL

A. Owner will engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.

B. Field and shop welds will be subject to testing and inspecting.

C. Testing agency will report test results promptly and in writing to Contractor and Engineer.

D. Remove and replace work where test results indicate that it does not comply with specified requirements.

E. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.7 REPAIRS AND PROTECTION

A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on fabricated and installed cold-formed metal framing with galvanized repair paint according to ASTM A780 and manufacturer's written instructions.

B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that cold-formed metal framing is without damage or deterioration at time of Substantial Completion.

END OF SECTION 05 4000

SECTION 05 5013

MISCELLANEOUS METAL FABRICATIONS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all professional services, labor, materials, equipment, and incidentals as shown, specified, and required to furnish miscellaneous metal fabrications including surface preparation and shop priming.
   2. The Work also includes:
      a. Providing openings in miscellaneous metal fabrications to accommodate the Work under this and other Sections, and attaching to miscellaneous metal fabrications all items such as sleeves, bands, studs, fasteners, and all items required for which provision is not specifically included under other Sections.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the Work to be installed with, or attached to miscellaneous metal fabrications Work.
   2. Hot-dip Galvanizing: Coordinate with steel fabricator detailing for and fabrication of assemblies to be hot-dip galvanized, to minimize distortion during galvanizing process.

C. Related Sections:
   1. Section 03 6000, Grouting.
   2. Section 05 0533, Anchor Systems.
   3. Section 05 5215, Aluminum Handrails and Railings.
   4. Section 05 5316, Aluminum Grating.
   5. Section 09 9100, Painting,

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ANSI A14.3, Ladders – Fixed –Safety Requirements.
   2. ANSI Z359.1, Safety Requirements for Personal Fall Arrest Systems, Subsystems, and Components.
   3. ASTM A36/A36M, Specification for Carbon Structural Steel.
   4. ASTM A53/A53M, Specification for Pipe Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
   5. ASTM A123/A123M, Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
   6. ASTM A153/A153M, Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
   7. ASTM A240/A240M, Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet and Strip for Pressure Vessels and for General Applications.
   8. ASTM A320/A320M, Specification for Alloy-Steel and Stainless Steel Bolting Materials for Low-Temperature Service.
   9. ASTM A384/A384M-02 Standard Practice for Safeguarding Against Warpage and Distortion During Hot-Dip Galvanizing of Steel Assemblies.

10. ASTM A500, Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
11. ASTM A572/A572M, Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel.
12. ASTM A786/A786M, Specification for Hot-Rolled Carbon, Low-Alloy, High-Strength Low-Alloy, and Alloy Steel Floor Plates.
13. ASTM A793, Specification for Rolled Floor Plate, Stainless Steel.
14. ASTM A992/A992M, Specification for Structural Steel Shapes.
15. ASTM A1085/A1085M, Specification for Cold-Formed Welded Carbon Steel Hollow Structural Sections (HSS).
16. ASTM B209, Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
17. ASTM B211, Specification for Aluminum and Aluminum-Alloy Bar, Rod and Wire.
18. ASTM B221, Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
19. ASTM B308/B308M, Specification for Aluminum-Alloy 6061-T6 Standard Structural Profiles.
20. ASTM B429, Specification for Aluminum-Alloy Extruded Structural Pipe and Tube.
21. ASTM B632/B632M, Specification for Aluminum-Alloy Rolled Tread Plate.
22. AWS D1.1/D1.1M, Structural Welding Code – Steel.
23. AWS D1.2/D1.2M, Structural Welding Code – Aluminum.
24. AWS D1.6, Structural Welding Code – Stainless Steel.
25. NAAMM, Metal Finishes Manual.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Welding:
      a. Qualify welding processes and welding operators in accordance with AWS D1.1/D1.1M, D1.2/D1.2M, or D1.6, as applicable.
      b. When requested by Engineer, provide certification that each welder employed on or to be employed for the Work have satisfactorily passed AWS qualification tests within previous 12 months. Ensure that all certifications are current.

B. Regulatory Requirements: Conform to the following:
   1. 29 CFR 1910, Occupational Health and Safety Standards.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Fabrication and erection details for assemblies of miscellaneous metal Work. Include plans, elevations, and details of sections and connections. Show anchorage and accessory items. Include setting drawings and templates for locating and installing miscellaneous metal items and anchorage devices.
   2. Product Data:
      a. Copies of manufacturer's specifications, load tables, dimension diagrams, anchor details, and installation instructions for products to be used in miscellaneous metal Work.

B. Informational Submittals: Submit the following:
   1. Test and Evaluation Reports:

a. Mill test report that indicate chemical and physical properties of each type of material, when requested by Engineer.

2. Qualifications Statements:
   a. Copies of welder's certifications, when requested by Engineer.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling and Unloading:
   1. Deliver products to Site to ensure uninterrupted progress of the Work. Deliver anchorage materials to be embedded in other construction in ample time to prevent delaying the Work.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Steel:
   1. W-Shapes and WT-Shapes: ASTM A992/A992M.
   2. S-Shapes and Channels: ASTM A572/A572M, Grade 50.
   3. Hollow Structural Sections: ASTM A1085 or ASTM A500/A500M, Grade C.
   4. Angles, Plates, Bars: ASTM A36/A36M.
   5. Steel Pipe: ASTM A53/A53M, Grade B.

B. Aluminum:
   1. Aluminum Shapes: ASTM B308/B308M, Alloy 6061-T6, ASTM B 221, Alloy 6061-T6.
   2. Aluminum Tubes and Pipes: ASTM B429, Alloy 6061-T6.
   3. Aluminum Bars and Rod: ASTM B211, Alloy 6061-T6.
   4. Aluminum Plates: ASTM B209, Alloy 6061-T6.

C. Stainless Steel:
   1. Plates and Sheets: ASTM A240/A240M, Type 304L or Type 316 stainless steel.
   2. Submerged or Intermittently Submerged: Type 316 stainless steel.
   3. Non-submerged: Type 304L stainless steel.

D. Stainless Steel Fasteners and Fittings: ASTM A 320/A 320M, Type 304L or Type 316 Stainless Steel.

E. Zinc-coated Hardware: ASTM A153/A153M.

2.2 MISCELLANEOUS METAL ITEMS

A. Shop Assembly:
   1. Pre-assemble items in the shop to the greatest extent possible to minimize field-splicing and field-assembly of units at the Site. Disassemble units only to extent necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

B. Aluminum Ladders:
   1. Fabricate ladders for locations shown or indicated with dimensions, spacing, details, and anchorages as shown and specified. Comply with OSHA 29 CFR 1910 and ANSI A14.3, except as otherwise shown or specified.

a. Unless otherwise shown, provide 1.5-inch diameter continuous side rails, spaced at least 1.5 feet apart.
b. Provide extruded square rungs, spaced maximum of 12 inches on centers, with non-slip surface on top of each rung. Adhesive strips for non-slip surfaces are not acceptable.

2. Fit rungs in centerline of side rails, plug weld, and grind smooth on outer rail faces.
3. Support each ladder at top and bottom and at intermediate points spaced not more than five feet on centers.
4. Use welded or bolted brackets, designed for adequate support and anchorage, and to hold ladder clear of wall surface with minimum of seven inches between wall and centerline of rungs.
5. Unless otherwise shown or approved by ENGINEER, extend rails 3.5 feet above top rung, and return rails to wall or structure, unless other secure handholds are provided. If adjacent structure does not extend above top rung, goose-neck extended rails back to structure to provide secure ladder access.
   Use extruded aluminum conforming to alloy and temper 6061-T6.

C. Safety Post:
1. Provide safety post for each fixed access ladder located below an access hatch. Safety post shall be manufactured of high-strength structural material with telescoping tubular section that locks automatically when fully extended.
2. Products and Manufacturers: Provide products of one of the following:
   a. LadderUP Safety Post by Bilco Company
   b. Or equal.
3. Use upward and downward movement of post shall be controlled by stainless steel spring balancing mechanism.
4. Safety post shall be hot-dip galvanized steel.

D. Steel Lintels:
1. Provide loose structural steel lintels for openings and recesses in masonry walls and brick walls as specified or as shown.
2. Weld adjoining members together to form a single unit, where shown or indicated.
3. Provide not less than eight inches bearing at each side of openings, unless otherwise shown.
4. Steel lintels to be installed in exterior walls shall be hot-dip galvanized and finish painted. Other steel lintels shall be painted.
5. Surface preparation and painting shall conform to Section 09 9100, Painting.
6. Where lintels are not shown on the Drawings, provide lintels as specified in the following table. Provide other lintels where shown and of size indicated on the Drawings.

Clear Span (Max)	Exterior Angle	Interior Angles (typical 8-inch wall)
4.0 feet	3.5 inches by 3.5 inches by 5/16 inches	Two 3.5 inches by 3.5 inches by 5/16 inches
6.0 feet	Four inches by 3.5-inches by 5/16 inches	Two 4 inches by 3.5 inches by 5/16 inches
8.0 feet	Five inches by 3.5 inches by 5/16 inches	Two 5 inches by 3.5 inches by 5/16 inches

E. Shelf Angles:
   1. Provide structural steel shelf angles of sizes shown, for attachment to concrete or masonry construction. Provide slotted holes to receive 3/4-inch bolts, spaced not more than six inches from ends and not more than 2.0 feet on centers, unless otherwise shown.
      a. Provide galvanized shelf angles on outdoor construction.
   2. Provide wedge-type concrete inserts, complete with fasteners, for attachment of shelf angles to cast-in-place concrete.

F. Aluminum Stair Nosings:
   1. Manufacturers: Provide products of one of the following:
      a. Supergrit Type 241BF by Wooster Products, Inc.
      b. Or equal.
   2. Fabricate extruded aluminum nosing of sizes and configurations as shown on the Drawings.
      a. Unless otherwise shown, provide ribbed abrasive filled type, using black abrasive filler.
   3. Provide anchors for embedding in concrete, either integral or applied to treads, as standard with manufacturer.

G. Bollards:
   1. Provide Schedule 80 galvanized steel pipe filled with concrete as shown on the Drawings. Paint as required in accordance ith Section 09 9100, Painting. Unless otherwise shown or specified, finish-paint bollard “Safety Yellow.”

H. Miscellaneous Framing and Supports:
   1. Provide miscellaneous metal framing and supports that are not part of structural steel or aluminum framework and are required to complete the Work.
   2. Fabricate miscellaneous units to sizes, shapes, and profiles shown on the Drawings or, if not shown, of required dimensions to receive adjacent grating, plates, tanks, doors, and other work to be retained by the framing.
   3. Except as otherwise shown, fabricate from structural shapes, plates, and bars, of all-welded construction using mitered corners, welded brackets, and splice plates and minimum number of joints for field connection.
   4. Cut, drill, and tap units to receive hardware and similar items to be anchored to the Work.
   5. Furnish units with integrally welded anchors for casting into concrete or building into masonry. Furnish inserts if units are to be installed after concrete is placed.
      a. Except as otherwise shown, space anchors, 2.0 feet on centers, and provide units the equivalent of 1.25-inch by 1/4-inch by eight-inch strips.
      b. Galvanize exterior miscellaneous frames and supports.
      c. Where shown or indicated, galvanize miscellaneous frames and supports that are not to be installed outdoors.
   6. Miscellaneous steel framing and supports shall be hot-dip galvanized and finish-painted, unless otherwise shown or indicated.
   7. For railings, refer to Section 05 5215, Aluminum Handrails and Railing.
   8. For grating requirements refer to Section 05 5316, Aluminum Grating.
   9. Surface preparation and painting of galvanized surface shall conform to Section 09 9100, Painting

I. Steel Raised-pattern Floor Plate:
   1. Provide raised-pattern floor plate conforming to ASTM A786/A786M and manufacturer’s standards. Plates shall be of thicknesses shown.
   2. Products and Manufacturers: Provide products of one of the following:

a. 4-Way Safety Steel Plate, by Ryerson Tull Company.
b. Raised Pattern Steel Floor Plate, by Central Steel and Wire Company.
c. Or equal.

3. Provide removable plates at locations and sizes shown. Provide perforated plates where shown.
4. Provide each plate section with four lifting handles as recommended by manufacturer. Lifting handles shall be recessed, drop handle type. Maximum weight of checkered plate or plank section shall be 150 pounds.
5. Finish: Hot-dip galvanize in accordance with ASTM A123/A123M.

J. Hurricane Tie Down:
1. Product and Manufacturer:
a. Seismic/Hurricane Tie H3 by Simpson Strong Tie
b. Or Equal.
2. Minimum 18-gage hot dip galvanized steel connector with hot dip galvanized or stainless steel fasteners. Fasteners shall be as recommended per approved tie manufacturer for the maximum tabulated loads.

K. Fasteners and Hardware: Provide Type 316 stainless steel fasteners for aluminum fabrications and zinc-coated hardware for galvanized fabrications, unless otherwise shown or specified.

L. Anchors and Expansion Anchors: Refer to Section 05 0533, Anchor Systems.

2.3 FINISHING

A. Surface Preparation and Shop Priming: Perform surface preparation and apply primer coat to miscellaneous metal fabrications in the shop. Conform to surface preparation and shop priming requirements in Section 09 9100, Painting.

B. Galvanizing:
1. Galvanizing of fabricated steel items shall comply with ASTM A123/A123M.
2. Details of fabrication of steel items and assemblies to be hot-dip galvanized shall conform to recommendations of ASTM A384/A384M to minimize the potential for distortion.

C. Aluminum Finish: Provide natural mill finish for aluminum Work unless otherwise shown or specified.

2.4 SOURCE QUALITY CONTROL

A. Tests and Inspections:
1. Materials and fabrication procedures shall be subject to inspection and tests in the mill, shop, and field, conducted by a qualified inspection agency. Such inspections and tests will not relieve Contractor of responsibility for providing materials and fabrication procedures complying with the Contract Documents.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions under which the Work is to be performed and notify Engineer in writing of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Install miscellaneous metal fabrications accurately in location, alignment, and elevation, plumb, level, true, and free of rack, measured from established lines and levels. Brace temporarily or anchor temporarily in formwork where fabrications are to be built into concrete, masonry, or other construction.

B. Anchor securely as shown and as required for the intended use, using concealed anchors where possible.

C. Manufactured items:
   1. Strictly follow all manufacturer's printed installation instructions.

D. Fit exposed connections accurately together to form tight, hairline joints. Field-weld steel connections that are not to be exposed joints and cannot be shop-welded because of shipping size limitations. Comply with AWS D1.1/D1.1M, D1.2/D1.2M and D1.6, as applicable to the material being welded. Grind steel joints smooth and touch-up shop paint coat. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication, and are intended for bolted or screwed field connections.

E. Protection of Aluminum from Dissimilar Materials:
   1. Coat surfaces of aluminum that will contact dissimilar materials such as concrete, masonry, and steel, in accordance with Section 09 9100, Painting.

END OF SECTION 05 5013

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 05 5215

ALUMINUM HANDRAILS AND RAILINGS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
1. Contractor shall provide all labor, materials, tools, equipment, and incidentals as shown, specified, and required to furnish and install aluminum handrail and railing systems. The Work also includes:
   a. Providing openings in, and attachments to, aluminum handrail and railing systems to accommodate the Work under this and other Specification Sections. Provide all items for aluminum handrails and railings, including anchorages, fasteners, studs, and other items required for which provision for is not specifically included under other Sections.
   b. Provide openings in and attachments to aluminum handrails and railings to accommodate work under other contracts. Assist other contractors in building on or attaching to aluminum handrails and railings all items such as fasteners and other items required for which provision is not specifically included under other contracts.
2. Aluminum handrails and railings Work shall include components and features shown and specified, and all components and features available from specified manufacturers required for providing complete aluminum handrail and railing system in accordance with the Contract Documents.

B. Coordination:
1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before aluminum handrails and railings Work.
2. Aluminum handrail and railing locations shall comply with Laws and Regulations.

C. Related Sections:
1. Section 03 6000, Grouting.
2. Section 05 0533, Anchor Systems.
3. Section 09 9100, Painting.

1.2 REFERENCES

A. Standards referenced in this Section are:
1. AA, Aluminum Design Manual.
2. ASTM B26/B26M, Specification for Aluminum-Alloy Sand Castings.
3. ASTM B117, Standard Practice for Operating Salt Spray (Fog) Apparatus.
4. ASTM B136, Standard Method for Measurement of Stain Resistance of Anodic Coatings on Aluminum.
5. ASTM B137, Standard Test Method for Measurement of Coating Mass per Unit Area on Anodically Coated Aluminum.
6. ASTM B221, Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and Tubes.
7. ASTM B241/B241M, Specification for Aluminum and Aluminum-Alloy Seamless Pipe and Seamless Extruded Tube.

8. ASTM B244, Standard Test Method for Measurement of Thickness of Anodic Coatings on Aluminum and of Other Nonconductive Coatings on Nonmagnetic Basis Metals with Eddy-Current Instruments.
9. ASTM B247, Specification for Aluminum and Aluminum-Alloy Die Forgings, Hand Forgings, and rolled Ring Forgings.
10. ASTM B429, Specification for Aluminum-Alloy Extruded Structural Pipe and Tube.
11. ASTM E 935, Standard Test Methods for Permanent Metal Railing Systems and Rails for Buildings.
12. NAAMM/Architectural Metal Products Division (AMP), Pipe Railing Manual.
13. NAAMM/AMP AMP 501 Finishes for Aluminum.

1.3 QUALITY ASSURANCE

A. Qualifications:
1. Manufacturer:
   a. Upon request manufacturer shall submit document at least five years successful experience in fabricating aluminum handrail and railing systems of scope and type similar to that required.
   b. Manufacturer shall be capable of providing custom detail drawings for the products required.
2. Professional Engineer:
   a. Contractor or handrail and railing manufacturer shall retain a registered professional engineer legally qualified to practice in same state as the Site. Professional engineer shall have at least five years experience designing aluminum handrails and railings.
   b. Responsibilities include:
      1) Reviewing aluminum handrail and railing system performance and design criteria stated in the Contract Documents.
      2) Preparing written requests for clarifications or interpretations of performance or design criteria for submittal to Engineer by Contractor.
      3) Preparing or supervising preparation of design calculations verifying compliance of aluminum handrail and railing system with requirements of the Contract Documents.
      4) Signing and sealing all calculations.
      5) Certifying that:
         a) Design of aluminum handrail and railing system was performed in accordance with performance and design criteria stated in the Contract Documents, and
         b) Design conforms to all applicable local, state, and federal Laws and Regulations, and to prevailing standards of practice.
3. Installer:
   a. Retain a single installer trained and with record of successful experience in installing aluminum handrail and railing systems.
   b. Installer shall have record of successfully installing aluminum handrail and railing systems in accordance with recommendations and requirements of manufacturer, or shall provide evidence of being acceptable to the manufacturer.
   c. Installer shall employ only tradesmen with specific skill and successful experience in the type of Work required.
   d. When requested by Engineer, submit name and qualifications of installer with the following information for at least three successful, completed projects:
      1) Names and telephone numbers of owner and architect or engineer responsible for each project.

2) Approximate contract cost of the aluminum handrail and railing systems for which installer was responsible.
3) Amount (linear feet) of aluminum handrail and railing installed.

B. Component Supply and Compatibility:
1. Obtain all materials furnished under this Section regardless of component manufacturer, from a single aluminum handrail and railing system manufacturer.
2. Aluminum handrail and railing system manufacturer shall review and approve or prepare all Shop Drawings and other submittals (except for delegated design submittals, when professional engineer is retained by other than handrail and railing manufacturer) for all components furnished under this Section.
3. Components shall be specifically constructed for specified service conditions and shall be integrated into overall assembly by aluminum handrails and railings manufacturer.

C. Regulatory Requirements: Comply with Laws and Regulations including:
1. OSHA Part 1910.23, Guarding Floor and Wall Openings and Holes.

D. Certifications:
1. Submit certification, signed by authorized officer of manufacturer and notarized, stating that handrail and railing systems comply with the design prepared by the professional engineer.
2. Submit certification, signed by authorized officer of Contractor and notarized, stating that all components and fittings are furnished by the same manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Drawings for fabrication and installation of aluminum handrail and railing systems with sizes of members, pipe wall thickness, information on components, and anchorage devices. Show all anchorages. Provide details drawn at scale of 1.5-inch equal to one foot.
b. Indicate required location of posts.
c. Indicate locations and details of all expansion joints, if any.
d. Indicate locations and details of gaps across seismic joints, if any.
e. Profile drawings of aluminum handrail and railing system components.
f. Custom detail drawings. Details of forming, jointing, sections, connections, internal supports, trim and accessories. Provide details drawn at scale of 1.5-inch equal to one foot.
2. Product Data:
a. Manufacturer's specifications, standard detail drawings, and installation instructions for aluminum handrail and railing systems.
b. Manufacturer's catalogs showing complete selection of standard and custom components and miscellaneous accessories for selection by Engineer.
3. Delegated Design Submittals:
a. Design Data:
1) Design computations or complete structural analysis of handrail and railing systems, signed and sealed by professional engineer. Professional engineer's seal shall be clearly legible, including state of registration, registration number, and name on seal.

2) Certification by professional engineer that professional engineer has performed design of aluminum handrail and railing systems in accordance with performance and design criteria stated in the Contract Documents, and that design conforms to all local, state, and federal Laws and Regulations, and to prevailing standards of practice.

4. Samples:
   a. Full-size Sample, two feet long, of assembled railing system at post and rail intersections. Sample shall have all associated components including typical connections, mounted toeboard and sleeve, and handrail at wall return, complete with mounting brackets, all with specified controlled uniform metal finish.
   b. Color Samples: Maximum range of clear anodized aluminum that shall appear in finished Work. Prepare range Samples, to show highest level of color control feasible for actual handrail and railing systems, as determined by licensor of finishing process specified, on actual extrusions and castings of the Work.
   c. Engineer will review Samples for finish, color, joint tolerances, workmanship, and general component assembly only. Compliance with other requirements is the responsibility of the Contractor.
5. Test Procedure: Submit detailed description of proposed shop testing procedures. Do not perform shop testing until Engineer approves shop test procedure:

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Certification on source of supply, as specified in Article 1.3 of this Section.
      b. Manufacturer certification specified in Article 1.3 of this Section.
   2. Source Quality Control Submittals:
      a. Manufacturer's load testing report in accordance with ASTM E935 for completed aluminum handrail and railing systems, demonstrating compliance with applicable requirements of building codes, safety codes, and other Laws and Regulations.
   3. Qualifications Statements: Submit qualifications for the following:
      a. Manufacturer, when requested by Engineer.
      b. Professional engineer.
      c. Installer, when requested by Engineer. Qualifications statement shall include record of experience with references specified.

C. Closeout Submittals: Submit the following:
   1. Maintenance Manuals: Furnish detailed maintenance manuals that include the following:
      a. Product name and number.
      b. Detailed procedures for routine maintenance and cleaning, including cleaning materials, application methods and precautions in use of products that may be detrimental to finish when improperly applied.
      c. Handrail and railings systems manufacturer's current catalog including individual parts.
      d. Maintenance manuals shall be in accordance with Section 01 7823, Operations and Maintenance Data.
   2. Guarantee: Provide in maintenance manual the guarantee specified.

1.5 DELIVERY, STORAGE AND HANDLING

A. Storage and Protection:
   1. Keep products off ground using pallets, platforms, or other supports. Protect products from corrosion and deterioration.

B. Handling of Products:
   1. Do not subject handrail and railing products to bending or stress.
   2. Do not damage edges or handle products in a manner that will cause scratches, warping, or dents.
   3. Protect handrails and railings by paper or coating as acceptable to handrail and railing manufacturer, against scratching, splashes of mortar, paint, and other marring during transportation, handling, and erection. Protect until completion of adjacent work.

1.6 GUARANTEE

A. Guarantee: Manufacturer shall provide written guarantee of availability of replacement parts and components for period of at least five years after completion of the Project.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. System Description: Aluminum handrail and railing system shall consist of equally spaced horizontal rails with totally concealed mechanical fasteners, internally threaded tubular rivets and components fastened to posts spaced no more than five feet on centers and system of handrails supported from adjacent construction by mounting brackets spaced at no more than five feet on centers.

B. Design Criteria and Performance Criteria:
   1. Design, fabricate, and install aluminum handrail and railing systems to withstand the most critical effects resulting from the following loads (loads listed below do not act concurrently):
      a. Uniform Load: 50 pounds per foot, applied at top in any direction.
      b. Concentrated Load: 200 pounds single load, applied at any point along the top in any direction.
      c. Components: Intermediate rails (all rails except the handrail), balusters, and panel fillers, if any, shall withstand horizontally-applied normal load of 50 pounds on an area equal to one square foot, including openings and space between rails. Reactions due to this loading are not required to be superimposed to loading specified for main supporting members of handrails and railings.
      d. Comply with AA Aluminum Design Manual for determining allowable stresses and safety factors for aluminum structural components.
      e. Limit deflection in each single span of railing and handrail to 1.5-inch maximum, and to 1/4-inch maximum on railing posts. Applied loads shall not produce permanent deflection in the completed Work when loads are removed.
   2. Thermal Control: Provide adequate expansion within fabricated systems that allows for thermal expansion and contraction caused by material temperature change of 140 degrees F to -20 degrees F without warp or bow of system components. Distance between expansion joints shall be based on providing 1/4-inch wide joint at 70 degrees F, which accommodates movement of 150 percent of calculated amount of movement for specified temperature range.
   3. Where handrail and railing systems cross expansion joints in the building or structure, provide expansion joints in handrail and railings systems.
   4. For posts located at or near end of runs as shown, uniformly space intermediate posts as required to conform to loading and deflection criteria specified, at intervals no greater than maximum post spacing specified. Where posts are shown for handrails along both sides of

walkways and other similar locations, locate posts opposite each other; do not stagger post locations.

2.2 MANUFACTURERS

A. Products and Manufacturers: Provide one of the following:
   1. Wesrail, by Moultrie Manufacturing Company.
   2. Alumaguard, by Alumaguard – A division of Bettinger West, Inc.
   3. Or equal.

2.3 MATERIALS

A. Extruded Aluminum Architectural and Ornamental Shapes: ASTM B221, Alloy 6063-T52.

B. Aluminum Forgings: ASTM B247.

C. Extruded or Drawn Aluminum Pipe and Tube:
   1. ASTM B429 or ASTM B241/B241M, Alloy 6063-T5, 6063-T52, or 6063-T832 as required by loadings, deflections, and post spacing specified.
   2. Provide Schedule 40 pipe, minimum, unless conditions of detail and fabrication require extra-heavy pipe to comply with Specifications. Rails and posts shall have minimum outside diameter of 1.90 inches.

D. Reinforcing Bars: Urethane foam-filled, Schedule 80, 23 inches long 6061-T6 aluminum reinforcing bars or tubes with outside diameter same as inside diameter of post.

E. Anchors and Fastenings:
   1. For anchors and fasteners, use Type 316 stainless steel; minimum 3/8-inch diameter.
   2. Provide minimum of four bolt fasteners per post where surface-mounted posts are shown. Components shall be in accordance with manufacturer's recommendations and as approved or accepted (as applicable) by Engineer on submittals.
   3. Anchors: In accordance with Section 05 0533, Anchor Systems.

F. Castings:
   1. Provide high-strength aluminum alloy brackets, flanges, and fittings suitable for anodizing as specified.
   2. Aluminum alloy sand castings: ASTM B26/B26M.

G. Brackets and Flanges:
   1. Provide manufacturer's complete selection of standard and custom brackets and flanges for railing system posts and for handrail supports.

H. Connector Sleeves: Schedule 40, five-inch long by 1.610-inch diameter.

I. Sockets: Provide six-inch deep by 2.5-inch outside diameter aluminum sockets with 3.5-inch wide socket cover on bottom of each socket and on top and bottom of removable post sockets.

J. Gates: For each gate in handrail or railing system, provide the following:
   1. Hinges: Two-self closing aluminum hinges.
   2. Latches and Stops: One latch and stop with rubber bumper and one-inch diameter plastic knobs.

K. Custom Cover Flanges: 1/4-inch high by four-inch diameter, aluminum.

L. Adhesive: Two-part waterproof epoxy-type as recommended by handrail and railing systems manufacturer.

M. Non-shrink Grout: Comply with Section 03 6000, Grouting.

N. Toeboards:
1. Provide extruded Alloy 6063-T5 or T52 aluminum alloy toeboards, unless railing is mounted on curbs or other construction of sufficient height and type to comply with OSHA 1910.23. Bars or plates are not acceptable.
2. Unless otherwise specified, toeboards shall comply with OSHA 1910.23, Section (e).

O. System Components and Miscellaneous Accessories: Provide complete selection of manufacturer's standard and custom aluminum handrail and railing systems components and miscellaneous accessories required. Show type and location of all such items on Shop Drawings and other submittals as applicable.

2.4 FABRICATION

A. General: Unless otherwise shown or specified, provide typical non-welded construction details and fabrication techniques recommended in NAAMM/AMP Pipe Railing Manual and NAAMM/AMP AMP 501.

B. Fabricate handrail and railing systems true to line and level, with accurate angles surfaces and straight edges. Fabricate corners without using fittings. Provide bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work. Form elbow bends and wall returns to uniform radius, free from buckles and twists, with smooth finished surfaces, or use prefabricated bends. Provide not less than four-inch outside radius.

C. Remove burrs from exposed edges.

D. Close aluminum pipe ends by using prefabricated fittings.

E. Weep Holes:
1. Fabricate joints that will be exposed to weather to exclude water.
2. Provide 15/64-inch diameter weep holes at lowest possible point on each post in handrail and railing systems.
3. Provide pressure relief holes at closed ends of handrail and railing systems.

F. Toeboards:
1. Provide manufacturer's standard toeboard, that accommodates movement caused by thermal change specified without warping or bowing toeboards.
2. Provide manufacturer's standard toeboard, which accommodates storage for removable socket covers.
3. Coordinate and cope toeboard as required to accommodate cover flanges at posts.
4. Toeboards shall follow curvature of railing. Where railing is shown to have curved contours at corners, or other locations, toeboard shall likewise be curved to follow line of railing system.

G. Reinforcing Bars: Provide reinforcing bar friction-fitted at each post in railing system. Extend reinforcing bars of tubes six inches into cast-in-place sleeves or other types of supporting brackets.

H. Mechanically Fitted Component Pipe Handrail and Railing System:
1. Use non-welded pipe handrail and railing system with posts, top and intermediate rail(s), and flush joints.
2. Provide top and one intermediate horizontal rail, equally spaced.
3. Use Type 304/305 stainless steel blind rivets and Type 304/305 stainless steel self-tapping screws in assembling components of the Work.

2.5 FINISHES

A. General:
1. Prepare surfaces for finishing in accordance with recommendation of aluminum producer and the aluminum finisher or processor.
2. Adjust and control direction of mechanical finishes specified to achieve best overall visual effect in the Work.
3. Color and Texture Tolerance: Provide uniform color and continuous mechanical texture for aluminum components. Engineer reserves the right to reject aluminum materials because of color or texture variations that are visually objectionable, but only where variation exceed range of variations established by manufacturer prior to fabrication, by means of range of Samples approved by Engineer.
4. Anodize aluminum components.

B. Finish:
1. Mechanically finish aluminum by wheel or belt polishing with aluminum oxide grit of 180 to 220 size, using peripheral wheel speed of 6,000 feet per minute; AA Designation - M32 Medium Satin Directional Texture.
2. Hand-Rubbed Finish: Where required to complete the Work and provide uniform, continuous texture, provide hand-rubbed finish to match medium satin directional texture specified to even out and blend satin finishes produced by other means.

C. Cleaning:
1. Provide non-etching chemical cleaning by immersing aluminum in inhibited chemical solution, as recommended by coating applicator, to remove lard oil, fats, mineral grease, and other contamination detrimental to providing specified finishes.
2. Clean and rinse with water between steps as recommended by aluminum manufacturer.

D. Exposed Aluminum Anodic Coating: Provide anodic coatings as specified that do not depend on dyes, organic or inorganic pigments, or impregnation processes to obtain color. Apply coatings using only the alloy, temperature, current density, and acid electrolytes to obtain specified colors in compliance with designation system and requirements of NAAMM/AMP Pipe Railing Manual and NAAMM/AMP AMP 501. Comply with the following:
1. Provide Architectural Class I high density anodic treatment by immersing the components in tank containing solution of 15 percent sulfuric acid at 70 degrees F with 12 amperes per square foot of direct current for minimum of sixty minutes; AA Designation A41 Clear .
2. Physical Properties:
a. Anodic Coating Thickness, ASTM B244: Minimum of 0.7-mils thick.
b. Anodic Coating Weight, ASTM B137: Minimum of 32 mg/sq. in.

c. Resistance to Staining, ASTM B136: No stain after five minutes dye solution exposure.
d. Salt Spray, ASTM B117: 30,000 hours exposure with no corrosion or shade change.

3. Seal finished anodized coatings using deionized boiling water to seal pores and prevent further absorption.
4. Products and Manufacturers: Provide one of the following:
   a. Alumilite 215 Clear by Aluminum Company of America, Inc.
   b. Or equal.

2.6 SOURCE QUALITY CONTROL

A. Allowable Tolerances:
1. Limit variation of cast-in-place inserts, sleeves and field-drilled anchor and fastener holes to the following:
   a. Spacing: Plus-or-minus 3/8-inch.
   b. Alignment: Plus-or-minus 1/4-inch.
   c. Plumbness: Plus-or-minus 1/8-inch.
2. Minimum Handrails and Railings Systems Plumb Criteria:
   a. Limit variation of completed handrail and railing system alignment to 1/4-inch in 12 feet with posts set plumb to within 1/16-inch in 3.0 feet.
   b. Align rails so variations from level for horizontal members and from parallel with rake of stairs and ramps for sloping members do not exceed 1/4-inch in 12.0 feet.
3. Provide “pencil-line” thin butt joints.

B. Factory Testing:
1. Perform load test on completed handrail and railing systems. Extent of handrail and railing systems to be factory-tested shall be as shown and specified.
2. Load test completed handrail and railing systems in accordance with requirements of ASTM E935. Provide written report to Engineer identifying and documenting testing methods used, magnitude and location of loads superimposed, and results of such tests on actual completed handrail and railing systems, including all anchors and fasteners to be used in the Work. Testing setup shall simulate actual conditions of installation to be used in the Work.
3. Do not ship products from factory until Engineer accepts load testing report.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine conditions under which Work will be performed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with installation until unsatisfactory conditions are corrected.

B. Verify to Engineer the gage of aluminum pipe railing posts and rails brought to the Site by actual measurement of on-Site material in presence of Engineer.

3.2 INSTALLATION

A. General:
1. Do not erect components that are scarred, dented, chipped, discolored, otherwise damaged, or defaced. Remove from Site railing and handrail system components that have holes,

cuts, gouges, deep scratches, or dents of any kind. Repairs to correct such Work will not be accepted. Remove and replace with new material.

2. Comply with installation and anchorage recommendations of NAAMM/AMP Pipe Railing Manual and NAAMM/AMP AMP 501 in addition to requirements specified and approved or accepted (as applicable) submittals.

B. Fastening to In-Place Construction:

1. Remove protective plastic immediately before installing.
2. Adjust handrails and railings prior to securing in place, to ensure proper matching at butting joints and correct alignment throughout their length. Plumb posts in each direction. Secure posts and rail ends to building or structure as follows:
   a. Anchor posts in concrete by providing sockets set and anchored into concrete floor slab. Provide closure secured to bottom of sleeve. Before installing posts, remove debris and water from sleeves. Verify that reinforcing bars or tubes have been inserted into posts before installation. Do not install posts without reinforcing bar. For all non-removable handrail and railing systems sections, after posts have been inserted into sockets, fill annular space between posts and sockets solid with grout as specified in Section 03 6000, Grouting. Crown the grout and slope grout to drain away from posts.
   b. Anchor posts to stair stringers with stringer or support flanges, angle type or floor type as required by conditions, shop-connected to posts and bolted to steel supporting members. Flanges shall be as recommended by manufacturer. Verify that reinforcing bars are inserted into posts before installation. Do not install posts without reinforcing bar.
   c. Side-mount posts by fastening them securely in brackets attached to steel or concrete fascia as shown and in accordance with approved or accepted (as applicable) submittals.
   d. Provide posts set in concrete with an aluminum floor cover flange.
3. Use devices and fasteners recommended by handrail and railing systems manufacturer and as shown on approved or accepted (as applicable) submittals.

C. Cutting, Fitting, and Placement:

1. Perform cutting, drilling and fitting required for installation. Set the Work accurately in location, alignment, and elevation, plumb, level, true, and free of rack, measured from established lines and levels.
2. Fit exposed connections accurately together to form tight hairline joints. Do not cut or abrade surfaces of units that have been finished after fabrication, and are intended for field connections.
3. Make permanent field splice connections using stainless steel blind rivets and five-inch minimum length connector sleeves. Tight press-fit field splice connectors and install in accordance with manufacturer's written instruction. Install two blind rivets per joint on 180-degree centers.
4. Make splices as near as possible to posts, but not exceeding 12 inches from nearest post.
5. Field welding is not allowed. Make splices using pipe splice lock employing a single allen screw to lock joint.
6. Secure handrails to walls with wall brackets and end fittings as shown. Drill wall plate portion of the bracket to receive one bolt, unless otherwise shown for concealed anchorage. Locate brackets as shown or, if not shown, at not more than five feet on centers. Provide flush type wall return fittings with same projection shown for wall brackets. Secure wall brackets and wall return fittings to building or structure. Refer to Section 05 0533, Anchor Systems.

7. Securely fasten toeboards in place with not more than 1/4-inch clearance above floor level.
8. Drill one 15/64-inch diameter weep hole not more than 1/4-inch above top of location of solid reinforcing bar or tube in each post.

D. Expansion Joints:
1. Provide slip joint with internal sleeve extending not less than two inches beyond joint on each side.
2. Construct expansion joints as for field splices, except fasten internal sleeve securely to one side of rail only.
3. Locate joints within six inches of posts.

E. Protection from Dissimilar Materials:
1. Coat aluminum surfaces in contact with dissimilar materials such as concrete, masonry, and steel, in accordance with Section 09 9100, Painting.
2. Do not extend coating beyond contact surfaces. Remove coating where exposed-to-view in the finished Work.

3.3 CLEANING AND REPAIRING

A. Cleaning:
1. Clean exposed surfaces of handrail and railing systems after completion of installation. Comply with recommendations of both handrail and railing system manufacturer and finish manufacturer. Do not use abrasives or unacceptable solvent cleaners. Test cleaning techniques on an unused section of railing before employing cleaning technique.
2. Remove stains, dirt, grease, and other substances by washing handrails and railings systems thoroughly using clean water and soap; rinse with clean water.
3. Do not use acid solution, steel wool, or other harsh abrasives.
4. If stain remains after washing, remove defective sections and replace with new material complying with this Section.

B. Handrails and railings shall be free of dents, burrs, scratches, holes, and other blemishes. Replace damaged or otherwise defective Work with new material that complies with this Section at no additional cost to Owner.

C. Prior to Substantial Completion, replace adjacent work marred by the Work of this Section.

END OF SECTION 05 5215

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 05 5311

STEEL GRATING

PART 1 – GENERAL

1.1 DESCRIPTION

A. Scope:
1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified and required to furnish and install steel grating and frames.
2. The Work includes:
a. Providing grating, frames, and appurtenances.
b. Providing openings in grating to accommodate the Work under this and other Sections and attaching to steel grating all items such as sleeves, bands, studs, fasteners, and items required for which provision is not specifically included under other Sections.

B. Coordination:
1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before steel grating Work.

C. Related Sections (Not Used)

1.2 REFERENCES

A. Standards referenced in this Section are:
1. ASTM A36/A36M, Specification for Carbon Structural Steel.
2. ASTM A510, Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel.
3. ASTM A1011/A1011M, Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
4. MS MIL-P-21035, Paint, High Zinc Dust Content Galvanizing Repair.
5. NAAMM MBG 531, Metal Bar Grating Manual.
6. NAAMM MBG 533, Welding Specifications for Fabrication of Steel, Aluminum and Stainless Bar Grating.

1.3 QUALITY ASSURANCE

A. Qualifications:
1. Manufacturer: Shall have at least five years experience manufacturing products substantially similar to those required and shall be able to submit documentation of at least five installations in satisfactory operation for at least five years each.

B. Component Supply and Compatibility:
1. Obtain all products included in this Section regardless of component manufacturer from a single steel grating manufacturer.
2. Steel grating manufacturer shall review and approve or prepare all Shop Drawings and other submittals for all components furnished under this Section.

3. Components shall be suitable for the specified service conditions and shall be integrated into overall assembly by steel grating manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Fabrication and erection of all steel gratings Work. Include plans, elevations, and details of sections and connections. Show anchorage and accessory items.
      b. Setting drawings and templates for location and installation of anchorage devices.
   2. Product Data:
      a. Manufacturer's specifications, load tables, dimension diagrams, anchor details, and installation instructions.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling, and Unloading:
   1. Deliver products to the Site to ensure uninterrupted progress of the Work. Deliver anchorage materials to be embedded in concrete in ample time to prevent delaying the Work.
   2. Comply with Section 01 65 00, Product Delivery Requirements.

B. Storage and Protection:
   1. Protect materials from corrosion and deterioration.
   2. Comply with Section 01 66 00, Product Storage and Handling Requirements.

PART 2 – PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Steel Grating: Provide steel grating complying with the following:
   1. Grating Design Loads: Uniform live load shall be as shown or indicated in the Contract Documents. Where live load is not shown or indicated, uniform live and concentrated loads shall be as indicated in the table below, whichever results in the greater design stresses.

	Live Load	**Concentrated Load**
a.	100 psf	500 lbs. per foot of grating width at center of span
b.	150 psf	750 lbs. per foot of grating width at center of span
c.	200 psf	1,000 lbs. per foot of grating width at center of span
d.	300 psf	1,500 lbs. per foot of grating width at center of span

   2. Maximum Clear Span Deflection for Uniform Live Loads: 1/120 of span, but not more than 1/4-inch.
   3. Maximum Fiber Stress: 18,000 psi.
   4. Minimum Size of Members:
      a. Minimum size of bearing bars shall be within standard mill tolerance of that indicated in load tables in NAAMM MBG 531 for applicable loading and deflection requirements.
      b. Minimum dimensions of cross bars shall be as indicated in the tables of Minimum Standard Cross Bars and Connecting Bars in NAAMM MBG 531.

5. Banding bar shall be 1/4-inch thick minimum. Top of banding bar shall be flush with top of grating unless otherwise shown or indicated. Banding bar shall be 1/4-inch shorter than bearing bar height.

2.2 MANUFACTURERS

A. Grating, Products and Manufacturers: Provide grating of one of the following:
   1. Weldforged, manufactured by IKG Industries.
   2. Light Duty Welded grating, manufactured by Ohio Gratings, Inc.
   3. Or equal.

2.3 MATERIALS

A. Hot rolled carbon steel sheet and strip bearing bars and cross bars shall comply with ASTM A1011/A1011M, Commercial Steel (CS Type 2).

B. Structural steel bearing bars and cross bars shall comply with ASTM A36/A36M.

C. Wire rod Cross Bars: ASTM A510, except that permissible tolerance on diameter of coarse round wire shall be plus-0.005-inch.

D. Frames: Steel complying with ASTM A36/A36M.

E. Galvanizing Repair Paint: High zinc-dust content paint for repairing damaged galvanized surfaces complying with MS MIL-P-21035.

2.4 FABRICATION

A. Use materials of minimum depth and thickness specified and as required to comply with performance criteria shown or indicated in the Contract Documents.

B. Provide grating as follows:
   1. Grating Type: Welded rectangular bearing bars with cross bars resistance-welded at right angles to bearing bars.
   2. Depth: One inch, minimum.
   3. Bearing Bars: Minimum one-inch by 3/16-inch spaced at 1-3/16-inch on centers.
   4. Cross Bars: Welded to bearing bars at maximum spacing of four inches on centers.
   5. Surface: Plain.
   6. Finish: Hot-dip galvanized.

C. Provide cutouts in grating for passage of piping, electrical conduit, valve stems, columns, ducts, and similar work. Where more than two bearings bars are included in a cut out, provide banding bars of same dimensions as bearing bars around opening welded to grating component parts.

E. Gratings shall be accurately fabricated, free from warps, twists, and other defects that would affect grating appearance or grating serviceability.

F. Tops of grating bearing bars and cross bars shall be in the same plane.

G. Welding shall comply with NAAMM MBG 533. Welds shall be ground smooth at top and bearing surfaces.

H. Openings in and edges of grating sections shall be banded with flat banding bars as specified in this Section, welded along the line of cutout or to end of grating panel.

I. Size each section of grating to weigh not more than 150 pounds, unless otherwise indicated in the Contract Documents.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Examine conditions under which Work is to be performed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with installation until unsatisfactory conditions are corrected.

B. Check all dimensions at the Site after piping and equipment are in place and determine exact locations of openings and cutouts.

3.2 INSTALLATION

A. Fastening to In-Place Construction:
   1. Use anchorage devices and fasteners to secure steel grating to supporting members or prepared openings, as recommended by manufacturer.
   2. For steel grating having bearing bars at 1-3/16-inch on centers or greater, provide four saddle clip anchors designed to fit over two bearing bars, and four stud bolts with washers and nuts for each grating panel, unless otherwise shown or indicated in the Contract Documents. For bearing bars spacing less than 1-3/16-inch on centers, provide anchors in accordance with manufacturer's recommendations.

B. Cutting, Fitting, and Placing:
   1. Perform cutting, drilling and fitting required for installation. Set the Work accurately in location, alignment and elevation, plumb, level, true, and free of rack. Do not use wedges or shimming devices.
   2. Where grating is penetrated by piping, electrical conduit, ducts, structural members, or similar protrusions, cut openings neatly and accurately to size and attach banding bar as specified.
   3. Divide panels into sections only to extent required for installation where steel grating is to be installed around previously installed piping, electrical conduit, ducts, structural members, or similar protrusions.

C. Steel gratings in concrete floors shall be removable and shall be arranged in sizes to be readily lifted. Provide steel gratings in concrete with steel angle frames having mitered corners and welded joints. Grind exposed joints smooth. Frames shall have welded anchors set into concrete. Angle size shall match grating depth selected for flush fit.

D. Clearance at ends or between sections of steel grating shall be not more than 1/4-inch.

E. Tops of steel gratings shall be set flush with surrounding construction.

F. Steel gratings shall be set with full and uniform end bearing on frames to preclude rocking movement; do not use wedges or similar shimming devices.

G. Remove stains, cement droppings, oils, dirt, grease, paint, and other foreign matter.

H. Repair galvanized coating, damaged in the shop or during field erection, with galvanizing repair paint applied in accordance with the repair paint manufacturer's instructions and recommendations.

+ + END OF SECTION + +

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 05 5316

ALUMINUM GRATING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install aluminum grating and frames.
   2. The Work includes:
      a. Providing grating, frames, and appurtenances.
      b. Providing openings in aluminum grating to accommodate the Work under this and other Sections, and attaching to aluminum grating all items such as sleeves, bands, studs, fasteners, and items required for which provision is not specifically included under other Sections.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before aluminum grating Work.

C. Related Sections:
   1. Section 09 9100, Painting.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. AA Aluminum Design Manual.
   2. ASTM B210, Specification for Aluminum and Aluminum-Alloy Drawn Seamless Tubes.
   3. ASTM B221, Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
   4. NAAMM MBG 531, Metal Bar Grating Manual.
   5. NAAMM MBG 533, Welding Specifications for Fabrication of Steel, Aluminum and Stainless Steel Bar Grating.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer: Shall have at least five years' experience manufacturing products substantially similar to those required and shall be able to submit documentation of at least five installations in satisfactory operation for at least five years each.

B. Component Supply and Compatibility:
   1. Obtain all products and materials included in this Section regardless of component manufacturer from a single aluminum-grating manufacturer.
   2. Aluminum grating manufacturer shall review and approve or prepare all Shop Drawings and other submittals for all products and materials furnished under this Section.
   3. Components shall be suitable for the specified service conditions and be integrated into overall assembly by aluminum grating manufacturer.

4. Provide only one type of aluminum grating exclusively throughout the Project.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Fabrication and erection of all Work. Include plans, elevations, and details of sections and connections. Show anchorage and accessory items.
      b. Setting drawings and templates for location and installation of anchorage devices.
   2. Product Data:
      a. Manufacturer's specifications, load tables, dimension diagrams, anchor details and installation instructions.
   3. Samples:
      a. Representative Samples of grating, appurtenances and other finished products requested by Engineer.
      b. Engineer'S review will be for type and finish only. Compliance with all other requirements is exclusive responsibility of Contractor.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Shipping, Handling and Unloading:
   1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices to be embedded in cast-in-place concrete in ample time to prevent delaying the Work.
   2. Comply with Section 01 6500, Product Delivery Requirements.

B. Storage and Protection:
   1. Protect materials from corrosion and deterioration.
   2. Do not store materials in contact with concrete or other materials that might cause corrosion, staining, scratching, or damage materials or finish.
   3. Comply with Section 01 6600, Product Storage and Handling Requirements.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Aluminum Grating: Provide aluminum grating complying with the following:
   1. Grating Design Loads: Uniform live load shall be as shown or indicated in the Contract Documents. Where live load is not shown or indicated, uniform live and concentrated loads shall be as indicated in the table below, whichever results in the greater design stresses.

	Live Load	**Concentrated Load**
a.	100 psf	500 lbs. per foot of grating width at center of span
b.	150 psf	750 lbs. per foot of grating width at center of span
c.	200 psf	1,000 lbs. per foot of grating width at center of span
d.	300 psf	1,500 lbs. per foot of grating width at center of span

   2. Maximum Clear Span Deflection for Uniform Live Loads: 1/120 of span, but not more than 1/4-inch.

3. Maximum Fiber Stress: 12,000 psi.
4. Do not install aluminum grating in areas subject to vehicular traffic.
5. Minimum Size of Members:
    a. Minimum size of bearing bars shall be within standard mill tolerance as indicated in load tables in NAAMM MBG 531 for applicable loading and deflection requirements.
    b. Minimum dimensions of cross bars shall be as indicated in tables of Minimum Standard Cross Bars and Connecting Bars in NAAMM MBG 531.
6. Banding bar shall be 1/4-inch thick minimum. Top of banding bar shall be flush with top of grating, unless otherwise shown or indicated. Banding bar shall be 1/4-inch shorter than the bearing bar height.
7. Comply with requirements of AA Aluminum Design Manual.

B. Stair Treads: Provide stair treads complying with the following:
1. Stair Tread Design Loads: Concentrated live load shall be:
    a. 300 pounds on front-most five inches of tread at center of tread of span up to 5.5 feet.
    b. 300 pounds on front-most five inches of tread at the one-third points of tread of span greater than 5.5 feet.
2. Maximum Clear Span Deflection for Concentrated Live Loads: 1/240 of span, but not more than 1/4-inch.
3. Maximum Fiber Stress: 12,000 psi.
4. Minimum Size of Members:
    a. Minimum size of bearing bars shall be within standard mill tolerance as indicated in load tables in NAAMM MBG 531 for applicable loading and deflection requirements.
    b. Minimum dimensions of cross bars shall be as indicated in tables of Minimum Standard Cross Bars and Connecting Bars in NAAMM MBG 531.
5. Carrier plate shall be 1/4-inch thick minimum. Top of carrier plate shall be flush with top of tread, unless otherwise shown or indicated. Provide carrier plate with hole and slot for attachment to stringer.
6. Comply with requirements of AA Aluminum Design Manual.

2.2 MANUFACTURERS

A. Grating, Products and Manufacturers: Provide one of the following:
1. Swage-Locked Bar Grating, by Ohio Gratings.
2. Swage-Locked Bar Grating, by AMICO.
3. Or equal.

B. Stair Treads, Products and Manufacturers: Provide one of the following:
1. Rectangular Bar Treads, by Ohio Gratings.
2. Rectangular Bar Treads, by AMICO.
3. Or equal.

2.3 MATERIALS

A. Bearing Bars: Aluminum alloy 6061-T6 or alloy 6063-T6, complying with ASTM B221.

B. Cross Bars or Bent Connecting Bars: Aluminum alloy 6063-T1, complying with either ASTM B221 or ASTM B210.

C. Frames: Aluminum alloy 6061-T6 or alloy 6063-T6, complying with ASTM B221.

D. Stud anchors welded to steel supports and other fasteners shall be Type 316 stainless steel.

2.4 FABRICATION

A. Use materials of minimum depth and thickness specified and required to comply with performance criteria in the Contract Documents.

B. Provide grating as follows:
1. Grating Type: Aluminum rectangular bar with swage-locked cross bars at right angles to bearing bars.
2. Depth: One-inch minimum.
3. Bearing Bars: Aluminum rectangular bar spaced at 1-3/16-inch on centers.
4. Cross-Bars: Swage-locked to bearing bars at maximum spacing of four inches on centers.
5. Surface: Serrated.
6. Finish: Mill.

C. Provide stair treads as follows:
1. Tread Type: Aluminum rectangular bar with swage-locked cross bars at right angles to bearing bars.
2. Depth: One-inch minimum.
3. Bearing Bars: Aluminum rectangular bar spaced at 1-3/16-inch on centers.
4. Cross Bars: Swage-locked to bearing bars at maximum spacing of four inches on centers.
5. Surface: Serrated.
6. Nosing: Cast aluminum abrasive nosing.
7. Finish: Mill.

D. Provide cutouts in grating for passage of piping, electrical conduit, valve stems, columns, ducts, and similar work. Where more than two bearings bars are included in a cut out, provide banding bars of same dimensions as bearing bars around opening welded to grating component parts.

E. Gratings shall be accurately fabricated, free from warps, twists, and other defects that would affect grating appearance and grating serviceability.

F. Welding shall conform to requirements of NAAMM MBG 533. Welds shall be ground smooth at top surfaces and bearing surfaces.

G. Openings in and edges of gratings sections shall be banded with banding bars. Weld bands to intersecting members.

H. Size each section of grating to weigh not more than 100 pounds, unless otherwise indicated in the Contract Documents.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions under which Work is to be performed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with installation until unsatisfactory conditions are corrected.

B. Check all dimensions at the Site after piping and equipment are in place and determine exact locations of openings and cutouts.

3.2 INSTALLATION

A. Fastening to In-Place Construction:
   1. Use anchorage devices and fasteners to secure aluminum grating to supporting members or prepared openings, as recommended by manufacturer.
   2. Weld Type 316 stainless steel stud bolts to receive saddle clip or flange block anchors to supporting steel members. Drill for machine bolts when supports are aluminum.

B. Cutting, Fitting, and Placing:
   1. Perform cutting, drilling and fitting required for installation. Set the Work accurately in location, alignment and elevation, plumb, level, true, and free of rack. Do not use wedges or shimming devices.
   2. Where gratings are penetrated by piping, electrical conduit, ducts, structural members, or similar protrusions, cut openings neatly and accurately to size and attach banding bar as specified.
   3. Divide panels into sections only to extent required for installation where aluminum grating is to be installed around previously installed piping, electrical conduit, ducts, structural members, or similar protrusions.

C. Aluminum gratings in concrete floors shall be removable and arranged in sizes to be readily lifted. Provide aluminum gratings in concrete with aluminum angle frames with mitered corners and welded joints. Grind exposed joints smooth. Frames shall have welded anchors set into concrete. Angle size shall match grating depth selected for flush fit.

D. Clearance at ends or between sections of grating shall be a maximum of 1/4-inch.

E. Tops of aluminum gratings shall be set flush with surrounding construction.

F. Aluminum gratings shall be set with full and uniform end bearing on frames to preclude rocking movement; do not use wedges or similar shimming devices.

G. Protection of Aluminum from Dissimilar Materials: Coat aluminum surfaces in contact with dissimilar materials such as concrete, masonry, steel, or other metals, in accordance with Section 09 9100, Painting.

END OF SECTION 05 5316

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 05 5534

ACCESS HATCHES

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including but not limited to Division 01, General Requirements.

1.2 DESCRIPTION OF WORK

A. The Contractor shall provide all labor, materials, equipment, and incidentals required to furnish and install in good workmanlike manner all hatches as shown on the contract drawings and as specified herein.

1.3 SUBMITTALS

A. All submittals shall conform completely to the requirements of the Contract Documents, including all requirements set forth in Division 01, General Requirements.

PART 2 - PRODUCTS

2.1 SURFACE MOUNTED FLOOR HATCH (TYPE 1)

A. The single leaf access frames and covers shall have a 1/4 inch thick, mill finish, aluminum frame designed for surface mounting. Door panel shall be 1/4 inch aluminum diamond plate, reinforced to withstand a 10 foot column of stationary water, or approximately 625 lbs. Psf. The door shall incorporate a 90 degree return flange around the perimeter.

B. The cover shall have overlap the frame and extend down 2 inches.

C. Stainless steel pressure locks shall be provided to work in conjunction with a 1/4 inch thick neoprene compression gasket, mounted to the underside of the door, to insure minimal water intrusion. Door shall open to 90 degrees and automatically lock with a stainless steel hold open arm with aluminum release handle. Hinges and all fastening hardware shall be 316L stainless steel. Unit shall lock with pad lock lugs. Unit shall be guaranteed against defects in material and/or workmanship for a period of 10 years.
   1. Provide anodized coating to protect all aluminum and stainless steel from Chlorine Gas.
   2. Provide powder-coated aluminum safety grating across opening.
   3. Grease stainless steel hardware to protect against Chlorine Gas.
   4. Manufacturers: Halliday products, Bilco or equal.

D. Provide safety grate below hatch.
   1. Safety Grate shall be designed to combine covering of the hole per OSHA standard 1910.23 and shall include fall-through protection and controlled confined space entry. The safety grate shall be made of 6061-T6 aluminum with a minimum ultimate strength of 38,000 psi and a minimum yield strength of 35,000 psi, per ASTM B221. Grate design shall use safety factors as defined in the “Specifications for Aluminum Structures”

by the Aluminum Association, Inc., 5th addition, Dec. 1986 for "Bridge Type Structures." Aluminum grating shall be designed to withstand a minimum live load of 300 lbs per sq ft. Deflection shall not exceed 1/150th of the span. Aluminum grate openings shall be (I bar grating with 1-3/16inch x 4inch opening with view area for observation and limited maintenance) 5 inch x 5 inch, which will allow visual inspection of the pit once the access hatch is opened. Each Aluminum grate shall be provided with a permanent hinge system which will lock the grate in the 90 degree position once opened. Design of the system must assure fall through protection is in place after the door has been closed, thereby protecting the next operator. Each grate shall have an opening arm with a red vinyl grip handle, which will allow opening of the grate, while providing the grate as a barrier between the operator and the pit. The opening arm shall also be equipped with a controlled confined space entry locking device (lock provided by others). This locking device will prevent unauthorized entry to the confined space. The grating system will allow anyone to make visual inspection and float adjustments without entering the confined space. Grate shall be painted with OSHA type safety orange paint. Welding shall be in accordance with ANSI/AWS D1.2-90 Structural Welding Code for Aluminum.

2.2 FLUSH MOUNTED ACCESS HATCHES (TYPE 2)

A. Covers with Frames for Drainage
   1. Design Loadings and Sizing: Design for live load capacity of 300 psf.
   2. Thickness of Frames and Doors Leaves: 1/4 inch thick, minimum.
   3. Provide stainless steel hinges, springs, and all other hardware.
   4. Provide stainless steel safety chain across opening.
   5. Product and Manufacturer
      a. Halliday Type KD, Bilco Type J, or Babcock-David Associates Type AM.

B. Components:
   1. Door Leaf Surface: Checkered, diamond plate, or other approved non-slip surface.
   2. Frame Anchors: Aluminum anchor flanges or strap anchors.
   3. Door Opening Mechanism
      a. Hold-Open Device.
      b. Door Leaves Ten Square Feet and Larger: Torsion bar springs or other approved means for counterbalanced operation.
   4. Cover Latch: Flush exterior locking device with removable handle and interior turn handle. Include locking hasp to receive Owner's padlock on exterior.
   5. Aluminum Covers: Mill-finished. Protect finish with a factory-applied coating of lacquer standard with the manufacturer.
   6. Coat surfaces in contact with concrete with bituminous coating: 30 mils dry film Tnemec 46H-413 Hi-Build Coal Tar Epoxy or equal.

C. Aluminum Material
   1. Extruded shapes and tubes: ASTM B221 or B308, 6061-T6.
   2. Extruded pipe: ASTM B429, 6063-T6.
   3. Plate and sheet: ASTM B209, alloy 3003-H16. Use alloy 5005 H16 where anodic coatings will be applied.
   4. Bars, rods and wire: ASTM B211.
   5. Castings: ASTM B26 or B108; alloy 214 for natural anodized finish, and alloy 43 for color anodized or baked enamel finish; except as otherwise recommended by aluminum producer or finisher.

6. Forgings: ASTM B247, alloy 6061-T6.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Installation of the hatches and appurtenances shall be done in accordance with written instructions provided by the Manufacturer.

END OF SECTION 05 5534

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 05 5600

METAL CASTINGS

PART 1 – GENERAL

1.1 DESCRIPTION:

A. Scope:
1. Contractor shall provide labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install metal castings.
2. Castings include metal items that are not part of miscellaneous metal fabrications or metal systems in other Specifications Sections.

B. Coordination:
1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before metal castings Work.

1.2 REFERENCES:

A. Standards referenced in this Section are:
1. ANSI A14.3, Safety Requirements for Fixed Ladders.
2. ASTM A48/A48M, Specification for Gray Iron Castings.
3. ASTM A126, Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings.
4. ASTM C478, Specification for Precast Reinforced Concrete Manhole Sections.

1.3 QUALITY ASSURANCE:

A. Qualifications:
1. Manufacturer: Shall have at least five years experience manufacturing products substantially similar to those required and shall be able to submit documentation of at least five installations in satisfactory operation for at least five years each.

B. Component Supply and Compatibility:
1. Obtain all frame, lid or cover, grate, and manhole step products included in this Section regardless of component manufacturer, from a single castings manufacturer.
2. Obtain all hydrostatic pressure relief valve products included in this Section regardless of component manufacturer, from a single castings manufacturer.
3. Castings manufacturer shall review and approve or prepare all Shop Drawings and other submittals for all components furnished under this Section.
4. Components shall be constructed for specified service conditions and shall be integrated into overall assembly by castings manufacturer.

1.4 SUBMITTALS:

A. Action Submittals: Submit the following:
1. Shop Drawings:

a. Fabrication and installation of all casting assemblies. Include plans, elevations, and details of sections and connections. Show anchorage and accessory items. Include setting drawings for location and installation of castings and anchorage devices.

2. Product Data:
   a. Copies of manufacturer's catalog information for the products proposed for use, specifications, load tables, dimension diagrams, anchor details, and installation instructions.

B. Informational Submittals: Submit the following:
1. Certificates:
   a. Furnish certification, signed by authorized officer of Contractor and notarized, stating that all components are furnished by the same manufacturer.
   b. Manufacturer's certification that the casting or lot of castings was made, sampled, tested and inspected in accordance with ASTM A48.
2. Qualifications Statements: Submit qualifications for the following:
   a. Manufacturer, when required by Engineer.

1.5 DELIVERY, STORAGE AND HANDLING:

A. Packing, Shipping, Handling, and Unloading:
1. Deliver products to the Site to ensure uninterrupted progress of the Work. Deliver anchorage materials to be embedded in concrete in ample time to prevent delaying the Work.
2. Comply with Section 01 6000, Product Requirements.

B. Storage and Protection:
1. Protect materials from corrosion and deterioration.
2. Comply with Section 01 6000, Product Requirements.

PART 2 – PRODUCTS

2.1 MATERIALS:

A. Round Manhole Frame with Solid Lid:
1. Material: ASTM A48/A48M, Class 35 B.
2. Lids for sanitary manholes shall be lettered "Sanitary" or "Sanitary Sewer". Lids for storm manholes shall be lettered "Storm" or "Storm Sewer".
3. Products and Manufacturers: Provide one of the following:
   a. R-1776, manufactured by Neenah Foundry Company.
   b. 1251 with type A cover, manufactured by East Jordan Iron Works, Inc.
   c. Or equal.

B. Catch Basin Type (2-2A and 2-2B) Grate:
1. Material: ASTM A48/A48M, Class 35 B.
2. Products and Manufacturers: Provide one of the following:
   a. R-4859-S, manufactured by Neenah Foundry Company.
   b. 5110 with Type M3 Grate, manufactured by East Jordan Iron Works, Inc.
   c. Or equal.

C. Curb Inlet Frame Grate and Curb Box:

1. Material: ASTM A48/A48M, Class 35 B.
2. Products and Manufacturers: Provide one of the following:
    a. R-3067-V, manufactured by Neenah Foundry Company.
    b. V-4066-1, manufactured by East Jordan Iron Works, Inc.
    c. Or equal.

D. Standard Clean Out Frame and Lid:
1. Material: ASTM A48/A48M, Class 35 B.
2. Products and Manufacturers: Provide one of the following:
    a. R-1910-D, manufactured by Neenah Foundry Company.
    b. V-1610-3 with Type A cover, manufactured by East Jordan Iron Works, Inc.
    c. Or equal.

E. NFC Clean Out Frame and Lid:
1. Material: ASTM A48/A48M, Class 35 B.
2. Products and Manufacturers: Provide one of the following:
    a. R-1530, manufactured by Neenah Foundry Company.
    b. 1058 with solid cover, manufactured by East Jordan Iron Works, Inc.
    c. Or equal.

2.2 FABRICATION:

A. Fabrication, General:
1. Castings shall be of uniform quality, free of sand holes, gas holes, shrinkage cracks, and other surface defects.
2. Castings shall be ground smooth and well-cleaned by shot blasting in the shop.
3. Design and fabricate round frames and covers to prevent rocking and rattling under traffic loads that will be imposed in actual use.
4. Fabricate castings true to pattern so that component parts fit together.
5. Each casting shall be identifiable and, depending on its size, shall indicate the following: name of producing foundry, ASTM material designation, individual part number, and cast or heat date. Castings shall include all lettering shown or indicated on the Drawings.

PART 3 – EXECUTION

3.1 INSPECCTION:

A. Examine conditions under which Work is to be performed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with installation until unsatisfactory conditions are corrected.

3.2 INSTALLATION:

A. Comply with casting manufacturer's printed instructions and the Contract Documents. Where castings are installed on precast concrete, fabricated fiberglass, or other fabricated products, install casting in accordance with requirements of manufacturer of product on which casting will be installed.

B. Set castings accurately to required location, alignment, and elevation, plumb, level, true and free of rack, measured from established lines and levels. Where applicable, brace temporarily or anchor temporarily in formwork.

END OF SECTION 56 5600

SECTION 06 1053

MISCELLANEOUS ROUGH CARPENTRY

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, material, tools, equipment, and incidentals as shown, specified, and required to furnish and install all miscellaneous rough carpentry Work.
   2. The Work also includes:
      a. Providing openings in miscellaneous rough carpentry to accommodate the Work under this and other Sections and building into miscellaneous rough carpentry items such as sleeves, anchorages, inserts and other items to be embedded in or penetrating miscellaneous rough carpentry for which placement is not specifically provided under other Sections.
   3. Extent of miscellaneous rough carpentry is shown or indicated.
   4. Types of materials required include:
      a. Miscellaneous blocking, furring strips, and other miscellaneous wood framing.
      b. Lumber for temporary protection.
      c. Lumber for temporary support.
      d. Pressure treatment of lumber specified in this Section.
      e. Miscellaneous accessories.
      f. Air and water infiltration barrier system.
      g. Vapor barrier system.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before miscellaneous rough carpentry Work.

C. Related Sections:
   1. Section 05 0533, Anchor Systems.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ALSC PS 20, American Softwood Lumber Standard.
   2. ASME B18.2.1 Square and Hex Bolts and Screws, Inch Series.
   3. ASME B18.6.1 Wood Screws, Inch Series.
   4. ASTM A653/A653M, Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
   5. ASTM D6841, Practice for Calculating Design Value Treatment Adjustment Factors for Fire-Retardant-Treated Lumber.
   6. ASTM F1667, Specification for Driven Fasteners: Nails, Spikes, and Staples.
   7. APA E445S, Performance Standards and Policies for Structural-Use Panels (APA PRP-108).
   8. NIST PS-1, Construction and Industrial Plywood.
   9. National Lumber Grade Authority (NLGA), Standard Grading Rules for Canadian Lumber.

10. Northeastern Lumber Manufacturers Association (NELMA), Standard Grading Rules for Northeastern Lumber.
11. Southern Pine Inspection Bureau (SPIB), Standard Grading Rules for Southern Pine Lumber.
12. West Coast Lumber Inspection Bureau (WCLIB), Standard Grading Rules.
13. Western Wood Products Association (WWPA), Western Lumber Grading Rules.

1.3 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with requirements of authorities having jurisdiction and the building code referred to in Section 01 4100, Regulatory Requirements for size, spacing and attachment of wood members, unless more stringent requirements are shown or specified in the Contract Documents.

B. Certifications:
1. Pressure Treatment: For each type of pressure treatment specified, submit certification by wood treating plant stating chemicals and process used, and certifying conformance with applicable standards referenced in the Contract Documents.
    a. For water borne preservatives, include statement that moisture content of treated materials was reduced to maximum of 19 percent prior to shipment to the Site.
2. Certificates of Grade: Where appearance of wood is important and grade marks will deface the Work, in lieu of grade markings on wood, submit certificates attesting that materials comply with grade requirements specified.

1.4 SUBMITTALS

A. Action Submittals; Submit the following:
1. Shop Drawings:
    a. List of species and grade of lumber proposed for each use.
    b. Fastener schedule with location, size, material and type of each fastener to be used in the Work.

B. Informational Submittals: Submit the following:
1. Certificates:
    a. Lumber treater’s certification of compliance, in accordance with Paragraph 1.3.B.1 of this Section.
    b. Certificates of grade in accordance with Paragraph 1.3.B.2 of this Section.
2. Tests and Evaluation Reports:
    a. For fire retardant treated structural panels, test data and design adjustment values in accordance with ASTM D5516 and ASTM D6305.
    b. For fire retardant treated lumber, test data and design adjustment in accordance with ASTM D5664 and ASTM D6841.
3. Manufacturer’s Instructions:
    a. Chemical treatment manufacturer’s instructions for proper use of each type of treated material.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling, and Unloading:

1. Deliver products to Site to ensure uninterrupted progress of the Work. Deliver anchorage products that are to be embedded in concrete or masonry in ample time to prevent delaying the Work.
2. Handle treated materials in accordance with AWPA M4.
3. Comply with Section 01 6500, Product Delivery Requirements.

B. Storage and Protection:
1. Keep materials dry during delivery and storage.
2. Keep materials off ground using pallets, platforms, or other appropriate supports. Protect materials from corrosion and deterioration. Stack lumber, and provide air circulation within stacks.
3. Comply with Section 01 6600, Product Storage and Handling Requirements.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Lumber, General:
1. Factory-mark each piece of lumber with type, grade, mill and grading agency. Surfaces that will be exposed to view shall not have grade marks or other types of identifying marks.
2. Nominal sizes are shown or indicated, unless otherwise shown or indicated in the Contract Documents. Provide actual sizes as required by ALSC PS 20 for moisture content specified for each use.
   a. Provide dressed lumber, surfaced four sides (S4S), unless otherwise shown or specified.
   b. Provide seasoned lumber with 19 percent maximum moisture content at time of dressing.
3. Provide the following grade and species:
   a. Construction Grade, for material up to and including four-inch wide.
   b. No. 2 or better for material greater than four-inch wide up to and including 12-inch wide.
   c. Eastern White Pine, NELMA.
   d. Spruce-Pine-Fir, NLGA.
   e. Hem-Fir (North), NLGA.
   f. Southern Pine, SPIB.
   g. Douglas Fir, WCLB.
   h. Douglas Fir, WWPA.
4. Lumber for Protection and Temporary Support: Size and grades to conform to Laws and Regulations, including OSHA.

B. Vapor Barrier:
1. Provide reinforced rubber, modified high density polyethylene vapor barrier with perm rating of 0.045 maximum. Provide maximum widths to minimize field seaming.
2. Provide adhesive, tapes and flashings as recommended by vapor barrier manufacturer, of type that maintains perm rating of entire vapor barrier installation
3. Products and Manufacturers: Provide one of the following:
   a. Rufco SS-300 Vapor Retarder and Adhesives by Raven Industries, Inc.
   b. Or equal.

C. Fasteners and Anchorages:

1. Fasteners exposed to the weather as well as fasteners embedded in, or in contact with, preservative treated wood shall be hot-dip galvanized.
2. Common wire nails shall conform to ASTM F1667.
3. Wood screws shall conform to ASME B18.6.1.
4. Lag screws and lag bolts shall conform to ASME B18.2.1.
5. Anchorage devices shall conform to Section 05 0533, Anchor Systems.
6. Use joist hangers, framing anchors and clips where shown or specified.
    a. Joist hangers shall be steel, zinc coated, sized to fit the supporting member, of sufficient strength to develop full strength of the supported member in accordance with applicable building code, and furnished complete with special nails required by joist hanger manufacturer.
    b. Framing anchors shall be hot-dip galvanized steel conforming to ASTM A653/A653M, Z275 G90. Steel shall not be lighter than 18-gage. Use special nails furnished by manufacturer for nailing.
    c. Clips shall consist of hot-dip galvanized conforming to ASTM A653/A653M, Z275 G90 steel angles, minimum 3/16-inch thick.

D. Wood Trim:
1. Western red cedar, custom grade.
2. Provide solid wood boards and battens complying with ALSC PS 20 and with applicable grading rules of authorized lumber inspection bureau or association under which each species is produced, S4S, with square edges.
3. Provide dressed, seasoned boards and battens with 15 percent maximum moisture content complying with dry size requirements of ALSC PS 20. Mark boards “MC-15” (moisture content 15 percent) or “KD” (kiln dried).

E. Panel edge clips: Extruded galvanized steel, H-shaped clips to prevent differential deflection of roof sheathing.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine substrates and supporting structure and conditions under which miscellaneous rough carpentry Work will be installed and notify Engineer in writing of conditions detrimental to proper completion of the Work. Do not proceed with installation until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Coordination: Fit miscellaneous rough carpentry Work to other Work and work under other contracts, as applicable, and scribe and cope as required for accurate fit. Correlate location of furring, nailers, blocking, grounds and similar supports to allow proper attachment of other construction.

B. General:
1. Discard units of material with defects that might impair quality of the Work, and units too small to fabricate the Work with minimum joints or optimum joint arrangement.
2. Set miscellaneous rough carpentry Work accurately to required levels and lines, with members plumb and true, accurately cut and fitted.

3. Securely attach miscellaneous rough carpentry Work to substrates by anchoring and fastening as shown and indicated in the Contract Documents. Countersink nail heads on exposed miscellaneous rough carpentry Work and fill holes. Make tight connections between members.
4. Install fasteners without splitting of wood, pre-drill as required and for masonry anchors fastened to wood stud wall framing.

C. Wood Grounds, Nailers, and Blocking:
1. Provide where shown or indicated, and where required for attachment of other construction. Form to shapes as shown or indicated and cut as required for true line and level of Work to be attached. Coordinate location with other work involved.
2. Attach substrates as required to support applied loading. Countersink bolts and nuts flush with surfaces, unless otherwise shown or indicated.
3. Provide permanent grounds of dressed, preservative-treated, key-bevelled lumber not less than 1.5-inch wide and of thickness required to bring face of ground to exact thickness of finish material involved. Remove temporary grounds when no longer required.

D. Plywood, General:
1. Install in accordance with the Contract Documents and requirements of authorities having jurisdiction.
2. Allow for installed clearances between individual plywood panels as specified by plywood manufacturer. Provide 1/4-inch space at panel edge joints and 1/8-inch space at panel end joints, unless otherwise recommended by manufacturer.
3. Install plywood with long dimension across supports.
4. Install roof sheathing using 8d helical or annular nails spaced fix inches at panel edges and 12 inches at intermediate framing.
5. Provide panel edge clips at unsupported edges of roof sheathing.

E. Vapor Barrier:
1. Install vapor barrier over entire interior room-side surfaces of exterior gypsum board perimeter walls, and over entire interior room-side surface plane of bottom of ceiling joists.
2. Install in accordance with manufacturer's written recommendations and using all taped joints and all taped fastener location to maintain perm rating of entire installed system in accordance with the Contract Documents.

END OF SECTION 06 1053

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 06 8213

FIBERGLASS-REINFORCED PLASTIC GRATING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all professional services, labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install fiberglass-reinforced plastic (FRP) grating. The Work also includes:
      a. Providing openings in FRP grating to accommodate the Work under this and other Sections and attaching to FRP grating all items such as sleeves, bands, studs, fasteners, and items required for which provision is not specifically included under other Sections.
      b. Providing openings in and attachments to FRP grating to accommodate work under other contracts, and assisting other contractors in building on or attaching to FRP grating items such as bands, fasteners, and studs and items required for which provision is not specifically included under other contracts.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before FRP grating Work.

C. Related Sections:
   1. Section 05 0533 Anchor Systems.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. AASHTO, Standard Specifications for Highway Bridges.
   2. ASTM D635, Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position.
   3. ASTM E84, Test Method for Surface Burning Characteristics of Building Materials.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer: Manufacturer shall have a minimum of five years experience producing materials substantially similar to those required and shall be able to submit documentation of at least five installations in satisfactory operation for at least five years each.

B. Component Supply and Compatibility:
   1. Obtain all products furnished under this Section regardless of component manufacturer from a single FRP grating manufacturer.
   2. FRP grating manufacturer shall prepare, or shall review and approve, all Shop Drawings and other submittals for components furnished under this Section.

C. Regulatory Requirements: Comply with the following:

1. OSHA, 29 CFR 1910.23, Guarding Floor and Wall Openings and Holes.
2. Building codes referred to in Section 01 4100, Regulatory Requirements.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Fabrication and erection drawings and schedules of all materials included under this Section. Include plans, elevations, and details, including connection details. Show anchorage and accessory items. Shop Drawings shall indicate location of planned field cut-outs in grating.
      b. Obtain Engineer's approval of field cut-outs in grating.
   2. Product Data:
      a. Manufacturer's specifications, load tables, dimension diagrams, and anchorage details.

B. Informational Submittals; Submit the following:
   1. Manufacturer Instructions:
      a. Setting drawings and templates for location and installation of anchorage devices.
      b. Manufacturer instructions for handling, storing, and installing the materials furnished.
   2. Qualifications Statements:
      a. Manufacturer qualifications, when requested by Engineer.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Storage and Protection:
   1. Protect materials from corrosion, staining, scratching, and deterioration.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. General:
   1. Maximum clear span deflection under uniform load equal to 250 pounds per square foot shall be the smaller of 1/200 of span or 1/4-inch, at four feet.
   2. Flame Spread Rating: 25 or less, ASTM E84; self-extinguishing ASTM D635.
   3. Sheet Size: As shown or indicated in the Contract Documents, and as required to comply with deflection requirements.
   4. Design Loads:
      a. Uniform live load shall be as shown. Where the live load is not shown, the uniform live load shall be as indicated below or the indicated concentrated load, whichever gives the greatest stresses.

	Live Load (psf)	**Concentrated Load (lbs per foot of grating at center of span)**
1)	100	500
2)	150	750
3)	200	1,000
4)	300	1,500

b. Maximum Clear Span Deflection for Uniform Live Loads: 1/240 of span, but not more than 1/4-inch.
c. Maximum Clear Span Deflection for Concentrated Loads: 1/180 of span.

B. High Load Capacity Molded FRP Grating: Provide materials complying with the following:
1. Grating shall be pultruded construction and designed for a maximum 1500 pounds wheel load and a non-concurrent 400 psf live load.
2. Pattern: Mesh configuration H147, 1-3/16" load bar spacing; 3" tie bar spacing on center.
3. Thickness: Three inches

C. Pultruded FRP Grating: Provide products conforming to the following:
1. Grating shall be pultruded construction with I-bar configuration of bearing bars and tie bars providing single-directional strength.
2. Depth: 1.5-inch minimum
3. Bearing Bars: Fiberglass I-bar minimum of one-inch spaced at 1.2-inch on centers.
4. Cross-Bars: Swage-locked to bearing bars at maximum spacing of four inches on centers.

D. FRP Stair Treads: Provide pultruded stair treads complying with the following:
1. Stair Tread Design Loads: Concentrated live load shall be:
a. 300 pounds on front-most five inches of tread at center of tread of span up to 5.5 feet.
b. 300 pounds on front-most five inches of tread at the one-third points of tread of span greater than 5.5 feet.
2. Maximum Clear Span Deflection for Concentrated Live Loads: 1/240 of span, but not more than 1/4-inch.
3. Maximum Fiber Stress: 12,000 psi.

2.2 MANUFACTURERS

A. High Load Capacity Molded FRP Grating:
1. Products and Manufacturers: Provide one of the following:
a. Fibergrate High Load Capacity Molded Grating, by Fibergrate Composite Structures, Inc.
b. Or equal

B. Pultruded FRP Grating:
1. Products and Manufacturers: Provide one of the following:
a. Safe-T-Span Pultruded Grating, by Fibergrate Composite Structures, Inc.
b. Duradek Pultruded Fiberglass Grating, by Strongwell Corporation.
c. Or equal.

C. Stair Treads: Provide one of the following:
1. Products and Manufacturers: Provide one of the following:
a. Safe-T-Span Pultruded Treads, by Fibergrate Composite Structures, Inc.
b. Duradek Pultruded Treads, by Strongwell Corporation.
c. Or equal.

2.3 MATERIALS

A. Fiberglass-Reinforced Plastic (FRP):
1. Premium-grade, fire-retardant vinyl ester resin with glass reinforcing.

2. Finished surfaces of FRP items and fabrications shall be smooth, resin-rich, free of voids and without dry spots, cracks, crazes, or un-reinforced areas. Glass fibers shall be well-covered with resin to protect against exposure due to wear and weathering.

B. Attachment, Clips, Fasteners, and Hardware: Provide titanium clips, bolts, nuts, washers, sleeves, fasteners, and associated hardware.

C. Color and Finish of Grating:
1. Color: Dark gray.

2.4 FABRICATION

A. General:
1. Use materials in accordance with the Contract Documents and approved Shop Drawings and submittals.
2. Sealing: Coat shop-fabricated cuts in FRP with vinyl ester resin.

B. Grating:
1. Reinforce grating with continuous rovings of equal number of layers in each direction. Top layer of reinforcing shall be no more than 1/8-inch below top surface of grating to provide maximum stiffness and prevent resin chipping of un-reinforced surfaces. Percentage of glass (by weight) shall not exceed 35 percent.
2. After molding, dry glass fibers shall not be visible on surface of bearing bars or cross bars. Bars shall be smooth and uniform with no evidence of fiber orientation irregularities, interlaminar voids, porosity, resin over-rich, or resin-starved areas.
3. Non-slip Surfacing: Grating shall have integrally-applied grit top on the surface of each bar providing maximum slip resistance.
4. Grating bar intersections shall be filleted to minimum radius of 1/16-inch to eliminate local stress concentrations and reduce the potential for resin cracking.
5. Layout: Each grating section shall be readily removable, except where shown or indicated on the Drawings. Manufacturer shall provide openings and holes where shown or indicated on the Drawings. Grating openings around protrusions such as structural elements, piping, conduit, shafts or other machinery, shall be discontinuous at the approximate centerline of the associated opening so each section of grating is readily removable.
6. Provide FRP grating to be installed in concrete with FRP angle frames having mitered corners and welded joints. Frames shall have welded anchors set into concrete. Angle size shall match grating depth selected for flush fit of grating.
7. Where grating is cut, seal the cut surfaces with catalyzed resin sealant of equal or superior corrosion resistance to the grating. Sealant shall be as recommended by grating manufacturer.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine conditions under which materials will be installed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Grating Installation:
   1. After structural elements, piping, conduit, shafts and other equipment are in place check all dimensions in the field and determine required grating cutouts.
   2. Placing:
      a. Install FRP grating with each section readily removable and replaceable, unless shown or indicated otherwise in the Contract Documents. Provide end-banding bars for each grating panel.
      b. Set tops of FRP gratings flush with surrounding construction.
      c. Install FRP grating with full and uniform end bearing on frames or bearing surfaces to preclude rocking movement. Do not use wedges or similar shimming devices.
      d. Provide FRP grating in concrete with angle frames. Grind exposed joints of angle frames smooth.
   3. Cutting and Fitting:
      a. Perform cutting, drilling, and fitting required for installation. Set the grating Work accurately in location, alignment, and elevation, plumb, level, true, and free of rack. Do not use wedges or shimming devices.
      b. Provide cutouts or openings in the field as approved by Engineer.
      c. Seal cut surfaces of grating requiring cutting during installation with sealant.
   4. Connections to Structural Elements and Bearing Surfaces:
      a. Attach gratings to bearing surface in accordance with grating manufacturer's recommendations
      b. Secure grating to FRP structural members, as required by manufacturers of grating and FRP structural member.
   5. Joints:
      a. Fit exposed connections accurately together to form tight joints.
      b. Adjacent units of FRP grating sections shall be neatly fitted together.
      c. Clearance at the ends or between sections of FRP grating shall be a maximum of 1/4-inch.
   6. Jointing Connections:
      a. Secure edges of grating to each other with end-panel clips.
      b. Secure clips to grating with bolts so that grating acts as a unit. Install bolts not more than three inches from each plate section end and not more than two feet on centers.
      c. For each FRP grating panel, provide four saddle clip anchors designed to fit over two adjacent grating section, and four stud bolts with washers and nuts for each grating panel.

END OF SECTION 06 8213

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 06 8223

FIBERGLASS-REINFORCED PLASTIC
HANDRAILS AND RAILINGS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment, incidentals, and professional design services as shown, specified, and required to furnish and install fiberglass-reinforced plastic (FRP) handrails and railings. The Work also includes:
      a. Providing openings in, and attachments to, FRP handrail and railing systems to accommodate the Work under this and other Sections. Provide all items for FRP handrails and railings, including anchorages, fasteners, studs, and other items required for which provision for is not specifically included under other Sections.
   2. FRP handrails and railings Work shall include components and features shown and specified, and all components and features available from specified manufacturers required for providing complete FRP handrail and railing system in accordance with the Contract Documents.
   3. Handrail and railing systems are shown to indicate general types of locations where handrails and railings are required. Where handrail or railing systems are not shown but may reasonably be inferred from the Contract Documents as required by either an authority having jurisdiction, OSHA, or other Laws or Regulations, provide handrail and railing systems of the type specified in this Section at no additional cost to Owner.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before FRP handrails and railings Work.
   2. FRP handrail and railings shall comply with Laws and Regulations. When Contractor is aware that FRP handrails and railings Work shown or indicated in the Contract Documents does not comply with Laws or Regulations, obtain written interpretation from Engineer.

C. Related Sections:
   1. Section 03 6000, Grouting.
   2. Section 05 0533, Anchor Systems.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ANSI/ASSE A1264.1, Safety Requirements for Workplace/Working Surfaces and Their Access; Workplace Floor, Wall and Roof Openings; Stairs and Guardrails Systems.
   2. ASTM D635, Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position.
   3. ASTM E84, Test Method for Surface Burning Characteristics of Building Materials.

1.3 QUALITY ASSURANCE

A. Qualifications:

1. Manufacturer:
    a. Manufacturer shall have a minimum of five years experience producing materials substantially similar to those required and shall be able to submit documentation of at least five installations in satisfactory operation for at least five years each.
    b. Manufacturer shall be capable of preparing and submitting custom detail shop drawings for the materials required.
2. Professional Engineer:
    a. Contractor or handrail and railing manufacturer shall retain a registered professional engineer legally qualified to practice in jurisdiction where the Site is located. Professional engineer shall have at least five years experience designing FRP handrails and railings.
    b. Responsibilities include:
        1) Reviewing FRP handrail and railing system performance and design criteria stated in the Contract Documents.
        2) Preparing written requests for clarifications or interpretations of performance or design criteria for submittal to Engineer by Contractor.
        3) Preparing or supervising preparation of design calculations verifying compliance of FRP handrail and railing system with requirements of the Contract Documents.
        4) Signing and sealing all calculations.
        5) Certifying that:
            a) Design of FRP handrail and railing system was performed in accordance with performance and design criteria stated in the Contract Documents, and
            b) Design conforms to Laws and Regulations, and to prevailing standards of practice.
3. Installer:
    a. Retain a single installer trained and with record of successful experience installing FRP handrail and railing systems.
    b. Installer shall have record of successfully installing FRP handrail and railing systems in accordance with recommendations and requirements of manufacturer, or shall submit evidence of being acceptable to the manufacturer.
    c. Installer shall employ only tradesmen with specific skill and successful experience in the type of Work required.
    d. When requested by Engineer, submit name and qualifications of installer with the following information for at least three successful, completed projects:
        1) Names and telephone numbers of owner and architect or engineer responsible for each project.
        2) Approximate contract cost of the FRP handrail and railing systems for which installer was responsible.
        3) Amount (linear feet) of FRP handrail and railing installed.

B. Component Supply and Compatibility:
1. Obtain all products furnished under this Section regardless of component manufacturer, from a single FRP handrail and railing system manufacturer.
2. FRP handrail and railing system manufacturer shall prepare, or shall review and approve, all Shop Drawings and other submittals (except for delegated design submittals, when professional engineer is retained by other than handrail and railing manufacturer) for all components furnished under this Section.
3. Components shall be suitable for the specified service conditions and shall be integrated into overall assembly by FRP handrails and railings manufacturer.

C. Regulatory Requirements: Comply with the following:
   1. OSHA, 29 CFR 1910.23, Guarding Floor and Wall Openings and Holes.
   2. Building codes referred to in Section 01 4100, Regulatory Requirements.

D. Certifications:
   1. Furnish notarized certification, signed by authorized officer of manufacturer, stating that handrail and railing systems conform to the design prepared by the professional engineer.
   2. Furnish notarized certification, signed by authorized officer of CONTRATOR, stating that all components and fittings are furnished by the same manufacturer

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Submit drawings for fabricating and installing FRP handrail and railing systems with sizes of members, tube wall thickness, information on components, and anchorage devices. Show all anchorages. Include details drawn at scale of 1.5-inch equal to one foot.
      b. Indicate required location of posts.
      c. Indicate locations and details of all expansion joints, if any.
      d. Indicate locations and details of gaps across seismic joints, if any.
      e. Profile drawings of FRP handrail and railing system components.
      f. Custom detail drawings. Details of forming, jointing, sections, connections, internal supports, trim, and accessories. Include details drawn at scale of 1.5-inch equal to one foot.
   2. Product Data:
      a. Manufacturer's published literature, specifications, standard detail drawings for FRP handrail and railing systems.
      b. Manufacturer's catalogs showing complete selection of standard and custom components and miscellaneous accessories for selection by Engineer.
   3. Delegated Design Submittals:
      a. Design computations or complete structural analysis of handrail and railing systems, signed and sealed by professional engineer. Professional engineer's seal shall be clearly legible, including jurisdiction of registration, registration number, and name on seal.
      b. Certification by professional engineer that professional engineer has performed design of FRP handrail and railing systems in accordance with performance and design criteria stated in the Contract Documents, and that design complies to Laws and Regulations, and to prevailing standards of practice.
   4. Test Procedure:
      a. Submit detailed description of proposed shop testing procedures. Do not perform shop testing until Engineer approves shop test procedure.
      b. Submit detailed description of proposed field testing procedures. Do not perform field testing until Engineer approves test procedure.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Manufacturer certification that materials were fabricated in accordance with professional engineer's design, in accordance with Paragraph 1.3 D.1 of this Section.
      b. Certification on source of supply, in accordance with Paragraph 1.3 B and Paragraph 1.3.D.2 of this Section.

2. Supplier Instructions:
    a. Instructions for handling, storing, and installing materials furnished.
    b. Templates for mounting to concrete.
3. Source Quality Control Submittals:
    a. Manufacturer's load testing report for FRP handrail and railing systems to be furnished for the Project, demonstrating compliance with requirements of the Contract Documents and Laws and Regulations.
4. Field Quality Control Submittals:
    a. Load testing report for completed, installed FRP handrail and railing systems at the Site, demonstrating compliance with requirements of the Contract Documents and Laws and Regulations.
5. Qualifications Statements: Submit qualifications for the following:
    a. Manufacturer, when requested by Engineer.
    b. Professional engineer, when requested by Engineer.
    c. Installer, when requested by Engineer. Qualifications statement shall include record of experience with references specified.

C. Closeout Submittals: Submit the following:
1. Operations and Maintenance Data: Submit maintenance manuals for materials furnished under this Section, including:
    a. Comply with Section 01 7823, Operations and Maintenance Data.
    b. Detailed procedures for routine maintenance and cleaning, including cleaning materials, application methods, and precautions in using the materials that may be detrimental to finish when improperly applied.
    c. Handrail and railings systems manufacturer's current catalog including individual parts.

1.5 DELIVERY, STORAGE AND HANDLING

A. Storage and Protection:
1. Protect materials from corrosion, staining, scratching, and deterioration.
2. Protect handrails and railings by paper or coating as acceptable to handrail and railing manufacturer, against scratching, splashes of mortar, paint, and other marring during transportation, handling, and erection. Protect until completion of adjacent work.

B. Handling of Products:
1. Do not subject handrail and railing materials to bending or stress.
2. Do not damage edges or handle materials in a manner that will cause scratches, warping, or dents.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. System Description:
1. Railing system shall consist of top and one intermediate horizontal rail(s) equally spaced, with toeboards where applicable.
2. Rails, Posts, and Toeboards:
    a. Rails shall each be minimum 1.75-inch square tube, with minimum 1/8-inch wall thickness.

b. Posts shall be minimum of two-inch square tube, 5/32-inch wall thickness with solid reinforcing stiffener.
c. Rails shall be continuous at post intersections.
d. Toeboards shall be 1/2-inch deep by four inches high. Toeboard shall have reinforcing ribs or other manufacturer-standard fabricated toeboard approved by Engineer.

3. Nominal Handrail Height Above Floor: In accordance with Laws and Regulations, but not less than 3.5 feet.
4. Comply with ANSI/ASSE A1264.1.

B. Design Criteria:
1. FRP handrail and railing system shall consist of equally-spaced horizontal rails, mechanical fasteners, and adhesively bonded components, fastened to posts spaced not more than five feet on centers and a system of handrails supported from adjacent construction by mounting brackets spaced at not more than five feet on centers.
2. Design Loads: Design, fabricate, and install FRP handrail and railing systems to withstand the most critical effects resulting from the following loads (loads listed below do not act concurrently):
a. Uniform Load: 50 pounds per foot, applied at top in any direction.
b. Concentrated Load: 200 pounds single load, applied at any point along the top in any direction.
c. Components: Intermediate rails shall withstand horizontally-applied normal load of 50 pounds on an area equal to one square foot, including openings and space between rails. Reactions due to this loading are not required to be superimposed to loading specified for main supporting members of handrails and railings.
d. Comply with generally accepted standards used in the FRP industry for determining allowable stresses and safety factors for structural FRP components.
e. Limit deflection in each single span of railing and handrail to 1.5-inch maximum, and to 1.4-inch maximum on railing posts. Applied loads shall not produce permanent deflection in the completed Work when loads are removed.
3. Thermal Control:
a. Provide adequate expansion within fabricated systems that allows for thermal expansion and contraction caused by material temperature change from 140 degrees F to -20 degrees F without warp or bow of system components.
b. Distance between expansion joints shall be based on providing 1/4-inch wide joint at 70 degrees F, that accommodates movement of 150 percent of calculated amount of movement for specified temperature range.
4. Where handrail and railing systems cross expansion joints in the building or structure, provide expansion joints in handrail and railings systems.
5. For posts located at or near end of runs as shown, uniformly space intermediate posts as required to comply with loading and deflection criteria specified, at intervals no greater than maximum post spacing specified. Where posts are shown or indicated for handrails along both sides of walkways and other similar locations, locate posts opposite each other; do not stagger post locations.
6. Provide each railing system post with solid reinforcing stiffener with outside dimension equal to inside dimension of post. Each post shall receive one reinforcing stiffener.

2.2 MANUFACTURERS

A. Products and Manufacturers: Provide one of the following:
1. Dynarail, by Fibergrate Composite Structures, Inc.

2. SAFRAIL, by Strongwell Corporation.
3. Or equal.

2.3 MATERIALS

A. Fiberglass-Reinforced Plastic (FRP):
1. Premium-grade, fire-retardant vinyl ester resin with glass reinforcing.
2. Finished surfaces of FRP items shall be smooth, resin-rich, free of voids and without dry spots, cracks, crazes, or un-reinforced areas. Glass fibers shall be well-covered with resin to protect against exposure due to wear and weathering.
3. Fire Resistance: 25, ASTM E84, self-extinguishing ASTM D635.

B. Attachment, Clips, Fasteners, Rivets, and Hardware: Provide titanium clips, bolts, nuts, washers, sleeves, fasteners, rivets, and associated hardware.

C. Color and Finish:
1. Color: Safety Yellow.
2. Finish: None .

D. Manufacturing Method:
1. Handrails and railings shall be pultruded FRP components.

2.4 FABRICATION

A. Handrail and Railing – General:
1. Use materials of minimum size and thickness as specified or indicated in the Contract Documents and in accordance with approved Shop Drawings and submittals.
2. Posts and Tubes:
   a. Fabricate connection of handrail to post so that rails are unbroken and continuous through post without using of packs or splices.
   b. Install bottom rail through post at prepared hole made to fit outside dimensions of rail.
   c. Fit top rail into machined, U-shaped pocket formed into top of post such that rail is located at center of post.
   d. For square cross-section members, exposed post corners shall be radiused to eliminate sharp edges.
   e. Join rails to post through combination of bonding and riveting.
   f. Sharp, protruding edges are unacceptable.
3. Support Post Attachments:
   a. Attach post bases according to the approved Shop Drawings, delegated design submittals, and manufacturer's recommendations.
   b. Reinforce post bases to a minimum height of 8.5 inches.
4. Rail Splices: Where required, splice rails using a 10-inch length of FRP tube bonded and riveted into place using epoxy adhesive, and rivets of material specified for fasteners.
5. Sealing: Coat shop-fabricated cuts in FRP with vinyl ester resin.

2.5 SOURCE QUALITY CONTROL

A. Fabrication Tolerances:
1. Minimum Handrails and Railings Systems Plumb Criteria:

a. Limit variation of completed handrail and railing system alignment to 1/4-inch in 12.0 feet.
b. Posts shall be plumb to within 1/16-inch in 3.0 feet.
c. Align rails so variations from level for horizontal members and from parallel with rake of stairs and ramps for sloping members do not exceed 1/4-inch in 12.0 feet.

2. Provide "pencil-line" thin butt joints.

B. Tests:
1. Load-test handrail and railing systems at the fabrication facility.
2. Submit written report identifying and documenting testing methods used, loads imposed, and how and where loads were applied, and results of such testing on actual complete handrail and railing systems including anchors and fasteners to be used in the Work.
3. Testing setup shall simulate actual conditions of installation to be used in the Work.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine conditions under which materials will be installed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Installation – General:
1. Remove protective wrapping from FRP handrails and railings immediately before installing materials.
2. Adjust handrails and railings prior to securing in place, to ensure proper matching at butting joints and correct alignment throughout their length. Plumb posts in each direction.
3. Installation Tolerances:
a. Limit variation of cast-in-place inserts, sleeves and field-drilled anchor and fastener holes to the following:
1) Spacing: Plus-or-minus 3/8-inch.
2) Alignment: Plus-or-minus 1/4-inch.
3) Plumbness: Plus-or-minus 1/8-inch.
b. Minimum Handrails and Railings Systems Plumb Criteria:
1) Limit variation of completed handrail and railing system alignment to 1/4-inch in 12.0 feet with posts set plumb to within 1/16-inch in 3.0 feet.
2) Align rails so variations from level for horizontal members and from parallel with rake of stairs and ramps for sloping members do not exceed 1/4-inch in 12.0 feet.
c. Provide "pencil-line" thin butt joints.
4. Secure posts and rail ends to buildings or structures as follows:
a. Anchor posts in concrete by means of sockets set and anchored into the concrete floor. Provide closure secured to bottom of sleeve. Before installing posts, remove debris and water from sleeves. Provide reinforcing stiffeners in each post before installing post; do not install posts without reinforcing stiffeners. For non-removable handrail and railing systems sections, after posts have been inserted into sockets, fill the annular space between each post and socket solid with non-shrink grout in accordance with Section 03 6000, Grouting. Crown grout and slope grout to drain away from posts.

b. Anchor posts to stair stringers with stringer or support flanges, angle type or floor type as required by conditions, shop-connected to posts and bolted to supporting members. Flanges shall be as recommended by FRP handrail and railing manufacturer. Provide reinforcing stiffeners in each post before installing post; do not install posts without reinforcing stiffeners.
c. Side-mount posts by fastening posts securely in brackets attached to fascia as shown and in accordance with approved Shop Drawings.
d. Provide removable railing sections where shown or indicated. Provide removable railing system posts with friction-fitted reinforcing stiffeners in each post. Accurately locate sleeves to match post spacing.

5. Use devices and fasteners recommended by FRP handrail and railing systems manufacturer and as shown or indicated on approved Shop Drawings.

B. Cutting, Fitting, and Placing:
1. Perform cutting, drilling and fitting required for installation.
2. Fit exposed connections accurately together to form tight hairline joints. Do not cut or abrade the surfaces of units that have been finished after fabrication, and are intended for field connections.
3. Make permanent field-splice connections using blind rivets and manufacturer's recommended adhesive and five-inch minimum length connector sleeves. Tightly press-fit field splice connectors and install in accordance with the Contract Documents and manufacturer's written instructions. Comply with epoxy manufacturer's recommendations for requirements of installation and conditions of use. Provide two blind rivets per joint on 180-degree centers.
4. Make splices as near as possible to posts, but not more than 12 inches from nearest post.
5. Secure handrails to walls with wall brackets and end fittings as shown. Locate brackets as shown or, if not shown, at not more than five feet on ceneters.
6. Provide flush-type wall return fittings with the same projection as that shown for wall brackets. Drill wall plate portion of bracket to receive one bolt, unless otherwise shown or indicated.
7. Secure wall brackets to building or structure as follows:
   a. For concrete and solid masonry anchorage, use expansion shields and lag anchors, in accordance with Section 05 0533, Anchor Systems.
   b. For hollow masonry anchorage, use toggle bolts having square heads.
8. Fasten toeboards in place with bolt hardware, not more than 1/4-inch clearance above floor level.

C. Fastening to Existing Construction:
1. Provide heavy-duty fascia or floor flange and anchorage devices and fasteners where necessary for securing handrail and railing systems components to existing construction; including threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts and other connectors as required, in accordance with Section 05 0533, Anchor Systems.
2. Use devices and fasteners recommended by the handrail and railing systems manufacturer and as shown on approved Shop Drawings.

D. Expansion Joints:
1. Provide slip joint with internal sleeve extending two inches, minimum, beyond joint on each side.
2. Construct expansion joints as for field splices, except fasten internal sleeve securely to one side of rail only.

3. Locate joints within six inches of a post.

3.3 FIELD QUALITY CONTROL

A. Site Tests:
   1. Load-test handrail and railing systems at the Site.
   2. Submit written report identifying and documenting testing methods used, loads imposed, and how and where loads were applied, and results of such testing on actual complete handrail and railing systems including anchors and fasteners used in the Work.

END OF SECTION 06 8223

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 06 8253

FIBERGLASS-REINFORCED PLASTIC MISCELLANEOUS FABRICATIONS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all professional services, labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install fiberglass-reinforced plastic (FRP) miscellaneous fabrications. The Work also includes:
      a. Providing FRP miscellaneous fabrications to accommodate the Work under this and other Sections, attaching to FRP miscellaneous fabrications items such as fasteners, and all items required, including embedded angles, for which provision is not specifically included under other Sections.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before FRP miscellaneous fabrications Work.

C. Related Sections:
   1. Section 03 6000, Grouting.
   2. Section 05 0533, Anchor Systems.
   3. Section 05 5013, Miscellaneous Metal Fabrications.
   4. Section 06 8213, Fiberglass-Reinforced Plastic Grating.
   5. Section 06 8223, Fiberglass-Reinforced Plastic Handrails and Railings.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. AISC Manual for Steel Construction
   2. ANSI A14.3 Ladders – Fixed – Safety Requirements.
   3. ANSI/ASSE A1264.1, Safety Requirements for Workplace/Working Surfaces and Their Access; Workplace Floor, Wall and Roof Openings; Stairs and Guardrails Systems.
   4. ASTM D635, Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position.
   5. ASTM E84, Test Method for Surface Burning Characteristics of Building Materials.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer:
      a. Manufacturer shall have a minimum of five years' experience producing materials substantially similar to those required and shall be able to submit documentation of at least five installations in satisfactory operation for at least five years each.
      b. Manufacturer shall be capable of preparing and submitting custom detail shop drawings for the materials required.
   2. Professional Engineer:

a. Contractor or fiberglass reinforced plastic miscellaneous fabrications manufacturer shall retain a registered professional engineer legally qualified to practice in the same state as the Site. Professional engineer shall have at least five years' experience in designing similar systems

b. Responsibilities include:

1) Reviewing fiberglass reinforced plastic miscellaneous fabrications system performance and design criteria stated in the Contract Documents.

2) Preparing written requests for clarifications or interpretations of performance or design criteria for submittal to Engineer by Contractor.

3) Preparing or supervising preparation of design calculations and related Shop Drawings.

4) Signing and sealing all design calculations and Shop Drawings.

5) Certifying that:

a) Design of fiberglass reinforced plastic miscellaneous fabrications systems has been performed in accordance with performance and design criteria stated in the Contract Documents, and

b) Design conforms to all applicable local, state, and federal Laws and Regulations, and to prevailing standards of practice

3. Installer:

a. Engage a single installer skilled, trained, and with record of successful experience in installing FRP miscellaneous fabrications systems in accordance with recommendations and requirements of manufacturer (or who can submit written acceptance by manufacturer), and who employs only tradesmen with specific skill and successful experience in the type of Work required.

b. Submit names and qualification to Engineer with the following information for at least three successful projects:

1) Names and telephone numbers of owner, architects, or engineers responsible for projects.

2) Approximate contract cost of FRP miscellaneous fabrications work.

3) Amount of FRP miscellaneous fabrications installed.

B. Component Supply and Compatibility:

1. Obtain all components for each type of system, such as ladders and cages, stairs and platforms, and structural shapes and framing and supports, each from a single FRP miscellaneous fabrications manufacturer.

2. FRP miscellaneous fabrications manufacturer shall prepare, or shall review and approve, all Shop Drawings and other submittals for components furnished under this Section.

3. Components shall be suitable for specified service conditions and shall be integrated into overall assembly by FRP miscellaneous fabrications manufacturer.

C. Regulatory Requirements: Comply with the following:

1. OSHA 29 CFR 1910.28, Duty to have fall protection and falling object protection.

2. OSHA 29 CFR 1910.23, Ladders.

3. Comply with codes referred to in Section 01 4100 Regulatory Requirements.

D. Certification: Submit the following:

1. Verification that materials purchased for the Work comply with material designations specified in the Contract Documents and the approved Shop Drawings.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Drawings for fabricating and erecting FRP miscellaneous fabrications, indicating sizes of members, materials, components, and anchorage devices, based on requirements of the Contract Documents.
      b. Show location of all anchorage items.
      c. Profiles of FRP miscellaneous fabrications, and details of forming, jointing, sections, connection, internal supports, trim, and accessories. Provide details drawn at scale of 1.5-inch equal to one foot.
      d. Custom details required for the Work under this Section.
   2. Product Data:
      a. Manufacturer's published literature, specifications, standard detail drawings for FRP miscellaneous fabrications.
      b. Manufacturer's catalogs showing complete selection of standard and custom components and miscellaneous accessories for selection by Engineer.

B. Delegated Design Submittals:
   1. Design Data: Submit the following:
      a. Design Calculations
         1) Complete calculations for each FRP miscellaneous fabrication, as one package with the Shop Drawings. Structural calculations shall include all specified performance criteria, required load cases and load combinations used in the design and resulting member forces, reactions, and deflections. The magnitude of reactions on foundations or supports from all critical load combinations shall be tabulated separately. All calculations and assumptions shall be presented so that Engineer can easily follow the progress and logic of Contractor's professional engineer. The design analysis shall include the name and office phone number of the designer to answer questions during the shop drawing review
         2) Design calculations shall be signed, sealed, and dated by Contractor's professional engineer. State of professional engineer's registration, registration number, and name on seal shall be clearly legible.

C. Informational Submittals: Submit the following:
   1. Certificates:
      a. Certification on source of supply, in accordance with Article 1.3 of this Section.
   2. Supplier Instructions:
      a. Instructions for handling, storing, and installing materials furnished.
      b. Templates for mounting to concrete or other existing materials.
   3. Qualifications Statements: Submit qualifications for the following:
      a. Manufacturer, when requested by Engineer.
      b. Professional engineer, when requested by Engineer.
      c. Installer, when requested by Engineer. Qualifications statement shall include record of experience with references specified.

D. Closeout Submittals: Submit the following:
   1. Operations and Maintenance Data: Submit maintenance manuals for materials furnished under this Section, including:
      a. Comply with Section 01 7823, Operations and Maintenance Data.

b. Detailed procedures for routine maintenance and cleaning, including cleaning materials, application methods, and precautions in using the materials that may be detrimental to finish when improperly applied.

1.5 DELIVERY, STORAGE AND HANDLING

A. Storage and Protection:
1. Protect materials from corrosion, staining, scratching, and deterioration.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. System Description – General:
1. FRP miscellaneous fabrications shall be as shown and shall comply with recommended practices of the American Composites Manufacturers Association, except as otherwise specified in this Section.
2. FRP ladders and stairs shall include all components and features shown and specified. Provide system components and features necessary for a complete system complying with the Contract Documents.
3. Provide ultraviolet light inhibitor in the resin to improve materials' resistance to degradation from ultraviolet light.
4. Where appropriate, provide allowance for trimming and fitting at the Site.
5. Where applicable, comply with ANSI/ASSE A1264.1.

B. Design Criteria:
1. Stairs and Platforms:
a. Stair and Platform Design Live Load: 100 psf.
b. Tread Design Loads: Concentrated live load shall be follows:
1) 300 pounds on front five inches of tread at center of tread spans up to 5.5 feet.
2) 300 pound on front 5.5 feet of tread at 1/3-points of tread span greater than 5.5 feet.
3) Maximum Clear Span Deflection for Concentrated Live Loads: 1/240 of span, but no greater than 1/4-inch.
2. Ladders:
a. Minimum design load on fixed ladders shall be a single concentrated load of 300 pounds applied at any point to produce the maximum load effect on the element being considered. The number and position of additional concentrated loads shall be a minimum of 1 unit of 300 pounds for every 10 ft of ladder height, in accordance with ASCE 7.
b. Where rails of fixed ladders extend above a floor or platform, each side rail extension shall be designed to resist a single concentrated live load of 100 pounds in any direction at any height up to the top of the side rail extension, in accordance with ASCE 7.
c. Consider ice loads where applicable, in accordance with ASCE 7.
d. Wind load on all parts of the ladder, where applicable, in accordance with ASCE 7.
e. Anticipated impact loads resulting from the use of ladder fall prevention systems.
3. Fasteners and Supports:
a. Provide the size, length and load carrying capacity required to carry the specified loadings required by design criteria multiplied by a minimum safety factor of four.

b. Where sizes are shown, the sizes shown shall be considered minimum. Increase size to comply with required design criteria loadings and minimum safety factor specified.
c. Anchors and Expansion Anchors: Comply with Section 05 0533, Anchor Systems.

2.2 MATERIALS

A. Fiberglass-Reinforced Plastic (FRP):
1. Provide premium-grade, glass-reinforced, vinyl ester resin.
2. Fire Resistance: 25 or less, ASTM E84; self-extinguishing ASTM D635.
3. Surfaces that will receive foot traffic, including ladder runs and treads, shall have non-skid surface.

B. Manufacturing Method:
1. Pultrusion Method: FRP ladders, FRP stairs, FRP structural shapes, FRP miscellaneous framing and supports.

C. Attachment, Clips, Fasteners, Rivets, and Hardware: Provide titanium clips, bolts, nuts, washers, sleeves, fasteners, rivets, and associated hardware.

2.3 FABRICATION

A. Shop Assembly: Preassemble items in the shop to the greatest extent possible, to minimize field splicing and assembly of components at the Site. Disassemble units only to extent necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinate installation.

B. FRP Stairs:
1. Products and Manufacturers: Provide of one of the following:
a. FRP Stairs by Fibergrate Composite Structures, Inc, of StonCor Group.
b. FRP Stairs by Strongwell Corporation
c. Or equal.
2. Provide FRP stairs complying with Laws and Regulations and OSHA 29 CFR 1910.27.
3. Fabricate stairs so that bolts and other fasteners do not appear on finish surfaces. Make joints true and tight, and make connections between parts light proof tight.
4. Construct stair units in compliance with sizes and arrangements shown. Provide framing, hangers, columns, struts, clips, brackets, bearing plates and other components for supporting stairs and associated platforms.
5. Provide brackets and bearing surfaces as detailed on the Drawings and as required to anchor and contain the stairs on the supporting structure.
6. Fabricate stringers of FRP channels, or plates, or a combination thereof, as shown or as required. Provide closures for exposed ends of stringers.
7. Construct platforms of FRP structural shapes and miscellaneous framing members, as shown or as required. Bolt framing members to stringers and headers.
8. Grating: Comply with Section 06 8213, Fiberglass-Reinforced Plastic Grating.
9. Handrails and Railing: Comply with Section 06 8223, Fiberglass-Reinforced Plastic Handrails and Railings.

C. FRP Ladders:
1. Fabricate ladders for locations shown or indicated with dimensions, spacing, details, and anchorages as shown and specified. Comply with OSHA 29 CFR 1910 and ANSI A14.3, except as otherwise shown or specified.

a. Unless otherwise shown, provide 1.5 inch diameter continuous side rails, spaced at least 1.5 feet apart.
b. The side rails shall be fiberglass reinforced pultruded polyester with OSHA safety yellow pigment.
c. The side rails shall be 2" square tube with a wall thickness of 0.156 inches minimum or greater as required by analysis. The rungs shall be pultruded 1.25" diameter FRP fluted tube.
d. All joints and rungs shall be riveted.
e. Ladders shall be shop assembled.

2. Fall Prevention System:
   a. Provide each ladder with a fall prevention system complying with 29 CFR 1910.
   b. System shall consist of a carrier rail securely and permanently attached to ladder, over which travels a sleeve to which harness belt can be attached.
   c. Rail:
      1) Notched at six-inch intervals and constructed of galvanized steel.
      2) Provide ladder attachments/rail mounting brackets of same material as rail, and as required by Supplier.
      3) For all ladders, include provisions to secure safety sleeve to carrier rail at top of vertical ladder so that sleeve will not slide down rail when safety belt is unsnapped.
      4) Ladders Below Hatches: Rail for ladder shall extend from bottom of ladder to top of ladder. Provide telescoping safety post as specified in this Article.
      5) Ladders Not Below Hatches: Rail for ladder shall extend from bottom of ladder to above horizontal landing or roof at top of ladder, Provide removable extension section at top of ladder. Arrange rail to allow climber to land on landing or roof without unsnapping climber's safety harness
   d. Accessories: Provide with each ladder the following, all furnished by fall prevention system Supplier:
      1) One safety sleeve compatible for use with the rail. Sleeve shall be cast bronze with five zinc-plated steel roller bearings. Sleeve shall travel smoothly on straight or curved rail.
      2) One safety harness that attaches to sleeve. Harness shall be of woven, high-strength nylon, with padded straps and forged steel buckles and rings. Harness shall distribute impact forces of a fall over climber's thighs, buttocks, chest, and shoulders.
      3) One shock-absorbing Y-lanyard no longer than six feet, complying with ANSI Z359.1. Lanyard shall be 5/8-inch diameter nylon rope with double-locking snap hooks at each end.

D. FRP Platforms:
1. The platform shall be fabricated from FRP structural shapes properly sized to support the specified design live load.
2. The stair and platform shall be provided with FRP grating, railing as specified.

E. FRP Structural Shapes:
1. Products and Manufacturers: Provide of one of the following:
   a. Dynaform Structural Shapes, by Fibergrate Composite Structures, Inc.
   b. EXTREN Series 625 Structural Shapes, by Strongwell Corporation
   c. Or equal.
2. Provide FRP miscellaneous structural framing required to complete the Work.
3. Fabricate FRP shapes to the sizes, shapes, and profiles shown, and as required to complete FRP framing Work.

4. Except as otherwise shown, fabricate from structural shapes, plates, and bars using mitered corners, brackets and splice plates and a minimum number of joints for field connection.
5. Cut, drill and tap units to receive hardware and similar items to be anchored to the Work.

F. Miscellaneous Framing and Supports:
1. Provide FRP miscellaneous framing and supports that are not part of structural FRP framework, as required to complete the Work.
2. Fabricate miscellaneous units to sizes, shapes, and profiles shown on the Drawings. If not shown, fabricate to required dimensions to receive adjacent grating, plates, storage tanks, doors, and other Work that will be located in, retained by, or supported by FRP framing or supports.
3. Except as otherwise shown or indicated, fabricate from FRP shapes, plates, and bars, of all-welded construction using mitered corners, welded brackets, and splice plates and minimum number of joints for field connection.
4. Cut, drill, and tap FRP miscellaneous framing and supports to receive hardware and similar items to be anchored to the Work.
5. Anchors:
   a. Provide FRP miscellaneous framing and supports with integrally-welded anchors for casting into concrete or masonry. Furnish inserts if FRP miscellaneous framing or supports are to be installed after concrete or masonry is placed.
   b. Except as otherwise shown or indicated, space anchors at maximum intervals of two feet on centers, and mount FRP units with the equivalent of 1.25-inch by 1/4-inch by eight-inch FRP strips, minimum. Provide larger mounting surface when required for the material or equipment being supported by the FRP miscellaneous farming or supports.
6. For grating requirements refer to Section 06 8213, Fiberglass-Reinforced Plastic Grating.
7. For FRP handrails and railings, refer to Section 06 8323, Fiberglass-Reinforced Plastic Handrails and Railings.

G. Grout: Provide non-shrink grout in accordance with Section 03 6000, Grouting.

2.4 SOURCE QUALITY CONTROL

A. Fabrication Tolerances:
1. Limit variation of cast-in-place inserts, sleeves and field-drilled anchor and fastener holes to the following:
   a. Spacing: Plus-or-minus 3/8-inch.
   b. Alignment: Plus-or-minus 1/4-inch.
   c. Plumbness: Plus-or-minus 1/8-inch.
2. Provide “pencil-line” thin butt joints.

B. Tests:
1. Perform manufacturer's standard tests and inspections on FRP miscellaneous fabrications.
2. Materials and fabrication procedures shall be subject to inspection and tests in the mill, shop, and at the Site, conducted by qualified inspection agency. Such inspections and tests shall not relieve Contractor of responsibility for providing materials and fabrication procedures in accordance with the Contract Documents.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine the substrate and conditions under which FRP miscellaneous fabrications Work is to be performed and notify Engineer in writing of unsatisfactory tolerances that exceed specified limits and other conditions detrimental to proper and timely completion of the Work. Do not proceed with installation until unsatisfactory conditions are corrected.

3.2 INSTALLATION – GENERAL

A. Install FRP miscellaneous fabrications accurately in location, alignment, and elevation, plumb, level, true, and free of rack, measured from established lines and levels. Brace temporarily or anchor temporarily in formwork where fabrications are to be built into concrete, masonry, or other construction.

B. Perform cutting, drilling and fitting required for the installation of FRP miscellaneous fabrications. Do not cut FRP members without approval of FRP manufacturer and Engineer. All cut or machined edges, holes and abrasions shall be sealed with a resin compatible with the resin matrix used in the structural shape recommended by FRP manufacturer.

C. Fit exposed connections accurately together to form tight, hairline joints. Field assemble with fasteners, clips, rivets, and other hardware as required.

D. Anchorage Devices:
   1. Provide anchorage devices, including anchor bolts, and other connectors required for securing FRP miscellaneous fabrications to floors, walls, and other in-place Work.
   2. Anchor securely as shown and as required for the intended use, using concealed anchors where possible
   3. Provide templates and other devices necessary for presetting anchorage devices to accurate locations.
   4. Refer to Section 05 0533, Anchor Systems, for anchorage requirements.

E. Setting Bases and Bearing Plates:
   1. Clean concrete and masonry bearing surfaces of bond-reducing materials and roughen to improve bond to surfaces. Clean bottom surface of FRP bearing plates and FRP base plates.
   2. Set loose and attached FRP base plates and FRP bearing plates for structural members or FRP supports on wedges or other adjusting devices.
   3. Tighten anchorage devices after supported members are positioned and plumbed. Do not remove wedges or shims, but if protruding, cut off flush with edge of FRP base or FRP bearing plate prior to packing with grout.
   4. Place grout between bearing surfaces and bases or plates in accordance with Section 03 6000, Grouting. Finish exposed surfaces, protect installed materials, and allow to cure in accordance with grout manufacturer's instructions, and as otherwise required.
   5. Leveling plates and wood wedges are not allowed.

F. Installation Tolerances:
   1. Limit variation of cast-in-place inserts, sleeves and field-drilled anchor and fastener holes to the following:
      a. Spacing: Plus-or-minus 3/8-inch.
      b. Alignment: Plus-or-minus 1/4-inch.

c. Plumbness: Plus-or-minus 1/8-inch.

2. Provide “pencil-line” thin butt joints.

G. Protection: Protect cast-in sleeves from debris and water intrusion by use of temporary covers or removable foam inserts.

3.3 INSTALLATION OF FRP STAIRS, PLATFORMS, AND LADDERS

A. Installation of FRP Stairs, Platforms, and Ladders – General:

1. Erect FRP stair Work to line, elevation, plumb, square, and true with runs registering level with floor and platform levels, in accordance with the approved shop drawings.
2. Erect FRP platforms to line, elevation, plumb, square, level, and true in accordance with the approved shop drawings.
3. Erect FRP ladders to line, elevation, plumb, square, level, and true in accordance with the approved shop drawings.
4. Provide anchorage devices, connectors, and fasteners where necessary for securing stairs and platforms to in-place construction; including, threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts and other connectors as required.
5. Where masonry walls support FRP stair or platform Work, provide temporary supporting struts, designed for the erection of FRP stair and platform components before installing masonry.

3.4 INSTALLATION OF FRP STRUCTURAL SHAPES

A. Field Assembly:

1. Set FRP structural shapes and members accurately to the lines and elevations shown and indicated. Align and adjust the various shapes and members forming part of a complete frame or structure before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
2. Level and plumb individual shapes and members of structure within tolerances as specified in AISC Manual for Steel Construction. For shapes or members requiring accurate alignment, provide clip angles, lintels, and other members, with slotted holes for horizontal adjustment at least 3/8-inch in each direction, or more when required.
3. Splice members only where shown or indicated.

B. Connections:

1. Comply with AISC Manual for Steel Construction, as applicable, for bearing, adequacy of temporary connections, and alignment.
2. Where holds in shapes or members are inadequately sized, address and make sufficiently large using means recommended by manufacturer of FRP shape or member.

3.5 FIELD QUALITY CONTROL

A. Tests and Inspections: All elements of completed FRP miscellaneous fabrications shall be visually inspected by Contractor, installer, and Engineer. Correct defective Work, and correct Work not installed to true line, elevation, and grade.

END OF SECTION 06 8253

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 07 1113

BITUMINOUS DAMPPROOFING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment, and incidentals as shown, specified, and required to furnish and install bituminous dampproofing.
   2. Extent of bituminous dampproofing is shown.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before bituminous dampproofing Work.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASTM D1187, Specification for Asphalt-Base Emulsions for Use as Protective Coatings for Metal.
   2. ASTM D1227, Specification for Emulsified Asphalt Used as Protective Coating for Roofing.
   3. ASTM D4479, Specification for Asphalt Roof Coatings—Asbestos-Free.
   4. ASTM D4586, Specification for Asphalt Roof Cement, Asbestos-Free.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Installer: Engage a single installer with successful experience installing bituminous dampproofing, and that is acceptable to or licensed by manufacturer of bituminous dampproofing materials, and that employs only workers with specific skill and successful experience in the type of Work required.

B Component Supply and Compatibility:
   2. Provide all bituminous dampproofing of each type required produced by one manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Schedule of all Project-specific surfaces where bituminous dampproofing will be applied.
   2. Product Data:
      a. Manufacturer's specifications and technical data for each required dampproofing material. Indicate VOC content of materials proposed.

B. Informational Submittals: Submit the following:
   1. Certificates:

a. Submit bituminous dampproofing manufacturer's certification or other data substantiating that materials proposed for use comply with the Contract Documents, and are recommended by bituminous dampproofing manufacturer for the required applications.
b. Certification indicating that bituminous dampproofing materials delivered in bulk, if any, to the Site comply with the Contract Documents. Include statistical and descriptive data for each product furnished. Submit certificate with each load before using the material in the load.
c. Certification indicating compliance with Laws and Regulations for air quality regarding maximum VOC content for bituminous dampproofing materials.
d. Certification that materials furnished is Asbestos-free as required by ASTM D4479 and ASTM D4586.

2. Supplier's Instructions:
   a. Manufacturer's instructions for handling and storing.
   b. Manufacturer's instructions for application methods and application procedures.
3. Qualifications Statements:
   a. Installer: Submit copy of manufacturer's acceptance of installer and installer's record of experience in work similar to that required under this Section.

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery of Materials:
1. Deliver bituminous dampproofing bulk shipments in original, unopened, undamaged containers with manufacturer's certification indicating compliance with the Contract Documents.
2. Do not store damaged or opened containers at the Site. Remove from Site and do not offer such damaged material again.
3. Include with each bulk shipment information on the material's shelf-life, date, quantity delivered, and other information as may be required to establish acceptability of materials delivered to the Site.

B. Storage of Materials:
1. Store emulsions at temperatures above 40 degrees F.

C. Handling of Materials:
1. Do not open containers or mix components until preparatory Work is completed.
2. Do not use solvent-based bituminous dampproofing without adequate ventilation. Prevent build-up of explosive and hazardous fumes.

1.6 PROJECT CONDITIONS

A. Environmental Requirements:
1. Do not install bituminous dampproofing when ambient air temperature is 40 degrees F or less.
2. Do not apply bituminous dampproofing materials to frozen substrates or to substrate in condition not complying with bituminous dampproofing material manufacturer's recommendations.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General:
   1. For interior and concealed-in-wall uses, provide bituminous dampproofing material that is odor-free after drying for 24 hours.

B. Cold-Applied, Cut-Back Asphalt Dampproofing:
   1. Asphalt Compound: Manufacturer's standard asphalt and cut-back solvent-based compound with mineral stabilizers, recommended for concealed in cavity wall interior applications, compounded to penetrate the substrate and build to a moisture-resistant, firm, elastic coating.
   2. Non-Fibrated Dampproofing Material:
      a. Provide non-fibrated type, spray-applied liquid dampproofing compound, complying with ASTM D4479, Type I.
      b. Products and Manufacturers: Provide one of the following:
         1) Spray-Mastic, by W.R. Meadows, Inc.
         2) Or equal.

C. Cold-Applied Asphalt Emulsion Dampproofing:
   1. Asphalt Emulsion: Manufacturer's standard asphalt and water emulsion, recommended by bituminous dampproofing material manufacturer for below-grade exterior applications to either damp (green) or dry substrates, compounded to penetrate the substrate and build to a moisture-resistant, breathing-type of elastic coating.
   2. Heavy-Fibrated, Torwel-Applied Material:
      a. Provide heavy-fibrated type, trowel-applied mastic dampproofing compound complying with ASTM D1187 Type I, or ASTM D1227 Type II, Class I.
      b. Products and Manufacturers: Provide one of the following:
         1) Hydrocide 700 Mastic, by ChemRex, Inc., Sonneborn Building Products Division.
         2) 920 AF Fibered (Trowel Grade) Emulsion Mastic, by Karnak Chemical Corporation.
         3) Or equal.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine the substrates and conditions under which bituminous dampproofing Work will be applied, and advise Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 PREPARATION

A. General:
   1. Do not proceed with bituminous dampproofing Work until blocking, nailers, piping, conduits, and other projections through the substrate are installed, with substrate properly patched and sealed or flashed to receive the bituminous dampproofing.

B. Surface Preparation:

1. Remove from the substrate dirt, oil, loose materials, and other substances that interfere with penetration, bond, and performance of bituminous dampproofing materials.
2. Dampen with water surfaces that are dry and are to receive application of bituminous dampproofing. Keep such surfaces damp ahead of application.

3.3 INSTALLATION

A. Cold-Applied, Cut-Back Bituminous Dampproofing on Exterior and Interior Surfaces:
   1. Prime the substrate when recommended by bituminous dampproofing manufacturer's instructions, using the type and quantity of primer recommended by bituminous dampproofing manufacturer.
   2. Apply coating of cold-applied, fibrated mastic bituminous dampproofing material by troweling-on to the substrate at uniform rate of one gallon per 12 square feet to provide uniform dry film thickness of not less than 1/16-inch.
   3. Apply coating of cold-applied, semi-fibrated, semi-mastic bituminous dampproofing material by brushing or spraying at the rate of one gallon per 20 square feet, to provide uniform dry film thickness of not less than 1/16-inch.
   4. Cold-Applied, Non-fibrated Liquid Dampproofing:
      a. Apply coating of cold-applied, non-fibrated liquid bituminous dampproofing material by brushing or spraying at the rate of one gallon per 80 square feet to produce uniform dry film thickness of not less than 12 mils.
      b. After first coat has dried for not less than 24 hours, repeat the application. Apply second coat at rate of one gallon per 120 square feet. Apply second coat at right angles to first coat.
   5. Cant Strips, Fillers and Extension of Coatings:
      a. On exterior surfaces, where lower edge of dampproofing terminates at a horizontal projection (including footings under walls), provide two-inch by two-inch bituminous grout cant strip.
      b. Mix sand with required bituminous material to form a plastic grout; form and compact in place. Provide bituminous grout fillers where shown and where required to close openings in the substrate.
      c. Extend coatings a distance of 12 inches onto adjoining walls, but do not extend onto surfaces to remain exposed-to-view.
   6. Fill cracks, crevices, and grooves. Coating shall be continuous and free of breaks and pinholes. Spread dampproofing around joints, grooves, and slots, and into all chases, corners, reveals, and soffits.

B. Cold-Applied Bituminous Dampproofing Emulsions on Exterior and Interior Surfaces:
   1. Apply coating of fibrated mastic, asphalt emulsion bituminous dampproofing material by trowelling-on to substrate at uniform rate of one gallon per 15 square feet to produce uniform dry film thickness of not less than 1/16-inch.
   2. Apply coating of liquid emulsion bituminous dampproofing material by spraying at the rate of one gallon per 20 square feet to produce uniform dry film thickness of not less than 1/16-inch. When necessary, apply in two coats to obtain required thickness, allowing time for complete drying between coating applications.
   3. Cant Strips, Fillers, and Extension of Coatings:
      a. On exterior surfaces, where lower edge of dampproofing terminates at a horizontal projection (including footings under walls), provide two-inch by two-inch bituminous grout cant strip.

b. Mix sand with required bituminous material to form a plastic grout; form and compact grout in place. Provide bituminous grout fillers where shown and wherever required to close openings in the substrate.
c. Extend coatings a distance of 12-inches onto adjoining walls, but do not extend onto surfaces to remain exposed-to-view.

3.4 PROTECTION OF EXECUTED WORK

A. Protect other work from spillage of bituminous dampproofing materials, and prevent such materials from penetrating and clogging drains, conductors, and other utilities.

B. Remedy damage to other construction that is soiled or otherwise damaged during installation of bituminous dampproofing.

END OF SECTION 07 1113

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 07 1916

SILATE WATER REPELLENTS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install silate water repellents.
   2. Extent of surface-applied silate water repellents includes all exterior split-face concrete unit masonry.
   3. Types of silate water repellents required include:
      a. Liquid, colorless, non-gloss-producing, VOC-compliant, applied water repellent.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before silate water repellants Work.
   2. Coordinate water repellant provided with sealant. Water repellant and sealant shall be compatible with each other.

C. Related Sections:
   1. Section 04 2200, Concrete Masonry Units.

1.2 QUALITY ASSURANCE

A. Qualifications:
   1. Installer:
      a. Water repellant applicator shall be acceptable to or licensed by water repellant manufacturer and shall be regularly-engaged in installing water repellant products and work similar to the Work required under this Section.

B. Component Supply and Compatibility:
   1. Provide all water repellants of each type required produced by one manufacturer.

C. Regulatory Requirements:
   1. VOC emissions from water repellant materials shall not exceed 343 grams per litre.

D. Mock-up:
   1. Prior to installing materials required under this Section, apply silate water repellant to area acceptable to Engineer on mock-up up required under Section 04 2200, Concrete Units Masonry.
   2. Mock-up shall indicate, relative to silate water repellants, proposed range of color change, surface sheen, and workmanship to be expected in the completed Work. Obtain Engineer's approval of visual qualities of mock-up before starting unit masonry construction and silate water repellants Work.
   3. Provide as many mock-up panels as required to obtain Engineer's approval.
   4. Water repellant application that does not comply with standards approved on mock-up panels shall be removed and reapplied to comply with the Contract Documents.

1.3 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Product Data:
      a. Manufacturer’s literature and specifications on products proposed for use. Indicate VOC emissions of materials.
      b. Detailed chemical analysis and test results of previously-performed tests of materials required under this Section applied to surfaces identical to, or similar to, those to which silate water repellants will be applied for the Project.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Manufacturer's certification indicating silate water repellent complies with or exceeds requirements of the Contract Documents.
   2. Supplier’s Instructions:
      a. Manufacturer’s instructions for handling, storing, and shelf-life.
      b. Manufacturer's instructions for methods and application procedures.
   3. Qualifications Statements:
      a. Installer: Submit copy of manufacturer’s acceptance of installer and installer’s record of experience in work similar to that required under this Section.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Comply with manufacturer's instructions for handling, storing, and shelf-life.

1.5 SITE CONDITIONS

A. Environmental Conditions for Installation:
   1. Comply with manufacturer’s installation instructions regarding required temperature of surface to which material is applied.
   2. Do not apply water repellant when ambient air temperature is lower than 50 degrees F.
   3. Do apply materials when ice or frost covers the substrate.
   4. Do apply materials when ambient temperature of surface exceeds 100 degrees F.
   5. Do apply materials in rainy conditions or when heavy rain is expected with four hours after application.
   6. Maintain ambient temperature above 20 degrees F during 24 hours after installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Products and Manufacturers: Provide one of the following:
   1. Protectosil Chem-Trete BSM 40 VOC, by Evonik Degussa Corporation.
   2. Prime-A-Pell Plus Series 662, by Tnemec Company, Inc.
   3. Or equal.

B. Products and Manufacturers: Provide one of the following:
   1. Protectosil Chem-Trete BSM 400, by Evonik Degussa Corporation.
   2. Prime-A-Pell Plus Series V662, by Tnemec Company, Inc.
   3. Or equal.

2.2 MATERIALS

A. Chemical Bonding Water Repellants Without Silicone Resin:
   1. Provide silane solution, with or without diffused quartz carbide; colorless, and VOC-compliant.
   2. When dry, water repellant shall be colorless and without gloss.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine under which the Work will be performed. Notify Engineer in writing of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

B. Verify that surfaces to receive water-repellent are clean, and free of efflorescence, stains, oil, grease, and other foreign matter detrimental to application.

C. Verify that required sealants have been installed in areas to receive water repellant.

3.2 PREPARATION

A. Protection of Adjacent Surfaces:
   1. Protect adjacent surfaces that will not receive silate water repellents. When applied or splashed onto surfaces not required to receive water repellents, remove immediately, using method recommended by water repellant manufacturer. Maintain cleaning materials available at the Site for immediate use.

B. Surface Preparation:
   1. Remove loose particles and foreign matter. Remove grease and oil using solvent, effective alkaline cleaner, or detergent as instructed by water repellant manufacturer. Scrub surfaces with water.
   2. Surfaces shall be dry prior to applying water repellant.

3.3 APPLICATION

A. Provide water repellants in accordance with water repellant manufacturer's instructions and recommendations.

B. Apply in two continuous, uniform coats as recommended by water repellant manufacturer. Allow to dry between coats as recommended by water repellant manufacturer.

C. Protect materials in vicinity of application. During windy conditions, do not apply water repellant by spraying. When plants and other flora receive water repellant coating, immediately remove water repellant from plants and flora by washing.

3.4 FIELD QUALITY CONTROL

A. Site Tests:
   1. Spray Test: After water repellent has dried, spray with water the surfaces to which water repellant was applied. After surfaces have adequately dried, inspect for signs of water

adsorption in presents of Engineer, and reapply water repellant to areas that indicate water absorption.

END OF SECTION 07 1916

SECTION 07 2105

BUILDING INSULATION

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment, and incidentals as shown, specified, and required to furnish and install building insulation.
   2. Extent of each type of building insulation is shown and indicated in the Contract Documents.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items that must be installed with or before building insulation Work.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASTM C177, Test Methods for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus.
   2. ASTM C203, Test Method for Breaking Load and Flexural Properties of Block-Type Thermal Insulation.
   3. ASTM C236, Test Methods for Steady-State Thermal Performance of Building Assemblies by Means of a Guarded Hot Box.
   4. ASTM C272, Test Method for Water Absorption of Core Materials for Structural Sandwich Constructions.
   5. ASTM C303, Test Method for Dimensions and Density of Preformed Block and Board-Type Thermal Insulation.
   6. ASTM C518, Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.
   7. ASTM C520, Test Methods for Density of Granular Loose Fill Insulation.
   8. ASTM C531, Test Method for Linear Shrinkage and Coefficient of Thermal Expansion of Chemical-Resistant Mortars and Monolithic Surfacings.
   9. ASTM C549, Specification for Perlite Loose Fill Insulation.
   10. ASTM C553, Specification for Mineral Fiber Blanket Thermal Insulation for Commercial and Industrial Applications.
   11. ASTM C578, Specification for Rigid, Cellular Polystyrene Thermal Insulation.
   12. ASTM C612, Specification for Mineral Fiber Block and Board Thermal Insulation.
   13. ASTM C665, Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.
   14. ASTM C764, Specification for Mineral Fiber Loose-Fill Thermal Insulation.
   15. ASTM D696, Test Method for Coefficient of Linear Thermal Expansion of Plastics between -30 Degrees C and 30 Degrees C with a Vitreous silica dilatometer.
   16. ASTM D1621, Test Method for Compressive Properties of Rigid Cellular Plastics.
   17. ASTM D2126, Test Method for Response of Rigid Cellular Plastics to Thermal and Humid Aging.
   18. ASTM E84, Test Method for Surface Burning Characteristics of Building Materials.

19. ASTM E96, Test Methods for Water Vapor Transmission of Materials.
20. ASTM E119, Test Methods for Fire Tests of Building Construction and Materials.
21. UL 1479, Fire Tests of Through-Penetration Firestops.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturers:
      a. Obtain building insulations, requiring hydrochlorofluorocarbon blowing agent from manufacturer(s) that manufacture product required using blowing agent acceptable for use until the year 2020 and complying in all respects with Copenhagen Amendments to the Montreal Protocol.
      b. Manufacturer shall provide complete technical services including preparation and review of Shop Drawings and submittals, installation methods, and proposed detailing for the Work.
   2. Installer: Engage single installer for each type of building insulation. Each installer shall be skilled, trained, and have record of successful experience in applying and installing each product, and possess successful record of performing work in accordance with recommendations and requirements of manufacturer or that can submit written evidence of being acceptable to manufacturer for providing the required Work. Installers shall employ only tradesmen with specific skill and successful experience in each type of Work required. Submit to Engineer name and qualifications of each installer with the following information for at least three successful, completed projects per installer:
      a. Names and telephone numbers of owner and architect or engineer responsible for each project.
      b. Approximate contract cost of the building insulation system installed.
      c. Quantity (area) of building insulation installed.

B. Regulatory Requirements: Comply with code interpretations by authorities having jurisdiction at the Site.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Drawings showing extent of the building insulation Work and all details required for the Work, referencing system components provided as Samples.
      b. Complete selection of fire stop manufacturer's recommended systems for each condition and kind of penetration encountered in the Work. Coordinate with equipment manufacturers for required number and kind of penetrations through fire-rated construction. Provide schedule of penetrations and fire stop system to be included for each condition and kind of penetration encountered.
   2. Product Data:
      a. Material specifications and general recommendations from building insulation manufacturer for each type of building insulation product. Include manufacturer's data substantiating that materials comply with Contract Documents.
      b. Test Reports: Copies of reports of tests on materials being furnished or previously-manufactured, identical materials verifying compliance with physical properties and environmental features specified in the Contract Documents. When requested by Engineer, submit qualifications and summary of experience of testing agencies in performing tests similar to those required.

3. Samples:
    a. Twelve-inch by twelve-inch Samples of each required type of building insulation.
    b. Samples will be reviewed by Engineer for color and texture only. Compliance with other requirements is responsibility of Contractor.

B. Informational Submittals: Submit the following:
1. Manufacturer's Instructions: Manufacturer's installation instructions. Indicate by copy of transmittal form that installer has received copy of manufacturer's installation instructions.
2. Site Quality Control Submittals: Submit results of specified Site quality control tests.

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery and Handling of Materials:
1. Do not deliver insulation materials to the Site before the time of installation.
2. Deliver materials in sufficient quantities to allow uninterrupted continuity of the Work.
3. Handle materials carefully to avoid damage and breakage or compressing of boards to less than their specified thickness, or other damage.
4. Handle materials in manner that prevents inclusion of foreign materials.
5. Conform to Section 01 6500, Product Delivery Requirements.

B. Storage of Materials:
1. Store materials in dry, enclosed area, off ground and away from possible contact with water, ice, and snow.
2. Prevent damage to materials during storage, including minimizing the time materials are stored at the Site before being incorporated into the Work. Store only sufficient quantity of building insulation materials at the Site required for continuous advancement of the Work without causing delay.
3. Conform to Section 01 6600, Product Storage and Handling Requirements.

1.6 SITE CONDITIONS

A. Environmental Conditions:
1. Complete the installation and concealment of building insulation materials as rapidly as possible to avoid damage from adjacent construction operations and adverse weather conditions.
2. Install building insulations when weather and temperature conditions comply with building insulations manufacturers' written recommendations.
3. Install building insulations when damaging environmental condition are not forecasted for the time when exposed systems materials components would be exposed to potential damage from the elements.
4. Protect building insulation Work from precipitation, frost, and direct sunlight.
5. Do not apply pressure-sensitive tape when temperature is below 35 degrees F or above 110 degrees F.
6. Record decisions, conditions, and agreements to proceed with the Work when weather conditions may be unfavorable. State reasons for proceeding, along with names of persons involved, and changes or revisions (if any), if required, to allow the Work to proceed.

1.7 . SCHEDULING

A. Proceed with building insulation Work when preceding Work is ready to receive the Work of this Section.

B. Proceed with building insulation and associated Work after curbs, blocking, substrate board, nailer strips, vents, drains and other projections through the substrates have been installed, and when substrate construction and framing of openings is complete.

C. Proceed with and complete the Work when materials, equipment and tradesmen required for the installation of building insulation and backfilling operations are at the Site and ready to follow with the Work in manner that does not leave the Work vulnerable to damage or deterioration.

D. Do not advance installation of building insulation beyond that necessary for proper sequencing of the Work. Do not advance the Work when there is no proper and secure protection from damaging weather and construction activities.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Performance Criteria:
1. Thermal Conductivity: Thicknesses shown are for thermal conductivity, k-value at 75 degrees F, specified for each material.
2. Provide adjusted thicknesses based on thicknesses shown or specified for building insulations, as required to comply with required thermal resistances for material having different thermal conductivity.

2.2 MATERIALS

A. Foam Plastic Insulations: Provide the following types:
1. General: Rigid, closed-cell, thermally stabilized, extruded, hydrochlorofluro-carbon blown, foam board insulation consisting of 100 percent virgin extruded polystyrene modified resin complying with ASTM C578.
2. Provide blowing agent with lowest available ozone depletion potential, such as HCFC-142b or better. HCFC-141b is not acceptable.
3. Perimeter Foundation Insulations: Provide very high-load-resisting, rigid foam board insulation complying with ASTM C578, Type VI.
   a. Physical Properties: Provide the following:
      1) Thermal Conductivity (k), ASTM C177 and ASTM C518: 0.20 Btu/inch/hour/square foot/degree F.
      2) Compressive Strength (psi at five percent deformation) ASTM D1621: 40 psi minimum.
      3) Flexural Strength, ASTM C203: 60 psi minimum.
      4) Coefficient of Thermal Expansion, ASTM D696: 3.5x10^5 inches/inch/degree F.
      5) Water Absorption, ASTM C272: Less than 0.1 percent by volume maximum.
      6) Water Vapor Permeance, ASTM E96: 0.3 to 0.8 perms/inch maximum.
      7) Flame Spread, ASTM E84: Five.
      8) Smoke Developed, ASTM E84: 165 maximum.
   b. Thickness: 1 layer at two inches thick.
   c. Width: 2.0 feet.
   d. Length: 8.0 feet.
   e. Products and Manufacturers: Provide one of the following:
      1) STYROFOAM 40 HIGH LOAD by the Dow Chemical Company.
      2) Foamular 400 by Owens-Corning Fiberglass Corporation.

3) Or equal.

4. Cavity Wall Rigid Insulation Board: Provide the following:
   a. Rigid, rectangular boards of extruded polystyrene complying with ASTM C578, Type X and IV.
   b. Physical Properties: Provide the following:
      1) Minimum Compressive Strength, (at 10 percent deformation), ASTM D1621: 25 psi.
      2) Flame Spread, ASTM E84: 10 maximum.
      3) Smoke Development, ASTM E84: 165 maximum.
      4) Vapor Transmission, ASTM E96: 1.1 perms/inch.
      5) Thermal Resistance, ASTM C177: 5.0 per inch.
      6) Maximum Water Absorption, ASTM C272: 0.10 percent by volume.
   c. Size: 1 layers of 16 inches by 96 inches by 1-5/8 inches thick.
   d. Products and Manufacturers: Provide one of the following:
      1) CAVITYMATE Plus by the Dow Chemical Company.
      2) Foamular 250 Square Edge by Owens-Corning Fiberglass Corp.
      3) Or equal.

B. Mineral Fiber Insulation: Provide the following types:
   1. General: Provide insulations formed from inorganic mineral fiber extrusions spun at 2,500 degrees F complying with ASTM C665 and ASTM C764.
   2. Loose Mineral Fiber Insulation: Provide non-asbestos rock, slag, or glass processed into fiber and formed into loose resilient wool mass or granular nodules complying with ASTM C764, Type 1 (for blowing) Type 2 (for pouring).
      a. Physical Properties:
         1) Thermal Conductivity (k), ASTM C764: 0.46 Btu/inch/hour/square foot/degree F.
         2) Ignition Loss: Less than one percent (99 percent pure mineral fiber).
         3) Density, ASTM C 64: 1.5 pounds per cubic foot (pcf).
      b. Products and Manufacturers: Provide one of the following:
         1) Industrial Mineral Wool Fiber by Rock Wool Industries, Inc.
         2) FBX Insulating Wool by Fibrex, Inc.
         3) Or equal.
   3. Safing Insulation: Provide unfaced semi-rigid non-asbestos, non-combustible blankets composed of compounds of spun mineral fiber felt, complying with ASTM C665, Type I.
      a. Physical Properties:
         1) Thermal Conductivity (k), ASTM C518: 0.25 Btu/inch/hour/square foot/degree F.
         2) Density, Manufacturer's Certified Test: Four pounds per cubic foot (pcf).
         3) Flame Spread, ASTM E84: 15 maximum.
         4) Smoke Developed, ASTM E84: Five maximum.
         5) Fire Resistance Rating, ASTM E119: Three hours.
      b. Thickness: Four inches.
      c. Width: 2.0 feet.
      d. Products and Manufacturers: Provide one of the following:
         1) Thermafiber Safing Insulation by USG Interiors, Inc.
         2) FBX Safing Insulation by Fibrex, Inc.
         3) Or equal.

C. Fire-Stop Sealants and Other Fire-Stop System Components: Provide the following:

1. Complete selection of fire-stop manufacturer's recommended silicone rubber fire-stop systems. Provide complete systems complying with UL 1479 with two- or three-hour fire rating. Provide equal fire protection as provided by fire-rating of construction penetrated.
2. Provide multiple component systems coordinated to meet actual conditions encountered in the Work and as recommended by fire-stop manufacturer. In addition to providing fire resistance, fire-stop systems shall also be gas and watertight.
3. Products and Manufacturers: Provide one of the following:
   a. 3M Fire Stop Systems by 3M, Inc.
   b. Or equal.

D. Miscellaneous Materials and Accessories: Provide the following:
1. Adhesive for Bonding Insulation: Type recommended by insulation manufacturer, and complying with fire resistance requirements.
2. Mechanical Anchors: Type and size shown or, if not shown, as recommended by insulation manufacturer for type of application shown and condition of substrate.
3. Safing Impaling Clips: Provide galvanized steel impaling clips complying with requirements of code authorities having jurisdiction at the Site and as recommended by insulation manufacturer for full system responsibility.
4. Protection Board: Fiberboard sheathing or heavy duty asphaltic panels as recommended by insulation manufacturer.
5. Adhesive Tapes: Complete selection of insulation manufacturer's recommended taping materials.
6. Bitumen: Asphalt, ASTM D 449.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and installer shall examine substrate and conditions under which building insulation Work will be performed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surfaces to receive building insulation shall be clean of all debris, dirt, and other contamination before installation begins.

3.3 INSTALLATION

A. General:
1. Comply with manufacturer's instructions for particular conditions of installation in each case. If printed instructions are not available or do not apply to Site conditions, before proceeding with the Work obtain from manufacturer and submit to Engineer specific installation recommendations from manufacturer.
2. Extend insulations full thickness over entire surface to be insulated. Cut and fit tightly around obstructions. Fill voids with insulation.
3. Apply number of layers of insulation specified, each of required thickness, or required thickness to provide thermal value shown or indicated in the Contract Documents, to make up the total thickness.

B. Unit-type Building Insulation:

1. Apply insulation units of type shown or indicated to substrate by method indicated. If not otherwise indicated and except for units resting on horizontal surfaces, bond units to substrate with adhesive or use mechanical anchorage to provide permanent placement and support of units.
2. Seal joints between closed-cell (non-breathing) insulation units by applying mastic or sealant of type recommended by the manufacturer to edge of each unit to form tight seal as units are shoved into place. Fill voids in completed installation with mastic or sealant.
3. Set vapor barrier faced units with vapor barrier to warm side of construction, (usually toward inside), except as otherwise shown or indicated. Do not obstruct ventilation spaces, except for fire-stopping.
4. Tape joints and ruptures in vapor barriers using adhesive tape of type recommended by insulation manufacturer, and seal each continuous area of insulation to surrounding construction so as to ensure vapor-tight installation of the units.
5. Stuff loose mineral fiber insulation into miscellaneous voids and cavity spaces as indicated. Compact to approximately 40 percent of normal maximum volume to density of approximately 2.5 pounds per cubic foot.

C. Safing Insulations and Fire-Stop Systems:
1. Install safing insulation and fire-stop systems to present continuous fire-rated fire barrier in areas shown and at perimeter of all fire-rated partitions and poke-through floor and wall penetrations, to maintain continuity of fire-rated construction whether or not shown.
2. Install fire stop sealants and other fire stop system components in thicknesses recommended by manufacturer at all locations where poke-through penetrations occur, at all locations where other penetrations such as ducts, pipe, cables, cable trays, and conduit occur and at perimeter of all fire-rated walls.
3. Include all components of manufacturer's fire/smoke-stop systems for complete system responsibility installed in accordance with manufacturer’s written recommendations and specifications.

D. Board-type Perimeter Insulation:
1. Install perimeter insulation after concrete footings have been poured and before on-grade concrete slab work begins.
2. Remove projections that interfere with placing.
3. Apply single 2.0-foot-wide continuous band of insulation of required thickness and number of layers at slab-on-grade buildings whether or not shown. Stagger joints between layers of insulation and butt insulation tightly together.
4. Protect top surface of horizontal insulation from damage during concrete Work by applying protection course material recommended by insulation manufacturer.
5. On vertical surfaces, set units in adhesive applied in accordance with manufacturer’s instructions. Use type of adhesive recommended by manufacturer of board-type perimeter insulation.
6. Tape bottom edge of insulation before temporarily attaching insulation to wall with mastic.
7. Tape all joints in vertical wall insulation.
8. Protect insulation on vertical surfaces from damage during backfilling by applying protection course material recommended by insulation manufacturer. Set in adhesive in accordance with recommendations of insulation manufacturers and protection course material.

E. Cavity Wall Rigid Insulation Board:
1. Install exterior wall rigid insulation board after all concrete unit masonry Work is complete.

2. Apply single layer of insulation cut to fit snugly and uniformly and in continuous contact with edges of continuous masonry horizontal joint reinforcement over entire plane of the wall.
3. Apply exterior wall rigid insulation to exterior concrete unit masonry walls in areas shown or indicated as receiving masonry outer cavity wall wythes.
4. Set units in adhesive applied in accordance with manufacturer's instructions. Use type of adhesive recommended by manufacturer of board-type cavity wall insulation.

F. Correcting Defective Work:
1. System components that are dislodged, damaged, expanded, broken, penetrated, or crushed by subsequent installation operations or damaged by detrimental weather shall be immediately replaced with undamaged material in compliance with the Contract Documents and properly protected as specified.
2. Only original installer shall repair or replace deteriorated or defective Work.

3.4 PROTECTION

A. Protection from Elements:
1. Protect all components of the Work from detrimental weather conditions. Do not allow building insulation materials to become wet or soiled, or covered with ice or snow. Provide continuous protection of materials against damage, wetting and moisture absorption and storing materials as specified
2. Work that cannot, for reasons acceptable to Engineer, be covered with complete construction system before onset of weather detrimental to the Work, shall be completely covered and protected in manner that deflects precipitation from building insulations without damaging adjacent Work.
3. Protect foam plastic building insulation from exposure to sunlight.

B. Protection During Construction:
1. Protect all components of the Work from construction operations including, but not limited to, backfilling, framing, and sheathing, aluminum siding, and concrete unit masonry Work, until work is completed and acceptable to Engineer.
2. Protect building insulations from damage and abuse by other contractors and installers until readiness for final payment.
3. Do not allow building insulations to come into contact with welding operations or other fire or ignition sources.
4. Do not allow construction traffic not associated with installation of building insulation in the area of building insulation Work. Protect the area from access by other installers and contractors until the building insulation Work has been incorporated into finished construction systems.

C. Building insulation that becomes wet, damaged, or deteriorated shall be promptly removed from the Site and replaced with materials conforming to this Section.

END OF SECTION 07 2105

SECTION 07 2216

ROOF BOARD INSULATION

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install all roof board insulation.
2. Types of products required include the following:
a. Extruded, pentane isomer blown, polyisocyanurate rigid board-type insulation.
b. Composite system of lightweight vermiculite insulating concrete with integral expanded polystyrene, rigid foam insulation board.
c. Miscellaneous materials and accessories.

B. Coordination:
1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with the roof board insulation Work.
2. All framing for openings, edge angles, nailers, curbs and other items shall be in place before start of roof board insulation Work.
3. Coordinate finish of galvanized steel metal roof deck for acceptance by composite roof board insulation manufacturer.
4. Field-verify location of all roof penetrations, drain locations, and deck deflections.

C. Related Sections:
1. Section 06 10 53, Miscellaneous Rough Carpentry.
2. Section 07 53 23, Ethylene-Propylene-Diene-Monomer (EPDM) Roofing.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
1. American Society for Testing and Materials, (ASTM).
a. ASTM C 150, Specification for Portland Cement.
b. ASTM C 177, Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus.
c. ASTM C 203, Test Methods for Breaking Load and Flexural Properties of Block-Type Thermal Insulation.
d. ASTM C 272, Test Method for Water Absorption of Core Materials for Structural Sandwich Constructions.
e. ASTM C 303, Test Method for Dimensions and Density of Preformed Block and Board-Type Thermal Insulation.
f. ASTM C 495, Test Method for Compressive Strength of Lightweight Insulating Concrete.
g. ASTM C 518, Test Method for Steady-State Thermal Transmission Properties by Means of Heat Flow Meter Apparatus.
h. ASTM C 550, Test Method for Measuring Trueness and Squareness of Rigid Block and Board Thermal Insulation.
i. ASTM C 1289, Specification for Faced Rigid Cellular Polyisocyanurate Thermal Insulation Board.

j. ASTM D 696, Test Method for Coefficient of Linear Thermal Expansion of Plastics between -30 Degrees C and 30 Degrees C with a Vitreous Silica Dilatometer.
k. ASTM D 1621, Test Method for Compressive Properties of Rigid Cellular Plastics.

2. ASTM D 1622, Test Method for Apparent Density of Rigid Cellular Plastics.
   a. ASTM D 1623, Test Method for Tensile and Tensile Adhesion Properties of Rigid Cellular Plastics.
   b. ASTM E 84, Test Method for Surface Burning Characteristics of Building Materials.
   c. ASTM E 96, Test Methods for Water Vapor Transmission of Materials.
3. Factory Mutual, (FM).
   a. FM Publication, Loss Prevention Data for Roofing Contractors, 1-29, Above-Deck Roof Components.
   b. FM Publication, Approval Guide.
4. Underwriters Laboratories, (UL).
   a. UL Building Materials Directory.

1.3 QUALITY ASSURANCE

A. Installer's Qualifications:
1. Roof board insulation Work shall be performed by the installer of the associated roofing for undivided responsibility.
2. Engage a single composite roof board insulation system installer, approved in writing by the manufacturer of the composite roof board insulation, who has qualified for appointment and has been trained by the manufacturer of the composite roof board insulation system and who is equipped to perform workmanship in accordance with both the requirements of the composite roof board insulation manufacturer and the membrane roof manufacturer so that there will be undivided responsibility for the performance of the composite roof board insulation Work.
3. Submit proof of acceptability of installer by manufacturer to Engineer.

B. Source Quality Control:
1. Obtain extruded polyiscoyanurate rigid board-type insulation from manufacturers who manufacture specified insulation using a blowing agent containing no chlorine-based compounds.
2. Engage a single manufacturer for each type of roofing insulation who shall provide the services of a technical representative to assist Contractor and Engineer by providing technical opinions on the adequacy of materials and methods of installation based on Shop Drawings approved by Engineer.
3. Provide such services during the time of delivery, storage, handling and installation of all roofing insulation.
4. The thicknesses shown are based on the thermal conductivity, k-value at 75°F specified for each material. Thicknesses of roof board insulation materials submitted by Contractor as "or equal" to specified materials shall have their thicknesses adjusted to provide the same thermal resistance as materials specified.

C. Erection Tolerances: Provide the following for composite roof board insulation:
1. In addition to filling the space between all metal deck flutes, provide minimum of 1/8-inch of insulating concrete over the top of the metal deck.
2. Finished system shall not pond water and shall provide a uniformly sloped surface to low point roof drains. If at any time up to the time of Final Acceptance the roof shows signs of ponding water, the composite roof board insulation system shall be repaired to provide uniform slope to drain, at no additional cost to Owner.

D. Requirements of Regulatory Agencies: Comply with fire-resistance ratings as required by governing authorities and building codes, and complies with the following roof board insulation requirements:
   1. Underwriters Laboratories requirements for roof deck constructions which are rated "UL Class A".
   2. Factory Mutual requirements for "Class 1-90" rated construction, for wind resistance.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Samples:
      a. Each fastener to be used in the Work.
      b. 12-inch by 12-inch sample of specified extruded and expanded rigid board-type insulation and composite insulation system.
   2. Shop Drawings:
      a. Field verified locations of all roof penetrations, drain locations, and deck deflections.
      b. Complete layout of all roof board insulation showing sizes, placement, number of courses and methods of fastening. Include statement that fastening method, location and density of fasteners have been approved by roof membrane manufacturer and comply with wind uplift requirements specified.
      c. Weights of all equipment to be used on roof.
      d. All required roof board insulation details approved by the roof board insulation manufacturer and the manufacturer of the respective roofing systems.
   3. Product Data:
      a. Manufacturer's specifications and installation instructions for each type of roof board insulation required. Include data substantiating that the materials comply with specified requirements.

B. Informational Submittals: Submit the following
   1. Certificates:
      a. Installer's qualifications.
   2. Site Quality Control Submittals:
      a. Submit Job Conditions Report, prepared by composite roof board insulation installer, as specified, and in addition, include a notarized statement from the full-time on-Site technical representative and installer that the composite roof board insulation system was installed according to manufacturer's written recommendations as shown on approved Shop Drawings.
   3. Source Quality Control Submittals:
      a. Laboratory test results for thermal resistance values based on ASTM C 177 or ASTM C 518 for actual composite roof board insulation system shown and specified.

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery of Materials:
   1. Do not deliver insulation materials to the Site before time of installation.
   2. Deliver materials in manufacturer's original, undamaged packages or acceptable bulk containers.

B. Storage of Materials:
   1. Do not allow insulation materials to become wet or soiled, or covered with ice or snow.
   2. Protect plastic insulation from exposure to sunlight.

3. Protect plastic insulation against ignition.
4. Store packaged materials to protect them from the weather and physical damage.

C. Handling of Materials:
1. Comply with manufacturer's recommendations for handling, storage and protection.
2. Do not use cement which shows indication of moisture damage, caking or other signs of deterioration.

1.6 JOB CONDITIONS

A. Pre-Roofing Conference: Provide both a representative of the composite roof board insulation system manufacturer and the foreman of the installer who will actually work on this Project at the Pre-Roofing Conference specified in Section 07 5323, Ethylene-Propylene-Diene-Monomer (EPDM) Roofing.

B. Environmental Requirements:
1. Do not install roof board insulation when weather conditions are such that the deck is not completely dry, there is ice or snow on the deck, or where there is no assurance that the roof board insulation can be completely protected from the weather by the end of the day's Work.
2. For applications of composite roof board insulation system, when the temperature is expected to fall below 40°F, submit written installation recommendations of the composite insulation system manufacturer confirming acceptability of the conditions encountered. Contractor shall verify that composite roof board insulation system installed under such adverse weather conditions meet all material and performance requirements specified. Installer shall record actual conditions of installation, including intervals between system component placement, weather and temperature conditions, temporary uses of roof (if any) and other pertinent installation factors and include in Job Conditions Report submitted to Engineer.
3. Hot water is not available at the Site and shall be supplied by composite roof board insulation installer as required by installation conditions.
4. Potable water is not available at the Site and shall be provided by composite roof board insulation installer.

C. Protection:
1. Do not overload the building structure with the weight of stored materials or use of equipment.
2. Install temporary water cut-offs at the end of each day's Work to protect the roof board insulation. Remove the temporary water cut-offs upon resumption of the Work.

1.7 SEQUENCING

A. Proceed with and complete the Work only when materials, equipment and tradesmen required for the installation of the roofing membrane over the roof board insulation are at the Site and are ready to follow with this Work immediately (same day) after the roof board insulation Work.

B. Do not install any more rigid board-type roof board insulation each day than can be covered with complete roofing system by the end of that working day.

C. Follow composite roof board insulation manufacturer's written requirements for installation timing and sequencing of Work. Do not place more leveling slurry coat than can be completely covered

with insulation within thirty minutes nor more expanded polysytrene insulation than can be covered with insulating concrete within four hours of placing insulations.

1.8 GUARANTEE

A. The manufacturer of the composite roof board insulation system shall warrant to Owner that the roof board insulation will remain in a re-roofable condition, for a period of ten years, should the roof membrane require replacement; that the roof board insulation will remain in place even if the roof membrane sustains wind damage; and that the roof board insulation's actual resistance to heat flow will be at least 80 percent of the installed value, provided the roof remains leak free.

B. The thickness of the composite roof board insulation system, the maximum step between layers of expanded polystyrene rigid board insulation and the minimum slope-to-drain requirements shall not vary from what is shown, specified and approved.

1.9 SUBSTITUTIONS

A. Manufacturer of the primary roofing membrane systems shall be a manufacturer who finds the generic types of insulation specified herein as acceptable and bondable if installed according to the roofing manufacturer's standards for complete product and performance responsibility.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Extruded Polyisocyanurate Rigid Board Roof board insulation:
   1. Rigid, rectangular boards of extruded closed-cell polyisocyanurate complying with ASTM C 1289, Type II, with low water vapor permeability and laminated to heavy black (non-asphaltic) fiber-reinforced felt facers with one side of board containing perforated facers and the other side containing non-perforated facers.
   2. Provide a blowing agent with zero ozone depletion potential, such as pentane.
   3. Physical Properties: Provide the following:
      a. Minimum Compressive Strength, (at 10 percent deformation), ASTM D 1621: 25 psi minimum.
      b. Flame Spread, ASTM E 108: Class A.
      c. Smoke Development, ASTM E 84: 120 maximum.
      d. Vapor Transmission, ASTM E 96: 0.8 perms/inch.
      e. Thermal Resistance, ASTM C 518: 7/inch.
      f. Maximum Water Absorption, ASTM C 209: 0.10 percent by volume.
   4. Size: 48-inches by 96 inches by 2-inch thick.
   5. Number of Layers: As required by thickness of roof board insulation shown.
   6. Products and Manufacturers: Provide one of the following:
      a. ACUltra (Pentane Blown) Hydrocarbon ACFoam - II by Atlas Roofing Corporation.
      b. Or equal.

B. Composite Roof board insulation:
   1. Expanded Polystyrene Rigid Board: Provide the following board as a system component of the composite roof board insulation system for use beneath all membrane roofing:
      a. Rigid: 100 percent virgin expand polystyrene modified resin bead board with bead fusion of 80 percent minimum with no visible voids.

b. Molded blocks air dried for minimum of six weeks with less than 0.5 percent residual pentane prior to fabrication.
c. Size: 24-inches by 48-inches with pattern of 30 holes and 30 slots per board.
d. Dimension Tolerances, ASTM C 550:
1) Length: ±1/16-inch.
2) Width: ±1/16-inch.
3) Thickness: ±1/16-inch.
4) Squareness: ±1/16-inch.
5) Flatness: ±1/32-inch.

2. Insulating Concrete: Provide the following:
a. Portland Cement: ASTM C 150, Type I, II or III.
b. Vermiculite Aggregate: As recommended by system manufacturer.
c. Calcium Chloride: Not permitted.
d. Water: Potable, clean, and free from deleterious amounts of acid, alkali and organic materials.
e. Physical Properties: Provide the following physical properties for the insulating concrete design mix:
1) Minimum Compressive Strength, ASTM C 495: 300 psi.
2) Density at Placement: 60 to 68 pcf.
3) Oven Dry Density: 33 to 42 pcf.

3. Reinforcing Mesh: 2160-2-1619 galvanized mesh as recommended by the manufacturer of the composite roof board insulation.
4. Products and Manufacturers: Provide one of the following:
a. NVS and Insulperm Polystyrene Roof board insulation System by Siplast, Incorporated.
b. Or equal.

C. Miscellaneous Materials:
1. Adhesive for Bonding Insulation: The type recommended by the roof board insulation manufacturer, and complying with fire-resistance requirements.
2. Mechanical Anchors: The type recommended by the roof board insulation manufacturer for the type of deck used, and complying with fire and insurance rating requirements.
3. Mastic Sealer: Type recommended by roof board insulation manufacturer for bonding edge joints between units and filling voids.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and installer shall examine the substrate and the conditions under which the roof board insulation Work is to be performed, and notify Engineer, in writing, of any unsatisfactory conditions. Do not proceed with the roof board insulation Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Commencement of the Work shall be understood by Engineer to mean that all conditions are acceptable to the manufacturer's technical representative, Contractor and installer to provide acceptable Work under this Contract.

3.2 PREPARATION

3.3 INSTALLATION

A. General:
   1. Comply with manufacturer's instructions for the particular conditions of installation in each case. If printed instructions are not available or do not apply to Site conditions, consult manufacturer's technical representative for specific recommendations before proceeding. Incorporate recommendations into the Work only as approved by Engineer. Record all such discussions and the basis for discussions in Job Conditions Report.
   2. Coordinate heights of wood blocking to provide flush transition between roof board insulation and perimeter wood blocking.
   3. Extend roof board insulation full thickness as shown over entire surface to be insulated.
   4. Cut and fit tightly around obstructions, and fill voids with roof board insulation.

B. Board-Type Roof board insulation Units: Install rigid board-type roof board insulation according to FM 1-29 Wind Storm Resistance Classification specified, and as follows:
   1. Install wood nailers as required by roofing membrane manufacturer.
   2. Prime surface of concrete deck with asphalt primer at the rate of 3/4 gallons per 100 square feet, unless greater weight is required by roofing membrane system manufacturer, and allow primer to dry. Set each layer of roof board insulation in a solid mopping of hot roofing asphalt.
   3. Apply two courses of roof board insulation to make up the total required thickness under roofing.
   4. Install rigid board-type roof board insulation to form a continuous, uninterrupted plane between metal purlins installed perpendicularly to slope of metal deck, with all roof board insulation boards tightly butted together. Align top of roof board insulation boards flush with top surface of metal purlins or as shown for ventilated metal roof assemblies.
   5. Stagger the short-side edges of roof board insulation board in one direction with the two opposite sides of each roof board insulation board continuously supported on steel deck ribs, as close as possible to the center of the rib as practical, and with a minimum bearing width of 1-inch. Trim board edges if they veer off the rib center. Stagger joints in each succeeding layer from joints of previous layer a minimum of 6-inches in each direction.
   6. Coat edges of closed-cell (non-breathing) units with either adhesive or mastic sealer, and shove into place against installed units so that joints are filled and sealed.
   7. Extend roof board insulation full thickness as shown over entire surface of roofs.

C. Roof board insulation System:
   1. Place expanded polystyrene rigid board insulation into the slurry within thirty minutes of insulating concrete placement with joints staggered in a running bond pattern.
   2. Tightly butt all rigid boards together and install in a manner that provides full contact of slurry to board, and with adequate pressure to cause insulating concrete to enter the locking/keying openings of the rigid board.
   3. Install rigid boards in a stair-stepped configuration with maximum step down of 1-inch between boards, over entire plane of roof surface. Cut boards as required in order to maintain 2-inches of insulating concrete cover at insulation step in compliance with slope-to-drain and high point and low point elevations shown.
   4. Within four hours of rigid board placement, place 2-inches of insulating concrete over rigid boards and screed to a smooth, consistently dense, uniformly sloped plane to roof drains at low points. Ensure that all locking/keying openings in rigid board are completely filled with insulating concrete. Provide finish and other system features acceptable to membrane roofing installer.
   5. Include reinforcing mesh as part of the composite roof board insulation system to help control crack formation and distribute forces within the composite roof board insulation system.

6. Provide high and low point elevations shown. Provide smooth, uniformly sloped top of insulating concrete plane, sloped to drain at 1/4-inch per foot.

3.4 PERFORMANCE

A. Roof board insulation Work shall withstand the uplift forces of wind, as defined by the roofing guarantee. Refer to Section 07 53 23, Ethylene-Propylene-Diene-Monomer (EPDM) Roofing.

B. Failures of the composite roof board insulation Work in bond or anchorage to the substrate, or between courses of roof board insulation, or within the roof board insulation, will be considered failures of materials or workmanship under the Roofing Guarantee.

3.5 FIELD QUALITY CONTROL

A. Test the substrate for moisture content, by suitable means, wherever there is a possibility that exposed substrate has acquired moisture in excess of the maximum content for optimum application of the insulation, as determined by the manufacturer.

3.6 PROTECTION

A. Do not permit construction traffic over completed insulation Work, except as required for roofing.

B. Protect roof board insulation Work from exposure to moisture, damage and deterioration, primarily by prompt installation of roofing Work to be placed over the roof board insulation.

3.7 COMPOSITE ROOF BOARD INSULATION FIELD TESTING

A. Check cast density hourly at the point of placement. Include reports as part of notarized Job Conditions Report information and submit to Engineer.

B. Retain a minimum of four 3-inch by 6-inch cylinder material specimens for each day's pour. Protect specimens from damage and temperature extremes and test in accordance with ASTM C 495. Submit results of test as part of notarized Job Conditions Report and submit to Engineer.

3.8 INSPECTION AND ACCEPTANCE

A. Roof board insulation which has become wet, damaged, or deteriorated, as determined by Engineer, shall be promptly removed from the Site, even if already installed.

B. Correct all improperly sloped, chipped, cracked, improperly set, ridged or rough areas in the roof board insulation to provide substrate acceptable to roofing manufacturer and Engineer.

C. Final acceptance will be contingent upon the receipt by Engineer of a Job Conditions Report certifying conformance of the Work with the requirements of this Section and which includes all information requested by these Specifications.

END OF SECTION 07 2216

SECTION 07 4113

METAL ROOF PANELS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
1. Contractor shall provide all labor, materials, equipment and incidentals required to furnish and install preformed, metal roof panels as shown and specified. The Work also includes:
   a. Providing openings in preformed, metal roof panels to accommodate the Work under this and other Sections and building into the preformed metal roof panels all items such as sleeves, inserts and all other items to be embedded in preformed metal roof panels for which placement is not specifically provided under other Sections.
2. The extent of preformed, metal roof panels Work is shown and is defined to include exterior preformed, prefinished metal roofing, cap and drip flashings, metal closures and all other associated trim and accessories.
3. The types of preformed, metal roof panels Work required include the following:
   a. Preformed metal roof panels.
   b. Miscellaneous fasteners, trim, flashings, closures, and accessories.

B. Coordination:
1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with, or embedded in, the preformed prefinished roof panels.

C. Related Sections:
1. Section 05 0533, Anchor Systems.
2. Section 05 1200, Structural Steel Framing.
3. Section 07 9200, Joint Sealants.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
1. American Society for Testing and Materials, (ASTM).
   a. ASTM A 167, Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet and Strip.
   b. ASTM A 653, Specification for Steel Sheet, Zinc-Coated, (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
   c. ASTM B 117, Practice for Operating Salt Spray (Fog) Apparatus.
   d. ASTM D 522, Test Methods for Mandrel Bend Test of Attached Organic Coatings.
   e. ASTM D 968, Test Methods for Abrasion Resistance of Organic Coatings by Falling Abrasive.
   f. ASTM D 2244, Practice for Calculation of Color Tolerances and Color Differences from Instrumentally Measured Color Coordinates.
   g. ASTM D 2247, Practice for Testing Water Resistance of Coatings in 100% Relative Humidity.
   h. ASTM D 4214, Test Methods for Evaluating the Degree of Chalking of Exterior Paint Films.

i. ASTM E 283, Test Method for Determining the Rate of Air Leakage Through Exterior Windows, Curtain Walls and Doors Under Specified Pressure Differences Across the Specimen.
j. ASTM E 331, Test Method for Water Penetration of Exterior Windows, Skylights, Doors and Curtain Walls by Uniform Static Air Pressure Difference.
k. ASTM G 152, Practice for Operating Open Flame Carbon Arc Light Apparatus for Exposure of Non-Metallic Materials.
l. ASTM G 153, Practice for Operating Enclosed Carbon Arc Light Apparatus for Exposure of Non-Metallic Materials.
m. ASTM G 155, Practice for Operating Xenon Arc Light Apparatus for Exposure of Non-Metallic Materials.

2. Underwriters Laboratories, Incorporated, (UL).
   a. UL, Building Materials Directory.
   b. UL 580, Tests for Uplift Resistance of Roof Assemblies.
3. Ohio Building Code, (OBC).

1.3 QUALITY ASSURANCE

A. Manufacturer Qualifications: Provide company specializing in architectural sheet metal products with a minimum of ten years of experience.

B. Installer Qualifications:
   1. Engage a single installer regularly engaged in preformed metal roof panels installation and with experience in the erection of the types of materials required; and who agrees to employ only tradesmen with specific skill and experience in this type of Work. Submit name and qualifications to Engineer.

C. Component Supply and Compatibility: Obtain all preformed, metal roof panels panels and accessories from the same manufacturer.

D. Requirements of Regulatory Agencies:
   1. Comply with UL Construction No. 95 for Class 1-90 wind uplift rating.
   2. Ohio Building Code.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Samples:
      a. Samples of each type of preformed metal roof panels panel and trim complete with factory-applied finish, two foot long by full-width. Samples will be reviewed by Engineer for pattern, texture and color only. Compliance with other requirements is the exclusive responsibility of Contractor.
      b. One of each type fastener employed, with statement of intended use. Samples will be reviewed by Engineer for material and color only. Compliance with other requirements is the exclusive responsibility of Contractor.
      c. Complete selection of manufacturer's standard and custom colors.
   2. Shop Drawings:
      a. Copies of manufacturer's specifications, standard and custom detail drawings and installation instructions for preformed metal roof panels, supports and trim. Submit manufacturer's standard warranty on factory-applied finish of preformed metal roofing panel.

b. Profiles of preformed prefinished roofing panel units, and the details of forming, jointing, gaskets (if any), supports, anchorages, trim, flashing, and accessories. Show details of weatherproofing at edges, terminations and penetrations of the preformed prefinished roof panel Work. Show 1/4-inch to the foot scale layout and elevations of entire Work. Show all details at 3-inch to the foot scale, indicating all internal components and intersection members, details and special fabrication techniques.

3. Delegated Design Submittals:
   a. Submit design computations signed and sealed by a Registered Professional Structural Engineer licensed in the State of Ohio to verify structural adequacy of members and connections, for review with Shop Drawings.

B. Informational Submittals: Submit the following:
1. Source Quality Control Submittals:
   a. Test Reports: Submit for approval certified laboratory tests reports for required performance tests:
      1) Air Infiltration: ASTM E 283.
      2) Water Infiltration: ASTM E 331.
      3) Wind Uplift: UL-90 rated wind up-lift resistance requirement specified in UL 580 test.
      4) Formability: ASTM D 522.
      5) Weathering: ASTM G 152, ASTM G 153, and ASTM G 155.
      6) Chalking Resistance: ASTM D 4214.
      7) Color Change: ASTM D 2244.
      8) Salt Spray: ASTM B 117.
      9) Abrasion: ASTM D 968.
      10) Humidity: ASTM D 2247.
2. Qualification Statements
   a. Installer's Qualifications
3. Certificates:
   a. Submit for approval written certification prepared, signed and sealed by a Registered Professional Structural Engineer, licensed in the State of Ohio, verifying that the design meets indicated loading requirements and codes of authorities having jurisdiction.

1.5 GUARANTEES:

A. Submit manufacturers and Contractor's written guarantees as specified, herein.

B. Site Quality Control Submittals:
1. Submit results of testing and inspection performed in the field by Manufacturer's technical representative.

1.6 DELIVERY, STORAGE AND HANDLING

A. Delivery of Materials:
1. Deliver preformed metal roof panels paneling and all accessories dry and undamaged, with manufacturer's protective coating intact.
2. Deliver preformed metal roof panels panels in bundles with banded wood surrounds and end caps intact.

B. Storage of materials:
   1. Store preformed prefinished roof paneling and accessory materials in a manner that will protect the panels from exposure to sun and condensation; with good air circulation around each piece.
   2. Store preformed prefinished roof paneling and accessory materials in an area protected from dirt, damage and weather.
   3. Do not store in contact with concrete or other materials that might cause corrosion.

C. Handling of Materials:
   1. Do not subject preformed prefinished roof paneling and accessory materials to bending or stress.
   2. Do not damage edges or handle material in a manner that will cause scratches, warps or dents.

1.7 GUARANTEE

A. Provide manufacturer's standard warranty on the coil coated polyvinylidene fluoride based coating specified, herein.

B. Guarantee that the polyvinylidene fluoride based coating meets all criteria specified and will not spall, check, craze, peel or otherwise lose adhesion for a period of twenty years from the date of Final Acceptance, to the extent that such shall create unsightly conditions or otherwise impair the intended architectural qualities of the building.

C. In the event that the coil coated polyvinylidene fluoride based coating fails to meet the specified standards the manufacturer shall, at their own expense, replace or field paint, at the direction of the Engineer, all areas affected by the failure. In the event that repainting is selected, it shall be done at mutually agreeable intervals throughout the term of the warranty.

D. The warranty does not apply where failure is caused by accidents, or external conditions or forces beyond the control of the manufacturer.

E. Provide a written guarantee agreeing to replace preformed metal roof panels panel Work which fails in material or workmanship within one year of the date of Final Acceptance. Failure of materials or workmanship shall include, but is not limited to, deterioration in excess of normal weathering and lack of water or weather tightness. Imperfections, by reason of defective materials, workmanship or arrangement of the various parts shall be made good to the satisfaction of the Owner, at the Contractor's expense.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Design Criteria:
   1. Provide preformed, prefinished roofing panels, framing and accessories that comply with the following minimum performance characteristics:
      a. Wind loading shall be 110 miles per hour, unless heavier loading is required by the Uniform Building Code.
   2. Anchorage system shall be designed so that panels are free to move for expansion and contraction and so that individual panels may be removed without disturbing adjacent panels.

3. Form panels in lengths, as required.

2.2 MATERIALS

A. Preformed Prefinished Metal Roof Panels:
   1. Custom-fabricated, roll-formed, 22 gauge minimum, but in no case lighter than required to meet deflection requirements. Panels shall be hot dipped galvanized ASTM A 653 Grade C steel panels.

B. Flashing and Trim:
   1. Provide flashings and sheet metal contour closure trim components, indicated or required for a complete installation, as part of the preformed metal roofing panels Work, including cap flashings, base and drip flashings, closure and batten cleats, panel stops and closures, surrounds at openings, soffits, and similar components of the Work.
   2. Provide factory fabricated trim components.
   3. Except as otherwise shown or specified, match the material, gage, and finish of the preformed metal roof panels.
   4. Provide all concealed fasteners for flashing and trim Work.

C. Miscellaneous Materials:
   1. Provide manufacturer's custom, stainless steel, self-tapping concealed fasteners, and hold-down cap assemblies, and other components needed for a complete, permanently weatherproof installation. Provide stainless steel complying with ASTM A 167.
   2. All fasteners used at all locations shall be stainless steel.
   3. Snowguards: Fabricate from 1-1/2 inch x 2 inch x 3/16 inch Aluminum Angle 6061-T6. Vertical leg factory notched for vertical panel legs. Fasteners for the compression clamp attachment shall be 1/4 inch diameter stainless steel bolts, nuts, and washers. Shop paint angles to match roofing color.
   4. Sealant: Provide manufacturer's standard factory applied elastomeric sealant for use within this Section of the Work, where applicable.

D. Provide strippable film of liquid applied to the top side of the painted coil to protect the finish during fabrication, shipping and field handling. This strippable film must be removed before installation.

E. Manufacturers: Provide products of one of the following:
   1. Merchant and Evans.
   2. Fabral.
   3. Centria.
   4. Or equal.

2.3 PREFORMED PREFINISHED ROOFING PANEL FABRICATION

A. General:
   1. Comply with the dimensions, profile limitations, gages and fabrication details as shown or specified.
   2. Prefabricate all components of the system at the factory, ready for field assembly of preformed prefinished roofing panels, joint cleat, anchor clips, trim and accessories.
   3. Fabricate components and assemble units to comply with the performance requirements specified for the completed installation of the Work.
   4. Provide panels with 2 ribs per panel.

5. Size: Provide 2 inch high seam by 18 inches wide panels.
6. Panels are to be mechanically seamed with factory applied sealant.

2.4 PREFORMED ROOF PANEL COATINGS

A. Finish Coating: Apply full strength polyvinylidene fluoride based coatings at the factory by coil coating, prior to fabrication of the preformed, metal roof panels panels. Comply with the following:
   1. Alkali clean and hot water rinse all surfaces to receive polyvinylidene fluoride based finish.
   2. Prepare a chemical conversion coating on the metal panel surface using phosphates or chromates followed by a cold water rinse. Seal with a chromic acid rinse and dry, except where panel manufacturer recommends another method to achieve greater coating reliability.
   3. Apply a base prime coat of epoxy paint to the prepared surface in its coil form, by reverse roller coating. Fully cure in a gas-fired oven to a dry film thickness of 0.25 to 0.35-mils.
   4. Apply finish coating over the primer by roller coating and fuse at a peak metal temperature of 470°F for a dry film thickness of 0.7 to 0.9-mils so that the total dry film is approximately 0.95 to 1.25-mil thick.
   5. Color shall be selected by Engineer.

B. Products and Manufacturers: Provide one of the following:
   1. Kynar 500 Fluropon by DeSoto, Incorporated.
   2. Kynar 500 Duranar by PPG Industries.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and installer must examine the alignment of the substrate framing before erection of the preformed metal roof panels Work begins and notify the Engineer, in writing, of unsatisfactory conditions. Do not proceed with the preformed metal roof panels panel Work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer.

3.2 PREPARATION

A. Wherever possible, take field measurements, prior to completion of shop fabrication and finishing of preformed metal roof panels. Do not delay job progress. Allow for trimming where final dimensions cannot be established before fabrication.

3.3 INSTALLATION

A. Comply with preformed metal roof panels panel manufacturer's instructions for assembly, installation, erection and seaming of preformed metal roofing panel Work.

B. Install light gauge metal framing in accordance with the manufacturer's instructions.

C. Anchor component parts of preformed metal roof panels panel and light gauge metal framing securely in place providing for necessary thermal and structural movement.

D. Do not exceed fastener spacing recommended by the preformed metal roof panel manufacturer.

E. All fasteners must be long enough to penetrate through the entire roof panel assembly and extend through the structural support a minimum of 1/2-inch.

F. Fasten flashings and accessories 12-inches on center.

G. Do not use exposed fasteners on the exterior panel faces.

H. Drive all fasteners normal to the surface and to a uniform depth.

I. Install sealants for the preformed metal roof panels panel Work as specified, and as required for watertight performance. Comply with sealant manufacturer's instructions for installation and curing.

J. Do not fabricate flashings, closures and associated trim at the Site.

K. Install all special flashing and trim shapes, and calking compounds required to maintain complete weathertightness.

L. Comply with roofing panel manufacturer's instructions and recommendations.

3.4 FIELD QUALITY CONTROL

A. Determine conformity of preformed prefinished metal finish to this Section as follows:
   1. The manufacturer of the preformed, metal roof panels shall set aside a labeled sample of the preformed, metal roof panels from each production lot of panels at the Site. Protect sample preformed metal roof panels from weather.
   2. Make sample preformed metal roof panels available at all times, for comparison with installed preformed metal roof panels, as requested by the Owner, for the full time period of the warranty.
   3. Make color comparison measurements with a Hunter Tristimulus Color Difference Meter employing methods of computation in use at the National Bureau of Standards conforming to ASTM D 2244.
   4. Manufacturer's technical representative shall visit the Site to perform field inspection of the roof panels, flashing and other system components at the start and at Substantial Completion of Work prior to issuance of warranty, as a minimum, and as otherwise requested by the Engineer. Each inspection visit shall include a written review of the entire installation to date, signed by the manufacturer's technical representative and submitted to the Engineer. Contractor shall notify the Engineer a minimum of two working days prior to the Site visit by the manufacturer's technical representative.

3.5 ADJUSTMENT AND CLEANING

A. Set preformed, metal roof panels plumb, level, and true to line, without warp or rack.

B. Clean exposed surfaces of preformed metal roof panels panel Work promptly after completion of installation. Comply with recommendations of the preformed, metal roof panels panel manufacturer.

C. Leave preformed metal roof panels panel and flashing perfectly flat, free from dents, burrs, scratches, holes or other blemishes.

D. Do not erect components which have become scarred, chipped or otherwise damaged or defaced.

E. Remove and replace with new material preformed, metal roof panels panels and component parts of the Work, including finish, which have been damaged beyond successful repair, as directed by the Engineer, in writing. Repair minor damage.

F. Do not use roofing panel sheets, trim members, and flashing sheets, in which holes have been made in locations where fasteners are not required.

G. At the completion of the Work, clean or replace adjacent work, marred by the Work of this Section.

H. Remove all materials and debris and leave the Site of the Work in clean condition.

END OF SECTION 07 4113

SECTION 07 6200

SHEET METAL FLASHING AND TRIM

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install sheet metal flashing and trim.
   2. The Work also includes:
      a. Providing openings in sheet metal flashing and trim to accommodate the Work under this and other Sections and building into the sheet metal flashing and trim all items such as sleeves, anchor bolts, inserts and all other items to be embedded in sheet metal flashing and trim for which placement is not specifically provided under other Sections.
   3. Extent of the sheet metal flashing and trim is shown.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with the sheet metal flashing and trim Work.
   2. Work advanced without sheet metal flashing and trim items that are specified to be cast-in-place or built-in-place as the Work advances, shall be stopped, demolished and rebuilt incorporating specified sheet metal flashing and trim Work, at no additional cost to Owner.

C. Related Sections:
   1. Section 03 3000, Cast-In-Place Concrete.
   2. Section 04 0505, Unit Masonry Construction.
   3. Section 07 4162, Metal Roof Panels.
   4. Section 07 9200, Joint Sealants.

6. The Society for Protective Coatings, (SSPC).
   a. SSPC - Paint 12, Cold Applied Asphalt Mastic (Extra Thick Film).

1.3 QUALITY ASSURANCE

A. Installer Qualifications:
   1. Engage a single installer who is a recognized flashing and trim installer, skilled and experienced in the type of flashing and trim Work required, and equipped to perform workmanship in accordance with recognized standards so that there will be undivided responsibility for the performance of the Work. Submit name and qualifications to Engineer along with at least three successfully completed Projects including names and telephone numbers of owners, architects and engineers, responsible for the project and the approximate contract price for flashing and trim work.

B. Source Quality Control:

1.4 SUBMITALS

A. Action Submittals: Submit the following:
   1. Samples:

a. 12-inch square samples of specified sheet metal flashing and trim metals.
b. Each item of gravel stop and coping system, demonstrating assembly of system joint components and fasteners, securely mounted to substrate simulating actual installation in the Work.
c. Polyvinylidene fluoride manufacturer's color samples for final selection by Engineer. After initial selection of colors by Engineer from manufacturer's color charts, submit Engineer's preliminary color choices on actual samples of metal substrate for final color selections by Engineer.
d. Samples will be reviewed by Engineer for color and texture only. Compliance with other requirements is the responsibility of Contractor.

2. Product Data:
   a. Copies of manufacturer's specifications, installation instructions and general recommendations for sheet metal flashing and trim required. Include manufacturer's data substantiating that the materials comply with the requirements.
   b. Submit full selection of manufacturer's standard, custom and premium color charts.
3. Shop Drawings:
   a. Drawings showing the manner of forming, jointing and securing flashings and trim. Show fully dimensioned joint details and waterproof connections to adjoining Work and details at obstructions and penetrations.
   b. Drawings showing the coordination of the Work of this Section with Section 04 0505, Unit Masonry Construction, and Section 07 4113, Metal Roof Panels. Provide detailed Shop Drawings showing large scale details of sections and profiles of all sheet metal flashing and trim to be used in the Work, with all items, including fastener locations, cleats and other miscellaneous accessories necessary to complete the Work, fully dimensioned, properly located, quantified and presented such that sequence of installation is acceptable to each roofing system and adjacent construction material installer.

B. Informational Submittals: Submit the following:
1. Qualifications Statements:
   a. Installer's qualifications

C. Closeout Submittals: Submit the following:
1. Guarantee:
   a. Submit guarantee as specified in section 1.7
2. Warranty
   a. Submit warranty as specified in section 1.7

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery of Materials:
1. Deliver sheet metal flashing and trim materials in manufacturer's original, unopened, and undamaged containers and rolls, with labels intact and legible, indicating compliance with approved Shop Drawings.
2. Items delivered in broken, damaged, rusted, or unlabeled condition shall immediately be removed from Site and not offered again for approval by Engineer.

B. Storage of Materials:
1. Store materials in an area undercover and protected from construction traffic.
2. Store materials in same package in which they were shipped, off the ground and on platforms protected from dirt and other contamination.

3. Store in a manner which does not permit water to remain on sheet metal flashing and trim materials and system components.

C. Handling of Materials:
1. Protect sheet metal flashing and trim from dents, scratches, warps and bends.
2. Remove strippable protective film, immediately proceeding installation of each system component.

1.6 JOB CONDITIONS

A. Scheduling:
1. Do not proceed with sheet metal flashing and trim Work until curb and substrate construction, cant strips, blocking, reglets and other construction to receive the Work is completed.
2. Deliver materials to the Site in sufficient quantities to ensure uninterrupted progress of the Work.
3. Schedule the installation of sheet metal flashing and trim to coincide with the installation of built-up bituminous roofing, waterproofing, drains, piping, blocking, nailers, reglets, framing at openings, curbs, parapets and other adjoining and substrate Work.
4. Proceed with and complete the Work only when materials, equipment and knowledgeable tradesmen, required for the installation of sheet metal flashing and trim, are at the Site and are ready to follow, and integrate sheet metal flashing and trim Work with roofing Work, in order to maintain watertight conditions.

1.7 GUARANTEE

A. Provide coping and cap flashing manufacturer’s fifteen year warranty against blow-off, leak, or premature membrane failure in winds of up to 110 miles per hour.

B. Provide manufacturer's twenty-year warranty on the specified coil coated polyvinylidene fluoride based coating.

C. Guarantee that the polyvinylidene fluoride based coating meets all criteria specified and will not spall, check, craze, peel or otherwise lose adhesion for a period of twenty years from the date of installation, to the extent that such shall create unsightly conditions or otherwise impair the intended architectural qualities of the building.

D. In the event that the coil coated polyvinylidene fluoride based coating fails to meet the specified standards the manufacturer shall, at their own expense, replace or field paint, at the discretion of Owner, all areas affected by the failure. In the event that repainting is selected, it shall be done at mutually agreeable intervals throughout the term of the warranty.

E. The warranty specified shall not deprive Owner of other rights Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

F. The warranty does not apply where failure is caused by accidents, or external conditions or forces beyond the control of the manufacturer.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Performance Criteria:
   1. Sheet metal flashing and trim shall be permanently watertight, and not deteriorate in excess of manufacturer's published limitations.
   2. Snap-lock coping shall be detailed, fabricated and installed to provide a minimum of FM 1-90 wind up-lift resistance and require no exposed fasteners of any kind.
   3. Comply with fabrication details recommended by FM, SMACNA, NRCA and the requirements of the sheet metal flashing and trim manufacturer, and as shown on approved Shop Drawings.

2.2 MATERIALS

A. Metal Sheet metal flashing and trim:
   1. Stainless Steel Sheet metal flashing and trim: Provide 26 gage sheet stainless steel, Type 316, complying with ASTM A 666, with No. 2D dead soft, fully annealed finish, unless required to be harder temper for proper forming and performance for application indicated.
   2. Lead Sheet metal flashing and trim: Provide sheet formed from common desilverized pig lead complying with ASTM B 29 and ASTM B 749; weighing 6.0 pounds per square foot.
   3. Aluminum Sheet metal flashing and trim: Provide aluminum complying with ASTM B 209, alloy 3003, temper H14. Provide sheet aluminum 0.032-inches thick with AA-C22A41 finish.

B. Elastic Sheet Flashing:
   1. Polychloroprene synthetic rubber sheet, 1/16-inch thick, black, with the following physical properties:
      a. Hardness, ASTM D 2240: 50 to 70 Shore A.
      b. Tensile Strength, ASTM D 412: 1500 psi.
      c. Tear Strength, ASTM D 624: 120 pounds per linear inch.
      d. Elongation, ASTM D 412: 300 percent.
      e. Brittleness Temperature, ASTM D 746: -30°F.
   2. Butyl synthetic rubber sheet, 1/16-inch thick, black, with the following physical properties:
      a. Hardness, ASTM D 2240: 50 to 70, Shore A.
      b. Tensile Strength, ASTM D 412: 1200 psi.
      c. Tear Strength, ASTM D 624: 200 pounds per linear inch.
      d. Elongation, ASTM D 412: 300 percent.
      e. Brittleness Temperature, ASTM D 746: -30°F.
   3. Ethylene-propylene-diene monomer synthetic rubber sheet, 1/16-inch thick, black, with the following physical properties:
      a. Hardness, ASTM D 2240: 50 to 70, Shore A.
      b. Tensile Strength, ASTM D 412: 1400 psi.
      c. Tear Strength, ASTM D 624: 125 pounds per linear inch.
      d. Elongation, ASTM D 412: 300 percent.
      e. Brittleness Temperature, ASTM D 746: -75°F.

C. Flashing Reglets:
   1. General:
      a. Provide snap-lock type reglets of Type 304 stainless steel, 0.020-inches minimum thickness.

b. Provide reglets that engage counterflashing by use of a snap-lock or spring-lock profile. System shall employ only mechanical interlocking features for securing counterflashing in reglet, without the need for clips or screws.
c. Provide manufacturer's standard Type 304 stainless steel spring-lock profile flashing, 5-1/8-inches high, designed to incorporate a positive air break and to engage spring-lock reglet flange.
d. Provide reglets with 1-inch end laps and spring-lock flashing with 3-inch end laps.

2. Cast-In-Place Reglets: Provide, cast-in-place reglets for concrete, with manufacturer's standard foam backer rod to prevent cement from entering reglet.
3. Provide reglet with a vertical snap-lock engagement slot, 1-inch high by 1/2-inch deep with connector alignment clips and special staples for securing to formwork.
4. Products and Manufacturers: Provide one of the following:
5. Type CO Concrete Reglet by Fry Reglet Corporation.
6. Or equal.
7. Built-In-Place Masonry Reglets: Provide built-in-place reglets for masonry installation with top flange 4-inches wide to penetrate the first wythe of brick.
   a. Provide reglets without exposed fasteners of any kind. Provide engagement flange 1-1/8-inch high by 1/2-inch wide with snap-lock profile designed to pressure-lock counterflashing in place.
   b. Products and Manufacturers: Provide one of the following:
      1) Type MA-4 Masonry Reglet by Fry Reglet Corporation.
      2) Or equal.

D. Miscellaneous Materials:
1. Burning Rod for Lead: Same composition as lead sheet.
2. Solder for Copper: ASTM B 32, 50 percent tin and 50 percent lead, used with rosin flux.
3. Solder for Stainless Steel: ASTM B 32, 60 percent tin and 40 percent lead alloy grade 60A, used with an acid flux of the type recommended by the stainless steel manufacturer. Use a non-corrosive rosin flux over tinned surfaces.
4. Stainless Welding Rods: Type recommended by stainless steel sheet manufacturer for the type of metal sheets furnished.
5. Nails, Screws and Rivets: Same material as flashing sheet, or as recommended by manufacturer of flashing sheet.
6. Cleats: Same metal and gage as sheet being anchored, 2-inches wide, punched for two anchors.
7. Bituminous Coating: SSPC-Paint 12, cold-applied solvent-type bituminous mastic coating for application in dry film thickness of 15-mils per coat.
8. Sealants: Refer to Section 07 9200, Joint Sealants.

2.3 FABRICATION

A. Fabricated Metal Flashing: Shop-fabricate metal sheet metal flashing and trim to comply with profiles and sizes shown, and to comply with manufacturer's recommended details. Except as otherwise shown or specified, provide soldered flat-lock seams, and fold back metal to form a hem on the concealed side of exposed edges. Comply with metal producers' recommendations for tinning, soldering and cleaning flux from metal.

B. Fabricated Elastic Flashings: Shop-fabricate elastic flashing to comply with profiles and sizes shown and to comply with elastomeric material manufacturer recommendations.

C. Where fabricator does not recommend grinding welds smooth, comply with SMACNA formed metal details requiring double-lock seamed construction.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and installer shall examine the substrate and the conditions under which the sheet metal flashing and trim Work is to be performed, and notify Engineer, in writing, of unsatisfactory conditions. Do not proceed with sheet metal flashing and trim Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 PREPARATION

A. Before installing sheet metal flashing and trim, verify shapes, and dimensions to be covered.

B. Prepare substrates as recommended by the sheet metal manufacturer.

3.3 INSTALLATION

A. General:
   1. Separate dissimilar metals from each other by painting each metal surface in the area of contact with a heavy application of bituminous coating, or by other permanent separation as recommended by the manufacturers of the dissimilar metals. Comply with the following:
      a. Separate stainless steel from dissimilar metals, including regular steel and iron, and from cementitious materials by a course of roofing felt wherever possible. Where felt application is not possible, coat the stainless steel or the other material with a 15-mil bituminous coating. Where felt is applied under sheets which will be soldered or welded, cover felt with a course of building paper before installing stainless steel. Comply with manufacturer's recommendations for other forms of protection of the stainless steel against corrosion.
   2. Provide thermal expansion for running trim, flashing, valleys, and other items exposed for more than 15 feet-0 inches continuous length. Maintain a watertight installation at expansion seams. Locate expansion seams as shown or, if not shown, at the following maximum spacing for each general flashing use:
      a. Valleys: Midway between drains (at high points in slopes), but in no case more than 30 feet-0 inches apart, except as otherwise shown.
      b. Sheet metal flashing and trim: At 10 feet-0 inch intervals and 2 feet-0 inch each side of corners and intersections.
   3. Fabricate and install Work with lines and corners of exposed units true and accurate. Form exposed faces flat and free of buckles, excessive waves and avoidable tool marks, considering the temper and reflectivity of the metal. Provide uniform, neat flat-locked seams with minimum exposure of solder, welds and sealant. Except as otherwise shown, fold back the sheet metal to form a hem on the concealed side of exposed edges. All exposed edges of all sheet metal flashing shall be hemmed not less than 1/2-inch wide.
   4. Conceal fasteners and expansion provisions wherever possible in exposed Work, and locate so as to minimize the possibility of leakage. Cover and seal Work as required for a watertight installation.

a. Provide cleat-type anchorages for metal flashings and trim wherever practical, arranged to relieve stresses from building movement, and thermal expansion and contraction.

5. On vertical surfaces lap two-piece flashings a minimum of 4-inches.
6. On sloping surfaces, for slopes of not less than 6-inches in 12-inches, lap unsealed flashings a minimum of 6-inches. For slopes less than 6-inches in 12-inches use soldered flat locked seams.
7. For embedment of metal flashing flanges in built-up bituminous roofing or composition flashing or stripping, extend flanges for a minimum of 4-inches embedment.

B. Installation of Stainless Steel Sheet metal flashing and trim:
1. Tin the edges of plain stainless steel to be soldered, for a width of 1-1/2-inches, using solder for stainless steel and acid flux. Remove every trace of acid flux residue from the metal promptly after tinning or soldering.
2. Where welded joints are shown, provide upturned, 1/2-inch wide hooked flanges, and weld between adjoining sheets; lay seam flat.

C. Installation of Lead Sheet metal flashing and trim:
1. Where prefabricated units of lead flashing are to be set in felts the under side may be coated with roofing cement.
2. Cut and shape lead sheets in place with minimum of 1-inch lapped joints, and form bends and folds to provide corners and intersections as shown. Shave or wire-brush joint areas immediately before sealing joint.
3. Burn joints in lead sheets to provide true welded construction, exercising care to avoid reduction of sheet thickness.

D. Installation of Aluminum Sheet metal flashing and trim: Bed base members and flashings of aluminum in roofing cement. Comply with manufacturer's instructions for installation and anchorage of units. Provide gasket-type washers under exposed screw and bolt heads. Shim and seal under units as required to provide continuous, level, plumb and true lines.

E. Installation of Elastic Sheet metal flashing and trim:
1. Bond elastic sheet metal flashing and trim sheets to vertical substrates and to other surfaces as indicated or recommended by sheet manufacturer, and seam the end joints.

F. Installation of Reglets and Reglet Counterflashing:
1. For installation of built-in-place masonry reglets refer to Section 04 0505, Unit Masonry Construction.
2. Install surface-mounted reglets complying with manufacturer's written instructions to produce a watertight installation. Use sealant specified in Section 07 9200, Joint Sealants.
3. Install counterflashing with positive pressure against base flashing and reglet and with air break at mid-point to prevent capillary action. No screws or exposed fasteners shall be permitted in the finished Work except those required at each pre-punched hole for surface-mounted reglet attachment.
4. End lap counterflashing horizontally a minimum of 3-inches.

3.4 FIELD QUALITY CONTROL

A. Polyvinylidene Fluoride Based Coatings: Determine conformity of sheet metal flashing and trim Work requiring painted finish to these Specifications as follows:

1. The manufacturer of the sheet metal flashing and trim Work shall set aside and label samples of each component of the sheet metal flashing and trim Work from each production lot for the Project. Protect samples from weather.
2. Make samples of sheet metal flashing and trim Work available at all times, for comparison with installed sheet metal flashing and trim Work as requested by Owner, for the full time of the warranty.
3. Make color comparison measurements with a Hunter Tristimulus Color Difference Meter employing methods of computation in use at the National Bureau of Standards conforming to ASTM D 2224.

3.5 ADJUSTMENT AND CLEANING

A. Protect sheet metal flashing and trim until Final Acceptance of the Work.

B. Do not permit workmen, or others, to step directly on flashing sheets in place, or to place or move equipment over sheet metal flashing and trim surfaces. Protect surfaces during installation of permanent covering work and adjoining Work.

C. Neutralize excess flux as the Work progresses with five percent to percent washing soda solution and rinse thoroughly.

D. Clean exposed surfaces of every substance which is visible or might cause corrosion or prevent uniform oxidation of the metal surfaces. Exercise extreme care to remove fluxes and ferrous metal particles, including welding splatter and grinding dust.

END OF SECTION 07 6200

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 07 9200

JOINT SEALANTS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment, and incidentals as shown, specified, and required to furnish and install joint sealants.
   2. Extent of each type of calking and sealant is shown or indicated and includes the following:
      a. Interior and exterior joints in equipment and construction systems not filled by another material, and that are not required to be open for operation.
      b. Exposed-to-view joints of all fire-rated sealants.
      c. Joints specified to be recalked.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate installation of items to be installed with or before joint sealants.
   2. Coordinate final selection of joint sealants so that materials are compatible with all calking and sealant substrates specified.

C. Related Sections:
   1. Section 03 1500, Concrete Accessories.
   2. Section 04 0519, Masonry Anchorage and Reinforcing.
   3. Section 04 0505, Unit Masonry Construction.
   4. Section 07 2105, Building Insulation.
   5. Section 08 8100, Glass Glazing.
   6. Section 09 5113, Acoustical Panel Ceilings

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASTM C510, Test Method for Staining and Color Change of Single- or Multicomponent Joint Sealants.
   2. ASTM C661, Test Method for Indentation Hardness of Elastomeric-Type Sealants by Means of a Durometer.
   3. ASTM C793, Test Method for Effects of Accelerated Weathering on Elastomeric Joint Sealants.
   4. ASTM C794, Test Method for Adhesion-in-Peel of Elastomeric Joint Sealants.
   5. ASTM C920, Specification for Elastomeric Joint Sealants.
   6. ASTM C1021, Practice for Laboratories Engaged in Testing Building Sealants.
   7. ASTM C1087, Test method for Determining Compatibility of Liquid-Applied Sealants with Accessories Used in Structural Glazing Systems.
   8. ASTM C1193, Guide for Use of Joint Sealants.
   9. ASTM C1247, Practice for Durability of Sealants Exposed to Continuous Immersion in Liquids.
   10. BAAQMD Regulation 8, Rule 51.

11. FS TT-S-00227, Sealing Compound: Elastomeric Type, Multi-component (for Calking, Sealing, and Glazing in Buildings and Other Structures).
12. FS TT-S-00230 Sealing Compound: Elastomeric Type, Single Component (for Calking, Sealing, and Glazing in Buildings and Other Structures).
13. NSF/ANSI Standard 61, Drinking Water System Components - Health Effects.
14. SCAQMD Rule 1168.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Installer:
      a. Engage a single installer, approved by product manufacturer, regularly engaged in calking and sealant installation and with successful experience in applying types of products required, and who employs only tradesmen with specific skill and successful experience in the type of Work required.
   2. Testing Laboratory:
      a. Furnish services of independent testing laboratory qualified according to ASTM C1021, for conducting testing required.

B. Component Supply and Compatibility:
   1. Obtain materials only from manufacturers who will, if required:
      a. Furnish at the Site services of a qualified technical representative to advise installer of proper procedures and precautions for using materials.
      b. Test joint sealants for compatibility with substrates for conformance with FS-TT-S-00227, and recommend remedial procedures as required.
   2. Before purchasing each sealant, investigate its compatibility with joint surfaces, joint fillers, and other materials in joint system. Provide products that are fully compatible with actual installation condition, verified by manufacturer's published data or certification, and as shown on approved Shop Drawings and other approved submittals.

C. Product Testing: Provide test results of laboratory pre-construction compatibility and adhesion testing, as specified in Article 3.1 of this Section, by qualified testing laboratory, based on testing of current sealant formulations within a 36-month period preceding the Notice to Proceed for the Work.
   1. Test elastomeric joint sealants for compliance with requirements specified by reference to ASTM C920 and, where applicable, to other standard test methods.
   2. Test other joint sealants for compliance using specified post-construction field adhesion test.

D. Mock-ups:
   1. Prior to installing joint sealant Work but after Engineer's approval of Samples, provide Sample of each type of calking and sealant in areas selected by Engineer to show representative installation of calkings and sealants. Obtain Engineer's approval of visual qualities of mock-ups before starting calking and sealant Work. Retain and protect mock-ups during construction as a standard for judging completed calking and sealant Work. Do not alter or destroy mock-ups until so allowed by Engineer.
   2. Perform the following testing on calking and sealant mock-up, as specified in this Section: Post-construction field adhesion testing and water leak test.
   3. Work that does not comply with test requirements on Sample areas will be considered defective.

E. Pre-installation Conference:
   1. Prior to installing joint sealants and associated Work, schedule and meet at the Site with calking and sealant installer, calking and sealant manufacturer's technical representative, other trades involved in coordinating with calking and sealant Work, Engineer, and Owner. Record discussions of pre-installation conference and decisions, agreements, and disagreements, and furnish copy of record to each party attending conference. Review foreseeable methods and procedures related to calking and sealant Work, including reviewing:
      a. Required submittals, both completed and yet to be completed.
      b. Status of test reports.
      c. Mock-up construction results.
      d. Status of substrate and similar considerations.
      e. Each major calking and sealant application required.
      f. Availability of products, tradesmen, equipment, and facilities required for avoiding delays.
   2. Reconvene conference at earliest opportunity if additional information must be developed to conclude subjects under consideration.
   3. Record revisions or changes agreed upon, reasons therefore, and parties agreeing or disagreeing with them.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Schedule of joint sealants installation, indication each specific surface where calking or sealants are to be provided and the material proposed for each application.
   2. Product Data:
      a. Copies of manufacturer's data sheets including color charts, specifications, recommendations, and installation instructions for each type of sealant, calking compound, and associated miscellaneous material required. Include manufacturer's published data, indicating that each product complies with the Contract Documents and is intended for the applications shown or indicated.
      b. Product test reports.
   3. Samples:
      a. Each type of actual cured material of each calking and sealant specified, in each of manufacturer's standard colors.
      b. Samples will be reviewed by Engineer for color and texture only. Compliance with other requirements is responsibility of Contractor.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Certify that materials are suitable for intended use and materials meet or exceed requirements of the Contract Documents.
      b. Certification from manufacturer that products furnished are appropriate for surfaces and conditions to which they will be applied.
      c. Certify that applicator is approved by manufacturer.
   2. Field Quality Control Submittals:
      a. Results of tests on job mock-ups.
      b. Pre-construction and post-construction field test reports.
      c. Compatibility and adhesion test reports.
      d. Contractor's Field Test Report Logs:

1) Indicate time present at the Site.
2) Include observations and results of field tests, and document compliance with manufacturer's installation instructions and supplemental instructions provided to installers.

3. Pre-installation conference record.
4. Qualifications: Submit qualifications for:
   a. Installer.
   b. Testing laboratory (if not already submitted under Section 01 4523, Testing Laboratory Services Furnished by Owner, or Section 01 4513, Testing Laboratory Services Furnished by Contractor).

C. Closeout Submittals: Submit the following:
1. Operations and Maintenance Data:
   a. Recommended inspection intervals.
   b. Instructions for repairing and replacing failed sealant joints.
2. Warranty: Submit written warranties as specified in this Section.

1.5 DELIVERY, STORAGE AND HANDLING

A. Comply with Section 01 6500, Product Delivery Requirements, and Section 01 6600, Product Storage and Handling Requirements, and the following:
1. Delivery of Products:
   a. Deliver products in calking and sealant manufacturer's original unopened, undamaged containers, indicating compliance with approved Shop Drawings and approved Sample color selections.
   b. Include the following information on label:
      1) Name of material and Supplier.
      2) Formula or Specification Section number, lot number, color and date of manufacture.
      3) Mixing instructions, shelf life, and curing time, when applicable.
2. Storage of Products:
   a. Do not store or expose materials to temperature above 90 degrees F or store in direct sunlight.
   b. Do not use materials that are outdated as indicated by shelf life.
   c. Store sealant tape in manner that will not deform tape.
   d. In cool or cold weather, store containers for sixteen hours before using in temperature of approximately 75 degrees F.
   e. When high temperatures prevail, store mixed sealants in a cool place.
3. Handling:
   a. not open containers or mix components until necessary preparatory Work and priming are complete.

1.6 JOB CONDITIONS

A. Environmental Conditions:
1. Do not install joint sealants under adverse weather conditions, or when temperatures are below or above manufacturer's recommended limitations for installation.
2. Proceed with the Work when forecasted weather conditions are favorable for proper cure and development of high-early bond strength.
3. Where joint width is affected by ambient temperature variations, install elastomeric sealants when temperatures are in the lower third of manufacturer's recommended installa-

tion temperature range, so that sealant will not be subjected to excessive elongation and bond stress at subsequent low temperatures.

4. When high temperatures prevail, avoid mixing sealants in direct sunlight.
5. Supplemental heat sources required to maintain both ambient and surface temperatures within the range recommended by manufacturer for material applications are not available at the Site.
6. Provide supplemental heat and energy sources, power, equipment, and operating, maintenance, and temperature monitoring personnel.
7. Do not use heat sources that emit carbon dioxide or carbon monoxide into areas of calking, sealants, and painting Work, and areas where Owner's personnel or construction personnel may work. Properly locate and vent such heat sources to outdoors so that joint sealants and other Work are unaffected by exhaust.

1.7 WARRANTY

A. Provide written warranty, signed by manufacturer and Contractor, agreeing to repair or replace sealants that fail to perform as air-tight and watertight joints; or fail in joint adhesion, cohesion, abrasion resistance, weather resistance, extrusion resistance, migration resistance, stain resistance, or general durability; or appear to deteriorate in any other manner not clearly specified in approved Shop Drawings and other submittals, as an inherent quality of material for exposure indicated.

1. Provide manufacturer warranty for period of one year from date of Substantial Completion of joint sealants Work.
2. Provide installer warranty for period of two years from date of Substantial Completion of joint sealants Work.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Provide elastomeric joint sealants for interior and exterior joint applications that establish and maintain watertight and airtight continuous joint seals without staining or deteriorating joint substrates.

B. VOC Performance Criteria:

1. VOC content of sealants used shall comply with current VOC content limits of SCAQMD Rule 1168. Sealants used as fillers shall comply with or exceed requirements of BAAQMD Regulation 8, Rule 51.
    a. Sealants: 250 g/L.
    b. Sealant Primers for Nonporous Substrates: 250 g/L.
    c. Sealant Primers for Porous Substrates: 775 g/L.

C. Provide colors selected by Engineer from calking and sealant manufacturer's standard and custom color charts. "Or equal" manufacturers shall provide same generic products and colors as available from manufacturers specified.

2.2 MATERIALS

A. Exterior and Interior Horizontal and Vertical Joints; Submerged and Intermittently Submerged in Potable Water or Water That Will be Treated to Become Potable:

1. One-component Polyurethane Sealant:

a. Products and Manufacturers: Provide one of the following:
   1) Sikaflex-1a by Sika Corporation.
   2) Or equal.
b. One-component, moisture cured, gun grade, polyurethane sealant, complying with:
   1) FS TT-S-00230C, Type II, Class A; ASTM C920, Type S, Grade NS, Class 25.
   2) Adhesion-in-Peel, FS TT-S-00230C, ASTM C794 (minimum five pounds.): Glass, minimum 20 pounds per linear inch; Aluminum, minimum 20 pounds per linear inch; Concrete, minimum 20 pounds per linear inch.
   3) Hardness (Standard Conditions), ASTM D2240: 20 to 25 (Shore A).
   4) Stain and Color Change, FS TT-S-00227E and ASTM C510: No discoloration or stain.
   5) Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weatherometer.
   6) Rheological Vertical Displacement at 120 degrees F, FS TT-S-00227E: No sag.
   7) VOC Content: 100 g/L, maximum.
   8) Listed in NSF/ANSI 61

2. Two-component Polyurethane Sealant:
   a. Products and Manufacturers: Provide one of the following:
      1) Sikaflex- 2c NS by Sika Corporation.
      2) Or equal.
   b. Two-component, moisture cured, gun grade, polyurethane sealant, complying with:
      1) FS TT-S-00227E, Type II, Class A; ASTM C920, Type M, Grade NS, Class 25.
      2) Adhesion-in-Peel, FS TT-S-00227E, ASTM C794 (Minimum five pounds per linear inch with no adhesion failure): 18 pounds.
      3) Hardness (Standard Conditions), ASTM C661: 25 (Shore A).
      4) Stain and Color Change, FS TT-S-00227E and ASTM C510: No discoloration or stain.
      5) Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weatherometer.
      6) Rheological Vertical Displacement at 120 degrees F, FS TT-S-00227E: No sag.
      7) Content: 220 g/L, maximum.
      8) in NSF/ANSI 61

B. Exterior and Interior Horizontal and Vertical Joints; Submerged and Intermittently Submerged in Wastewater:

2.3 TWO-COMPONENT POLYURETHANE SEALANT:

A. Products and Manufacturers: Provide one of the following:
   1. Sikaflex- 2c NS by Sika Corporation.
   2. Vulkem 227 by Tremco Sealant/Waterproofing Division of RPM International, Inc.
   3. Or equal.

B. Polyurethane based, two-component elastomeric sealant complying with:
   1. FS TT-S-00227E: Type II (non-sag) Class A and ASTM C920, Type M, Grade NS, Class 25.

2. Adhesion-in-Peel, FS TT-S-00227E and ASTM C794: (Minimum five pounds per linear inch with no adhesion failure): 18 lbs.
3. Hardness (Standard Conditions), ASTM C661: 25 (Shore A).
4. Stain and color change, FS TT-S-00227E and ASTM C510: No discoloration or stain.
5. Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weatherometer.
6. Rheological Vertical Displacement at 120 degrees F, FS TT-S-00227E: No sag.
7. Content: 220 grams per liter, maximum.

C. Exterior and Interior Vertical Joints; Non-submerged:
1. Two-component Polyurethane Sealant:
a. Products and Manufacturers: Provide one of the following:
1) Sikaflex- 2c NS by Sika Corporation.
2) Dymeric 240 FC by Tremco Sealant/Waterproofing Division of RPM International, Inc.
3) Or equal.
b. Polyurethane based, two-component elastomeric sealant complying with:
1) FS TT-S-00227E: Type II (non-sag) Class A and ASTM C920, Type M, Grade NS, Class 25.
2) Adhesion-in-Peel, FS TT-S-00227E and ASTM C794: (Minimum five pounds per linear inch with no adhesion failure): 10 pounds.
3) Hardness (Standard Conditions), ASTM C661: 25 to 35 (Shore A).
4) Stain and color change, FS TT-S-00227E and ASTM C510: No discoloration or stain.
5) Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weatherometer.
6) Rheological Vertical Displacement at 120 degrees F, FS TT-S-00227E: No sag.
7) Content: 100 g/L, maximum.

D. Exterior and Interior Horizontal Joints; Non-submerged:
1. Two-component Polyurethane Sealant:
a. Products and Manufacturers: Provide one of the following:
1) Sikaflex- 2c SL by Sika Corporation.
2) THC/900 by Tremco Sealant/Waterproofing Division of RPM International, Inc.
3) Or equal.
b. Polyurethane based, two-component elastomeric, self-leveling sealant complying with the following:
1) FS TT-S-00227E, Type I (self-leveling) Class A. and ASTM C920, Type M, Grade P, Class 25
2) Water Immersion Bond, FS TT-S-00227E: Elongation of 50 percent with no adhesive failure.
3) Hardness (Standard Conditions), ASTM C661: 35 to 45.
4) Stain and Color Change, FS TT-S-00227E and ASTM C510: No discoloration or stain.
5) Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weatherometer.
6) Content: 165 g/L, maximum.

E. Miscellaneous Materials:
   1. Joint Cleaner: As recommended by calking and sealant manufacturer.
   2. Joint Primer and Sealer: As recommended for compatibility with calking and sealant by calking and sealant manufacturer.
   3. Bond Breaker Type: Polyethylene tape or other plastic tape as recommended for compatibility with calking and sealant by calking and sealant manufacturer, to be applied to sealant-contact surfaces where bond to substrate or joint filler must be avoided for proper performance of calking and sealant. Provide self-adhesive tape where applicable.
   4. Sealant Backer Rod: Compressible rod stock polyethylene foam, polyethylene jacketed polyurethane foam, butyl rubber foam, neoprene foam or other flexible, permanent, durable nonabsorptive material as recommended for compatibility with calking and sealant by calking and sealant manufacturer. Provide size and shape of rod that will control joint depth for sealant placement, break bond of sealant at bottom of joint, form optimum shape of sealant bead on back side, and provide highly-compressible backer to minimize possibility of sealant extrusion when joint is compressed.
   5. Low-temperature Catalyst: As recommended by calking and sealant manufacturer.

F. Products for Other Applications:
   1. Glazing Sealants: Refer to Section 08 8100, Glass Glazing.
   2. Fire-Rated Sealants: Refer to Section 07 2105, Building Insulation.
   3. Compressible Filler: Refer to Section 04 0511, Masonry Anchorage and Reinforcing.
   4. Acoustical Sealants: Refer to Section 09 5113, Acoustical Panel Ceilings.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine joint surfaces, substrates, backing, and anchorage of units forming sealant rabbet, and conditions under which calking and sealant Work will be performed, and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work and performance of sealants. Do not proceed with calking and sealant Work until unsatisfactory conditions are corrected.

B. Laboratory Pre-construction Compatibility and Adhesion Testing: Submit to joint sealant manufacturers for testing indicated below samples of materials that will contact or affect joint sealants.
   1. Use ASTM C1087 to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
   2. Submit at least eight pieces of each type of material, including joint substrates, shims, joint sealant backings, secondary seals, and miscellaneous materials.
   3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
   4. For products that fail tests, obtain joint-sealant manufacturer's written instructions for corrective measures including using specially formulated primers.
   5. Immersion Testing: ASTM C1247 for potable water and wastewater.
   6. Testing will not be required if joint sealant manufacturers submit joint preparation data based on previous testing of current sealant products for adhesion to, and compatibility with, joint substrates and other materials matching those submitted and mock-up field testing is acceptable.

3.2 PREPARATION

A. Protection: Do not allow joint sealants to overflow or spill onto adjoining surfaces, or to migrate into voids of adjoining surfaces including rough textured materials. Use masking tape or other precautionary devices to prevent staining of adjoining surfaces, by either the primer/sealer or calking and sealant materials.

B. Joint Surface Preparation:
   1. Clean joint surfaces immediately before installing sealant compound. Remove dirt, weakly adhering coatings, moisture and other substances that would interfere with bonds of sealant compound as recommended in sealant manufacturer's written instructions as shown on approved Shop Drawings.
   2. If necessary, clean porous materials by grinding, sandblasting, or mechanical abrading. Blow out joints with oil-free compressed air or by vacuuming joints prior to applying primer or sealant.
   3. Roughen joint surfaces on vitreous coated and similar non-porous materials, when sealant manufacturer's data indicates lower bond strength than for porous surfaces. Rub with fine abrasive cloth or steel wool to produce a dull sheen.
   4. Concrete Joint Preparation: Refer to Section 03 1500, Concrete Accessories

C. Mixing:
   1. Comply with sealant manufacturer's written instructions for mixing multi-component sealants.
   2. Thoroughly mix components before use.
   3. Add entire contents of activator can to base container. Do not mix partial units.
   4. Mix contents for minimum of five minutes or as recommended by sealant manufacturer, until color and consistency are uniform.

3.3 INSTALLATION

A. Install joint sealants after adjacent areas have been cleaned and before joint has been cleaned and primed, to ensure calking and sealant joints will not be soiled. Replace calking and sealant joints soiled after installation.

B. Comply with sealant manufacturer's written instructions except where more stringent requirements are shown or indicated in the Contract Documents, and except where manufacturer's technical representative directs otherwise, only as acceptable to Engineer.

C. Prime or seal joint surfaces as shown on approved Shop Drawings and approved other submittals. Do not allow primer or sealer to spill or migrate onto adjoining surfaces. Allow primer to dry prior to applying sealants.

D. Apply masking tape before installing primer, in continuous strips in alignment with joint edge to produce sharp, clean interface with adjoining materials. Remove tape immediately after joints have been sealed and tooled as directed.

E. Confirm that compressible filler is installed before installing sealants. Refer to Section 04 0505, Unit Masonry Construction, for locations.

F. Do not install sealants without backer rods and bond breaker tape.

G. Roll back-up rod stock into joint to avoid lengthwise stretching. Do not twist, braid, puncture, or prime backer rods.

H. Employ only proven installation techniques that will ensure that sealants are deposited in uniform, continuous ribbons without gaps or air pockets, with complete "wetting" of joint bond surfaces equally on opposite sides. Except as otherwise indicated, fill sealant rabbet to a slightly concave surface slightly below adjoining surfaces. Where horizontal joints are between a horizontal surface and a vertical surface, fill joint to form a slight cove, so that joint will not trap moisture and dirt.

I. Install sealants to depths recommended by sealant manufacturer but within the following general limitations, measured at the center (thin) section of bead.
   1. For horizontal joints in sidewalks, pavements, and similar locations sealed with elastomeric sealants and subject to traffic and other abrasion and indentation exposures, fill joints to depth equal to 75 percent of joint width, but not more than 5/8-inch deep or less than 3/8-inch deep.
   2. For vertical joints subjected to normal movement and sealed with elastomeric sealants and not subject to traffic, fill joints to a depth equal to 50 percent of joint width, but not more than 1/2-inch deep or less than 1/4-inch deep.

J. Remove excess and spillage of compounds promptly as the Work progresses.

K. Cure calking and sealant compounds in compliance with manufacturer's instructions and recommendations, to obtain high-early bond strength, internal cohesive strength, and surface durability.

3.4 EXISTING JOINTS

A. Mechanically remove existing sealant and backer rod.

B. Clean joint surfaces of residual sealant and other contaminates capable of affecting sealant bond to joint surface.

C. Conduct laboratory pre-construction compatibility and adhesion testing on joint surfaces in accordance with Paragraph 3.1.B of this Section.

D. Allow joint surfaces to dry before installing new sealants.

3.5 FIELD QUALITY CONTROL

A. Post-construction Field Adhesion Testing: Before installing elastomeric sealants, field-test joint sealant adhesion to joint substrates as follows:
   1. Extent of Testing: Test completed elastomeric sealant joints as follows:
      a. Perform ten tests for the first 1,000 feet of joint length for each type of elastomeric sealant and joint substrate.
      b. Perform one test for each 1,000 feet of joint length thereafter, and minimum of one test per each floor per elevation.
      c. Test Method: Test joint sealants according to Method A, Field-applied Sealant Joint Hand Pull Tab, and Method D, Water Immersion in Appendix X1 of ASTM C1193. For joints with dissimilar substrates, verify adhesion to each substrate separately by extending cut along one side and verifying adhesion to opposite side. Repeat procedure for opposite side.
      d. Inspect joints for complete fill, absence of voids, and joint configuration complying with specified requirements. Record results in a log of field adhesion tests.

e. Inspect tested joints and report on whether:
   1) Sealants in joints connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each type of product and joint substrate. Compare these results to determine if adhesion passes sealant manufacturer's field-adhesion hand-pull test criteria.
   2) Sealants filled the joint cavities and are free of voids.
   3) Sealant dimensions and configurations comply with specified requirements.

f. Record test results in a log of field adhesion tests. Include dates when sealants were installed, names of persons who installed sealants, test dates, test locations, whether joints were primed, adhesion results and percent elongations, sealant fill, sealant configuration, and sealant dimensions.

g. Repair sealants pulled from test area by applying new sealants following same procedures used originally to seal joints. Ensure that original sealant surfaces are clean and that new sealant contacts original sealant.

h. Evaluation of Field Test Results: Sealants not evidencing adhesive failure from testing or noncompliance with other requirements will be satisfactory. Remove sealants that fail to adhere to joint substrates during testing or to comply with other requirements. Retest failed applications until test results prove sealants comply with indicated requirements.

i. Do not proceed with installation of elastomeric sealants over joint surfaces that have been painted, lacquered, waterproofed, or treated with water repellent or other treatment or coating unless a laboratory test for durability (adhesion), in compliance with FS TT-S-00227, has successfully demonstrated that sealant bond is not impaired by the coating or treatment. If laboratory test has not been performed or shows bond interference, remove coating or treatment from joint surfaces before installing sealant.

B. Water Leak Testing: Field test for water leaks as follows:
   1. Flood the joint exposure with water directed from a 3/4-inch diameter garden hose, without nozzle, held perpendicular to wall face, two feet from joint and connected to water system with 30 psi minimum normal water pressure. Move stream of water along joint at an approximate rate of 20 feet per minute.
   2. Test approximately five percent of total joint system, in locations that are typical of every joint condition, and that can be inspected easily for leakage on opposite face. Conduct test in presence of Engineer, who will determine actual percentage of joints to be tested and actual period of exposure to water from hose, based on extent of observed leakage or lack of observed leakage.
   3. Where nature of observed leaks indicates potential of inadequate joint bond strength, Engineer may direct that additional testing be performed at a time when joints are fully cured, and before Substantial Completion.

3.6 ADJUSTING AND CLEANING

A. Where leaks and lack of adhesion are evident, replace sealant.

B. Clean adjacent surfaces of sealant and soiling resulting from the Work. Use solvent or cleaning agent recommended by sealant manufacturer. Leave all finish Work in neat, clean condition.

C. Protect sealants during construction so that they will be without deterioration, soiling, or damage at time of readiness for final payment of the Contract.

3.7 PROTECTION

A. During and after curing period, protect joint sealants from contact with contaminating substances and from damage resulting from construction operations or other causes, so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original Work.

END OF SECTION 07 9200

SECTION 08 1113

HOLLOW METAL DOORS AND FRAMES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install hollow metal doors and frames.
   2. Extent of hollow metal doors and frames is shown.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before the hollow metal doors and frames Work.

C. Related Sections:
   1. Section 04 0505, Unit Masonry Construction.
   2. Section 06 1053, Miscellaneous Rough Carpentry.
   3. Section 07 9200, Joint Sealants.
   4. Section 08 7100, Door Hardware.
   5. Section 08 8100, Glass Glazing.
   6. Section 09 9100, Painting.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American National Standards Institute, (ANSI).
      a. ANSI in association with Steel Door Institute, ANSI/SDI 100, Steel Doors and Frames.
      b. ANSI in association with Door and Hardware Institute, ANSI/A115.1-A115.17/DHI, Specifications for Steel Door and Frame Preparation for Hardware.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. Manufacturer shall have a minimum of five years experience producing substantially similar equipment and shall be able to show evidence of at least five installations in satisfactory operation for at least five years.
   2. Provide hollow metal doors, frames, and accessories manufactured by a single firm specializing in the production of this type of Work and complying with specified standards of ANSI, NFPA, SDI and UL.
   3. Provide hollow metal doors and frames from a manufacturer who is a member of SDI.

B. Component Supply and Compatibility:
   1. Obtain all equipment included in this Section regardless of the component manufacturer from a single hollow metal doors and frames manufacturer.
   2. The hollow metal doors and frames equipment manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.
   3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the hollow metal doors and frames manufacturer.

C. Regulatory Requirements:
   1. Fire-Resistance-Rated Assemblies: Wherever a fire-resistance classification is shown or scheduled for hollow metal doors and frames (3-hour, 1-1/2-hour, and similar designations), provide fire-resistance-rated hollow metal doors and frames tested as a fire door assembly, complete with type of fire door hardware to be used.
   2. Identify each fire-resistance-rated door and frame with recognized testing laboratory labels, indicating applicable fire-resistance-rating of both door and frame. Provide fire-resistance-

rated doors and frames with metal labels permanently fastened to door and frame. Labels shall display all UL required information.

3. Temperature Rise Rating: Wherever a temperature rise rating is required by the building code, provide doors for fire-resistance-ratings shown and in accordance with UL 10B.
    a. For a UL 3-hour (A) classification, provide doors with a temperature rise rating of not more than 250°F maximum to 30 minutes of exposure.
    b. For a UL 1-1/2-hour (B) classification, provide doors with a temperature rise rating of not more than 450°F or 650°F maximum to 30 minutes of exposure.
4. Door and frame assemblies shall comply with NFPA 80, and as specified. Modify specified hollow metal door and frame system components to comply with requirements of governing jurisdictions for fire-resistance-rated construction.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
    1. Shop Drawings:
        a. Fabrication and installation drawings of hollow metal doors and frames. Include details of each frame type, elevations of each door type, conditions at openings, details of construction, location and installation requirements of finish hardware and reinforcements, and details of joints, connections and every composite member. Show all door and frame reinforcements, including welds, plate lengths, locations and gauges, identified for each component of finish hardware specified in Section 08 7100, Door Hardware.
        b. Provide a schedule of doors and frames using same reference numbers for details and openings as those shown.
    2. Samples:
        a. Pressed metal corner section of frame, 12-inches by 12-inches minimum, showing all special, supplemental and standard reinforcements, attachments, supports and anchors specified. Provide corner sample for each type of frame specified.
        b. Cut-away section of all door types specified, showing internal construction, edge details and reinforcements for butts, closers and similar items of finished hardware, 2 foot-0 inches by 2 foot-0 inches minimum. Include louver sections, vision panel and glazing stops.
        c. Engineer reserves the right to require samples showing fabrication techniques and workmanships of all component parts, and the detailing and fabrication of accessories and auxiliary items for all door and frame Work, before fabrication of the Work proceeds.

B. Informational Submittals: Submit the following:
    1. Certificates:
        a. Certification of Labeled Construction for fire-resistance-rated doors and frames.
    2. Test and Evaluation Reports:
        a. Laboratory test report for required performance and specified feature verification for doors and frames selected at random by Engineer for testing.
        b. Test reports indicating compliance with ANSI A250.4 and ANSI A250.5.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling and Unloading:

1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices which are to be embedded in cast-in-place concrete in ample time to prevent delay of that Work.
2. Deliver hollow metal doors and frames cartoned or crated to provide protection during transit and job storage.

B. Storage and Protection:
1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.
2. Store doors and frames at the Site under cover.
3. Place units up off floors in a manner that will prevent rust and damage.
4. Avoid the use of non-vented plastic or canvas shelters, which could create a humidity chamber. If cardboard wrapper on the door becomes wet, remove the carton immediately.
5. Provide a 1/4-inch space between stacked doors to promote air circulation.

C. Acceptance at Site:
1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace loss and repair damage to new condition in accordance with manufacturer's instructions.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Design Criteria:
1. Door Classification: Provide hollow metal doors of Grades and Models in accordance with ANSI/SDI 100, and ANSI A250.5 as follows:
a. Grade III, Extra Heavy-Duty, 1-3/4-inches thick (Level A); Model 2A, seamless design.

B. Details of Construction:
1. Provide doors of two outer stretcher-leveled sheets, 16-gauge minimum. Construct doors with smooth, flush surfaces without visible joints or seams on exposed faces or edges, except around glazed or louvered panel inserts. No fillers shall be used. Provide weep hole openings in the bottom of exterior doors to permit the escape of entrapped moisture.
2. Reinforce inside of doors with honeycomb core completely filling the inside of the door and laminated to the inside of both face panels with an adhesive. The honeycomb material shall have a crushing strength not less than 6,000 pounds per square foot and the lamination shall withstand not less than 1,100 pounds per square foot in shear.

C. Frame Construction:
1. Form frames of cold-rolled sheet material, 16-gauge minimum. Provide seamless frames for all Work, unless specifically specified and shown as permitting exposed fasteners.
2. Provide hollow metal frames for doors, transoms, side-lights, borrowed lights, and other openings of size and profile as shown or specified.

2.2 MANUFACTURERS

A. Products and Manufacturers: Provide one of the following:

1. Series CH with DURA-WELD seams with Series F16 Frames and DW F16 Frames by Pioneer Industries, Incorporated.
2. Or equal.

2.3 MATERIALS

A. Door Faces and Frames: Zinc-coated, cold-rolled carbon steel sheets of commercial quality, complying with ASTM A 366, and ASTM A 653/A 653M, G 60 zinc coating, mill-phosphatized.

B. Honeycomb Core: Phenolic resin-impregnated, nominal 1-inch hexagonal cell size, one piece, Kraft fiber core board, with 42 psi minimum crushing strength.

C. Supports and Anchors: Formed sheet metal, hot-dip galvanized after fabrication complying with ASTM A 153/A 153M, Class B, and in compliance with requirements of ANSI A250.5. Provide supports and anchors as follows:
   1. Jamb Anchors: 16-gauge minimum, and of the following types:
      a. Masonry Construction: Adjustable, corrugated or perforated, T-shaped to suit frame size with leg not less than 2-inches wide by 10-inches long.
      b. Gypsum Wallboard and Steel Stud Construction: Two-piece compression anchors with exposed compression fasteners.
   2. Floor and Head Anchors: 14-gauge minimum, and of the following types:
      a. Monolithic Concrete Slabs: Clip-type, with two holes to receive fasteners, welded to bottom of jambs and mullions.
      b. Separate Topping Concrete Slabs: Adjustable-type with extension clips, allowing not less than 2-inches height adjustment. Terminate bottom of frames at finish floor surface.

D. Inserts, Bolts and Fasteners: Sheet metal hot-dip galvanized complying with ASTM A 153/A 153M, Class C or D as applicable.

E. Miscellaneous Accessories:
   1. Head Strut Supports: 3/8-inch by 2-inch hot-dipped galvanized steel.
   2. Structural Reinforcing Members: Provide structural reinforcing members as part of frame assembly, where shown at mullions, transoms, or other locations that are to be built into frame.
   3. Head Reinforcing: For frames over 4 feet-0 inch wide, in masonry openings, provide continuous steel channel or angle stiffener, not less than 12-gauge for full width of opening, welded to back of frame at head.
   4. Spreader Bars: Provide removable spreader bar across bottom of frames, tack welded to jambs and mullions.
   5. Plaster Guards: 26-gauge minimum galvanized steel.
   6. Louvers, Stops and Moldings: 16-gauge minimum, cold-rolled, hot-dipped galvanized, formed sheet metal.

2.4 FABRICATION

A. General:
   1. Fabricate hollow metal units to be rigid, neat in appearance and free for defects, warp or buckle. Accurately form metal to required sizes and profiles.
   2. Wherever practicable, fit and assemble units in the manufacturer's plant. Clearly identify Work that cannot be permanently factory-assembled before shipment, to assure proper

assembly at the Site. Weld exposed joints continuously, grind, dress, and make smooth, flush and invisible. Filler to conceal manufacturing defects shall not be acceptable.

3. Exposed Fasteners: Unless otherwise shown or specified, do not use exposed fasteners in the Work. Where exposed fasteners are shown or specified, provide countersunk flat Phillips or Jackson heads for exposed screws and bolts.

B. Doors:
   1. Fabricate all hollow metal doors and panels in compliance with ANSI A250.5.
   2. Fabricate all doors with flush top and bottom closing channel, without exposed fasteners. Reinforce tops and bottoms of doors with inverted, flush-mounted, minimum 20-gauge, horizontal steel channels fastened to internal reinforcement channel and with 20-gauge closing plate spot-welded to closure channel. Close top and bottom edges to provide weather seal, as integral part of door construction or by addition of inverted steel channels and plates.
   3. Hollow Metal Panels:
      a. Fabricate hollow metal panels of the same materials, construction, and finish as specified for hollow metal doors.
      b. Provide astragal integral with top of door where shown.
   4. Edge profiles shall be provided on both stiles of doors beveled 1/8-inch in 2-inches.

C. Frame Construction:
   1. Fabricate all hollow metal frames in compliance with ANSI A250.5 and as specified.
   2. Fabricate frames with reinforced, mitered corners that are continuously arc-welded for the full depth and width of the frame, with bottom spreader bar; except provide drywall frames as specified.
   3. Grind all exposed welds flush and smooth.
   4. Knock-down-type frames shall be used for drywall construction only and shall provide the following additional features:
      a. Specifically designed for drywall construction.
      b. Frames shall be knocked down, designed to be securely installed in the rough opening after the wallboard is applied.
      c. Jamb and head connection shall be a neat, flush, miter with head securely locked to top of jamb.
      d. Mitered corners shall be reinforced with a concealed corner cup to provide a firm interlock of jamb to head.
      e. Provide two anchors at head of frames exceeding 3 foot-6 inches wide.
      f. Provide vertical steel head support struts extending from top of frame at each jamb to supporting construction above. Bend top of struts to provide flush contact for securing to supporting construction above. Provide adjustable bolted anchorage to frame jamb members.
   5. Mullions and Transom Bars:
      a. Provide closed mullions and transom bars where shown. Fasten mullions and transom bars at crossings and to jambs by butt-welding. Reinforce joints between frame members with concealed clip angles or sleeves of same metal and thickness as frame.
   6. Head Reinforcing: Where installed in masonry, leave vertical mullions in frames open at the top so they can be filled with grout.
   7. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor.
   8. Head Anchors: Provide two anchors at head of frames exceeding 3 foot-6 inches wide for frames mounted in drywall partitions.

9. Head Strut Supports: Provide vertical steel struts extending from top of frame at each jamb to supporting construction above, unless frame is anchored to masonry or to other structural support at each jamb. Bend top of struts to provide flush contact for securing to supporting construction above. Provide adjustable bolted anchorage to frame jamb members.
10. Rubber Door Silencers: Drill stop to receive three silencers on single-door frames and four silencers on double-door frames. Install plastic plugs to keep holes clear during construction.
11. Plaster Guards: Provide manufacturer's standard plaster guards or dust cover boxes.

D. Finish Hardware Preparation:
1. General:
   a. Prepare hollow metal units to receive mortised and concealed finish hardware, including cutouts, reinforcing, drilling and tapping in accordance with approved Finish Hardware Schedule and templates provided by finish hardware supplier and as specified. Comply with applicable requirements of ANSI/DHI A115.1 to A115.17 and ANSI A250.4. Refer to Section 08 7100, Door Hardware.
   b. Obtain approved hardware schedule, hardware templates, and samples of finish hardware where necessary to ensure correct detailing and fabrication of the hollow metal doors and frames, from finish hardware supplier.
2. Doors:
   a. Preparation includes sinkages, and cut-outs for mortised and concealed finish hardware and reinforcements for both concealed and surface-applied finish hardware.
   b. Drill and tap mortise reinforcements at factory, using templates.
   c. Detail and fabricate reinforcements with concealed connections designed to develop full strength of reinforcements for high-frequency applications.
   d. Reinforce doors for required finish hardware, with minimum gauges of reinforcements provided as follows:
      1) Hinges: Steel plate 3/16-inches thick by 1-1/2-inches wide by 6-inches longer than hinge and secured by not less than six spot or projection welds with top hinge further reinforced with a high-frequency back-up reinforcement.
      2) Mortise Locksets and Dead Bolts: 12-gauge steel sheet, secured with not less than four spot or projection welds.
      3) Cylinder Locks: 12-gauge steel sheet, secured with not less than two spot or projection welds.
      4) Flush Bolts: 12-gauge steel sheet, secured with not less than two spot or projection welds.
      5) Surface-Applied Closers and Overhead Stops: 3/16-inch steel plate, not less than 10-inches long, secured with not less than six spot or projection welds.
      6) Push Plates and Bars: 16-gauge steel sheet secured with not less than two spot or projection welds.
      7) Surface Panic Devices: 16-gauge sheet steel secured with not less than two spot or projection welds.
      8) Automatic Door Bottoms: Reinforce for mortise-type units with 14-gauge steel, and 16-gauge for surface-applied units.
3. Frames:
   a. Reinforce frames for required finish hardware with minimum gauges as follows:
      1) Hinges and Pivots: Special full width of frame, 3/16-inch thick steel plate by 8-inches longer than hinge, secured to both rabbets by not less than twelve spot or projection welds.

2) Strike Plate Clips: 10-gauge steel plate by 1-1/2-inches wide by 3-inches long with mortar guard boxout secured with not less than six spot or projection welds.
3) Surface-Applied Closers: 3/16-inch steel plate, secured with not less than six spot or projection welds. Coordinate closer function and presence of overhead stops and weather-stripping, with location of reinforcement plate.
4) Concealed Closers: Removable steel access plate, 12-gauge internal reinforcement of size and shape required, and enclosing housing to keep closer pocket free of mortar or other materials.

E. Stops and Moldings:
1. Provide stops and moldings around solid, glazed and louvered panels in hollow metal units and in frames to receive glass.
2. Fabricate fixed stops and moldings integral with frame. Provide fixed stops on inside of hollow metal units exposed to exterior and on corridor side of interior units.
3. Provide removable stops and molds at other locations, formed of not less than galvanized 20-gauge steel sheets. Secure with countersunk machine screws spaced uniformly not more than 12-inches on center. Form corners with butted hairline joints.
4. Coordinate width of rabbet between fixed and removable stops with type of glass or panel and type of installation indicated. Refer to Section 08 8100, Glass Glazing.

2.5 SHOP PAINTING

A. Clean, treat and paint exposed surfaces of fabricated hollow metal units, including galvanized surfaces.

B. Clean steel surfaces of mill scale, rust, oil, grease, dirt and other foreign materials before the application of the shop coat of paint.

C. Apply pretreatment to cleaned metal surfaces, using cold phosphate solution (SSPC Paint 2), or basic zinc chromate-vinyl butyral solution (SSPC Paint 27).

D. Refer to Section 09 9100, Painting, for field-applied primer and finish paint for exterior or interior exposed ferrous, non-ferrous, or galvanized surfaces.

E. Apply shop-coat of prime paint within time limits recommended by pretreatment manufacturer. Apply a smooth coat of even consistency to provide a uniform dry film thickness of not less than 1.5-mils.

F. Finish shall be rust inhibitive primer capable of passing a 500-hour salt spray and a 1,000-hour humidity test in accordance with ASTM B 117 as certified by an independent laboratory.

2.6 SOURCE QUALITY CONTROL

A. After Shop Drawings approval, manufacturer shall not make any further detailing, fabrication or changes to approved methods of support and anchorage, nor shall doors and frames be brought to the Site, which do not conform, in all ways, to performance criteria specified.

B. Allowable Tolerances: Provide door and frame manufacturing tolerances in compliance with SDI 117 and as follows:
1. Nominal Clearance between Door and Frame Head and Jamb: 1/8-inch.

2. Nominal Clearance between Meeting Edges of Pairs of Doors: 1/8-inch.
3. Nominal Clearance at Bottom of Door: 3/4-inch.
4. Nominal Clearance between Face of Door and Door Stop: 1/16-inch.
5. Provide all Work plumb and true to adjoining surfaces with all miters and copes accurately formed.
6. Provide completely water and vapor tight joints.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine the substrate and conditions under which hollow metal doors and frames are to be installed and notify Engineer, in writing, of any conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Frames that are bowed, twisted or otherwise unacceptable shall be removed from the Site and replaced with properly constructed frames.

3.2 PREPARATION

A. Drilling and tapping for surface-applied, finish hardware may be done at Site.

B. Protective Coating: Protect inside, concealed, faces of door frames in plaster or masonry construction using fibered asphalt emulsion coating. Apply over shop primer approximately 1/8-inches thick and allow to dry before installation.

3.3 INSTALLATION

A. Install hollow metal units and accessories in accordance with approved Shop Drawings, SDI 105 and as shown and specified.
1. Do not install doors and frames until all the Work, which could damage doors and frames, has been completed.
2. Provide temporary doors until construction sequencing allows installation of permanent doors and frames.
3. Do not proceed with the installation of permanent hollow metal doors until Contractor can provide finished Work complying with all requirements of these Specifications.
4. Protect built-in frame Work with temporary wood protection.

B. Placing Frames:
1. Place frames at fire-rated openings in accordance with NFPA 80.
2. Set frames accurately in position, plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces and spreaders leaving surfaces smooth and undamaged. Remove spreader bars only after frames have been properly set and secured.
3. Make field splices in frames as detailed on approved Shop Drawings, welded and finished to match factory work.

C. Setting Masonry Anchorage Devices:
1. In masonry construction, building in of anchors and grouting of frames is included in Section 04 0505, Unit Masonry Construction.

2. Set anchorage devices opposite each anchor location, in accordance with details on approved Shop Drawings and anchorage device manufacturer's instructions as follows:
    a. Masonry Walls: Install at least three jamb anchors per jamb up to 7 feet-6 inches height; four anchors up to 8 feet-0 inch jamb height; one additional anchor for each 2 foot-0 inch or fraction thereof over 8 feet-0 inch height.
    b. Structural Steel: Secure frames to structural steel framing using machine bolts inserted through tubular steel pipe sleeves reinforcement concealed in hollow metal frames at 6-inches from top and bottom and 2 foot-0 inches on center. Apply removable stop to cover anchor bolts.
    c. Steel Stud Construction: Secure knocked-down-type drywall frames to gypsum wallboard metal studs using compression anchor assemblies. Install at least three jamb anchors per jamb up to 7 feet-6 inches height; four anchors up to 8 feet-0 inch jamb height; one additional anchor for each 2 foot-0 inch or fraction thereof over 8 feet-0 inch height.
3. Floor anchors may be set with powder-actuated fasteners instead of masonry anchorage devices and machine screws, if so indicated on approved Shop Drawings.

D. Door Installation:
1. Fit hollow metal doors accurately in their respective frames, with the following clearances:
    a. Jambs and Head: 3/32-inch.
    b. Meeting Edges, Pairs of Doors: 1/8-inch.
    c. Bottom: 3/4-inch, where no threshold.
    d. Bottom: At threshold, 1/8-inch.
2. Place fire-resistance-rated doors with clearances as specified in NFPA 80.
3. Finish hardware installation is specified under Section 08 7100, Door Hardware. Locate finish hardware as shown on approved Shop Drawings, in accordance with hardware templates provided by finish hardware manufacturers and in accordance with Door and Hardware Institute, Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames.

3.4 ADJUSTMENT AND CLEANING

A. Check and readjust operating finish hardware items in hollow metal door and frame Work just prior to final inspection. Leave Work in complete and proper operating conditions.

B. Where problems of installation or damage are cause for rejection of hollow metal door and frame Work, consult SDI 122 and the recommendations of the hollow metal door and frame manufacturer, for suggestions concerning required adjustments in the Work. Submit recommendations to Engineer for approval. Replace and repair unacceptable Work, as directed by Engineer, so that there will be no doubt as to the acceptability of the Work at the time of Substantial Completion.

C. Prime Coat Touch-Up: Immediately after installation, sand smooth all rusted or damaged areas of prime coat and apply touch-up of compatible air-drying primer.

D. Protection: Protect installed hollow metal doors and frames against damage from other construction activities.

END OF SECTION 08 1113

SECTION 08 1116

ALUMINUM DOORS AND FRAMES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all aluminum doors and frames Work.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before the aluminum doors and frames Work.

C. Related Sections:
   1. Section 04 0505, Unit Masonry Construction.
   2. Section 06 1053, Miscellaneous Rough Carpentry.
   3. Section 07 9200, Joint Sealants.
   4. Section 08 7100, Door Hardware.
   5. Section 08 8100, Glass Glazing.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. Aluminum Association, (AA).
      a. AA DAF 45, Designation System for Aluminum Finishes.
   2. Architectural Aluminum Manufacturing Association, (AAMA).
      a. AAMA 701.1, Standard for Sliding Weatherstripping.
   3. American Society for Testing and Materials, (ASTM).
      a. ASTM B 117, Practice for Operating Salt Spray (Fog) Apparatus.
      b. ASTM D 522, Test Methods for Mandrel Bend Test of Attached Organic Coatings.
      c. ASTM D 523, Test Method for Specular Gloss.
      d. ASTM D 968, Test Methods for Abrasion Resistance of Organic Coatings by Falling Abrasive.
      e. ASTM D 1308, Practice for Effect of Household Chemicals on Clear and Pigmented Organic Finishes.
      f. ASTM D 2244, Practice for Calculation of Color Tolerances and Color Tolerances and Color Differences from Instrumentally Measured Color Coordinates.
      g. ASTM D 2247, Practice for Testing Water Resistance of Coatings in 100% Relative Humidity.
      h. ASTM D 4214, Test Methods for Evaluating the Degree of Chalking of Exterior Paint Films.
   4. National Association of Architectural Metal Manufacturers, (NAAMM).
      a. NAAMM, Hardware Location for Custom Hollow Metal Doors.
      b. NAAMM, Metal Finishes Manual.
   5. The Society for Protective Coatings, (SSPC).
      a. SSPC Paint 12, Cold Applied Asphalt Mastic (Extra Thick Film).

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. Provide aluminum doors, transom and frames manufactured by a single firm specializing in the production of this type of Work. Manufacturer shall have a minimum of five years of experience in the production of aluminum doors and frames, and shall be able to show evidence of satisfactory operation in at least five installations.

B. Component Supply and Compatibility:
   1. Obtain all products included in this Section regardless of the component manufacturer from a single aluminum doors and frames manufacturer.
   2. The aluminum doors and frames manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.
   3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the aluminum doors and frames manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Copies of manufacturer's fabrication and installation drawings of aluminum doors and frames. Include details of each frame type, elevations of each door type, conditions at openings, details of construction, location and installation requirements of finish hardware and reinforcements, details of joints and connections. Show all door and frame reinforcements.
      b. Provide a schedule of doors and frames using same reference numbers for details and openings as those shown.
   2. Samples: Submit the following:
      a. Samples of each required aluminum finish, on 12-inch long extrusions or 6-inch square sheets, of the alloys to be used for the Work. Where normal color and texture variations are to be expected, include two or more units in each sample, to show the range of such variations.
      b. Samples shall be reviewed by Engineer for color and texture only. Compliance with other requirements is the exclusive responsibility of Contractor.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling and Unloading:
   1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices which are to be embedded in cast-in-place concrete in ample time to prevent delay of that Work.
   2. Deliver aluminum doors and frames cartoned or crated to provide protection during transit and job storage.

B. Storage and Protection:
   1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.
   2. Store doors and frames at the Site under cover. Place units up off the floors in a manner that will prevent corrosion and damage. Avoid the use of non-vented plastic or canvas

shelters, which could create a humidity chamber. If the cardboard wrapper on the door becomes wet, remove the carton immediately. Provide a 1/4-inch space between stacked doors to promote air circulation.

C. Acceptance at Site:
1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace loss and repair damage to new condition in accordance with manufacturer's instructions.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Aluminum Extrusions: Provide aluminum Alloy 6063-T5 or equal for properties of strength (not less than 22,000 pounds per square inch ultimate tensile strength), corrosion resistance, abrasion resistance, application of required finish, and control of color.

B. Aluminum Sheets:
1. Provide aluminum Alloy 5005-H14, or equal, for properties of strength corrosion resistance, abrasion resistance, application of required finish, and control of color.
2. Provide smooth sheet for exposed faces of doors and panels, except as otherwise specified.

C. Fasteners: Aluminum, non-magnetic stainless steel or other non-corrosive metal fasteners guaranteed by the manufacturer to be compatible with the doors, frames, stops, panels, hardware, anchors and other items being fastened.
1. For exposed fasteners (if any), provide Phillips flat-head screws with finish matching the item fastened.
2. Do not use exposed fasteners, except where unavoidable for the assembly of units, and unavoidable for the application of hardware. Provide only concealed screws in glazing stops.

D. Reinforcement and Brackets: Manufacturer’s standard formed or fabricated aluminum units, of shapes, plates or bars.

E. Inserts: For required anchorage into concrete or masonry work, furnish inserts of 12- gauge steel stainless steel after fabrication.

F. Expansion Anchor Devices: Stainless steel, drilled-in, expansion bolt anchors.

G. Bituminous Coatings: Cold-applied asphalt mastic complying with SSPC Paint 12, compounded for 30-mil thickness per coat.

2.2 FABRICATION

A. General:
1. Sizes and Profiles: The required sizes for door and frame units and the profile requirements are shown. Variable dimensions for profiles (if any) are shown along with maximum and minimum dimensions as required to achieve design requirements and coordination with other work.

2. The details shown are based upon standard details by one or more manufacturers. Similar details by other manufacturers will be acceptable, provided they comply with the size requirements, and with minimum/maximum profile requirements as shown.

B. Flush Type Aluminum Doors:
1. Provide tubular frames members with minimum wall thickness of 1/8-inch, fabricated with reinforced mechanical or welded joints in accordance with manufacturer's standard fabrication methods. Limit edge exposure and face molding exposure to 0.50-inch maximum width.
2. Fabricate flush doors with cores laminated between two sheets of 0.040-inch thick aluminum laminated to 1/8-inch thick oil-tempered hardboard with epoxy adhesive to form a door thickness of 1-3/4-inch and of a true 5-ply construction.
3. Provide cores of 20 percent phenolic resin-impregnated honeycomb material 80 lbs. per 3,000 sq. ft. ream, (7/16-inch cells) laminated with an epoxy adhesive between two sheets of 1/8-inch thick tempered hardboard.
4. Provide transom frames of the same material, finish, thickness and gauge as the door and frame material.
5. Products and Manufacturers: Provide one of the following:
   a. 100 BE Doors with Frame by Cline Aluminum Doors, Inc.
   b. Or equal.

2.3 HARDWARE

A. Flush Doors: Refer to Section 08 7100, Door Hardware, and to the frame, door and hardware schedules and details, for the furnishing and installing of hardware items. Hardware templates only will be furnished to the manufacturer for the fabrication of door and frames to receive hardware not supplied by door manufacturer.

B. Hardware Installation: Cut, reinforce, drill and tap frames and doors as required to receive hardware, except do not drill and tap for surface-mounted items until the time of installation. Comply with hardware manufacturer's instructions and template requirements. Use concealed fasteners, wherever possible.

2.4 ALUMINUM FINISHES

A. General:
1. Preparation: After fabrication of doors and frames, but before lamination of panels, prepare the aluminum surfaces for finishing in accordance with the aluminum producer's recommendations and standards of the finisher or processor. Process all components of each assembly simultaneously to attain complete uniformity of color.
2. Samples:
   a. Comply with industry standard colors and texture samples. Establish Samples of the required finish, for Engineer'S acceptance, prior to fabrication of the Work. Engineer reserves the right to reject material finishes with objectionable variations from the established samples.
   b. Prepare samples on extrusions and sheets of the exact alloys to be used for the Work, and show range of natural variations to be expected in finished Work, by duplicate samples of varying color and texture.

B. Anodized Finishes: NAAMM AA-M10-C22-A41, (minimum thickness of 0.7- mils), Clear.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine the substrate and conditions under which aluminum doors and frames Work are to be installed and notify Engineer, in writing, of any conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 INSTALLATION

A. Comply with manufacturer's specifications and recommendations for the installation of aluminum doors and frames.

B. Set units plumb, level and true to line, without warp or rack of frames, doors or panels. Anchor securely in place. Separate aluminum and other corrodible metal surfaces from sources of corrosion or electrolytic action at points of contact with other materials.

3.3 ADJUSTMENT AND CLEANING

A. Clean aluminum surfaces promptly after installation of frames and doors. Remove excess glazing and sealant compounds, dirt and other substances.

B. Where protective coating has been supplied, remove coating completely as soon as the completion of construction activities no longer requires its retention.

C. Contractor shall provide protective treatment and other precautions required as recommended by manufacturer, through the remainder of the construction period, to ensure that doors and frames will be without damage or deterioration (other than normal weathering) at the time of Final Acceptance.

END OF SECTION 08 1116

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 08 1613

FIBERGLASS REINFORCED PLASTIC DOORS AND FRAMES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install fiberglass reinforced plastic doors and frames as shown and specified.
   2. The extent of doors and frames Work is shown on the Drawings.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate the installation of items that must be installed or demolished in association with the doors and frames.

C. Related Sections:
   1. Section 07 92 00, Calking and Sealants.
   2. Section 08 71 00, Finish Hardware.

1.2 QUALITY ASSURANCE

A. Reference Standards: Comply with the latest edition of the applicable provisions and recommendations of the following, except as otherwise shown or specified:
   1. ANSI A115, Specifications for Door and Frame Preparations for Hardware.
   2. ASTM A 103, Zinc (hot-galvanized) Coatings on Products Fabricated From Rolled, Pressed, and Forged Steel Shapes, Plates, Bars, and Strip.
   3. ASTM A 123, Zinc (Hot-Galvanized) Coatings on Products Fabricated from Rolled, Pressed, and Forged Steel Shapes, Plates, Bars, and Strip.
   4. ASTM B 509, Cellular Elastomeric Preformed Gasket and Sealing Material.
   5. ASTM D 2000, Classification for Elastomeric Materials for Automotive Applications.
   6. Underwriters Laboratories, Inc. “Standard for Fire Test of Doors, UL10B”.
   7. ASTM D 635, Standard Test Method for Rate of Burning or Extent and Time of Burning of Self Supporting Plastics in a Horizontal Position.
   8. ASTM E 84, Standard Test Method for Surface Burning Characteristics of Building Materials.
   9. ASTM D 2287, Nonrigid Vinyl Chloride Polymer and Copolymer Molding and Extrusion Compounds.
   10. NAAMM, Entrance Manual.
   11. Laminate properties:
      a. ASTM D 882 Tensile strength.
      b. ASTM D 790 Flexural strength.

c. ASTM D 2583 Barcol Hardness.
d. ASTM D 256 Impact resistance.
e. ASTM D 792 Density/specific gravity of laminate.

12. Core Properties
    a. ASTM C 177 Thermail properties.
    b. ASTM D 1622 Density/specific gravity.
    c. ASTM D E 84 Surface burning characteristics.

B. Manufacturer Qualifications: Provide doors and frames manufactured by a single firm specializing in the production of this type of Work.

1.3 SUBMITTALS

A. Shop Drawings: Submit for approval the following:
1. Product Data: Manufacturer's printed product data indicating characteristics of products specified in this Section.
2. Plans: Indicate location of each door opening assembly in project.
3. Elevations: Dimensioned elevation of each type door opening assembly in project; indicate sizes and locations of door hardware, and lites and louvers, if specified.
4. Details: Installation details of each type installation condition in project; indicate installation details of glazing, if specified.
5. Schedule: Indicate each door opening assembly in project; cross-reference to plans, elevations, and details.

B. Selection Samples: Manufacturer's standard color chips.

C. Verification Samples: Two (2) samples to verify color match.

D. Manufacturer's Instructions: Printed installation instructions for door opening assemblies.

E. Warranty Documents: Manufacturer's standard warranty documents, executed by manufacturer's representative, countersigned by Contractor.

1.4 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery of Materials:
1. Package door opening assemblies in manufacturer's standard containers.

B. Storage of Materials:
1. Store door assemblies in manufacturer's standard containers, on end, to prevent damage to face corners and edges.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Fiberglass Met: Random glass fiber mat. Minimum 4.5 ounces per square foot weight of glass material.

B. Roving: Unidirectional glass fiber mat, minimum 16 ounces per square yard weight.

C. Resins: Formulated for specified environment, minimum flame spread 25 in accordance with ASTM E 84, self-extinguishing in accordance with ASTM D 635.

D. Anchors: Manufacturer’s standard stainless steel fasteners.

E. Bonding Materials: Manufacturer’s standard frame-to-opening bonding system.

F. Joint Sealer: Sealant, specified in Section 07 92 00.

2.2 FABRICATION

A. General:
1. Sizes and Profiles: The required sizes for door and frame units, and the profile requirements are shown on the Drawings. Variable dimensions for profiles (if any) are shown along with maximum and minimum dimensions as required to achieve design requirements and coordination with other work.
2. The details shown are based upon standard details by one or more manufacturers. Similar details by other manufacturers will be acceptable, provided they comply with the size requirements, and with minimum/maximum profile requirements as shown.

2.3 HARDWARE

A. Flush Doors: Refer to Section 08 71 00, Finish Hardware, and to the frame, door and hardware schedules and details, for the furnishing and installing of hardware items. Hardware templates only will be furnished to the manufacturer for the fabrication of door and frames to receive hardware not supplied by door manufacturer.

B. Hardware Installation: Cut, reinforce, drill and tap frames and doors as required to receive hardware, except do not drill and tap for surface-mounted items until the time of installation. Comply with hardware manufacturer's instructions and template requirements. Use concealed fasteners wherever possible.

2.4 MANUFACTURED UNITS

A. Non-rated Fiberglass Reinforced Plastic (FRP) Doors:
1. Thickness: 1-3/4 inches.
2. Thermal Insulating Value: >R factor 12.
3. Construction:
a. Style and Rail Structure: One-piece molded U-shaped cross-section, minimum 15 mil gel coat, minimum three (3) layers random-fiberglass mat, saturated with resins.

b. Core: End-grain balsa wood, resin-impregnated.
c. Face Sheets: Molded in one continuous piece, resin reinforced with hand-laid glass fiber mat, nominal 1/8 inch thick, minimum 15 mil gel-coated surface with minimum two (2) layers random-fiberglass mat ad one (1) layer roving, saturated with resins.
d. Door Edges: Minimum three (3) layers resin-reinforced glass fiber mat, nominal 3/8 inch thick, machine tooled.

4. Sizes: Indicated on Drawings.
5. Finish: Smooth gloss surface, minimum value 88 in accordance with ASTM D 523.
6. Color: To be selected by Engineer.

B. Non-rated Fiberglass Frames:
1. Construction: One-piece molded cross-section with molded stop, minimum 15 mil get coat, minimum two (2) layers random-fiberglass mat, saturated with resins polyurethane foam core. Sizes: For door sizes and frame depths indicated on drawings.
2. Frame Profile: 5-3/4 inches deep, 2 inches wide face; double rabbeted with 5/8 inch high stop.
3. Sizes: Indicated on Drawings.
4. Finish: Satin finish, with true and consistent color throughout frame thickness.
5. Color: To be selected by Engineer.

C. Product and Manufacturer: Provide one of the following:
1. Fiberglass Reinforced Plastic door and frames by Chem-Pruf Door Company.
2. Or Equal.

2.5 FABRICATION

A. Fiberglass Reinforced Plastic (FRP) Doors: Workmanship is to be of the highest quality in order to meet quality control requirements.
1. Stile and Rail Structure:
a. Form in mold of exact door size, with get coat layer to form, glass mat layers to a U-shaped channel interior.
b. Formulate get coat for environment and integral color specified.
c. Form structure as single component, jointed construction at intersections of stiles and rails is prohibited.
d. Form mortise for lockset, and recess for strike plate in lock stile, at time of molding.
e. Embed compression members at the time of molding in locations where thru-bolting of hardware is required.
2. Core:
a. Fit core material within stile/rail structure, fit around compression members and projections of mortises.
b. Mold openings for lites or louvers, if specified, form to sizes and at locations indicated.
3. Face sheets:

a. Formulate get coat with integral color specified, embed glass materials.
b. Chemically bond face sheets to stile/rail structure and core material.

B. Fiberglass Frames:
1. Resin transfer in mold of exact wall opening size, with get coat. Glass mat layers to form solid fiberglass outer surface.
2. Formulate get coat for environment and integral color specified.
3. Form structure of fiberglass components.
4. Form mortise for kick strike, and recess for strike plate in lock jamb, at time of molding.
5. Embed reinforcement for hinges and other indicated hardware in fiberglass matriz, provide for hinge leaf recesses in hinge jamb at time of molding.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and his installer must examine the substrate and conditions under which doors and frames Work are to be installed and notify the Engineer in writing of any conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer.

3.2 INSTALLATION

A. Install door opening assemblies in accordance with shop drawings, SDI-100, and manufacturer's printed installation instructions, using installation methods and materials specified in installation instructions.

B. Installation of door hardware is specified in Section 08710.

C. Install door hardware in accordance with manufacturer's printed instructions, using through-bolts to secure surface applied hardware.

D. Site Tolerances: Maintain plumb and level tolerances specified in manufacturer's printed installation instructions.

3.3 CLEANING AND REPAIRING

A. Adjust doors in accordance with door manufacturer's maintenance instructions to swing open and shut without binding, and to remain in place at any angle without being moved by gravitational influence.

B. Adjust door hardware to operate correctly in accordance with hardware manufacturer's maintenance instructions.

C. Clean surfaces of door opening assemblies and sight-exposed door hardware in accordance with manufacturer's maintenance instructions.

D. Protect door opening assemblies and door hardware from damage by subsequent construction activities until final inspection.

+ + END OF SECTION + +

SECTION 08 3100

ACCESS DOORS AND PANELS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified and required to furnish and install all access doors and panels Work.
   2. Extent of access doors and panels is shown.
   3. Types of products required include the following:
      a. Wall access doors.
      b. Miscellaneous hardware, accessories and fasteners.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before the access doors and panels Work.

C. Related Sections
   1. Section 04 0505, Unit Masonry Construction.

1.2 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Copies of manufacturer's technical data and installation instructions for each type of access door and panel assembly. Transmit copy of the instructions for each type to the installer. Provide setting drawings, templates, instructions and directions for installation of anchorage devices.

PART 2 - PRODUCTS

2.1 DETAILS OF CONSTRUCTION

A. Description:
   1. Provide access door and panel assemblies manufactured as integral units and complete with all components and accessories ready for installation.

B. Masonry Wall Access Door: Provide the following wall access panel:
   1. Non-rated access door: 14-gauge galvanized steel door.
   2. Frames: 16-gauge galvanized steel with flanged
   3. Finish Hardware:
      a. Hinge: Continuous concealed piano hinge.
      b. Lock: Key operated cylinder lock with automatic dust shutter, stainless steel cam.
   4. Finish: Prime coat of rust inhibitive electrostatic powder, baked gray enamel.
   5. Size: 16-inches by 16-inches.
   6. Product and Manufacturer: Provide products of one of the following:
      a. Architectural Non-Rated Access Door by Nystrom.
      b. Or equal.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor must examine the areas and conditions under which access doors are to be installed and notify Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 INSTALLATION

A. Comply with manufacturer's instructions for installation of access doors and panels.

B. Coordinate installation with work of other trades.

C. Set frames accurately in position and securely attach to support with face panels plumb or level in relation to adjacent finish surfaces.

3.3 ADJUSTMENT AND CLEANING

A. Adjust hardware and panels after installation for proper operation.

B. Remove and replace panels or frames, which are warped, bowed or otherwise damaged.

END OF SECTION 08 3100

SECTION 08 3323

OVERHEAD COILING DOORS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment, and incidentals as shown, specified, and required to furnish and install overhead coiling doors.
   2. Extent of overhead coiling doors is shown.
   3. Types of products required include:
      a. Aluminum, very high cycle, heavy-duty, overhead coiling doors with insulated slats and full perimeter weather-stripping.
      b. Chain operators.
      c. Electric operators and chain operators, control stations, starters, safety edge devices and similar and associated components with all power and control connections, including disconnect switches.
      d. Angles, brackets, hoods and supports.
      e. Inserts and anchoring devices.
      f. Miscellaneous materials and accessories for complete, functional system.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items that must be installed with or before overhead coiling door Work.

C. Related Sections:
   1. Section 09 9100, Painting.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASTM A36/A36M, Specification for Carbon Structural Steel.
   2. ASTM A366/A366M, Specification for Commercial Steel Sheet, Carbon, (0.15 maximum percent) Cold-Rolled.
   3. ASTM A653/A653M, Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
   4. ASTM E84, Test Method for Surface Burning Characteristics of Building Materials.
   5. NEMA MG 1, Motors and Generators.
   6. NFPA 70, National Electrical Code.
   7. Standards for Safety, UL 10B, Fire Tests of Door Assemblies.
   8. UL, Building Materials Directory.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Supplier Qualifications: Supplier shall have a minimum of five years experience producing substantially similar products to those required and shall be able to document at least five installations in satisfactory operation for at least five years.

2. Installer Qualifications:
    a. Retain a single installer for all overhead coiling door Work, with documented and successful experience in type of Work required, and who is authorized representative of overhead coiling door manufacturer for installing and maintaining products required. Installer shall employ only tradesmen with successful experience in type of Work required.
    b. References: Provide names and telephone numbers of architects or engineers as applicable, and owner's representatives for at least three successful projects performed by proposed installer, similar to the Work required for this Project.

B. Component Supply and Compatibility:
    1. Obtain all products included in this Section regardless of component Supplier from one overhead coiling door manufacturer.
    2. Overhead coiling door Supplier shall review and approve or to prepare all Shop Drawings and submittals for all products provided under this Section.
    3. Components shall be suitable for specified service conditions and be integrated into overall assembly by overhead coiling door Supplier.

C. Regulatory Requirements:
    1. Comply with requirements of codes listed in Section 01 4100, Regulatory Requirements.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
    1. Shop Drawings:
        a. Drawings showing all components and their assembly, all with accurate dimensions. Include details at frames, elevations of each overhead coiling door design type, details of construction and conditions at openings.
        b. Complete interconnecting wiring diagrams for power, signal and control systems indicating all system operating components and control station wiring required for complete, operational system complying with Specifications. Define and differentiate between components that are furnished and installed as part of overhead coiling door Work; both at the Site and in the factory, and those that must be furnished, or installed, as part of the Work under other Sections 26 0510 and 26 0519.
    2. Product Data:
        a. Manufacturer's specifications and data sheets, roughing-in diagrams, and installation instructions for each type and size of overhead coiling door.
        b. Include manufacturer's data on operators, operating instructions and maintenance data. Indicate by transmittal form that installer has received a copy of diagrams and installation instructions.
        c. Electric operator and other operating system component specifications indicating compliance with Specifications. Provide motor nameplate data and ratings; characteristics, mounting arrangements, size and location of winding termination lugs, conduit entry and grounding lugs; and coatings.
    3. Samples:
        a. Specified galvanized, primed painted steel finish on 12-inch by 12-inch panel of insulated flat slats identical to those that will be used in the Work. Provide sample of full depth of door, demonstrating slat insulation and thermal-break feature. Engineer's review will be to determine acceptability of finish only.

B. Informational Submittals: Submit the following:
   1. Design Data:
      a. Calculations showing that detailing and fabrication of components complies with structural performance specified.
   2. Supplier Instructions:
      a. Provide manufacturer instructions for handling and installing specified products.
      b. Setting drawings; summary of loads on walls, jambs and structural elements; templates; and instructions and directions for installation of inserts and anchorage devices, furnished by overhead coiling door Supplier and installed under other Sections of these Specifications.
   3. Site Quality Control Submittals:
      a. Provide report of all operating tests, problems encountered, and corrective actions implemented. Document successful completion of field operating test for all products.
      b. Provide report of each visit to Site by Supplier's representative.
   4. Qualifications Statements:
      a. Supplier.
      b. Installer.

C. Closeout Submittals: Submit the following:
   1. Operation and Maintenance Data:
      a. Provide complete operation and maintenance manuals, including test reports, maintenance data and schedules, description of operation, and information on recommended spare parts.
      b. Provide operation and maintenance manuals per Section 01 7823, Operation and Maintenance Data.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling and Unloading:
   1. Deliver products to Site to ensure uninterrupted progress of the Work. Deliver anchorage devices to be embedded in concrete in ample time to prevent delaying the Work.
   2. Deliver products to Site suitably crated, braced, and protected against distortion and damage during transit and unloading. Label all parts to comply with approved Shop Drawings and submittals.
   3. Upon delivery, inspect products for damage. Notify Engineer in writing of loss or damage to products. Replace loss and repair damage to new condition in accordance with manufacturer's instructions. Minor damage may be repaired provided finished items are equal in all respects to new items and acceptable to Engineer; otherwise, remove and replace damaged items.
   4. Conform to Section 01 6500, Product Handling Requirements.

B. Storage and Protection:
   1. Store materials to allow easy access for inspection and identification. Keep all material off ground using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.
   2. Store doors and frames under cover.
   3. Place units up off floor in manner that prevents rust and damage.
   4. Avoid using non-vented plastic or canvas shelters.
   5. Conform to Section 01 6600, Product Storage and Handling Requirements.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Design Criteria:
1. Structural: Overhead coiling door components shall be capable of resistance to these loads:
a. Wind Loading: Provide resistance to both positive and negative wind pressure loading of 30 pounds per square foot acting over entire plane of door curtain slats.
b. Dead Loading: Provide resistance to deformation of door components caused by effects of gravity loads.
c. Applied loadings shall not cause short-term or permanent deformation of system components. Doors shall remain operable and undamaged during and after application of specified wind pressure loading.
2. Helically-Wound Torsion Springs: Provide Very-High-Cycle design capable of performing for 100,000 operational cycles. Provide non-resetable electric counters for overhead coiling doors.
3. Electric Operators and Controls:
a. Operator system shall be constructed so that motor can be removed without disturbing limit-switch adjustment and without affecting emergency auxiliary operator.
b. Operators shall be constructed for 100,000 service-free, operating cycles.
c. Fixtures shall be listed and labeled as specified.
4. Chain Hoist Operation: Reduction roller chain and sprocket drive or suitable gearing, mounted on counterbalance shaft, shall operate with a maximum 35 pounds of pulling force.

B. Definitions:
1. Operating Cycle: One complete cycle of an overhead coiling door or fire-resistance-rated overhead coiling door begins in closed position. Door is then moved to open position and back to closed position.
2. Listed and Labeled: Per NFPA 70, Article 100.

2.2 MANUFACTURERS

A. Non-fire Resistance-Rated Overhead Coiling Doors:
1. Products and Manufacturers: Provide products of one of the following:
a. Thermo-Tite Door 800C Series Insulated Double Panel Overhead Coiling Doors, by Wayne Dalton Corp.
b. Weather-Tite Insulated Service Doors by McKeon Door Company.
c. Or equal.

2.3 MATERIALS

A. Door Curtain:
1. Door Curtain Slats: Fabricate door curtain of flat, interlocking slats, designed in compliance with structural performance criteria specified of continuous length for width of door, without splices.
2. Door Curtain Slats: Fabricate overhead rolling door curtain of flat interlocking slats designed to withstand the specified wind loading, of continuous length for the width of the door without splices. Provide aluminum slats back and front panels and finish as follows:
a. Finish:
1) Exterior Slats: NAAM AA-M21C22A41 (0.04" min.) Clear Anodized.

2) Interior Slats: NAAM AA-M21C22A41 (0.024" min.) Clear Anodized.

b. Slat Size and Features: 3/4-inches by three inches; pressure filled, foamed-in-place polyisocyanurate plastic insulation with minimum resistance to thermal flow (R) value of 6.25 and UL Tested Flame Spread of 75 maximum according to ASTM E84; thermal-break construction.

3. Endlocks: Heavy malleable iron castings, galvanized after casting, secured to curtain slats with two galvanized rivets. Provide endlocks on alternate curtain slats for curtain alignment and resistance against lateral movement.
4. Windlocks: Heavy malleable iron castings, galvanized after casting , and secured to curtain slats with three galvanized rivets. Space windlocks 2.0 feet on centers on both edges of curtain, or as required to comply with structural performance criteria specified.
5. Bottom Bar: Consisting of two galvanized steel angles, each not less than 1.5 inches by 1.5 inches by 1/8-inch thick.
6. Bottom Astragal: Replaceable gasket of flexible vinyl or neoprene.

B. Curtain Jamb Guides:
1. Fabricate curtain jamb guides of steel shapes with sufficient depth and strength to retain curtain against specified wind loading. Build-up units with minimum 3/16-inch thick steel sections complying with ASTM A36/A36M. Slot bolt holes for track adjustment.
2. Secure continuous wall angle to wall framing by 3/8-inch minimum diameter bolts at not more than 2.6 feet on centers, unless otherwise recommended by door manufacturer. Extend wall angles above door opening head to support coil brackets, unless otherwise shown. Place and locate anchor bolts on exterior wall guides so that they are concealed when door is closed.
3. Provide removable stops on guides to prevent over-travel of curtain, and a continuous bar for holding windlocks, if any.

C. Fascia Panels: Same material as door curtain slats.

D. Weather Seals:
1. Provide replaceable, compressible, and adjustable natural rubber or neoprene rubber weather-stripping for exterior doors. Secure weather seals with continuous metal pressure bars. At door heads, use a 1/8-inch thick replaceable, continuous sheet secured to inside of curtain coil hood. At door jambs, use a 1/8-inch thick continuous strip secured to exterior side of jamb guide.
2. Provide double guide weather-stripping that, when tested at 1.30 pounds per square foot pressure differential, allows maximum of 3.75 cubic feet per minute air infiltration per linear foot of overhead coiling door perimeter.
3. Provide weather-stripping continuously around all perimeter edges of door including hood baffle, astragal and guide weather-stripping.

E. Counterbalancing Mechanism:
1. Counterbalance doors by an adjustable-tension, steel helical torsion spring, mounted around steel shaft, mounted in spring barrel, and connected to door curtain with required barrel rings. Use grease-sealed ball bearings or self-lubricating graphite bearings for rotating members.
2. Counterbalance Barrel:
a. Fabricate spring barrel of hot-formed structural quality carbon-steel, welded or seamless pipe, of sufficient diameter and wall thickness to support roll-up of curtain without distorting slats and limiting barrel deflection to no more than 0.03-inch per foot of span under full load.

b. Provide spring balance of one or more oil-tempered, heat-treated steel helical torsion springs. Size springs to counterbalance the weight of curtain with uniform adjustment accessible from outside barrel. Provide cast steel barrel plugs to secure ends of springs to barrel and shaft.
c. Fabricate torsion rod for counterbalance shaft of case-hardened steel, of required size to hold fixed spring ends and carry torsional load.

3. Brackets: Provide mounting brackets of manufacturer's standard design, either cast-iron or cold-rolled steel plate with bell-mouth guide groove for curtain.

F. Weather and Waterproof Hoods:
1. Form to entirely enclose coiled curtain and operating mechanism at opening head, and act as weather seal. Contour to suit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Provide closed ends for surface-mounted hoods, and portion of between-jamb mounting projecting beyond wall face. Provide intermediate support brackets as required to prevent sag.
2. Fabricate steel hoods from 22-gauge hot-dip galvanized steel coating, complying with ASTM A653/A653M, phosphate-treat before fabrication.

2.4 ACCESSORIES

A. Manual Door Operators:
1. Provide manual operators, except where electric door operators are shown. When not shown, provide chain hoist operator units.

B. Chain Hoist Operator:
1. Provide manual direct drive chain hoist side-mounted operator consisting of endless stainless steel hand chain, chain cast-iron pocket wheel, and chain guard.
2. Provide chain hoist with self-locking mechanism allowing curtain to be stopped at all points in its travel and remain in position until movement is reactivated. Furnish hand chain with chain holder secured to operator guide.
3. Provide endless chain length that extends to 3.0 feet above floor.
4. Gears shall be high grade gray cast-iron.

C. Safety Stop Lock Bearings: Provide overhead coiling doors with safety stop lock bearings that will stop downward travel of overhead coiling door upon sensing a sudden, rapid acceleration of pipe shaft.

D. Electric Door Operators:
1. General: Provide electric door operator assembly of size and capacity recommended and provided by overhead coiling door manufacturer; complete with electric motor and factory pre-wired motor controls, including reversing starter, gear reduction unit, solenoid operated brake, clutch, remote control stations, and control devices and wiring complying with requirements of NFPA 70. Magnetic reversing starter shall be of internal type with thermal overload protection and reset button.
2. Provide operators and electric accessories suitable for use in NFPA 70, Class I, Division 1, Group D Hazardous Locations.
3. Provide hand-operated disconnect or mechanism for automatically engaging sprocket and chain operator and releasing brake for emergency manual operation. Mount disconnect and operator to be accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.

4. Operator system shall be provided so that motor can be removed without disturbing limit-switch adjustment and without affecting emergency auxiliary operator.
5. Door Operator Type:
    a. Provide wall or bracket-mounted door operator units consisting of electric motor, a worm gear running-in-oil primary drive from motor to reduction gear box, chain or worm gear drive from reduction box to gear wheel mounted on counterbalance shaft, and quick-clutch disconnect-release for manual operation.
    b. Provide motor, clutch, and drive assembly of horsepower and design as determined by door manufacturer for size of door required and as specified.
6. Electric Motors:
    a. Provide high-starting torque, reversible, continuous-duty; Class A insulated electric motors, complying with NEMA MG 1, with overload protection.
    b. Size to start, accelerate, and operate door in either direction, from all intermediate positions, at not less than eight inches or more than twelve inches per second without exceeding nameplate ratings or considering service factor.
    c. Coordinate wiring requirements and current characteristics of motors with building electrical system, and refer to electrical Specifications.
    d. Provide totally enclosed, non-ventilated or fan-cooled motors, waterproof electric motors, fitted with a plugged drain, and controller with NEMA Type 4X enclosure.
    e. Provide adjustable limit switches, rotary-type, driven by time chain and interlocked with motor controls set to automatically stop door at fully opened and closed positions. Geared limit switches shall contain spare set of contacts.
7. Remote Control Station:
    a. Unless otherwise shown, provide momentary-contact, three-button control station with push button controls labeled, “OPEN”, “CLOSE”, and “STOP”. Provide at locations as shown or scheduled.
    b. Provide interior units, full-guarded type, surface-mounted, heavy-duty, with general-purpose NEMA 1 enclosure, unless otherwise shown.
    c. Provide exterior units, full-guarded type, standard duty, surface-mounted, weatherproof type, NEMA Type 4X enclosure, key-operated.
8. Safety Edge Device:
    a. Provide each door with pneumatic safety air switch, extending full width of door bottom, located within an U-shaped neoprene or rubber astragal mounted to bottom door rail.
    b. Unit shall operate such that contact with switch before fully closing will immediately change air chamber pressure sending signal from air switch to electric motor, that will stop downward travel and reverse door direction to fully opened position.
    c. Connect to control circuit through retracting safety cord with cable reels provided for each electric operating door.
    d. Compressible strip shall serve as a weather seal along bottom of door.
    e. Safety edge shall be acceptable for use in NFPA 70 Class I, Division 1 locations.

2.5 PAINTING

A. Surface-prepare in the shop and shop-prime all ferrous metal and galvanized surfaces, exposed and unexposed, except lubricated surfaces, with door manufacturer’s standard rust inhibitive primer, drying to a flat sheen.

B. Refer to Section 09 9100, Painting, and coordinate compatibility of shop and Site-primed and finished paint for interior and exterior ferrous and non-ferrous metals.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine substrates and conditions under which overhead coiling doors are to be installed and notify Engineer of conditions detrimental to proper and timely completion of the Work. Do not proceed with Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 INSTALLATION

A. Install, wire, connect and adjust doors, motors, starters, control stations, limit and safety switches and other electrical accessories and connections required, per manufacturer's written instructions, approved Shop Drawings and submittals, and the Contract Documents.

B. Lubricate bearings and sliding parts and adjust mechanism so moving parts operate smoothly and are free of warp, twist, or distortion and fit watertight for door's entire perimeter.

C. Adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment. Test door closing when activated by detector or alarm connected fire release system. Reset door-closing mechanism after successful test.

D. Repair damaged products and restore finish to match manufacturer's original finish.

3.3 FIELD QUALITY CONTROL

A. Tests: Perform operating tests on all products at the Site following installation of products, including controls. Should tests indicate malfunction, make necessary repairs and adjustments. Repeat tests and adjustments until, in opinion of Engineer, installation is complete and products are functioning properly and are ready for permanent operation.

B. Supplier's Services:
   1. Provide services of factory-trained representative of Supplier for installation supervision, start-up, operation testing, and training of Owner's operating and maintenance personnel. Representative shall make at least 1 visit to the Site with at least 2hours on-Site per visit (excluding travel time). First visit shall be to assist in installing products. Subsequent visits shall be for checking completed installation, start-up and training. Supplier's representative shall test-operate system in presence of Engineer and verify that each overhead coiling door conforms to requirements. Supplier's representative shall revisit Site as often as necessary until all installation is entirely satisfactory.
   2. Costs, including travel, lodging, meals and incidentals, for Supplier's representative's visits shall be at no additional cost to Owner.

END OF SECTION 08 3323

SECTION 08 4523

TRANSLUCENT FRP WINDOW ASSEMBLIES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install translucent FRP window assemblies.
   2. The extent of the insulated translucent FRP window assemblies is shown and specified.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate the installation of items that must be installed prior to the insulated translucent FRP window assemblies Work.

C. Related Sections:
   1. Section 07 9200, Joint Sealants.

1.2 QUALITY ASSURANCE

A. Manufacturer's and Erector's Qualifications
   1. Sandwich panel system manufacturer must be listed by a recognized building code authority such as the International Conference of Building Officials, which requires quality control inspections by an approved agency.
   2. Quality control inspections and testing, conducted at least once each year shall include manufacturing facilities, sandwich panel components and production sandwich panels for conformance with "Acceptance Criteria for Sandwich Panels" as regulated by the State and Local Building Codes or equivalent.
   3. Materials and products shall be manufactured by a company continuously and regularly employed in the manufacture of similar materials for a period of at least ten consecutive years; and which can show evidence of these materials being satisfactorily used on at least six projects of similar size, scope and type within such a period. At least three of the projects shall have been in successful use for five years or longer.
   4. Erection shall be by installer which has been in the business of erecting similar materials for at least five consecutive years; and can show evidence of satisfactory completion of projects of similar size, scope and type.

B. Performance Requirements: The manufacturer shall be responsible for the configuration and fabrication of the complete panel system.
   1. Panels shall resist a wind load of 35 pounds per square foot.
   2. System to conform to applicable sections of Ohio Building Code.
      a. Basic Wind Speed: 95 mph.
      b. Importance Factor: 1.15.
      c. Exposure Category: C
      d. Flat Roof Snow Load: 30 psf.
      e. Snow Importance Factor Is: 1.1
      f. Thermal Factor, Ct: 1.1

3. System to conform to applicable sections of Ohio Building Code.

1.3 SUBMITTALS

A. Samples: Submit for approval the following:
   1. Samples of each required type and color of aluminum finish, on 12-inch long sections of extrusion shapes used in the Work, and 6-inch squares of sheet aluminum as required for the translucent FRP window and roof units and accessories. Samples will be reviewed by Engineer for color and texture only. Compliance with other requirements is the exclusive responsibility of Contractor.
   2. Engineer reserves the right to require samples showing fabrication techniques and workmanship of component parts, and the design of accessories and other exposed auxiliary items for translucent FRP window assemblies Work, before fabrication of the Work proceeds.
   3. One of each type fastener employed, with statement of intended use. Samples will be reviewed by Engineer for material and color only. Compliance with other requirements is the exclusive responsibility of Contractor.

B. Shop Drawings: Submit for approval the following:
   1. Shop Drawings for the assembly and erection of the entire insulated translucent FRP window assemblies , showing all dimensions, gages, finishes, location of joints, connections, fasteners, expansion provisions, and locations and types of glazing gaskets, pressure plates and snap covers and other related items as required. Provide wall elevations at 1/4 inch scale, and full size detail sections of every typical composite member. Coordinate the submittal of Shop Drawings for component parts (as specified in other Sections) with this submittal. Show anchorages and alignments not shown on Shop Drawings of the components. Indicate clearly on Shop Drawings, all deviations from Engineer'S Drawings. Include structural calculations required to show compliance with wind pressure loading requirements in the Work.
   2. Copies of manufacturers' Specifications and installation instructions for required materials and components which are not included in the other submittals specified in other Sections of these Specifications. Coordinate the submittal of such other data with this submittal, and with the submittal of samples required by other Sections.
   3. Maintenance Manual: Upon completion of the Work, furnish copies of detailed maintenance manual including the following information:
      a. Product name and number.
      b. Name, address and telephone number of manufacturer and local distributor.
      c. Detailed procedures for routine maintenance and cleaning.
      d. Detailed procedures for light repairs such as dents, scratches and staining.

C. Test reports to be furnished by sandwich panel system manufacturer. The manufacturer shall submit certified test reports made by an independent testing organization for each type and class of panel system. Reports shall verify that the material will meet all performance requirements of this specification. Previously completed test reports will be acceptable if current and indicative of products used on this project. Test reports required are:
   1. Flame Spread and Smoke Development (ASTM E-84).
   2. Burn Extent (ASTM D-635).
   3. Color Difference (ASTM D-2244).
   4. Impact Strength (SPI Method).
   5. Bond Strength (ASTM C-297 and ASTM D-1002).

6. Accelerated Aging (ASTM D-1037).
7. Insulation "U" Factor (NFRC 100).

D. Proof of regular, independent quality control monitoring under a building code review and listing program shall be submitted.

E. Contractor shall submit written guarantee accompanied by test reports that state that the products to be furnished are in accordance with or exceed this specifications.

1.4 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Storage of Materials:
1. Store translucent panels on the long edge, several inches above the ground, blocked and under cover to prevent warping.
2. Protect from weather and damage.
3. Store in designated areas as close as possible to point of installation.

1.5 GUARANTEE

A. Insulated Sandwich Panels: Submit copies of written guarantee agreeing to repair or replace panels which fail to perform as specified, including failure of the seal due to faulty manufacture of the unit for a period of 5 years.

PART 2 - PRODUCTS

2.1 PRODUCT AND MANUFACTURER

A. Provide one of the following:
1. Insulated Translucent FRP Window assemblies by Kalwall Corporation.
2. Insulated Translucent FRP Window assemblies by Major industries.
3. Or equal.

2.2 MATERIALS

A. Translucent Facing:
1. Translucent faces shall be manufactured from glass fiber reinforced thermoset resins by insulated translucent FRP window assemblies fabricator especially for architectural use.
2. Flammability: The interior face sheet shall have a flamespread rating no greater than 45 and smoke developed no greater than 350 when tested in accordance with ASTM E-84. Burn extent by ASTM D-635 shall be no greater than 1 inch. Faces shall not deform, deflect or drip when subjected to fire or flame.
3. Weatherability:
a. The full thickness of the exterior face shall not change color more than 3.0 Hunter or CIE Units (DELTA E by ATM D-2244) after five years outdoor South Florida weathering at 7 degrees facing south, determined by the average of at least three white samples without a protective film or coating to insure maximum, long-term color stability.
b. The exterior face shall have a permanent glass erosion barrier to provide maximum long-term resistance to reinforcing fiber exposure and shall be warranted against same for 25 years.

c. The exterior face shall have a self-cleaning thermoset acrylic urethane surface molecularly bonded under factory controlled conditions, minimum 1.2 mils thick, and fully field restorable if worn or damaged.

4. Appearance:
   a. The face sheets shall be uniform in color to prevent splotchy appearance. Faces shall be completely free of ridges and wrinkles which prevent proper surface contact in bonding to the aluminum grid core. Clusters of air bubbles/pinholes which collect moisture and dirt will not be acceptable.
   b. Exterior face sheets shall be .070 inches thick. Interior face sheets shall be .045 inches thick. Faces shall not vary more than 10 percent in thickness.
5. Strength: The exterior face sheet shall be uniform in strength and repel an impact equal to 60 ft/lbs without fracture or tear in accordance with SPI Shatter Resistance Test.
6. Translucent Facing Color: Colors are to be selected by Engineer.

B. Non-Combustible Grid Core:
1. The aluminum I-beams shall be 6061-t6, 6063-T6 or 6005-t5 with provisions for mechanical interlocking of muntin-mullion and perimeter to prevent high and low intersections which do not allow full bonding surface to contact with face material. Width of I-beam shall be no less than 7/16 inch. Aluminum I-beam for the grid shall be machined to tolerances of not greater than .002 inches.

C. Adhesive:
1. The laminate adhesive shall be heat and pressure resin type engineered for structural sandwich panel use. Adhesive shall pass testing requirements specified by the International Conference of Building Officials "Acceptance criteria for Sandwich Panel Adhesive".
   a. Initial bond strength between the face and the grid core shall be at least:
      1) 750 PSI tensile strength by ASTM C-297 after two exposures to six cycles each of the aging conditions prescribed by ASTM D-1037.
      2) Shear strength average of four exposures by ASTM D-1002:
         a) 50 percent relative humidity at 68°F: 540 PSI.
         b) 182° F: 100 PSI
         c) Accelerated aging by ASTM D-1037 at room temperature : 800 PSI.
         d) Accelerated aging by ASTM D-1037 at 182° F:250 PSI.

2.3 PANEL CONSTRUCTION

A. Panels shall have a thickness of 2-3/4 inch with a "U" factor of .24, light transmission of 30 percent, and shading coefficient of 0.30.

B. Panels shall be fully removable and self-contained as a unit.

C. Translucent panels shall be a true sandwich panel of flat fiberglass sheets bonded to a grid core of mechanically interlocking aluminum I-beams and shall be laminated under a controlled process of heat and pressure. Tape bond systems are not allowed.

D. All grid patterns shall be as shown on Contract Drawings and be symmetrical about the horizontal center line of each panel.

E. The adhesive bonding line shall be straight, cover the entire width of the I-beam and have a neat, sharp edge. In order to insure bonding strength, white spots at intersections of muntins and

mullions shall not exceed four for each 40 square feet of panel, nor shall they be more than 3/64 inches in width.

2.4 BATTENS AND PERIMETER CLOSURE SYSTEM

A. Extruded 6061-T6 or T5and 6063-T6 or T5 aluminum screw clamp-tite closure system. Thermal break perimeter system shall be factory prefabricated with "U" = .50 or less.

B. All battens and perimeter closures to be supplied with 410 series stainless steel screws (excluding fasteners to the building).

C. Head, sill, jamb type channel members, closure members, and interior angles to have a minimum fillet of .090-inch to ensure strength at point of greatest stress.

D. Fasteners to the building shall be 300 Series stainless steel screws or bolts in expansion anchors of the size required to support the window system and as recommended by manufacturer.

2.5 FLEXIBLE SEALING TAPE

A. Sealing tape shall be manufacturer's standard pre-applied to closure system at the factory under controlled conditions.

2.6 ALUMINUM FINISHES

A. Anodized Couting:Architectural Class I clear anodized, type AA-M10C22A41

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and his installer must examine the substrate and conditions under which insulated translucent FRP window assemblies Work is to be installed and notify Engineer in writing of any conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until satisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 INSTALLATION

A. Comply with manufacturer's specifications and recommendations for the installation of FRP window system.

B. Set units plumb, level and true to line, without warp or rack of frames or sash. Anchor securely in place. Separate aluminum and other corrodible metal surfaces from sources of corrosion or electrolytic action at points of contact with other materials.

C. Refer to Section 07 9200, Joint Sealants.

3.3 ADJUSTMENT AND CLEANING

A. Clean aluminum surfaces promptly after installation, exercising care to avoid damage of the finish. Remove excess glazing and sealant compounds, dirt and other substances.

B. Advise Contractor of protective treatment and other precautions required through the remainder of the construction period, to ensure that window units will be without damage or deterioration, other than normal weathering, at the time of Final Acceptance.

END OF SECTION 08 4523

SECTION 08 5113

ALUMINUM WINDOWS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all aluminum windows Work.
   2. Extent of the aluminum windows is shown and specified.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before the aluminum windows Work.

C. Related Sections:
   1. Section 08 8100, Glass Glazing.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:

      e. ASTM D 968, Test Methods for Abrasion Resistance of Organic Coatings by Falling Abrasive.
      f. ASTM D 1308, Test Method for Effect of Household Chemicals on Clear and Pigmented Organic Finishes.
      g. ASTM D 2244, Practice for Calculation of Color Tolerances and Color Differences from Instrumentally Measured Color Coordinates.
      h. ASTM D 2247, Practice for Testing Water Resistance of Coatings in 100% Relative Humidity.
      i. ASTM D 4214, Test Methods for Evaluating Degree of Chalking of Exterior Paint Films.
      j. ASTM E 283, Test Method for Determining the Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen.

k. ASTM E 330, Test Method for Structural Performance of Exterior Windows, Doors, Skylights and Curtain Walls by Uniform Static Air Pressure Difference.
l. ASTM E 331, Test Method for Water Penetration of Exterior Windows, Skylights, Doors and Curtain Walls by Uniform Static Air Pressure Difference.

3. Federal Specification, (FS).
   a. FS RR-W-365, Wire Fabric.
4. National Association of Architectural Metal Manufacturers, (NAAMM).
   a. NAAMM Metal Finishes Manual for Architectural and Metal Products.
5. Uniform Building Code, (UBC).

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. Manufacturer shall have a minimum of five years experience producing substantially similar equipment and shall be able to show evidence of at least five installations in satisfactory operation for at least five years.

B. Installer's Qualifications:
   1. Installer shall be certified by the manufacturer of the aluminum windows to install the product accepted for this Project. Installer shall provide evidence of at least five years installing similar product to the product accepted for this Project as well as at least three references for projects where the exact product accepted for this Project has been successfully installed.
   2. Submit name and qualifications of the installer to the Engineer.

C. Component Supply and Compatibility:
   1. Obtain all products included in this Section regardless of the component manufacturer from a single aluminum window manufacturer.
   2. The aluminum window manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.
   3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the aluminum window manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Fabrication and installation of aluminum window units and associated components of the Work. Include wall elevations at 1/4-inch scale, typical unit elevations at 1-inch scale and full-size detail sections of every typical composite member. Show anchors, hardware, operators and other components not included in manufacturer's standard data, including glazing details. Indicate clearly on the Shop Drawings, all deviations from Contract Documents.
   2. Product Data:
      a. Copies of manufacturer's specifications, recommendations and standard details for aluminum window units, including fabrication, finishing, hardware and other components of the Work. Include certified test laboratory reports as necessary to show compliance with the requirements.
      b. Copies of manufacturers' specifications and installation instructions for required materials and components, which are not included in the other submittals, specified

in other Sections of these Specifications. Coordinate the submittal of such other data with this submittal, and with the submittal of samples required by other Sections.

B. Informational Submittals: Submit the following:
   1. Test and Evaluation Reports: Certified laboratory test reports for required performance tests.
   2. Qualification Statements:
      a. Installer

C. Closeout Submittals: Submit the following:
   1. Operations and Maintenance Documentation: Upon completion of the Work, furnish five copies of detailed maintenance manual including the following information:
      a. Product name and number.
      b. Name, address, e-mail address and telephone number of manufacturer and local distributor.
      c. Detailed procedures for routine maintenance and cleaning.
      d. Detailed procedures for light repairs such as dents, scratches and staining.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling and Unloading:
   1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices which are to be embedded in cast-in-place concrete in ample time to prevent delay of that Work.

B. Storage and Protection:
   1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.

C. Acceptance at Site:
   1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace loss and repair damage to new condition in accordance with manufacturer's instructions.

PART 2 - PRODUCTS

2.1 EQUIPMENT PERFORMANCE

A. Design Criteria:
   1. Except as otherwise shown or specified, the requirements for aluminum windows, and the terminology and standards of performance and fabrication workmanship, are those specified and recommended in AAMA 101, and the applicable general recommendations published by Architectural Aluminum Manufacturer's Association, National Association of Architectural Metal Manufacturers and Aluminum Association.
   2. All custom and standard features and finishes offered by the named manufac-turers shall be made available to Engineer from any “or equal” manufacturer submitted by Contractor.
   3. Custom High Performance Insulated Thermal-Barrier Aluminum Windows:

a. Performance and Testing: Except as otherwise specified, comply with the air infiltration tests, water resistance tests and applicable load tests specified in AAMA 101 for the type and classification of aluminum window units required in each case.
b. Comply with Architectural Performance Class and Section 4 “Optional Performance Grades” of AAMA 101 Group II-Compression Seal Window Products AP-AW50, Architectural.
c. Design Pressure:
    1) Provide uniform structural test pressure of 75 pounds per square foot.
    2) Air Infiltration Test, ASTM E 283: Maximum infiltration 0.065 cubic feet per minute per linear foot of operating ventilator when tested at 6.24 pounds per square foot differential pressure.
    3) Water Penetration Test, ASTM E 331: No water penetration for 15 minutes when window is subjected to rate of flow of five gallons per hour per square foot with differential pressure across window unit of ten pounds per square foot.
    4) Wind Load Test, ASTM E 330: Minimum 50 pounds per square foot positive and negative load for ten seconds. Maximum deformation of frame or sash member L/175 of span length.
d. Testing: Wherever manufacturer's standard window units comply with the requirements and have been tested in accordance with the specified tests, provide certification by the manufacturer of compliance with such tests; otherwise, perform the required tests through a recognized testing laboratory or agency and provide certified test results.
e. Provide internal drainage to lead all infiltrated water to the exterior through weep slots.
f. Other Loading: Applicable requirements of the Ohio Building Code.

2.2 MANUFACTURERS

A. Manufacturers: Provide products of one of the following:
    1. TR 7100 series fixed windows by Traco Architectural Systems, Inc.
    2. Or equal.

2.3 DETAILS OF CONSTRUCTION

A. Aluminum Extrusions: Alloy and temper, ASTM B 221, 6063-T5 and not less than 1/8-inch thickness at any location for mainframe sash members and tube supports. Vertical mullions and support clips as recommended by the window manufacturer.

B. Thermal Separator: Interior and exterior aluminum frame sections shall be thermally separated by a continuous urethane connector.

C. Fasteners: Stainless steel, guaranteed by the manufacturer to be non-corrosive and compatible with the aluminum window members, trim, hardware, anchors and other components of the window units.
    1. Do not use exposed fasteners, except where unavoidable for the application of hardware. Match the finish of the metal surrounding the fastener, unless otherwise specified.
    2. Provide Phillips flat-heat machine screws for exposed fasteners, unless otherwise specified.

D. Glazing Gaskets: Neoprene or EPDM.

E. Glass and Glazing Materials: Refer to Section 08 8100, Glass Glazing.

F. Hardware:
1. Projected-In Windows: Mullion mounted high-pressure die-cast zinc nickel-plated steel pawl cam-action in-line base locking handles with concealed pawl. Provide non-magnetic stainless steel keepers. Baked enamel aluminum color with lacquer finish.
2. Heavy-duty 6-bar hinges with stainless steel balance arms. Provide sliding pivots with nylon friction-adjustable shoe in a stainless steel track.
3. Concealed limited opening device.
4. Manufacturer: Provide the product of the following:
   a. Truth Division Sealed Power Corporation.

2.4 WINDOW CLASSIFICATION (GRADE)

A. AW-PG100-FW, Architectural Windows: Provide window units complying with the following :
1. Extruded aluminum-glazing stops of 0.062-inch minimum wall thickness, except 0.050-inch minimum for snap-on type.
2. Hardware and anchors of non-magnetic stainless steel and white bronze.
3. Fabricate units with all main corners and intersections of frame and sash mitered. Provide double tubular frame with hydraulically crimped gusset corner construction. Mortise or cope secondary members to fit, and weld in place with hairline joints.
4. Provide metal thickness as required to withstand performance requirements, but not less than 0.078-inch for frame members.
5. Provide means of drainage for water and condensation, which may accumulate in members of the window units.

2.5 FABRICATION AND ACCESSORIES

A. General: Provide specified manufacturer's standard fabrication and accessories, except to the extent more specific or more stringent requirements are specified. Include complete system for assembly of components and anchorage of window units, and prepare sash for glazing.

B. Sizes and Profiles: The required sizes for window units and the profile requirements are shown. The details shown are based upon standard details by one or more manufacturers. It is intended that similar details by other manufacturers will be acceptable, provided they comply with the size requirements, and with minimum/ maximum profile requirements specified.

C. Coordination of Fabrication: Wherever possible check actual window openings in the construction Work by accurate field measurement before fabrication, and show recorded measurements before fabrication, and show recorded measurements on final Shop Drawings. However, coordinate fabrication schedule with construction progress as directed by Contractor to avoid delay of the Work. Where necessary, proceed with fabrication without field measurements, and coordinate installation tolerances to ensure proper fit of window units.

D. Provide mullions and cover plates as shown, matching window units and complete with anchors for support to structure and for installation of window units. Allow for erection tolerances and provide for movements of window units due to thermal expansion and building deflections.

E. Provide extruded aluminum true-divided mullions, and custom aluminum panning as shown.

2.6 ALUMINUM WINDOW FINISHES

A. Exposed Aluminum Polyvinylidene Fluoride Based Coating: Apply full strength polyvinylidene fluoride based coatings at the factory by coil coating for sheet material and spray coating for extruded or factory-fabricated material. Provide a four-coat system complying with the following:
   1. Alkali clean and hot water rinse all surfaces to receive polyvinylidene fluoride based finish.
   2. Prepare a chemical conversion coating on the surface, using phosphates or chromates followed by a cold-water rinse. Seal with a chromic acid rinse and dry, except where manufacturer recommends another method to achieve greater coating reliability.
   3. Apply a base prime coat of epoxy paint to the prepared surface in its coil form, by reverse roller coating. Fully cure in a gas-fired oven to a dry film thickness of 0.2 to 0.4-mils. Follow with a barrier coat 1.0-mils thick.
   4. Apply color coat containing mica pearlescent or metallic flakes over the barrier coat by roller coating for coil material and airless or Ransburg Elastrostatic Hand Spray for extrusions and fuse at a peak metal temperature of 440°F for a dry film thickness of 0.7-mils for coil coating and 1.2-mils for spray coating so that today dry film is approximately 1.0-mil thick for coil material and 1.5-mil thick for extruded material.
   5. Apply clear fluoropolymer topcoat to provide a dry film thickness of 0.4 to 0.8-mils. The entire system shall have a dry film thickness of 2.6-mils, minimum.
   6. Provide the following physical properties, as proven by appropriate and recognized laboratory test methods acceptable to Engineer:
      a. Weathering, ASTM D 4214: Chalking, not more than No. 8, after exposure for 5,000 hours in Sunshine Arc Weatherometer XWR using 60/60 cycle.
      b. Color Change, ASTM D 2244: No greater than 5 N.B.S units after removal of external deposits and after exposure for 5,000 hours in Sunshine Arc Weatherometer XWR using 60/60 cycle.
      c. Humidity Resistance, ASTM D 2247: No blister after 3,000 hours.
      d. Salt Spray, ASTM B 117: Few scattered blisters no larger than ASTM No. 4, and no more than 1/16-inch creep from areas scribed to bare metal after 3,000 hours.
      e. Dry Adhesion: No pick-off when tape tested over 1/16-inch cross hatch.
      f. Wet Adhesion: No pick-off when tape tested over 1/16-inch cross hatch; extruded material only.
      g. Boiling Water Adhesion: No pick-off when tape tested over cross hatch area after one-hour immersion in distilled boiling water.
      h. Water Immersion: No pick-off when tape tested over cross hatch area after immersion in aerated distilled water 80 ±10°F after 500 hours.
      i. Abrasion Resistance, ASTM D 968: Coefficient of abrasion of 67, minimum.
      j. Gloss, ASTM D 523: 30 ±5 reflectivity at 60°F.
      k. Pencil Hardness, ASTM D 3363: HB-H minimum.
      l. Dry Film Thickness: Primer, 0.2 to 0.4-mils, barrier coat, 1.0-mils, color coating, 0.7 to 1.5-mils; clear topcoat, 0.4 to 0.8-mils.
      m. Solvent Resistance: 100 Double MEK rubs, minimum.
      n. Flexibility, ASTM D 522: No cracking prior to metal fracture.
      o. Acid Resistance, ASTM D 1308: Sixteen hour spot test with five percent hydrochloric acid - no effect.
      p. Alkali Resistance, ASTM D 1308: Sixteen hour spot test with five percent sodium hydroxide - no effect.

B. Color:
   1. Full selection of manufacturer's standard, custom and premium colors for final selection by Engineer.

2. Engineer will select custom special extended life premium colors for aluminum windows at time of Shop Drawing and sample submission review.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine the substrate and conditions under which custom aluminum window system Work is to be installed and notify Engineer, in writing, of any conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until satisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 INSTALLATION

A. Comply with manufacturer's specifications, installation manuals and recommendations for the installation of window units, hardware, operators, and other components of the Work.

B. Erection Tolerances:
   1. Limit variations from plumb, level or dimensioned angle to the following:
      a. 1/8-inch maximum deviation in story height or in 10-foot vertical or angular run, and in 20-foot horizontal runs.
      b. 1/4-inch maximum deviation in 40 foot runs, all directions.
   2. Limit variations from theoretical member locations shown, based on established floor lines and column lines, including variations from plumb and level, to the following:
      a. 3/8-inch total maximum deviation for members at all locations.
      b. 1/8-inch maximum change in deviation for members for ten foot runs, all directions.
   3. Limit offsets in end-to-end and edge-to-edge alignments of adjoining and consecutive members, which form planes, continuous runs and profiles, to the following:
      a. 1/16-inch maximum offset in flush alignment, including members, which are to be 1/2-inch or less out-of-flush, and including members, which are separated 2-inches or less by a reveal or protrusion in the plane of the aluminum window wall.
      b. 1/8-inch maximum offset in alignments, which are to be out-of-flush by more than 1/2-inch, or separated by a reveal or protrusion of more than 2- inch width.

C. Anchor units securely in place. Separate aluminum and other corrodible metal surfaces from sources of corrosion or electrolytic action at points of contact with other materials.

D. Refer to Section 07 9200, Joint Sealants, for compounds, fillers and gaskets to be installed concurrently with window units.

E. Do not install component parts, which are observed to be defective in any way, including warped, bowed, dented, abraded and broken members, and including glass with edge damage.

F. Do not cut, or trim, component parts during erection, in a manner, which would damage the finish, decrease the strength, or result in a visual imperfection or a failure in performance of the aluminum window wall. Return component parts, which require alteration to the shop for refabrication, if possible, or for replacement by new parts.

G. Install component parts level, plumb, true to line and with uniform joints and reveals. Secure to structure with non-staining and non-corrosive shims, anchors, fasteners, spacers and fillers. Use

erection equipment, which will not mar or stain finished surfaces, and will not damage the component parts.

H. Apply a bituminous coating of approximately 30-mil dry film thickness, or other suitable permanent separator, on concealed contact surfaces of dissimilar materials before installation, wherever there is the possibility of corrosive or electrolytic action.

I. Anchor component parts securely in place as shown, by bolting, or other permanent mechanical attachment system, which will comply with performance requirements and permit movements, which are intended or necessary. Install slip-joint linings to ensure movement as intended or necessary.

J. Clean debris, dust and other substances from behind the aluminum window wall as it is erected, and provide temporary closures if necessary to prevent the accumulation of such substances in the void spaces behind the aluminum window walls.

K. Install thermal barrier between pressure plate and mullion.

L. Attach pressure plate with screws. Install snap covers over pressure plates.

M. Install glazing using dry glazing retainers, which provide a firm but resilient clamping grip on the glazing.

N. Refer to Section 08 8100, Glass Glazing, for installation requirements.

O. Clean aluminum surfaces promptly after installation of windows, exercising care to avoid damage of the finish. Remove excess glazing and sealant compounds, dirt and other substances. Lubricate hardware and other moving parts.

P. Advise Contractor of protective treatment and other precautions required through the remainder of the construction period, to ensure that window units will be without damage or deterioration, other than normal weathering, at the time of Final Completion.

Q. Maintain the aluminum window wall in a clean condition throughout the construction period, so that it will be without any evidence of deterioration or damage, other than the effects of normal weathering, at the time of Final Completion. Select methods of cleaning which will promote the achievement of uniform appearance and stabilized colors and textures for materials that weather or age with exposure.

R. Contractor shall advise Engineer, in writing, of protection and surveillance requirements that Contractor shall provide at no additional cost to the Owner, to ensure that the aluminum windows Work will be without deterioration or damage at the time of Final Completion by Owner.

S. Remove and replace with new material aluminum window components, which have been damaged, including finish, beyond successful repair, as directed by Engineer. Repair minor damage.

T. Immediately before the time of Final Completion, clean the aluminum windows thoroughly, inside and out. Demonstrate proper cleaning methods to Owner'S maintenance personnel during this final cleaning.

U. At the completion of the Work, clean or replace adjacent work, marred by the Work of this Section.

V. Remove all materials and debris and leave the Site of the Work in clean condition.

3.3 FIELD QUALITY CONTROL

A. Water Penetration Test: Perform test in accordance with NAAMA Standard FC-1: "Field Check for Water Leakage of Metal Curtain Walls", except limit test area to one bay wide (but not less than 20 feet or more than 40 feet) by one story high, located from mid-bay to mid-bay and from mid-story-height to mid-story-height.

B. Depending upon the prevalence or absence of leakage in the initial water penetration test, and upon measures adopted by the aluminum window wall Contractor to eliminate sources of leakage from subsequently erected work, the Engineer will determine the necessity, and scope of, additional tests. In no case will the total of tested area amount to less than one percent, nor more than ten percent of the aluminum window wall area, except as subsequently authorized by the Engineer.

END OF SECTION 08 5113

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 08 7100

DOOR HARDWARE

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install door hardware. Furnish door hardware for all doors in compliance with these Specifications herein.
2. Extent of door hardware is specified. Door hardware is defined to include all items known commercially as door hardware, except special types of unique and non-matching hardware specified in the same Section as the door and door frame.

B. Coordination:
1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with, or before, the door hardware.
2. Coordinate the Work of other Sections to provide clearances and accurate positioning of recessed or cast-in-place items.

C. Related Sections:
1. Section 08 1113, Hollow Metal Doors and Frames.
2. Section 08 1116, Aluminum Doors and Frames.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
1. American National Standards Institute, (ANSI).
   a. ANSI A117.1, Accessible and Usable Buildings and Facilities.
2. American National Standards Institute, (ANSI), in association with Builders Hardware Manufacturers' Association, (ANSI/BHMA).
   a. ANSI/BHMA A156.1, Butts and Hinges.
   b. ANSI/BHMA A156.3, Exit Devices.
   c. ANSI/BHMA A156.4, Door Controls - Closers.
   d. ANSI/BHMA A156.6, Architectural Door Trim.
   e. ANSI/BHMA A156.7, Template Hinge Dimensions.
   f. ANSI/BHMA A156.8, Door Controls - Overhead Stops and Holders.
   g. ANSI/BHMA A156.13, Mortise Locks and Latches, Series 1000.
   h. ANSI/BHMA A156.16, American National Standard for Auxiliary Hard-ware.
   i. ANSI/BHMA A156.18, Hardware - Materials and Finishes.
   j. ANSI/BHMA A156.21, Thresholds.
   k. ANSI/BHMA A156.22, Door Gasketing and Edge Seal Systems.
3. ANSI, in association with Door and Hardware Institute, (ANSI/DHI).
   a. ANSI/DHI A115.1, Preparation of Mortise Locks in 1-3/8-inch and 1-3/4-inch Standard Steel Doors and Frames.
4. ANSI, in association with National Fire Protection Association, (ANSI/NFPA).
   a. ANSI/NFPA 252, Standard Methods of Fire Tests of Door Assemblies.
5. ANSI, in association with Underwriters' Laboratories, Inc., (UL).

a. UL 10B, Fire Tests of Door Assemblies.

6. The Americans with Disabilities Act of 1990 (Public Law 101-336), Appendix A to Title 28 Code of Federal Regulations Part 36 (Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities - ADAAG).
7. Door and Hardware Institute, (DHI).
   a. DHI, Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames.
   b. DHI, Recommended Locations for Builders' Hardware for Custom Steel Doors and Frames.
   c. DHI, Sequencing and Format for the Hardware Schedule.
8. Hollow Metal Manufacturers Association, Division of National Association of Architectural Metal Manufacturers, (HMMA).
   a. HMMA 830, Hardware Preparation and Locations for Hollow Metal Doors and Frames.
9. National Fire Protection Association, (NFPA).
   a. NFPA 80, Fire Doors and Fire Windows.
10. Steel Door Institute, (SDI).
    a. SDI 109, Hardware for Standard Steel Doors and Frames.
    b. SDI 118, Basic Fire Door Requirements.
11. Underwriters' Laboratories, Inc., (UL).
    a. UL 305, Panic Hardware.
    b. UL, Building Materials Directory.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. Provide door hardware and accessories manufactured by firms specializing in the production of this type of Work and complying with specified standards of ANSI, BHMA, DHI, NFPA, HMMA, SDI and UL.
   2. Provide door hardware from manufacturers who are members of BHMA and participate in BHMA certification programs.

B. Installer's Qualifications:
   1. The door hardware installer shall have in his employ an architectural hardware consultant. The architectural hardware consultant shall be a member of the Door and Hardware Institute, (DHI), who has passed the DHI certification examine and successfully completed an apprenticeship program. The architectural hardware consultant shall be responsible for preparing door hardware schedules and Shop Drawings and be present at the Site for the purpose of checking and supervising the Work of the installer during the time of installation and adjustment of the door hardware Work, and shall prepare a written field report on status of completed door hardware installation as specified.
   2. Submit name and qualifications of the installer to Engineer.

C. Requirements of Regulatory Agencies:
   1. Provide door hardware for fire-resistance-rated openings in compliance with NFPA 80.
   2. Provide only door hardware that has been tested, listed and labeled by UL for the types and sizes of doors required, and complies with the requirements of the door and door frame labels.
   3. Modify features of door hardware items specified, and provide additional accessories and features as required to meet UL and NFPA requirements, at no additional cost to the Owner.

D. Codes: Comply with applicable requirements of codes.

E. Source Quality Control:
   1. Obtain each type of door hardware item from only one manufacturer.
   2. Provide door hardware schedule, for submission to, and for approval by, Engineer, prepared in compliance with DHI standards.
   3. Comply with specified BHMA standards.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Product Data:
      a. Copies of manufacturer's data for each item of door hardware. Include whatever information may be required to show compliance with specified requirements, and include instructions for installation and for maintenance of operating parts and exposed finishes. Include mounting heights and locations for each item of door hardware. Provide Engineer with latest complete technical catalogue of all available door hardware manufactured by proposed manufacturers, even if manufacturer specified by Engineer is submitted by Contractor to perform the Work. Furnish templates to fabricators of other Work, which is to receive door hardware.
   2. Shop Drawings:
      a. Copies of the Door Hardware Schedule in the manner and format specified, complying with the actual construction Progress Schedule requirements (for each draft). Include explanation of abbreviations, symbols, and codes used to present scheduled information.
         1) Prepare and submit Door Hardware Schedule in compliance with HDI standards.
      b. Based on the door hardware requirements specified, organize the final Door Hardware Schedule into "hardware sets," indicating complete designation of every item required for each door or opening. Furnish initial draft of schedule at the earliest possible date, in order to facilitate the fabrication of other Work (such as hollow metal frames) which may be critical in the Project Schedule. Furnish final draft of schedule after Samples, manufacturer's data sheets, coordination with Shop Drawings for other Work, delivery schedules and similar information have been completed and accepted.
      c. Include a separate key schedule, showing clearly how Owner’s final instructions on keying of locks have been fulfilled.
      d. Door Hardware Schedules are intended for coordination of the Work. Review and acceptance by Engineer does not relieve Contractor of responsibility to fulfill the requirements as shown and specified.

B. Submittals: Submit the following:
   1. Test and Evaluation Reports:
      a. Certified independent laboratory test reports for BHMA certification program and certification tests for each type of product specified.
   2. Qualifications Statements:
      a. Installer.

C. Submittals: Submit the following:
   1. Operation and Maintenance Documentation: Upon completion of the Work, furnish five copies of detailed maintenance manuals, including the following information:

a. Product name and manufacturer.
b. Name, address, e-mail address and telephone number of manufacturer and local distributor.
c. Detailed procedure for routine maintenance and cleaning.
d. Detailed procedures for repairs such as dents, scratches and staining.
e. Parts identification manual and maintenance manuals for each piece of door hardware.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling and Unloading:
1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices which are to be embedded in cast-in-place concrete in ample time to prevent delay of that Work.
2. Deliver all items of door hardware in manufacturer's original, undamaged packages, bearing accurate representation of the item within each package.
3. Pack each piece of door hardware separately, complete with screws, keying, instructions and templates, tagged to correspond with items submitted on approved Shop Drawings and as specified.

B. Storage and Protection:
1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.
2. Provide secure storage area for door hardware items, secured by locks and accessible only to door hardware installer, Engineer and Contractor.
3. Store door hardware in manufacturers' original packages.

C. Acceptance at Site:
1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Items that arrive in a damaged condition shall be removed from the Site and not offered again for acceptance. Replace loss and repair damage to new condition in accordance with manufacturer's instructions.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Description:
1. Where the door, shape, size, fire-resistance-rating, frequency of use, or function of a member receiving door hardware is such as to prevent, or make unsuitable, the types of door hardware specified, furnish similar types having as nearly as practicable the same operation but of type or kind more appropriate to the design intension and requirements of governing authorities having jurisdiction at the Site. Clearly identify and highlight to Engineer all such required modifications on Shop Drawings submitted for approval.
2. If door hardware for any location is not specified, provide door hardware equal in design and quality to adjacent door hardware specified for comparable openings at no additional cost to Owner.

3. Furnish door hardware items of proper design for use on doors and frames of the thickness, profile, swing, security and similar requirements, as necessary for proper installation and function.
4. Unless otherwise specified, comply with DHI, Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames and Recommended Locations for Builders' Hardware for Custom Steel Doors and Frames.

2.2 DETAILS OF CONSTRUCTION

A. General:
1. Hand of Door: The Drawings show the swing or hand of each door leaf (left, right, reverse bevel, etc.). Furnish each item of door hardware for proper installation and operation of the door swing as shown.
2. Manufacturer's Name Plate: Do not use manufacturer's products which have manufacturer's name or trade name displayed in a visible location (omit removable nameplates), except in conjunction with labels required by governing authorities having jurisdiction at the Site.
3. Base Metals: Produce door hardware units of the basic metal and forming method specified, using the manufacturer's standard metal alloy, composition, temper and hardness. Do not substitute materials or forming methods for those specified.
4. Fasteners: Manufacture door hardware to conform to published templates, generally prepared for machine screw installation. Do not provide door hardware, which has been prepared for self-tapping sheet metal screws, except as specifically indicated.
5. Furnish screws for installation, with each door hardware item. Provide Phillips flat-head screws except as otherwise specified. Finish exposed (exposed under any condition) screws to match the hardware finish or, if exposed in surfaces on other Work, to match the finish of such other Work as closely as possible, including "prepared for paint" in surfaces to receive painted finish.
6. Provide fasteners which are compatible with both the unit fastened and the substrate, and which will not cause corrosion or deterioration of door hardware, base material or fastener.
7. Provide concealed fasteners for door hardware units, which are not exposed when the door is closed, except to the extent no standard manufacturer units of the type specified are available with concealed fasteners. Do not use through bolts for installation where the bolt head or the nut on the opposite face is exposed in other Work under any condition, except where it is not possible to adequately reinforce the Work and use machine screws or concealed fasteners of another standard type to satisfactorily avoid the use of through bolts.
8. Tools for Maintenance: Furnish two complete sets of specialized tools as required for Owner's continued adjustment, maintenance, removal and replacement of door hardware.

B. Mortise Hinges:
1. Templates and Screws: Provide only template-produced units.
2. Base Metal: Except as otherwise specified, fabricate hinges from stainless steel and finish to match the latch and lock set.
3. Number of Hinges: Provide three hinges on each door leaf of less than 60-inches in height; provide one additional hinge for next 30-inches of door height or fraction thereof; provide two additional hinges for each 30-inches, or fraction thereof, for doors above 90-inches tall.
4. Hinge Size: Except as otherwise specified or as required to comply with UL and NFPA, provide hinges of the following sizes:
   a. Interior Doors:
      1) Average Use, Maximum 36-Inches Wide: 4-1/2-inch standard weight (0.134-inches).

2) Heavy Use, Maximum 36-Inches Wide: 4-1/2-inch heavy-weight (0.180-inches).

b. Exterior Doors, Maximum 36-Inches Wide: 4-1/2-inch heavy-weight (0.180-inch).

5. Types of Hinges: Provide full-mortise type, ball-bearing hinges, swaged for mortise applications, inner leaf beveled, square cornered, unless manufacturer's recommendations indicate that half-mortise, half-surface, full-surface or other type should be used for the frame and door type or condition.
6. Hinge Pins: Except as otherwise specified, provide hinge pins as follows:
   a. Pins: Stainless steel.
   b. Exterior Doors: Non-removable pins. Provide set screw in hinge barrel that, when tightened into a groove in hinge pin, prevents removal of pin while door is closed.
   c. Tips: Slope ends of hinge barrel.
7. Conform to ANSI/BHMA A156.7.
8. Comply with UL, List of Inspected Fire Protection Equipment and Materials and NFPA 80 requirements.
9. Products and Manufacturers: Provide one of the following:
   a. FBB 199 and FBB 191 by Stanley Commercial Hardware, Division of The Stanley Works.
   b. T4B3386 and TB3313 by McKinney Products Company, Division of ESSEX Industries, Incorporated.
   c. Or equal.

C. High-Security Mortise Locks and Latch Sets:
1. Strikes: Provide manufacturer's standard wrought box strike, for each location and use shown. Provide stainless steel curved lip strikes, unless otherwise recommended by manufacturer, finished to match lock or latch set trim.
2. Lock Throw: Provide minimum of 3/4-inch anti-friction latch bolt and 1-inch dead bolt throw. Comply with UL requirements for throw of latch bolts and deadbolts on fire-resistance-rated openings.
3. Materials: Provide the following features and materials:
   a. Latch Bolt: Two-piece; mechanical; anti-friction, stainless steel.
   b. Dead Bolt: One-piece, stainless steel with two enclosed hardened-steel roller armor pins.
   c. Case: Wrought steel, zinc dichromatized.
   d. Cylinders: High-security; brass; pick- and drill-resistant; ANSI/BHMA A156.5 - E09211A.
   e. Armor Front: 8-inches by 1-1/4-inches wide, minimum; steel.
   f. Escutcheon: 8-inches by 2-1/2-inches wide by 3/16-inches thick, minimum; stainless steel, US 32D.
   g. Hubs: Sintered steel, copper infiltrated.
   h. Lever with Stop Pin: Brass, plated to match stainless steel, with additional built-in stop to prevent over-torquing of lever.
   i. All components shall be of marine quality, wherever possible.
4. Backset: 2-3/4-inches.
5. Modify specified locks and latches to comply with UL, Building Materials Directory, and List of Inspected Fire Protection Equipment and Materials and NFPA 80 requirements.
6. Finish: US 32D satin.
7. Conform to ANSI/BHMA A156.13, Series 1000, Security Grade 1.
8. Products and Manufacturers: Provide one of the following:
   a. High Security SL8700 Mortise Lockset Augusta - ASL Lever Handles and Trim by Yale Security, Incorporated, Division of Yale Security Group.

b. Or equal.

D. Panic Exit Devices:
1. Exit Doors: Where required by governing authorities having jurisdiction at the Site, provide panic exit devices, of the type required, including UL labels.
2. Fire Doors: Where shown or specified as a fire-resistance-rated door, provide units listed and labeled by UL, to comply with the fire-resistance-rating and size of door shown.
3. Strikes: Provide manufacturer's standard wrought stainless steel jamb-mounted top latch bolt and bottom latch bolt for each location and use shown to allow independent opening and closing of each leaf of double doors with panic exit devices; complying with UL List of Inspected Fire Protection Equipment and Materials and NFPA 80 requirements.
4. Lock Throws: Provide minimum of 3/4-inch latch bolt throw complying with UL List of Inspected Fire Protection Equipment and Materials and NFPA 80 requirements.
5. Provide concealed vertical rod type exit device and mortise type exit devices as specified.
6. Provide the following features and materials:
   a. Latch Bolt: Two-piece; mechanical; anti-friction, stainless steel.
   b. Dead Bolt: One-piece, stainless steel with two enclosed hardened-steel roller armor pins.
   c. Case: Wrought steel, zinc dichromatized.
   d. Cylinders: High-security; brass; pick- and drill-resistant; ANSI/BHMA A156.5 - E09211A.
   e. Armor Front: 8-inches by 1-1/4-inches wide, minimum; steel.
   f. Escutcheon: 8-inches by 2-1/2-inches wide by 3/16-inches thick, minimum; stainless steel, US 32D.
   g. Hubs: Sintered steel, copper infiltrated.
   h. Crossbar: Oval, seamless with interlocking expansion collets and roll pins; knurled, satin stainless steel, 0.062-inches minimum thickness, with steel reinforcing tube.
   i. Concealed bolts: Minimum 1/2-inch diameter, stainless steel.
7. Backset: Provide minimum backset of 2-3/4-inches.
8. Finish: US 32D satin.
9. ANSI/BHMA: A156.3, Type 3 and Type 8, Grade 1; F08, entrance by lever, key locks or unlocks lever for entrances shown as accessible to people with disabilities as required by ADAAG; and F05, entrance by thumb piece, key locks or unlocks thumb piece.
10. Products and Manufacturers: Provide one of the following:
    a. 1530-L8 (F) and -T8 (F) Series Mortise Exit Devices and 1520(F) CVR Concealed Vertical Rod Exit Devices; with Escutcheon Trim and Augusta - ASL Lever Handles and Thumbpiece/Handle/Cylinder Unit by Yale Security, Incorporated, Division of Yale Security Group.
    b. Or equal.

E. Cylinders and Keying System:
1. Standard System: Except as otherwise specified, provide new master key system for the Project.
2. Multiple-Building System: Except as otherwise specified, provide new grandmaster key system for Project.
3. Existing System: Grandmaster key or great-grandmaster keys the locks to Owner’s existing system, with a new master key for the Project.
4. Review the keying system with Owner’s and provide the type required (master, grandmaster or great grandmaster), either new or integrated with Owner’s existing system.
5. Furnish all locks with manufacturer's cylinders for interchangeable-core pin tumbler inserts. Furnish only temporary inserts for the construction period, and remove these before

Substantial Completion. Construction control keys and cores shall not be part of Owner's permanent keying system. Permanent cores and keys shall be furnished to Owner prior to Substantial Completion.

6. Comply with the Owner's instructions for master keying and, except as otherwise specified, provide individual change key for each lock which is not designated to be keyed alike with a group of related locks.
7. Permanent keys and cores shall be stamped with the applicable key mark for identification. These visual key control marks or codes shall not include the actual key cuts. Permanent keys shall also be stamped "DO NOT DUPLICATE".
8. Cylinder Material: Brass, bronze or Series 300 stainless steels.
9. Cylinder Features: Seven-pin, high-security, removable core.
10. Key Material: Nickel silver.
11. Key Quantity: Furnish three keys for each lock and five keys for each master and grandmaster system. Provide one extra key blank for each lock.

F. Overhead, Surface-Mounted, Door Closers:

1. Provide all doors, unless specially shown or specified as being provided with floor-mounted or concealed overhead closers, with surface-mounted overhead door closers. Provide both active and inactive door leafs with closers.
2. Size of Units: Except as otherwise specified, comply with the manufacturer's recommendations for size of door control unit, depending upon size of door, exposure to weather, and anticipated frequency of use.
3. Where parallel arms are specified, and for closers on exterior doors, provide closer unit one size larger than recommended for use with standard arms.
4. Use parallel arm arrangement for doors that would otherwise have the door closer appearing in finished corridors or entries.
5. Comply with UL, Building Materials Directory, and List of Inspected Fire Protection Equipment and Materials, and NFPA 80. Modify closers specified as required.
6. Provide hold open feature for all non-fire-resistant-rated doors, unless otherwise specified.
7. Provide corner bracket mounting on exterior doors. Select all arms to clear weather-stripping, and overhead door holders.
8. Provide long arm to allow door to swing 180 degrees where long arm will eliminate floor-mounted stops.
9. Provide closers with spring power adjustment feature capable of increasing spring power 15 percent minimum in all closer sizes.
10. Provide individual regulating valves for closing and latching speeds, and separate adjustable back check valve.
11. Provide delayed closing action feature on all door closers. Position valve at top of closure.
12. Provide the following materials and features:
    a. Full Metal Cover: Aluminum.
    b. Case: Cast-iron.
    c. Arms: Plated to match full metal covers.
    d. Other Parts: Steel.
    e. Extreme temperature fluid.
    f. Security torx machine screws.
    g. Ten-year warranty.
    h. Provide manufacturer's optional corrosion protection.
13. Finishes: US 26D satin chrome. Color coordinate all arms and other accessories.
14. Highly Corrosive Atmospheres: Provide all closers with specified manu-facturer's optional corrosion protection.
15. ANSI/BHMA: A156.4, C02011, in compliance with PT 1 and PT 4.

16. Products and Manufacturers: Provide one of the following:
    a. DC2000DA M71, M73, M74, M75, M87 by Corbin Russwin, Incorporated, Division of Yale Security Group.
    b. Or equal.

G. Heavy-Duty, Concealed Overhead Holders and Stops:
1. Provide heavy-duty, concealed overhead holders and stops on all exterior and all interior doors, unless otherwise specified to receive an extra heavy-duty overhead holder and stop in List of Door Hardware Items at end of Part 3. Comply with UL and NFPA requirements for hold-open feature.
2. Provide the following features and materials:
    a. Shock Absorber Spring: Heavy tempered steel.
    b. Channel: Heavy-gauge brass.
    c. All other Parts: Stainless steel.
    d. Adjustment: Degree of hold-open and stop shall be adjustable after installation.
3. Finish: US 32D satin.
4. Coordinate placement of concealed overhead holder and stop with overhead closers.
5. ANSI/BHMA: A156.8, C51511.
6. Products and Manufacturers: Provide one of the following:
    a. Heavy-Duty 100H (ADJ) Series Concealed Holders and Stops by Glynn-Johnson Part of Worldwide Ingersoll-Rand Corporation.
    b. Or equal.

H. Flush Bolts:
1. Provide flush bolts on the inactive leaf of all pairs of doors, unless otherwise specified.
2. Provide flush bolts at the top and bottom of door.
3. Provide downset of 12-inches for all automatic flush bolts, and manufacturers' automatic flush bolt strikes, for the locations specified in List of Door Hardware Items at end of Part 3.
4. Comply with UL, Hardware, Automatic or Surface Bolts, and NFPA 80, for automatic flush bolt requirements.
5. Provide the following features and materials:
    a. Automatic Flush Bolts: All parts bronze.
    b. Flush Bolt Levers: Forged Brass.
    c. Flush Bolt Plate: Forge Brass.
    d. Flush Bolt Guide and Strike: Wrought Brass.
    e. Flush Bolt Rods: 1/2-inch round rods, bronze, 12-inches minimum length.
    f. Bolt Head: Brass.
6. Provide extension flush bolts with 3/4-inch throws and with top bolt not over 6 foot-0 inches above finished floor. Provide bottom flush bolt 12-inches long.
7. ANSI/BHMA: A156.16: L14081, L14251 and L14091.
8. Products and Manufacturers: Provide one of the following:
    a. GJ FB6 Extension Flush Bolts by Glynn-Johnson Part of Worldwide Ingersoll-Rand.
    b. Or equal.
9. Where required by governing authorities having jurisdiction at the Site, provide cast bronze automatic flush bolts bearing the UL label.
10. Products and Manufacturers: Provide one of the following:
    a. GJ FB30 Automatic Flush Bolts by Glynn-Johnson Part of Worldwide Ingersoll-Rand Corporation.
    b. Or equal.

I. Coordinators:
   1. Provide coordinator device on all pairs of doors required or specified to have automatic flush bolts, or panic exit devices. Comply with UL, List of Inspected Fire Protection Equipment and Material, and NFPA 80 requirements.
   2. Provide manufacturer's standard units equipped with a safety release mechanism which allows the active leaf to close if under extreme pressure and whose active door lever, located nearest the active door stop, holds the active door ajar until the trigger mechanism is released to the retracted position by the closing of the inactive leaf.
   3. Materials: Anodized aluminum.
   4. Finish: US 27 satin.
   5. ANSI/BHMA: A156.3, BHMA 5.1, Type 21A.
   6. Products and Manufacturers: Provide one of the following:
      a. COR 1, 2 and 3 Series with FB Series by Glynn-Johnson Part of Worldwide Ingersoll-Rand.
      b. Or equal.

J. Astragals:
   1. Provide metal astragal bar, not less than 1/8-inch by 2-inches, for exposed flathead screw mounting on active leaf of all pairs of doors. Comply with UL and NFPA requirements for types and locations of astragals.
   2. Provide astragal of cold-rolled steel with prime painted finish.
   3. Provide astragal of extruded aluminum with clear anodized finish.
   4. Products and Manufacturers: Provide one of the following:
      a. No. 357 Series by Pemko Manufacturing Company.
      b. Or equal.

K. Dust-Proof Strikes:
   1. Provide brass dust-proof strikes, which incorporate a slotted plunger raised to flush position by spring tension for all flush bolts.
   2. Provide 5/8-inch inside diameter dust-proof strikes; threshold mounted and surface mounted.
   3. Finish: US 26D satin chrome.
   4. ANSI/BHMA: A156.16, L14011-L14012.
   5. Products and Manufacturers: Provide one of the following:
      a. DP-1 and DP-2 by Glynn-Johnson Part of Worldwide Ingersoll-Rand.
      b. Or equal.

L. Door Pulls, Push and Protection Armor:
   1. Door Pulls: Provide heavy-duty surface-mounted door pulls with pull plates where specified in List of Door Hardware Items at end of Part 3.
      a. Door pulls shall be stainless steel US 32D and have 1-inch diameter 12-inch long handles which project 2-1/2-inches from pull plate surface.
      b. Pull plates shall be 8-inches by 16-inches, stainless steel US 32D; 0.050-inches thick.
      c. Provide all non-removable fasteners.
      d. Pulls shall be fastened to plates at factory.
      e. ANSI/BHMA: A156.6, J405; B3E.
      f. Products and Manufacturers: Provide one of the following:
         1) 40 Series Pull Plates and Handles by Hager Hinger Company.
         2) Or equal.
   2. Push Plates:

a. Provide 0.125-inch thick stainless steel plate with No. 4 finish.
b. Size: 8-inches by 16-inches with beveled edges.
c. ANSI/BHMA: A156.6, J304; B3E.
d. Products and Manufacturers: Provide one of the following:
1) 80S Beveled by Hager Hinger Company.
2) Or equal.

3. Protection Armor:
a. Provide one armor plate per leaf of each door scheduled to receive armor-plate protection.
b. Provide 16-gauge stainless steel with No. 4 finish 2 foot-0 inches high by 12-inches less in width than width of door.
c. ANSI/BHMA: A156.6, J101; B3E.
d. Products and Manufacturers: Provide one of the following:
1) 193S Beveled Stainless Steel Armor Plate by Hager Hinge Company.
2) Or equal.

M. Stripping and Seals:
1. Provide perimeter weather stripping at all exterior doors. Provide stripping and seals for interior doors where scheduled in List of Door Hardware Items at end of Part 3.
2. Continuity of Stripping: Except as otherwise specified, stripping at each opening shall be continuous and without unnecessary interruptions at door corners and hardware.
3. Replaceable Seal Strips: Resilient or flexible seal strip of every unit shall be easily replaceable and readily available from stocks maintained by the manufacturer.
4. Provide bumper-type weather-stripping at jambs and head, including a resilient insert and metal retainer strip, surface-applied, of the following metal, finish and resilient bumper material:
a. Housing: Extruded aluminum with dark bronze anodized finish; 0.062-inch minimum thickness of main walls and flanges.
b. Dimensions: 1-3/8-inches by 7/8-inches, stop-mounted.
c. Seals: Closed-cell extruded silicone.
d. ANSI/BHMA: A156.22, R3E264.
e. Products and Manufacturers: Provide one of the following:
1) No. 350DSPK and 2891 DPK (for parallel arms) by Pemko Manufacturing Company.
2) Or equal.

N. Thresholds:
1. All exterior and interior doors shall be provided with thresholds.
2. Metal: Mill finish extruded bronze.
3. Surface Pattern: Fluted tread, manufacturer's standard.
4. Provide countersunk stainless steel screws and expansion shields.
5. Width: Five-inches wide and of length sufficient to span full width of rough openings, coped and scribed neatly at and around door frames.
6. Construction:
a. Single-piece, complying with manufacturer's recommendations.
7. Profile: Provide manufacturer's unit, which conforms to the minimum size and profile requirements specified.
a. Floor Drop: Except where no change in floor elevation is shown from one side of threshold to the other, provide profile that accommodates 1/2-inch drop in floor elevation, unless another dimension is shown.

b. For doors equipped with panic hardware, including floor bolts, provide profile with stop bar of proper size and shape to function as the strike plate for the floor bolts.

8. Thickness: 1/2-inch, minimum.
9. ANSI/BHMA: A156.21, J12100.
10. Products and Manufacturers: Provide one of the following:
    a. 171B by Pemko Manufacturing Company.
    b. Or equal.

O. Silencers:
1. Provide silencers for all door frames.
2. Provide pneumatic design that, once installed, forms an air pocket to reduce noise.
3. Provide minimum of three per strike side of door jambs.
4. ANSI/BHMA: A156.16, BHMA 6.5, L03011.
5. Products and Manufacturers: Provide one of the following:
    a. GJ 64 by Glynn-Johnson Part of Worldwide Ingersoll-Rand.
    b. Or equal.

P. Wall and Floor Stops: Provide the following where scheduled in List of Door Hardware Items at end of Part 3:
1. Dome-Type Floor Stops:
    a. Cast bronze extra heavy-duty wall mounted door stop, one per leaf.
    b. Coordinate height of dome-type floor mounted doors stops with threshold condition and undercut of door.
    c. Finish: US 26D satin chrome.
    d. ANSI/BHMA: A156.16, L12161.
    e. Products and Manufacturers: Provide one of the following:
        1) FB13/14R, FB17 by Glynn-Johnson Part of Worldwide Ingersoll-Rand Corporation.
        2) Or equal.
2. Wall Stops:
    a. Cast bronze extra heavy-duty wall mounted door stop, one per leaf.
    b. Convex rubber bumper.
    c. ANSI/BHMA: A156.16, L12101.
    d. Products and Manufacturers: Provide one of the following:
        1) GJ 50C by Glynn-Johnson Part of Worldwide Ingersoll-Rand Corporation.
        2) Or equal.

Q. Sealants: Provide elastomeric sealant complying with FS TT-S-00227, Type 2 (non-sag) Class A for use with thresholds.

2.3 HARDWARE FINISHES

A. Provide matching finishes for door hardware units at each door or opening, to the greatest extent possible in compliance with ANSI/BHMA A156.18.

B. Reduce differences in color and textures as much as commercially possible where the base metal or metal forming process is different for individual units of door hardware exposed at the same door or opening. In general, match all items to the manufacturer's standard finish for the latch and lock set for color and texture.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine the substrate to receive door hardware, and the conditions under which the Work will be performed, and notify Engineer, in writing, of unsatisfactory conditions. Do not proceed with the door hardware Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 PREPARATION

A. Templates: Furnish door hardware templates to each fabricator of doors, frames and other Work to be factory-prepared for the installation of door hardware. Check the Shop Drawings of such other Work, to confirm that adequate provisions are made for the proper installation of the door hardware.

B. Prepare Work to receive door hardware Work in compliance with ANSI/DHI A115.1.

3.3 INSTALLATION

A. Installer shall check and approve the installation before operation. Installer shall assure that the system operates to the Owner's satisfaction.

B. Mount door hardware units at heights recommended in, Door and Hardware Institute, “Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames” and “Recommended Locations for Builders’ Hardware for Custom Steel Doors and Frames", except as otherwise specified or required to comply with governing authorities having jurisdiction at the Site, HMMA 830 and ADAAG requirements.

C. Install each door hardware item in compliance with the manufacturer's instructions and recommendations and approved Shop Drawings. Wherever cutting and fitting is required to install door hardware onto or into surfaces that are later to be painted or finished in another way, install each item completely, then remove, and store in a secure place during the finish application. After completion of the finishes, re-install each item. Do not install surface-mounted items until finishes have been completed on the substrate.

D. Set units level, plumb and true to line and location. Adjust and reinforce the attachment substrate as necessary for proper installation and operation.

E. Drill and countersink units that are not factory-prepared for anchorage fasteners. Space fasteners and anchors in accordance with industry standards.

F. Cut and fit threshold and floor covers to profile of door frames, with mitered corners and hair-line joints. Join units with concealed welds or concealed mechanical joints. Cut smooth openings for spindles, bolts and similar items, if any.

G. Screw thresholds to substrate with No. 10 or larger screws, of the proper type for permanent anchorage and of bronze or stainless steel that will not corrode in contact with the threshold metal.

H. Set thresholds in a bead of elastomeric sealant to completely fill concealed voids and exclude moisture from every source. Do not plug drainage holes or block weeps. Remove excess sealant before sealant cures to a firm set.

I. Adjust and check each operating item of door hardware and each door, to ensure proper operation or function of every unit. Lubricate moving parts with the type lubrication recommended by manufacturer (graphite-type if no other recommended). Replace units that cannot be adjusted and lubricated to operate freely and smoothly as intended for the application.

J. Final Adjustment: Where door hardware installation is made more than one month prior to Substantial Completion, return to the Work during the week prior to acceptance or occupancy, and make a final check and adjustment of all door hardware items in each space and area. Clean and re-lubricate operating items as necessary to restore proper function and finish of door hardware and doors. Adjust door control devices to compensate for final operating of heating and ventilating equipment.

K. Provide manufacturer's authorized representative to instruct and train Owner's personnel in proper adjustment and maintenance of door hardware during the final adjustment of door hardware.

L. Door hardware, which is blemished or defective, will be rejected even though it was set in place before defects were discovered. Remove and replace with new door hardware. Repair all resultant damage to other Work.

M. Continued Maintenance Service: Approximately six months after the acceptance of door hardware in each area, the installer, accompanied by the representative of the latch and lock manufacturer, shall return to the Project and re-adjust every item of hardware to restore proper function of doors and door hardware. Consult with and instruct Owner's personnel in recommended additions to the maintenance procedures. Clean and lubricate operational items wherever required. Replace door hardware items that have deteriorated or failed due to faulty design, materials or installation of door hardware units. Prepare a written report of current and predictable problems (of substantial nature) in the performance or the door hardware.

3.4 FIELD QUALITY CONTROL

A. Provide a written field report, prepared by installer's architectural hardware consultant, identifying actual condition, location, manufacturer, and product designation for each item of door hardware actually present on each door at the Site, including whether door hardware is adjusted and operating properly, compared with each item referenced to approved Shop Drawings and Contract requirements.

B. Installer's hardware consultant shall provide opinions to, and assist Engineer in determining, acceptability of installation as Work proceeds. All comments and discussions, conversations and meetings with Engineer shall be included in written field report for submission to Engineer for review and approval at completion of door hardware installation.

C. As part of written field report to be submitted to Engineer for approval, recommend remedial actions for Work not in compliance with these Specifications. No payment for Work shall be made until remedial recommendations and actions have been approved by Engineer and incorporated into the Work.

3.5 LIST OF DOOR HARDWARE ITEMS

A. Scheduled items for each door are generic and rely on information specified above. The listing of hardware functions and types provided are only a general guideline for the final Door Hardware

Schedule. Contractor shall submit a Door Hardware Schedule acceptable to all governing authorities having jurisdiction at the Site.

B. Provide the following door hardware items:

1. Set 1: Doors: R101-1, R002-3, R003-3, R102-3, R102-4, R107-1, R108-1, R109-1

Qty	Description
3	Hinges
1	Closer
1	Panic Exit Device - Entrance
3	Silencers
1	Stops
1	Protection Armor
1	Threshold
1	Weatherstripping

2. Set 2: Doors: R002-1, R002-2, R003-1, R003-2, R101-2, R107-2, R108-2, R109-2, R110-2

Qty	Description
3	Hinges
1	Closer
1	Panic Exit Device – Passage
3	Silencers
1	Stops
1	Protection Armor

3. Set 3: Doors: R106-1

Qty	Description
3	Hinges
1	Closer
1	Panic Exit Device - Storage
3	Silencers
1	Stops
1	Protection Armor
1	Threshold
1	Weatherstripping

4. Set 4: Doors: R101-2

Qty	Description
3	Hinges
1	Closer
1	Lockset – Office
3	Silencers
1	Stops

5. Set 5: Doors: R104-1, R106-1

Qty	Description
3	Hinges
1	Closer
1	Lockset – Storage
3	Silencers

1	Stops

6. Set 6: Doors: R106-2

Qty	Description
6	Hinges
1	Closer – Active Door
1	Flush Bolt top and bottom (inactive door)
1	Lockset – Storage
3	Silencers
1	Stops
1	Threshold
1	Weatherstripping

7. Set 7: Doors: R103-1

Qty	Description
3	Hinges
1	Lockset – Privacy
3	Silencers
1	Stops

8. Set 8: Doors: R105-1

Qty	Description
6	Hinges
1	Closer – Active Door
1	Flush Bolt top and bottom (inactive door)
1	Lockset – Storage
3	Silencers
1	Stops

END OF SECTION 08 7100

SECTION 08 8100

GLASS GLAZING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install glass glazing.
   2. Extent of glass glazing is shown.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before, the glass glazing Work.
   2. Notify other contractors in advance of the installation of the glass glazing to provide them with sufficient time for the installation of items included in their contracts that must be installed with, or before, the glass glazing Work.

1.3 QUALITY ASSURANCE

A. Primary Glass Manufacturer and Glazing Materials Manufacturer Qualifications:
   1. Provide glass glazing materials manufactured by firms specializing in the production of the types of glass glazing products specified, in compliance with specified standards.
   2. Provide glass from manufacturers who are members of GANA and PGMC and participate in certification programs.
   3. Obtain glass glazing materials from manufacturers who will send a qualified technical representative to the Site, for the purpose of advising the installer of proper procedures and precautions for the use of the materials and who will assist Engineer with opinions on the acceptability of materials and Work.

B. Fabricator Qualifications:
   1. Provide laminated and insulating glass fabrications from fabricators who are licensed by primary glass manufacturer to produce specified units and with documented skill and successful experience in this type of Work and who agree to employ only tradesmen who are trained, skilled and have successful experience in this type of Work.
   2. Provide laminated and insulating glass fabrications from fabricators who are members of GANA or SIGMA and participate in certification programs.
   3. Obtain laminated and insulating glass fabrications from fabricators who will, if required, send a qualified technical representative to the Site, for the purpose of assisting Engineer with opinions on the acceptability of materials and installation methods.

C. Installer's Qualifications:
   1. The installer of the glass glazing materials shall be a firm with documented skill and successful experience in the installation of the types of materials required and who agrees to employee only tradesmen who are trained, skilled and have successful experience in the types of materials and glazing systems specified and who are certified under the National Glass Association Glazier Certification Program as Level 3 (Master Glaziers).
   2. Submit records of experience and certifications to Engineer.

D. Glass Testing Agency Qualifications: An independent testing agency with the experience and capability to conduct the testing specified, as documented according to ASTM E 548.

E. Sealant Testing Agency Qualifications: An independent testing agency qualified according to ASTM C 1021 to conduct testing specified, as documented according to ASTM E 548.

F. Source Limitation: All materials provided under this Section shall be obtained from a single supplier or manufacturer who, with Contractor, shall assume full responsibility for the completeness of the Work. The supplier or manufacturer shall be the source of information on all material furnished regardless of the manufacturing source of that material.

G. Regulatory Requirements:
   1. Wherever a fire-resistance-rating classification is shown or scheduled for doors or windows, (1-hour, 2-hour, 3-hour), provide glass complying with the requirements specified and established by UL, NFPA and other governing authorities having jurisdiction at the Site.
   2. Safety Glass: Comply with ANSI Z97.1, with label on each piece of glass as required by governing authorities having jurisdiction.

H. Codes: Comply with applicable requirements of codes referenced in Section 01 4100, Regulatory Requirements.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Plans and elevations showing location of each type and kind of glass specified and details of glazing system. Include manufacturer's recommendations for glazing.
      b. Dimensions and details of manufacturer's glue line thickness and bite dimensions and verifications.
   2. Product Data:
      a. Copies of manufacturers' specifications, "Spec-Data" sheets, installation instructions for each type of glass, glazing sealant or compound, gasket and associated miscellaneous material and all recommended installation precautions for required materials and components, which are not included in other submittals, specified in other Sections. Coordinate the submittal of such other data with this submittal, and with the submittal of samples required by other Sections.
      b. Structural performance calculations indicating that detailing and fabrication have been based on the results of the required analysis and performance criteria specified.
   3. Delegated Design Submittals:
      a. Structural silicone sealant performance features and calculations indicating sealant joints have been detailed and fabricated in compliance with silicone sealant manufacturer’s recommended guidelines for dissimilar metal adhesion. Structural and other performance calculations for the structural silicone joints shall be prepared, signed and stamped with the seal of a Registered Professional Engineer, licensed to practice in the State of Ohio, and recognized as an expert in the required Work.
   4. Samples:
      a. 12-inch square samples of each type of glass required.
      b. Insulating glass samples need not be hermetically sealed, but edge construction, wavelength-selective interlayer and low-E coatings shall be included and identified. Include specially prepared samples with each interlayer film product's identity marked on film and incorporated into sample.
      c. Submit 12-inch long samples of each color for each type of exposed-to-view glazing sealant and gasket. Install sample between two strips of material similar to, or representative of, channel surfaces where sealant or gasket will be used, held apart to represent typical joint widths.
      d. Review of samples by Engineer will be for color, texture and pattern only. Compliance with other requirements is the responsibility of Contractor.

B. Submittals: Submit the following:
   1. Certificates:
      a. Low-E glass fabricator shall provide a letter of compliance verifying performance characteristics of each glass unit.
      b. Certification that all glass materials subject to the applicable standards of the CPSC are in compliance. The certification shall be issued in conformance with procedures stated in the standard.
      c. Include primary glass manufacturer's and fabricator’s published data, and letters of certification, based on certified test laboratory reports, indicating that each material complies with specified requirements and is acceptable for the applications shown.

d. Certification that fabricated products comply with manufacturer's published performance.
e. Age of silicone sealant.

2. Test Reports:
   a. Certified laboratory test reports for required performance tests in compliance with ASTM E 548.
   b. Provide wavelength-selective insulating glass or low-E glass manufacturer's computer-aided sheet engineering analysis to determine deflection and rabbet depth for individual applications, specified loadings, performance requirements, support criteria and other parameters, in order to indicate compliance with these Specifications.
   c. Wavelength-selective polyester film insulating glass or low-E glass fabricator's computer performance analysis of each glass configuration including argon filled interlayers for insulating glass units.
   d. Adhesion and compatibility test report from glazing sealant manufacturer indicating glazing sealants were tested for adhesion to glazing channel substrates and for compatibility with glass and other glazing material.
   e. Performance analysis of each configuration of insulating glass incorporating wavelength selective interlayer or low E coating using LBL-35-298, Window 4.1.
3. Qualifications Statements:
   a. Fabricator.
   b. Installer.

1.5 Closeout Submittals: Submit the following:
1. Warranty Documentation:
   a. Manufacturer's and fabricator's guarantees, as specified.

1.6 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling and Unloading:
1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices which are to be embedded in cast-in-place concrete in ample time to prevent delay of that Work.

B. Storage and Protection:
1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.
2. Protect glass glazing materials according to manufacturer's and fabricator's written instructions to prevent damage to glass glazing materials from condensation, temperature changes, direct exposure to sun, or other causes.
3. For insulating glass that will be exposed to substantial altitude changes, comply with insulating glass fabricator's written recommendations for venting and sealing to avoid hermetic seal ruptures.

C. Acceptance at Site:
1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace loss and repair damage to new condition in accordance with manufacturer's instructions.

1.7 SPECIAL WARRANTIES

A. General: The special warranties specified in this Article shall not deprive Owner of other rights or remedies Owner may otherwise have under the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under the Contract Documents.

B. Special Warranties:
   1. Laminated Glass: Provide written warranty, signed by the fabricator and Contractor and running to benefit of Owner, agreeing to replace, for a period of five-years from the date of Substantial Completion, glass units that show deterioration, as specified.
   2. Insulating Glass: Provide written warranty, signed by the fabricator and Contractor and running to the benefit of Owner, agreeing to replace, for a period of ten-years from the date of Substantial Completion, glass that shows signs of deterioration, as specified.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Design Criteria: For glass performance, manufacture, size, type, construction and thickness, comply with the following:
   1. Provide glass glazing systems capable of withstanding normal thermal movements and wind and impact loads without failure, including loss or glass breakage attributable to defective manufacture, fabrication, or installation; failure of sealants (both structural and weather-resisting) to remain watertight, airtight and to maintain structural performance characteristics specified; deterioration of glazing materials; or other defects in construction.
   2. Normal Thermal Movement: Provide glass that allows for thermal movements resulting from a maximum temperature range of 120°F in ambient and 180°F surface temperature acting on glass framing members and glazing components. Base structural performance calculations on surface temperatures of materials caused by both solar heat gain and nighttime-sky loss.
   3. Comply with requirements of Consumer Product Safety Commission, Part 1201, Safety Standards for Architectural Glazing Materials, for all the Work.
   4. Structural Performance: Provide structural calculations for analysis of required glass thicknesses for glass lites shown, that are used to establish final fabricating and detailing requirements. Indicate compliance with the following minimum criteria for all glass shown:
      a. Project Wind Speed: 70 miles per hour based on ASCE 7 and the other governing authorities having jurisdiction at the Site.
      b. Importance Factor: Category 1; Iw = 1.15; Design Factor: 1.15.
      c. Exposure Category: Exposure C; Ce = 1.13.
      d. Wind Stagnation Pressure: qs = 12.6 psf.
      e. Long-Duration Loading: One month.
      f. Short-Duration Loading: Sixty seconds, based on three-second gust speed.
      g. Probability of Breakage for Vertical Glazing: Eight lites per 1,000 under wind action.
      h. Maximum Lateral Deflection: For glass supported on all four edges, provide thickness required to limit center deflection at design wind pressure to 1/50 times the short side length or 1-inch, whichever is less.
   5. Glass thicknesses shown are minimums. Confirm glass thicknesses by analyzing Project structural loadings and in-service conditions using glass manufacturer's recommended load tables and other structural performance criteria specified. Where manufacturer’s load tables

indicate acceptability of lesser thickness material than required by performance criteria specified, provide specified thicknesses and features as a minimum. Where load tables indicate the need for greater thickness, or additional features, than specified, provide greater thicknesses and features at no additional cost to Owner. Comply with practice for determining minimum thickness and types of glass, to resist loadings required by governing authorities having jurisdiction at the Site, according to ANSI/ASTM E 1300.

6. Provide each configuration of insulating glass incorporating low-E coatings.
7. Glazing Sealant System Compatibility:
   a. Glazing sealants shall be compatible with the channel surfaces, joint fillers, insulating glass sealing system, laminated glass interlayer material and other materials in contact with the glazing channel in compliance with ASTM C 1087.
   b. Provide only materials and manufacturer's recommended variation of the specified materials, which are known to be fully compatible with the actual installation conditions, as shown by manufacturer's published data or certification submitted to Engineer for approval.
8. Adhesion of Elastomeric Joint Sealants: Comply with ASTM C 793 and ASTM C 794.
9. Center-of-Glass U-Values: NFRC 100 methodology using LBL-35298 WINDOW 4.1 computer-aided software design, expressed as Btu/square foot by height by degree F.
10. Center-of-Glass Solar Heat Gain Coefficient: NFRC 200 methodology using LBL-35298 WINDOW 4.1 computer-aided software design.
11. Solar Optical Properties: NFRC 300.

B. Definitions:
1. Interspace: The space between lites of an insulating glass unit that contains dehydrated air or a specified gas.
2. Deterioration of Coated Glass: Defects that develop from normal use, that are attributed to the manufacturing process, and not to causes other than glass breakage and practices for maintaining and cleaning coated glass contrary to manufacturer’s written instructions. Defects include peeling, cracking, and other indications of deterioration in metallic coating.
3. Deterioration of Laminated Glass: Defects that develop from normal use, that are attributed to the manufacturing process, and not to causes other than glass breakage and practices for maintaining and cleaning coated glass contrary to manufacturer’s written instructions. Defects include edge separation, delamination materially obstructing vision through glass or structural performance or safety of units; blemishes exceeding those allowed by specified laminated glass standards; and cracking, crazing or color change of films concealed in the lamination.
4. Deterioration of Insulating Glass: Failure of the hermetic seal under normal use that is attributed to the fabricating process or incompatibility of sealants or mishandling during installation, and not to causes other than glass breakage and practices for maintaining and cleaning glass contrary to manufacturer’s written instructions. Evidence of failure shall include the obstruction of vision by dust, moisture, or film on interior surfaces of insulating glass.

2.2 GLASS

A. Clear, Float Glass:
1. Uncoated, Monolithic, Clear, Float Glass: Provide clear glass in compliance with ASTM C 1036, Type I (transparent glass, flat), Class 1 (clear), Quality q^3 (glazing select); 1/4-inch thick, minimum.
2. Products and Manufacturers: Provide one of the following:
   a. Clear Float Glass by PPG Industries, Incorporated.

b. Clear Float Glass by Pilkington Libbey-Owens-Ford Company.
c. Or equal.

B. Clear, Fully Tempered, Float Glass:
1. Uncoated, Monolithic, Clear, Fully Tempered, Float Glass: Provide clear glass, with roll-wave distortion parallel to bottom edge of glass, in compliance with ASTM C 1048, Type I (transparent glass, flat), Class 1 (clear), Quality q^3 (glazing select), Kind FT.
2. Provide heat-strengthened glass that has been heat-strengthened by manufacturer's special process (after cutting to final size,) to achieve a flexural strength of up to five times that of annealed glass strength; 1/4-inch thick, minimum.
3. Products and Manufacturers: Provide one of the following:
a. Herculite Clear by PPG Industries, Incorporated.
b. Fully Tempered Clear Glass by Guardian Industries, Corporation.
c. Or equal.

C. Clear, Pyrolytic-Coated, Float Glass:
1. Coated, Monolithic, Clear, Float Glass: Provide clear float glass with solar-reflective metallic-oxide coating applied by pyrolytic deposition during initial manufacture in compliance with ASTM C 1036, Type I (transparent glass, flat), Class 1 (clear), Quality q^3 (glazing select); 1/4-inch thick, minimum.
2. Physical Properties:
a. Tint Color: Clear.
b. Visible Light Transmittance: 69 to 82 percent.
c. Solar Heat Gain Coefficient: 0.37 to 0.69.
d. Outdoor Visible Light Reflectance: Ten to twelve percent.
e. Shading Coefficient: 0.44 to 0.81.
3. Products and Manufacturers: Provide one of the following:
a. Sungate 1000 Low-E Clear Float Glass by PPG Industries, Incorporated.
b. Energy Advantage Low-E Clear Float Glass by Pilkington Libbey-Owens- Ford Company.
c. Or equal.

D. Clear, Insulating, Float Glass Units:
1. Uncoated, Monolithic, Clear, Float Glass: Provide clear glass in compliance with ASTM C 1036, Type I (transparent glass, flat), Class 1 (clear), Quality q^3 (glazing select).
2. Insulating Glass Units: Provide preassembled units consisting of two lites of glass separated by a dehydrated interspace, and complying with ASTM E 774 for Class C units, permanently and hermetically sealed together at edges with spacers and sealant.
3. System Sealing: Dual seal with polyisobutylene primary sealant and silicone secondary sealant, complying with ASTM C 1249.
4. Overall Unit Thickness and Thickness of Each Lite:
a. Overall Thickness: 1-inch.
b. Each Lite: 1/4-inch.
5. Physical Properties:
a. Exterior Appearance: Clear.
b. Visible Light Transmittance: 78 percent, minimum.
c. Solar Heat Gain Coefficient: 0.70.
d. Outdoor Visible Light Reflectance: 15 percent.
e. Shading Coefficient: 0.81.
f. Winter Nighttime U-value: 0.48.
g. Summer Daytime U-value: 0.55.

6. Products and Manufacturers: Provide one of the following:
    a. Clear Twindow by PPG Industries, Incorporated.
    b. Clear Thermopane by Pilkington Libbey-Owens-Ford Company.
    c. Or equal.

2.3 GLAZING SEALANTS, TAPES AND GASKETS

A. General:
1. Colors: Provide black or other natural color wherever no other color is available. Wherever material is not exposed-to-view, provide manufacturer's standard color, which has the best overall performance characteristics for the application shown.
    a. Provide manufacturer's standard colors as shown or, if not shown, provide color selected by Engineer from manufacturer's standard colors to either blend or contrast with adjoining surfaces.
    b. Provide custom colors, as selected by Engineer.
2. Hardness specified is intended to indicate the general range necessary for overall performance. Submit glazing and sealant manufacturer’s recommendations for actual hardness for each condition of installation and use. Except as shown or specified, provide glazing materials within the following ranges of hardness (Shore A, fully cured, at 75°F):
    a. 15 to 35 for elastomeric compounds and tapes used with rigid stops and frames for large glass sizes (in excess of 100 united inches). Provide material sufficiently hard to withstand exposure to abrasion and vandalism.
    b. 25 to 50 for rubber-like curing compounds used with rigid stops and frames for medium and small glass sizes (less than 100 united inches). Provide materials sufficiently hard to withstand impact of moving sash and doors.
    c. 35 to 60 for molded gaskets used with rigid stops and frames, depending upon strength needed for application or insertion of units.
    d. 75 to 80 for structural gaskets (not supported by stops).
    e. Non-Elastomeric Compounds: (Shore A not applicable) 2 to 12 mm penetration for 5.0 seconds of penetrometer needle on nominally cured compound, complying with ASTM D 2451.
3. Provide size and shape of gaskets and preformed glazing units as recommended by the manufacturer and as indicated on approved Shop Drawings.
4. Comply with ASTM C 920 and other requirements for each liquid-applied, chemically curing sealant specified.
5. Where additional movement capability is specified, provide products with the capability, when tested for adhesion and cohesion under maximum cyclic movement, in compliance with ASTM C 719, to withstand the specified percentage change in the joint width existing at the time of installation and remain in compliance with other requirements in ASTM C 920 for uses shown.

B. Preformed Butyl Rubber Back-Bedding Mastic Glazing Tape:
1. Preformed tape of polymerized butyl or mixture of butyl and polyisobutylene with inert fillers with built-in spacer of synthetic rubber, solvent-based with minimum 95 percent solids, non-sag consistency, tack-free time of 24 hours or less, paintable, non-staining, complying with AAMA 806.3.
2. Products and Manufacturers: Provide one of the following:
    a. Polyshim II Glazing Tape by Tremco, Incorporated.
    b. Or equal.

C. Dense Compression Wedge Gaskets:

1. Provide molded or extruded, closed-cell silicone wedge gaskets in compliance with ASTM C 1115, Type C.
2. Products and Manufacturers: Provide one of the following:
    a. Dense Silicone Wedge Gaskets SCR-900 by Tremco, Incorporated.
    b. Or equal.

D. Exterior, One-Part, Silicone Rubber Sealant:
1. Silicone rubber-based, one-part elastomeric sealant, complying with ASTM C 920, Type S, Grade NS, Class 25, Use NT, M, G, A and O.
2. Products and Manufacturers: Provide one of the following:
    a. Spectrem I by Tremco, Incorporated.
    b. 863 Architectural Silicone Sealant by Pecora Corporation.
    c. Or equal.

E. Structural Silicone Sealant:
1. Provide a one-component, self-priming, shelf-stable, neutral-cure, elastomeric adhesive complying with ASTM C 920, Type S, Grade NS, Class 25, Use NT, G and A, and specifically formulated for silicone structural glazing complying with the following as-cured physical properties, after seven days at 77°F and 50 percent relative humidity:
2. Durometer Hardness, Shore A, points; ASTM D 2240: 27 to 40.
3. Ultimate Tensile, ASTM D 412: 225 to 350 psi.
4. Ultimate Elongation, ASTM D 412: 525 to 550 percent.
5. Tear Strength, Die B; ASTM D 624: 40 to 49 ppi.
6. Peel Strength, ASTM C 794: 30 to 40 ppi.
7. Products and Manufacturers: Provide one of the following:
    a. DOW CORNING 995 Silicone Structural Adhesive by Dow Corning Corporation.
    b. 895 Silicone by Pecora Corporation.
    c. Or equal.

2.4 MISCELLANEOUS GLAZING MATERIALS

A. General: Provide products of material, size, and shape complying with referenced glazing standards, requirements of manufacturers of glass glazing materials for applications shown, and approved Shop Drawings. Provide materials with a proven record of compatibility with surfaces shown and specified.

B. Setting Blocks: Elastomeric material, 80 to 90 Shore A durometer hardness, with proven compatibility with sealants used in the Work and as recommended by the glass manufacturer.

C. Spacers and Edge Blocks: Elastomeric blocks or continuous extrusions, with a Shore A durometer hardness recommended by glass manufacturer to maintain lites in place and to limit lateral movement for installation shown, and with proven compatibility with sealants used in the Work.

D. Cylindrical Glazing Sealant Backing: Closed-cell or waterproof-jacketed rod stock of synthetic rubber or plastic foam complying with ASTM C 1330, Type O (open-cell material), proven to be compatible with sealants used, flexible and resilient, with 5 to 10 psi compression strength for 25 percent deflection.

E. Cleaners, Primers and Sealers: Type recommended by sealant, gasket and glass manufacturer.

2.5 FABRICATION OF GLASS AND OTHER GLAZING PRODUCTS

A. Glass manufacturer's recommended glazing channel dimensions are intended to provide for necessary minimum bite on the glass, minimum edge clearance and adequate sealant thicknesses, with reasonable tolerances. Contractor shall be responsible for correct glass size for each opening, within the tolerances and necessary dimensions established on approved Shop Drawings.

2.6 TOLERANCES

A. Allowable Tolerances: Provide fully tempered and heat-strengthened glass, formed by horizontal roller-hearth process, free of tong marks, and not exceeding the following flatness tolerances (either face, any direction, any location) based on 1/4-inch glass thickness with inversely proportionate tolerances for other thicknesses:
   1. For 12-inch Run: 1/16-inch bow.
   2. For 3-foot Run: 1/8-inch bow.
   3. For 7-foot Run: 1/4-inch bow.
   4. For 10-foot Run: 3/8-inch bow.

2.7 SOURCE QUALITY CONTROL

A. To the greatest extent possible, provide each type of glass glazing materials from one manufacturer.

B. Providing insulating glass with a certified Class A rating according to SIGMA.

C. Obtain glass and sealant test results for product test reports from qualified testing agencies regularly engaged in the business of testing glass and sealant products.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine the framing and glazing channel surfaces, backing, removable stop design, and the conditions under which the glass glazing is to be performed, and notify Engineer, in writing, of any conditions detrimental to the proper and timely completion of the Work. Do not proceed with the glazing until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 PREPARATION

A. Clean the glazing channel, or other framing members to receive glass, immediately before glazing. Remove coatings, which are not firmly bonded to the substrate. Remove lacquer from metal surfaces wherever elastomeric sealants are used.

B. Apply primer or sealer to joint surfaces wherever recommended by sealant and glass manufacturer.

3.3 INSTALLATION

A. General:
   1. Comply with combined recommendations of glass, window and glazing products manufacturers and other materials used in glazing, except where more stringent requirements are shown or specified, and as shown on approved Shop Drawings.

2. Comply with GANA, Glazing Manual, except as shown and specified otherwise, and except as specifically recommended otherwise by the manufacturers of the glass glazing materials, as accepted by Engineer on approved Shop Drawings.
3. Inspect each piece of glass immediately before installation, and remove from Site all that have observable edge damage or face imperfections.
4. Unify appearance of each series of lights by setting each piece to match others as nearly as possible. Inspect each piece and set with pattern, draw and bow oriented in the same direction as other pieces.
5. Cut and install tinted and reflective glass as recommended in manufacturer's technical bulletin as provided on approved Shop Drawings.
6. Install sealants as recommended by sealant manufacturers, and as recommended on approved Shop Drawings.
7. Do not attempt to cut, seam, nip or abrade glass on Site, which is tempered, heat strengthened, or coated.
8. Do not proceed with installation of liquid glazing sealants under adverse weather conditions, or when temperatures are below or above manufacturer's recommended limitations for installation.
9. Proceed with glazing only when forecasted weather conditions are favorable to proper cure and development of high early bond strength. Wherever channel action is affected by ambient temperature variations, install glazing sealants only when temperatures are in the middle third of manufacturer's recommended installation temperature range, so that sealant will not be subjected to excessive elongation or compression, and bond stress will not be excessive at extremely low or high temperatures.
10. Coordinate the installation of the glass glazing Work with the Progress Schedule in order to avoid delay of Project.

B. Tape and Sealant Glazing:
1. Place setting blocks in sill rabbets, sized and located to comply with referenced glazing publications. Set blocks in thin course of compatible sealant for heel bead. Position glass on setting blocks and press against tape for full contact.
2. Provide spacers for glass lites where the length plus width is larger than 4 foot-2 inches. Locate spacers directly opposite each other on both inside and outside faces of glass. Install correct size and spacing to preserve required face clearances, unless gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and to comply with system performance requirements.
3. Provide 1/8-inch minimum bite for spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.
4. Provide edge spacers are shown on approved Shop Drawings and as required to prevent glass lites from moving sideways in glazing channel.
5. Cut glazing tape to length and set against permanent stops. Install horizontal strips first, extending over width of opening, before applying vertical strips.
6. Remove paper backing from tape. Place glazing tape on free perimeter of glass. Install tapes continuously. Do not stretch tape to make them fit openings. Place joints in tapes at corners of openings with adjoining lengths butted together, not lapped. Seal butt joints of tape with joint sealant.
7. Center glass lites in openings on setting blocks and press firmly against tape by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings.
8. Install removable stop, avoiding displacement of tape, and exert pressure on tape for full continuous contact. Position tapes on fixed stops so that, when compressed by glass, their

exposed edges are flush with or protrude slightly above sightline of stops. Calk space above glazing tape to top of glazing stop. Tool exposed surfaces of sealant compounds to provide a substantial "wash" away from the glass.

9. Clean and trim excess glazing materials from the installation, and eliminate stains and discolorations.
10. Where wedge-shaped gaskets are driven into one side of the channel to pressurize the sealant or gasket on the opposite side, provide adequate anchorage to ensure that gasket will not "walk" out when subjected to dynamic movement. Anchor gasket to stop with matching ribs, or by proven adhesives, including embedment of gasket tail in cured heel bead. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.
11. Square cut wedge-shaped gaskets at corners and install gaskets in a manner recommended on approved Shop Drawings and to prevent corners from pulling away; seal corner joints and butt joints with sealant as recommended by gasket manufacturer and as shown on approved Shop Drawings.

C. Dry Gasket Glazing: Install glass in gaskets as recommended by the glass and window manufacturer. Refer to Section 08 1113, Hollow Metal Doors and Frames, Section 08 5113, Aluminum Windows.

D. Skylight Glazing: Refer to Section 08 6200, Unit Skylights.

E. Cure glazing sealants and compounds in compliance with manufacturer's instructions and recommendations, to obtain high early bond strength, internal cohesive strength and surface durability.

F. The installer shall advise Contractor of procedures required for the protection of glass glazing sealants and compounds during the construction period, so that they will be without deterioration or damage, other than normal weathering, at the time of Substantial Completion.

G. Furnish specific instructions on the precautions and provisions required to prevent glass damage resulting from the alkaline wash from concrete surfaces and similar sources of possible damage.

H. Protect exterior glass from breakage immediately upon installation, by attachment of crossed streamers to framing held away from glass. Do not apply markers of any type to surfaces of glass.

I. Remove and replace glass, which is broken, chipped, cracked, abraded or damaged in other ways during the construction period, including natural causes, accidents and vandalism.

J. Maintain glass in a reasonably clean condition during construction, so that it will not be damaged by corrosive action and will not contribute (by wash-off) to the deterioration of glazing materials and other work.

K. Remove non-permanent labels and wash and polish glass on both faces not more than four days prior to Substantial Completion. Comply with glass manufacturer's recommendations for cleaning.

3.4 FIELD QUALITY CONTROL

A. Watertight and airtight installation of each piece of glass is required, except as otherwise shown. Each installation must withstand normal temperature changes, wind loading, impact loading (for

operating sash and doors) without failure of any kind including loss or breakage of glass, failure of sealants or gaskets to remain watertight and air-tight, deterioration of glazing materials and other defects in the Work.

B. After nominal cure of exterior glazing sealants, which are exposed to the weather, test for water leaks. Flood the joint exposure with water directed from a 3/4-inch hose held perpendicular to wall face, 2 foot-0 inches from joint, connected to a water system with 30 psi minimum normal water pressure. Move stream of water along joint at an approximate rate of 20 foot-0 inches per minute.

C. Test approximately five percent of total glazing system, in locations which are typical of every joint condition, and which can be inspected easily for leakage on opposite face. Conduct tests in the presence of Engineer, who will determine the actual percentage of joints to be tested and the actual period of exposure to water from the hose, based upon the extent of observed leakage, or lack thereof.

D. Repair glazing installation at leaks or, if leakage is excessive, replace glazing sealants as directed by Engineer.

E. Wherever nature of observed leakage indicates the possibility of inadequate glazing joint bond strength, Engineer may direct that additional testing be performed at a time when joints have been fully cured, followed by natural exposure through both extreme temperatures, and returned to the range of temperature in which it is feasible to conduct testing. Repair or replace Work as required and directed by the Engineer.

END OF SECTION 08 8100

SECTION 08 9000

LOUVERS AND VENTS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all louvers and vents Work.
   2. Extent of louvers and vents Work is shown.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with the louvers and vents Work.
   2. Verify size, location and placement of louver and vents prior to fabrication, wherever possible. Coordinate field measurements and Shop Drawings with fabrication and shop assembly to minimize field adjustments, splicing, mechanical joints and field assembly of units. Preassemble units in as large sections as practicable.

C. Related Sections:
   1. Section 07 9200, Joint Sealants.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American Society for Testing and Materials, (ASTM).
      a. ASTM B 117, Practice for Operating Salt Spray Apparatus.
      b. ASTM D 522, Test Methods for Mandrel Bond Test of Attached Organic Coatings.
      c. ASTM D 523, Test Method for Specular Gloss.
      d. ASTM D 1308, Test Method for Effect of Household Chemicals on Clear and Pigmented Organic Finishes.
      e. ASTM D 2244, Test Method for Calculation of Color Differences from Instrumentally Measured Color Coordinates.
      f. ASTM D 2247, Practice for Testing Water Resistance of Coatings in 100% Relative Humidity.
      g. ASTM D 3363, Test Method for Film Hardness by Pencil Test.
      h. ASTM D 4214, Test Methods for Evaluating Degree of Chalking of Exterior Paint Films.

1.3 QUALITY ASSURANCE

A. Performance Criteria: Comply with Sheet Metal and Air Conditioning Contractor's National Association, Architectural Sheet Metal Manual, recommendations for fabrication, construction details, and installation procedures, except as otherwise shown on the Drawings or specified.

B. Component Supply and Compatibility:
   1. Obtain each separate type of louver and vents from a single supplier and from a single manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following
   1. Shop Drawings:
      a. Include plans, elevations, sections, details and attachments to other work. Show blade profiles, angles and spacing.
   2. Product Data:
      a. Copies of manufacturer's material specifications, recommended written installation instructions and manufacturer's specifications showing
   3. Delegated Design Submittals:
      a. For installed louvers and vents indicated to comply with design loads, include structural analysis data signed and sealed by a Registered Professional Engineer licensed in the State of Ohio, who is responsible for their preparation.
   4. Samples: For units with factory-applied color finishes.
      a. Cut-a-way samples of corner section of each type of louver made from 12-inch lengths of full size components and showing the proposed details of joinery, anchorage, movement, glazing, flashing and drainage and with specified finish, prior to fabrication of the Work.
   5. ENGINEER reserves the right to require samples demonstrating design, detailing and fabrication techniques and workmanship for each auxiliary louver component and accessory, before fabrication proceeds.
      a. Provide anodized finish manufacturer's complete color charts.
      b. One of each type fastener employed, with statement of intended use.
      c. Samples will be reviewed by Engineer for materials, fabrication techniques, proposed system components, workmanship and color. Compliance with other requirements is the responsibility of Contractor.

B. Informational Submittals: Submit the following:
   1. Source Quality Control Submittals:
      a. Comprehensive tests performed by a qualified testing agency or by manufacturer and witnessed by a qualified testing agency, for each type of louver.

1.5 PROJECT CONDITIONS

A. Field Measurements: Verify louver openings by field measurements before fabrication and indicate measurements on Shop Drawings.

1.6 WARRANTY

A. Provide written warranty agreeing to replace louver and vent Work which fails in materials or workmanship within three years of the date of Final Acceptance. Failure of materials or workmanship shall include, but is not limited to, excessive leakage or air infiltration, excessive deflections, deterioration of finish or metal in excess of normal weathering, and defects in accessories, weatherstripping, and other components of the Work.

B. The warranty does not apply where failure is caused by accidents, or external conditions or forces beyond the control of the manufacturer.

PART 2 - PRODUCTS

2.1 LOUVER AND VENTS PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide louvers and vents capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of louver components, noise or metal fatigue caused by louver blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act on vertical projection of louvers.
   1. Wind Loads: Determine loads based on a uniform pressure of 30 lbf/sq.ft., acting inward or outward.

B. Seismic Performance: Provide louvers capable of withstanding the effects of earthquake motions determined according to the Ohio Building Code and ASCE 7, "Minimum Design Loads for Buildings and Other Structures": Section 9, "Earthquake Loads".
   1. Seismic Design Criteria: Refer to contract drawings.

C. Thermal Movements: Provide louvers that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
   1. Temperature Change (Range): 20°F, ambient; 120°F, material surfaces.

2.2 MATERIALS

A. Aluminum Sheet: ASTM B 209, Alloy 5005 with temper as required for forming or as otherwise recommended by the metal producer to provide the required finish.

B. Aluminum Extrusions: ASTM B 221, Alloy 6063-T52.

C. Fastenings: Use same material as items fabricated. Provide types, gages and lengths to suit unit installation conditions. Use Phillips flat-head machine screws for exposed fasteners, unless otherwise specified. Use continuous aluminum closure angles on the inside perimeter frame of all louver and vents Work, finished to match louvers and vents.

D. Post-installed Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to four times the loads imposed, for concrete, or six times the loads imposed, for masonry, as determined by testing conforming to ASTM E 488, conducted by a qualified independent testing agency.

E. Protection of aluminum from dissimilar materials shall conform to Section 09 9100, Painting.

2.3 FABRICATION, GENERAL

A. Assemble louvers and vents in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

B. Vertical Assemblies: Where height of louver and vent units exceeds fabrication and handling limitations, fabricate units to permit field-bolted assembly with close-fitting joints in jambs and mullions, reinforced with splice plates.
   1. Continuous Vertical Assemblies: Fabricate units without interrupting blade-spacing pattern, unless horizontal mullions are shown.

C. Maintain equal louver blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.

D. Fabricate frames, including integral sills, to fit in openings of sizes as shown, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.
   1. Frame Type: Channel, unless otherwise shown and as specified.

E. Include supports, anchorages, and accessories required for complete assembly.

F. Provide vertical mullions of type and at spacing shown, but not more than recommended by manufacturer, or 72-inches on centers, whichever is less.
   1. Fully Recessed Mullions: Where shown, provide mullions fully recessed behind louver blades. Where length of louver exceeds fabrication and handling limitations, fabricate with close-fitting blade splices designed to permit expansion and contraction.
   2. Exposed Mullions: Where shown, provide units with exposed mullions of same width and depth as louver frame. Where length of louver exceeds fabrication and handling limitations, provide interlocking split mullions designed to permit expansion and contraction.

G. Where shown, provide subsills made of same material as louvers.

H. Join frame members to each other and to fixed louver blades with fillet welds concealed from view, unless otherwise shown or size of louver assembly makes bolted connections between frame members necessary.

2.4 FIXED, EXTRUDED ALUMINUM LOUVERS

A. Furnish 6-inch fixed louvers where shown, or scheduled. Drainable blades shall incorporate a front lip gutter and recessed second gutter, both of which direct water to jamb and mullion drains.

B. Free Area Velocity: Maximum 960 feet per minute free area velocity at a pressure drop of not more than 0.17-inches water gage carrying less than 0.01 ounces of water per square foot of free area.

C. All blades shall be 0.081-inch thick. Provide all blades with integral drainage trough along edge of blades. Frame shall be 0.125-inches thick. Mullions shall be of the sliding interlock type.

D. Free Area: Not less than 7.3 square feet for a 48-inch by 48-inch high louver.

E. Provide louver supports designed to carry 30 pounds per square foot wind load.

F. Install gravity backdraft damper and louver screen behind the louver.

G. Products and Manufacturers: Provide one of the following:

1. No. A6177 by Construction Specialties, Incorporated.
2. No. K6776 by the Airolite Company .
3. Or equal.

2.5 FINISHES

A. Anodized Finish:
1. Class I, Clear Anodic Finish: AA-M12C22A41 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018-mm or thicker) complying with AAMA 611.

2.6 LOUVER SCREENS

A. Provide removable screens for all louvers.

B. Fabricate screen frames of the same metal and finish as the louver units to which secured. Provide frames consisting of extra heavy duty extruded 0.090-inch aluminum for permanently securing screen mesh. Frames shall be rewirable.

C. Provide insect screen of 18 by 14 mesh, 0.0123-inch diameter stainless steel intercrimp wire. 0.063-inch diameter stainless steel intercrimp wire for all other louvers.

D. Provide bird screen, 1/2-inch square stainless steel wire, 0.063-inch diameter wire.

E. Locate screens on inside face of louvers. Secure screens to louver frames with machine screws, spaced at each corner and at 12-inches on centers.

F. Provide minimum No. 8 stainless steel metal screws, unless larger screws are required by screen size.

G. Provide cross bar screen reinforcement of same material and finish as louver which subdivides screens into maximum area of 50 square feet.

2.7 SILL EXTENSION

A. Gage and Finish: Same as louver.

2.8 ATTACHMENT FRAME

A. Gage and Finish: Same as louver.

B. Size: As shown on the Drawings.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and his installer must examine the areas and conditions under which louvers and vents Work and associated items are to be installed and notify Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 PREPARATION

A. Coordinate setting drawings, diagrams, templates, instructions and directions for the installation of anchorages which are to be embedded in concrete or masonry construction. Coordinate the delivery of such items to the Site.

3.3 INSTALLATION

A. Locate and place louver units plumb, level and in proper alignment with adjacent work.

B. Use stainless steel expansion bolt anchors with stainless steel washers and neoprene gaskets. Use spring clips at all anchors to stop deflection of the louver frame. Provide anchors spaced 2 feet-0 inches on centers. Provide continuous aluminum angles for anchoring all operable louvers.

C. Form tight joints with exposed connections accurately fitted together. Provide reveals and openings for sealants and joint fillers, as shown.

D. Repair finishes damaged by cutting, welding, soldering and grinding operations required for fitting and jointing. Restore finishes and prime coats of paint so that there is no evidence of corrective Work. Return items which cannot be refinished in the field to the shop, make the required alterations, and refinish the entire unit, or provide new units, as determined by Engineer.

E. Protection of Aluminum from Dissimilar Materials: Coat all aluminum surfaces in contact with dissimilar materials such as concrete, masonry, steel and other metals as specified in Section 09 9100, Painting.

3.4 FIELD QUALITY CONTROL

A. Determine conformity of louver polyvinylidene fluoride finish to these Specifications, as follows:
   1. The manufacturer of the louver and vents shall set aside and label samples of the metal from each production lot for the job. Protect samples from weather.
   2. Make sample louver and vent available at all times, for comparison with installed louver and vent Work as requested by Owner, for the full time of the warranty.
   3. Make color comparison measurements with a Hunter Tristimulus Color Difference Meter employing methods of computation in use at the National Bureau of Standards conforming to ASTM D 2224.

3.5 ADJUSTMENT AND CLEANING

A. Set adjustable louver blades for uniform alignment in open and closed positions.

B. Adjust louvers so moving parts operate smoothly.

C. Louvers with dents, warps, gouges or scratches shall be replaced with new louvers, at no additional cost to Owner.

END OF SECTION 08 9000

SECTION 09 5113

ACOUSTICAL PANEL CEILINGS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install acoustical panel ceilings. The Work also includes:
      a. Providing openings in acoustical panel ceilings to accommodate the Work under this and other Sections and building into the acoustical panel ceilings all items to be embedded in, or penetrate, acoustical panel ceilings.
   2. Extent of acoustical panel ceilings is shown.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before, the acoustical panel ceilings Work.
   2. Coordinate furnishing and installing products for maintaining the fire-resistance-rating of ceiling construction at perimeters and penetrations where built-in and recessed items and transitions with other building components occur in the acoustical panel ceilings Work.

C. Related Sections:
   1. Section 07 2105, Building Insulation.
   2. Section 07 9200, Joint Sealants.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American Society for Testing and Materials, (ASTM).
      a. ASTM A 153/A 153M, Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
      b. ASTM A 366/A 366M, Specification for Commercial Steel Sheet, Carbon, (0.15 maximum percent) Cold-Rolled.
      c. ASTM A 510, Specification for General Requirements for Wire Rods and Coarse Round Wire,
      d. ASTM A 641/A 641M, Specification for Zinc-Coated (Galvanized) Carbon Steel Wire.
      e. ASTM B 221, Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
      f. ASTM C 423, Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.
      g. ASTM C 635, Specification for the Manufacture, Performance, and Testing of Metal Suspension Systems for Acoustical Tile and Lay-In Panel Ceilings.
      h. ASTM C 636, Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels.
      i. ASTM C 834, Specification for Latex Sealants.

o. ASTM E 795, Practice for Mounting Test Specimens During Sound Absorption Tests.
p. ASTM E 1264, Classification for Acoustical Ceiling Products.
q. ASTM E 1414, Test Method for Airborne Sound Attenuation Between Rooms Sharing a Common Ceiling Plenum.
r. ASTM E 1477, Test Method for Luminous Reflectance Factor of Acoustical Materials by Use of Integrating-Sphere Reflectometers.
s. ASTM F 593, Specification for Stainless Steel Bolts, Hex Cap Screws and Studs.
t. ASTM F 594, Specification for Stainless Steel Nuts.

2. Architectural Metal Products Division of the National Association of Architectural Metal Manufacturers, (AMP).
   a. AMP, 501, Finishes for Aluminum.
3. Ceiling and Interior Systems Construction Association, (CISCA).
   a. CISCA, Acoustical Ceilings: Use and Practice.
   b. CISCA, Ceiling Systems Handbook.
4. Underwriters' Laboratories, Inc., (UL).
   a. UL, Fire Resistance Directory.

1.3 QUALITY ASSURANCE

A. Installer's Qualifications:
1. Engage a single installer regularly performing installation of acoustical panel ceilings with documented skill and successful experience in the installation of the types of materials required; and who agrees to employee only tradesmen who are trained, skilled and have successful experience in installing the types of materials specified.
2. Submit name and qualifications to Engineer along with the following information on a minimum of three successful projects:
   a. Names and telephone numbers of owners, architects or engineers responsible for projects.
   b. Approximate contract cost of the acoustical panel ceilings.
   c. Amount of area installed.

B. Testing Agency Qualifications: The independent testing agency shall demonstrate to Engineer’s satisfaction, based on evaluation of criteria submitted by testing agency, that it has the experience and capability to satisfactorily conduct the testing indicated without delaying the Work. Submit name and qualifications to Engineer.

C. Source Quality Control:
1. Furnish all components of each acoustical panel ceiling system from a single manufacturer and from a single supplier with adequate resources to provide products of consistent performance characteristics, physical properties and appearance, without delaying the Work.

D. Mock-Ups:

1. Before proceeding with final purchase of materials and installation of acoustical panel ceiling systems, but after Engineer's acceptance of Samples and Shop Drawings, install 100 square foot samples of each type of acoustical panel ceiling system, including all accessory trim, insulation specified in Section 07 2105, Building Insulation, control and expansion joints specified in Section 07 9513, Expansion Joint Cover Assemblies, built-in items that may be specified in other Sections, indicating the final relationship and configurations of the various parts and components and the quality of workmanship that shall be achieved in the Work. Locate mock-ups in areas selected by Engineer to show a representative installation of each type of acoustical panel ceiling system.
2. Incorporate materials and methods of installation that are identical to Project requirements.
3. Obtain Engineer's acceptance of visual qualities of mock-up before start of acoustical panel ceiling Work. Retain and protect mock-up during construction as a standard for judging completed acoustical panel ceiling. Do not alter or remove approved mock-ups.
4. Build as many mock-ups as required to obtain Engineer's acceptance. Disassemble rejected mock-ups and remove all components from Site. Do not incorporate rejected mock-up components into the Work. Accepted mock-up may be incorporated into the finished Work.
5. Acoustical panel ceiling Work that proceeds without approved mock-ups shall be stopped, and mock-ups prepared for Engineer's acceptance.
6. Acoustical panel ceilings that do not meet the standard of workmanship on the accepted mock-up shall be removed and replaced with new material.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Copies of manufacturer's product specifications and installation instructions for each acoustical ceiling material required, and for each suspension system. Include certified laboratory test reports and other data as required to show compliance with these Specifications.
      b. Include manufacturer's recommendations for cleaning and refinishing acoustical units, including precautions against materials and methods, which may be detrimental to finishes and acoustical performances.
   2. Reflected ceiling plans of suspension systems, showing hanger, anchor and acoustical panel locations, drawn to a scale of 1/4-inch equal to 1 foot-0 inch, and details of all transitions of acoustical panels with other items such as light fixtures, air diffusers, and perimeter walls and all supporting and suspension system details, including method of attachment of suspension system hangers to building structure, drawn to a scale of 3/4-inches equal to 1 foot-0 inches.
      a. Show and coordinate locations of ceiling-mounted items, automatic fire suppression system sprinkler heads, speakers, and penetrations for other items of Work that are to be coordinated with the ceiling, and show framing and support details for Work supported by the suspension system.
      b. Complete information on all anchors and supports indicating maximum resistance to tension, in compliance with performance criteria specified.
   3. Samples:
      a. Full size samples for each acoustical panel specified. Samples shall show the full range of exposed color and texture to be expected in the completed Work.
      b. 12-inch long samples of each exposed runner and molding.
      c. Engineer's review will be for color and texture only. Compliance with other requirements is the responsibility of Contractor.

B. Informational Submittals: Submit the following:
   1. Test Reports:
      a. Certify compliance with ASTM C 635 and other specified requirements, and indicate structural classification of each type of suspension system.
      b. Evidence of acoustical panel ceiling system's compliance with requirements of governing authorities having jurisdiction at the Site.
      c. Certified field quality control test reports for required anchor performance tests.
   2. Qualifications Statements:
      a. Installer.
      b. Testing laboratory.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling and Unloading:
   1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices which are to be embedded, in ample time to prevent delay of that Work.
   2. Deliver accepted materials in original, unopened, undamaged, protective packaging, with manufacturer's and testing and inspection agencies labels accurately indicating brand name, pattern, size, thickness and fire-resistance-rating of packaged materials.
   3. All markings and labels shall be legible and intact.
   4. Inspect acoustical panel ceiling materials and reject components differing from accepted Samples and Shop Drawings. Immediately remove rejected components from the Site and do not incorporate into the Work.
   5. Handle materials in a manner that avoids chipping edges or damaging units in any way and as recommended by manufacturer's approved installation recommendations and the recommendations of specified standards.

B. Storage and Protection:
   1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.
   2. Store materials in a fully enclosed space where they will be protected against damage and constantly within limits of manufacturer's written recommended environmental conditions.
   3. Store materials in original protective packaging to prevent soiling, physical damage or wetting.
   4. Store cartons open at each end to stabilize moisture content and temperature.

C. Acceptance at Site:
   1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace loss and repair damage to new condition in accordance with manufacturer's instructions.

1.6 JOB CONDITIONS

A. Environmental Requirements:
   1. Before installing acoustical panels permit them to reach room temperature and
   2. Do not install interior acoustical panel ceilings until the space has been enclosed and is weathertight, and until installation of moisture-bearing material in the space has been

completed and the space is nominally dry, and until ambient conditions of temperature and humidity are continuously maintained at levels indicated for final occupancy.

B. Scheduling:
1. Do not begin installation of acoustical panel ceilings until all Work above ceilings has been completed and accepted by Engineer.
2. Furnish cast-in-place, and built-in-place anchors and their locations, to other trades for installation well in advance of time needed for coordinating locations of acoustical panel ceiling supports with other Work that must share plenum area above acoustical panel ceilings.

1.7 EXTRA MATERIALS

A. Extra Materials:
1. At time of completing the installation, deliver stock of extra material and store in a secure area at the Site as directed by Owner. Furnish full-size units, packaged with protective covering for storage, and identified with appropriate labels.
2. Acoustical Panels: Furnish an amount equal to two percent of the amount installed, or at least one full package of acoustical panels.
3. Do not provide partial packages of materials. Round-up quantities to furnish only complete, unopened and undamaged packages; with legible labels accurately representing contents of package indicating compliance with approved Samples and Shop Drawings, and matching materials actually installed.
4. Submit quantities of each system component required for the Work, based on actual purchase order to manufacturer for materials to be used on this Project, with calculations establishing quantity of extra materials to be furnished to Owner.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Performance Criteria:
1. General:
a. Standards: Provide manufacturer's standard acoustical panel ceiling systems that comply with ASTM E 1264 classifications as designated by types, patterns, acoustical ratings, and light deflections.
b. References: In general, the recommendations of CISCA, "Acoustical Ceilings: Use and Practice" shall be considered part of this Section, unless otherwise specified.
c. Standards for Terminology and Performance: Applicable publications by the Ceiling and Interior Systems Construction Association (CISCA), including "Ceiling Systems Handbook" and ASTM C 635.
d. Provide complying UL acoustical panel ceiling systems to match acoustical panels in adjacent non-fire-resistance-rated acoustical panel ceiling assemblies. Where exact match is not available, submit samples of available complying acoustical panels for Engineer's selection.
2. Noise Reduction Coefficient (NRC): The average of sound absorption coefficients when tested in accordance with ASTM C 423 for a specification range of ten points, for middle frequencies of 250, 500, 1000, and 2000 Hertz with face of test specimen mounted in compliance with ASTM C 795 for Mounting Type E-400 (400 millimeter air space) standard mounting according to ASTM E 1264. Provide not less than the following:
a. NRC Rating: Range of 0.50, except as otherwise specified.

3. Ceiling Attenuation Class: Provide acoustical panel ceilings that have been tested for sound transmission loss through the acoustical tile ceiling, determined in accordance with ASTM E 1414 and ASTM E 413. Provide not less than the following:
    a. CAC Class: 40, for Mounting Type E-400.

2.2 CEILING PANELS

A. Performance Criteria:
1. General:
    a. Standards: Provide manufacturer's standard acoustical panel ceiling systems that comply with ASTM E 1264 classifications as designated by types, patterns, acoustical ratings, and light deflections.
    b. References: In general, the recommendations of CISCA, "Acoustical Ceilings: Use and Practice" shall be considered part of this Section, unless otherwise specified.
    c. Standards for Terminology and Performance: Applicable publications by the Ceiling and Interior Systems Construction Association (CISCA), including "Ceiling Systems Handbook" and ASTM C 635.
2. Noise Reduction Coefficient (NRC): The average of sound absorption coefficients when tested in accordance with ASTM C 423 for a specification range of ten points, for middle frequencies of 250, 500, 1000, and 2000 Hertz with face of test specimen mounted in compliance with ASTM C 795 for Mounting Type E-400 (400 millimeter air space) standard mounting according to ASTM E 1264. Provide not less than the following:
    a. NRC Rating: Range of 0.50, except as otherwise specified.
3. Ceiling Attenuation Class: Provide acoustical panel ceilings that have been tested for sound transmission loss through the acoustical tile ceiling, determined in accordance with ASTM E 1414 and ASTM E 413. Provide not less than the following:
    a. CAC Class: 40, for Mounting Type E-400.

2.3 CEILING PANELS

A. General: Unless otherwise specified, provide standard lay-in panels of the type selected by Engineer. Provide sizes shown on reflected ceiling plans or, if not otherwise shown, 24-inch by 48-inch grid-size panels.

B. Acoustical Panels:
1. Mineral Fiber Acoustical Panels: Provide units not less than 15/163/4-inch thick and of density not less than 1.25 pounds per square foot, medium-coarse non-directional texture, NRC 0.50 to 0.60, STC 35-39, light reflectance over 67 percent. [1]
2. Surface Finish: Factory-applied white vinyl latex paint.
3. Product and Manufacturer: Provide one of the following:
    a. Cirrus Tegulant beveled edge by Armstrong World Industries, Inc.
    b. Frost shadow line tapered edge by USG.
    c. Or equal.

2.4 CEILING SUSPENSION SYSTEMS

A. General: Comply with ASTM C 635, as applicable to the type of suspension system required for the type of acoustical panel ceiling units specified.
1. Structural Class, Heavy-Duty System (Direct Hung): 16 pounds per linear foot of main runners, minimum.
    a. Main Runners: 0.020-inch thick metal, minimum.

b. Cross Tees: 0.020-inch thick metal, minimum.

B. Exposed Suspension System: Manufacturer's standard, 5/16-inch wide by 1-1/2-inch high exposed runners, cross-runners and accessories, with exposed cross runners stepped to lay flush with main runners; manufactured from hot-dipped galvanized G90, commercial steel CS Type B, complying with ASTM A 653; double-webbed construction with stainless steel clip end tap feature interlocking with cross tee slots to prevent lateral pull-out.
1. Finish of Exposed Members: Provide uniform factory-applied finish on exposed surfaces of ceiling suspension system including moldings, trim and accessories.
a. Finish: Manufacturer's standard baked enamel finish, white, unless otherwise selected by Engineer.

C. Products and Manufacturers: Provide one of the following:
1. 1200 System and Fire Front 1250 Direct Hung Suspension Systems by Chicago Metallic Corporation.
2. Or equal.

2.5 MISCELLANEOUS MATERIALS

A. Hangers:
1. Wire Hangers: Galvanized, soft-temper steel wire complying with ASTM A 641/A 641M, Class C zinc coating, pre-stretched; bare steel diameter of 8-gauge (0.162-inch).
2. Rod Hangers: Commercial steel complying with ASTM A 510, mild carbon steel; 1/4-inch bare steel rod diameter; hot-dip galvanized in compliance with ASTM A 153/A 153M, Class B-1.

B. Anchors:
1. Provide built in place anchors fabricated from stainless steel components complying with ASTM F 593 and ASTM F 594, Group 1, alloy Type 316 for bolts, and anchors with holes or loops for attaching hangers.
2. Comply with ASTM E 488 for concrete inserts, clips, bolts, screws and other devices applicable to the indicated method of structural anchorage for acoustical panel ceiling hangers.

C. Hold-Down Clips for Non-Fire-Resistance-Rated Ceilings: For interior ceilings consisting of acoustical panels weighing less than one pound per square foot, provide hold-down clips spaced 2 foot-0 inches on centers on all cross tees.

D. Sheet Metal Edge Molding and Trim: Type and profile shown, or if not shown, manufacturer's standard metal channel molding for edges and penetrations that fit acoustical panel edge details and suspension systems specified; formed from commercial grade sheet steel of same material, color and finish as used for exposed flanges of suspension system members.
1. For lay-in panels with reveal edge details, provide stepped edge molding that forms reveal of same depth and width as that formed between edge of panel and flange at exposed suspension member.
2. For circular penetrations in ceiling, provide shop-fabricated edge moldings fabricated to diameter required to fit penetrations exactly.
3. For narrow-face suspension systems, provide suspension system and manufacturer’s standard edge moldings that match width and configuration of exposed runners.

E. Extruded Aluminum Edge Molding and Trim: Type and profile shown, or if not shown, manufacturer's standard extruded aluminum molding for edges and penetrations that fit acoustical panel edge details and suspension systems specified; including splice plates, corner pieces, and attachment and other clips, complying with the following:
   1. Aluminum Alloy: 6063-T5 complying with ASTM B 221.
   2. Finish of Exposed Members: Provide the following finish for all edge moldings and trim components:
      a. Finish: Manufacturer's standard baked enamel finish, white, unless otherwise selected by Engineer.

F. Acoustical Sealant for Exposed and Concealed Joints: Provide a modified acrylic-latex, non-sag, paintable, non-staining, sealant complying with ASTM C 834 and effective in reducing airborne sound transmission through perimeter joints in building construction as demonstrated by testing representative assemblies according to ASTM E 90 and acceptable for use with UL Design Designations specified.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine the conditions under which the acoustical panel ceiling Work is to be performed and notify Engineer, in writing, of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 PREPARATION

A. Concrete Inserts: Provide inserts for incorporation into formwork. Furnish layouts for cast-in-place ceiling support anchors whose installation is specified in other Sections.

B. Measure each ceiling area and establish layout of acoustical panels to balance border widths at opposite edges of each ceiling. Avoid the use of less-than-half width panels at borders, and comply with accepted Shop Drawing layout.

3.3 INSTALLATION

A. General:
   1. As a minimum standard, unless otherwise shown, specified, required by accepted Shop Drawings, or governing authorities having jurisdiction at the Site, install acoustical panel ceilings to comply with CISCA's "Ceiling System Handbook."
   2. Where acoustical panel ceilings must resist lateral forces, comply with requirements of governing authorities having jurisdiction at the Site and ASTM E 580.

B. Install suspension systems to comply with ASTM C 636, with hangers supported only from building structural members. Locate hangers near each end and spaced four feet along each carrying channel or direct-hung runners, unless otherwise shown.
   1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or ceiling suspension system.
   2. Splay hangers only where required and, if permitted by governing authorities having jurisdiction at the Site for fire-resistance-rated construction assemblies, to miss obstructions and offset resulting horizontal forces by bracing, counter-splaying, or other equally effective means.

3. Where width of ducts and other obstructions within ceiling plenum produces hanger spacing that interfere with the location of hangers required to support standard suspension system members, install supplemental suspension members and hangers in the form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by Reference Standards and publications.
4. Secure wire hangers to ceiling suspension members by looping or wire-tying with a minimum of three tight turns, either directly to structure or to inserts, eye screws, clips or other anchorage devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause them to deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.
5. Connect rod hangers directly to structural members, including additional framing members introduced for ceiling support, by attaching to inserts, eye-screws, or other devices and fasteners that are secure and appropriate for both structure to which hangers are attached and type of hanger involved. Install hangers in a manner that will not cause hangers to deteriorate or otherwise fail due to age, corrosion or elevated temperatures.
6. Do not support ceilings directly from permanent metal forms or floor deck. Furnish cast-in-place hanger inserts that extend through forms.
7. Do not attach hangers to steel deck tabs.
8. Do not attach hangers to steel roof deck. Attach hangers to structural members.
9. Do not connect or suspend steel framing from ducts, pipes or conduit.
10. Sway-brace suspended steel framing with hangers used for support.
11. Space hangers not more than 4 foot-0 inches on centers along each member, supported directly from hangers and provide hangers not more than 8-inches from ends of each member.
12. Secure bracing wires to ceiling suspension members and to supports with a minimum of four tight turns. Suspend bracing from structural members as required for hangers, without attaching top permanent metal forms, steel deck, or steel deck tabs. Fasten bracing wires into concrete with cast-in-place or post-installed anchors.
13. Install suspension system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.

C. Arrange acoustical panels and orient directionally-patterned panels in the manner shown on accepted Shop Drawings.
1. Install acoustical panels in coordination with suspension system, with edges concealed by support of suspension members.
2. Install acoustical panels with pattern running in one direction.
3. For reveal-edged panels on suspension system runners, install panels with bottom of reveal in firm contact with top surface of runner flanges.
4. Install acoustical panels with undamaged edges and fitted accurately into suspension system runners and edge moldings.
5. Scribe and cut panels at borders and penetrations to provide a neat, precise fit.
6. Install hold-down clips in areas shown, and in areas where required by governing authorities having jurisdiction at the Site, or for fire-resistance-ratings; space as recommended by panel manufacturer, unless otherwise specified.

D. Install edge moldings and trim of the type shown at edges of each acoustical ceiling area, and at locations where edge of units would otherwise be exposed after completion of the Work.
1. Sealant Bed: Apply acoustical sealant in a continuous ribbon, concealed on back of vertical legs of molding before fastening to vertical surface.

2. Secure moldings to building construction by fastening with screw-anchors into the substrate, through holes drilled in vertical leg. Space holes not more than 3- inches from each end and not more than 16-inches on centers along each molding, leveling with ceiling suspension system to tolerances specified.
3. Miter corners of moldings accurately to provide hair-line joints, securely connected to prevent dislocation.
4. Do not use exposed fasteners, including blind rivets, on molding or trim.

E. Install sound attenuation insulation in areas shown. Lay insulation directly on ceiling system, and close major openings to completely cover all areas shown to receive sound attenuation insulation.

3.4 FIELD QUALITY CONTROL

A. Testing Agency:
1. Contractor shall engage a qualified independent testing agency, accepted by Engineer, to perform quality control testing.
2. Perform all specified testing in compliance with the requirements of ASTM E 488.
3. Extent and Testing Frequency: Testing shall take place in successive stages in areas described below. Proceed with installation of acoustical panel ceilings only after results for previously installed hangers comply with requirements.
4. Extent of Each Test Area: When installation of ceiling suspension systems on each floor has reached 20 percent completion, but no acoustical panels have been installed, perform the following tests:
   a. Within each test area testing agency will, select one of every ten anchors used to attach hangers to concrete and will test them for 1,140 pounds of tension. It will also select one of every two post-installed anchors used to attach bracing wires to concrete and will test them for 1,620 pounds of tension.
   b. When testing discovers fasteners and anchors that do not comply with requirements, testing agency will test those anchors not previously tested until twenty consecutively pass and then will resume initial testing frequency.
5. Testing agency shall report test results promptly and in writing to Engineer.
6. Where fasteners and anchors are removed and replaced, additional testing shall be performed to determine compliance with specified requirements.

B. Allowable Tolerances:
1. Surfaces to Receive Acoustical Treatment: Free from irregularities and level to within 1/4-inch in 12 feet.
2. Deflection:
   a. Suspension System Components, Hangers, and Fastening Devices Supporting Light Fixtures, Ceiling Grilles, and Acoustical Units: Maximum deflection 1/360 of the span.
   b. Deflection Test: ASTM C 635.
3. Allowable Tolerance of Finished Acoustical Ceiling System: Level within 1/8-inch in 12 feet-0 inches.
4. Accessibility Percentage: 100.

3.5 ADJUSTMENT AND CLEANING

A. Do not proceed with installation of acoustical panels until testing is completed and non-complying fasteners and anchors have been replaced with new material complying with the requirements of these Specifications.

B. Clean exposed surfaces of acoustical panel ceilings, including trim, edge moldings and suspension system members. Comply with manufacturer's written instructions for cleaning and touch-up of minor finish damage. Remove and replace Work that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.

C. Installer shall advise Contractor and Engineer of required protection for the acoustical panel ceilings, including manufacturer's recommended temperature and humidity limitations and dust control, so that the Work will be without damage and deterioration at the time of acceptance by Owner. Contractor shall provide required protection.

END OF SECTION 09 5113

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 09 6153

CONCRETE HARDENER

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all concrete hardener Work.
   2. The extent of the concrete hardener includes all interior concrete floors not shown or scheduled to be finished with another material.
   3. The types of concrete hardener Work required include, but are not necessarily limited to, silicate penetrant.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before, the concrete hardener Work.
   2. Notify other contractors in advance of the installation of the concrete hardener Work to provide them with sufficient time for the installation of items included in their contracts that must be installed with, or before, the concrete hardener Work.

C. Related Sections:
   1. Section 03 3000, Cast-In-Place Concrete.

1.2 QUALITY ASSURANCE

A. Installer's Qualifications: Engage a single installer regularly engaged in the installation of concrete hardeners with five years experience in the application of the types of materials required, and who agrees to employ only tradesmen with specific skills and experience in this type of Work. Installer shall meet the requirements of the concrete hardener manufacturer for providing guarantee coverage. Submit name and qualifications to Engineer.

B. Source Quality Control: Obtain all material from only one manufacturer who will send a qualified technical representative to the Site for the purpose of advising the installer of proper procedures and precautions for the use of the material, at no additional cost to the Owner.

1.3 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Copies of manufacturer’s specifications, recommendations and installation instructions. Include manufacturer’s published data, indicating the material complies with the requirements and is intended for the application shown.
      b. Submit installer's qualifications in accordance with Article 1.2, above.

B. Informational Submittals: Submit the following:
   1. Certificates: Submit a certificate of coverage signed by a duly authorized representative of the manufacturer.

C. Closeout Submittals: Submit the following:
   1. Maintenance Data: Upon completion of the Work, furnish five copies of detailed maintenance manual including the following information:
      a. Product name and number.
      b. Name, address and telephone number of manufacturer and local distributor.
      c. Detailed procedures for routine maintenance and cleaning.
      d. Detailed procedure for light repair such as scratches and staining.
   2. Guarantee Documentation:
      a. Submit for approval written guarantee agreeing to replace the concrete hardener should it fail to perform as specified in Article 1.6, below.

1.4 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling and Unloading:
   1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices which are to be embedded, in ample time to prevent delay of that Work.
   2. Deliver materials in concrete hardener manufacturer's original unopened containers.
   3. Include the following information on the label:
      a. Name of material and supplier.
      b. Formula or specification number, lot number and date of manufacturer.
      c. Mixing instructions, shelf life and curing time when applicable.
   4. Failure to comply with these requirements shall be sufficient cause for the rejection of the material in question, by Engineer, and requiring its removal from the Site. In such a case, supply new material conforming to the specified requirements, at no additional cost to Owner.
   5. Handle materials carefully to prevent inclusion of foreign materials.
   6. Do not open containers or mix components until all necessary preparatory Work has been completed.

B. Storage and Protection:
   1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.
   2. Store materials so as to preclude the inclusion of foreign material.
   3. Protect material from freezing.

C. Acceptance at Site:
   1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace loss and repair damage to new condition in accordance with manufacturer's instructions.

1.5 JOB CONDITIONS

A. Environmental Conditions:
   1. Do not apply concrete hardener to uncured concrete. Comply with manufacturer's written instructions for minimum ten days of curing time.
   2. Apply hardener only when temperature of concrete is 50°F or above.

B. Protection:

1. Do not allow concrete hardener to overflow or spill onto adjoining surfaces.
2. Remove concrete hardener that is splashed on surfaces not designated to receive concrete hardener immediately by flushing with water.

C. Sequencing:
1. Coordinate the Work so that the concrete hardener is installed when best results will be obtained, as recommended by the manufacturer's technical representative.

1.6 GUARANTEE

A. Provide a five year written guarantee, signed by Contractor and installer, stating that should concrete floors show signs of dusting because of wear and abrasion they will be re-installed, in the manner specified herein, at no additional cost to Owner, from the date of Final Acceptance of the Work.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Concrete Hardener: Provide a clear, colorless, aqueous solution of chemically active silicates and fluosilicates plus a wetting and penetrating agent, that reacts with the free lime and calcium carbonates to bind soft, loose particles together and form a hard dense vitreous surface which is resistant to chemical attack and the growth of mildew, fungi and other organisms. Use potable water only.

2.2 MANUFACTURERS

A. Products and Manufacturers: Provide one of the following:
1. Lapidolith by Sonneborn Division of Contech, Incorporated.
2. Armortop by Anti-Hydro Waterproofing Company.
3. Or equal.

2.3 MIXES

A. Follow manufacturer's written instructions for the proper mixing, dilution and coverage of each coat.

2.4 FINISH

A. The finished installation of the concrete hardener shall have a smooth, uniform even finish without discontinuities or discolorations.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine the substrates and the conditions under which the concrete hardener Work is to be performed and notify Engineer, in writing, of any conditions detrimental to the proper and timely completion of the Work and performance of the concrete hardener. Do not proceed with the concrete hardener Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 SUBSTRATE PREPARATION

A. Steel trowel concrete in strict accordance with printed directions supplied by the concrete hardener manufacturer.

B. Provide concrete free of all honeycombing and fins.

C. Do not use sealers, curing or parting compounds on the concrete.

D. Provide wet curing only.

E. Surfaces to receive concrete hardener shall be clean, dry and free of all loose dirt, oil, wax and other foreign matter.

3.3 INSTALLATION

A. Provide the services of a manufacturer's technical representative for the purpose of advising the installer of proper procedures and precautions for the use of the material prior and during the installation of the concrete hardener.

B. Apply concrete hardener using the coverage recommended by the manufacturer per coat.

C. Apply a minimum of three separate coats.

D. Apply a fourth coat using undiluted material should the manufacturer's technical representative recommend this procedure, based on field conditions, and as directed by Engineer.

E. Apply each coat by spray.

F. Mop up excess solution or puddles.

G. After each of the first and second applications, allow the floor to dry until no longer visibly wet.

H. To avoid the development of crystals, when applying the third coat, flush the surface liberally with clean, hot water. At the same time, brush the floor rapidly with a stiff-bristle broom. Mop up excess water.

I. Follow manufacturer's written instructions should white crystals develop after the first or second coat. Consult manufacturer's technical representative.

3.4 ADJUSTMENT AND CLEANING

A. Clean adjacent surfaces of concrete hardener resulting from the Work. Use solvent or cleaning agent recommended by the concrete hardener manufacturer. Leave all finished Work in a clean neat appearance.

B. Protect the concrete hardener until fully cured.

END OF SECTION 09 6153

SECTION 09 6505

RESILIENT FLOORING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install resilient flooring.
   2. Extent of resilient flooring is shown.
   3. Types of products required include the following:
      a. Vinyl floor tile.
      b. Vinyl cove base and pre-molded cove base corners.
      c. Vinyl sanitary cove base and pre-molded sanitary cove base corners.
      d. Edging strips.
      e. Floor and tile adhesive.
      f. Cove adhesive.
      g. Miscellaneous accessories, fillers and fasteners.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with or before, the resilient flooring Work.
   2. Coordinate requirements for maximum safe moisture-emission level of concrete slabs in compliance with resilient flooring manufacturer's written recommendations and in compliance with ASTM E 1643 and Section 03 3000, Cast-In-Place Concrete.
   3. Coordinate the finishing of substrates for acceptability of substrates to resilient flooring manufacturer, as indicated on approved Shop Drawings.
   4. Remove all chemicals, compounds and other materials from substrates to receive the Work of this Section, as may be required by the resilient flooring manufacturer, even if other Sections permit chemicals, compounds and other materials.
   5. Coordinate and schedule filling and grinding of cementitious underlayments to avoid later difficulty or delay in performing the resilient flooring installation Work.
   6. Coordinate required thickness of cementitious underlayments with doors, thresholds, piping and equipment, adjacent materials and similar items in order to provide smoothly aligned transitions acceptable to Engineer and in compliance with governing authorities.
   7. Coordinate the use of products specified in other Sections to provide substrates acceptable to the resilient flooring manufacturer and Engineer.
   8. Coordinate the installation of moisture barriers and insulation, specified in other Sections, to substrates before the installation of resilient flooring.

C. Related Sections:
   1. Section 03 3000, Cast-In-Place Concrete.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:

1. The Americans with Disabilities Act of 1990 (Public Law 101-336), Appendix A to Title 28 Code of Federal Regulations Part 36 - Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities - ADAAG.

22. National Fire Protection Association, NFPA 253, Standard Method of Test for Critical Radiant Flux of Floor Covering Systems Using a Radiant Heat Energy Source.
23. National Fire Protection Association, NFPA 258, Method of Test for Specific Density of Smoke Generated by Solid Materials.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. Provide all components of resilient flooring system and auxiliary products produced by a single manufacturer, including recommended primers, adhesives and edging strips, as required.
   2. Provide products from manufacturer who participates in ISO certification programs and who manufacture resilient flooring systems and auxiliary products conforming to the requirements of those programs.

B. Installer's Qualifications:

1. Engage a single installer regularly performing installation of resilient flooring with documented skill and successful experience in the installation of the types of materials required; and who agrees to employee only tradesmen who are trained, skilled and have successful experience in installing the types of materials specified.
2. Submit name and qualifications to Engineer along with the following information on a minimum of three successful projects:
    a. Names and telephone numbers of owners, architects or engineers responsible for projects.
    b. Approximate contract cost of the resilient flooring.
    c. Amount of area installed.

C. Source Quality Control:
1. Furnish all components of resilient flooring system from a single manufacturer, and from a single supplier with adequate resources to provide products of consistent performance characteristics, physical properties and appearance, without delaying the Work.
2. Obtain materials only from manufacturers who will, if required, send a qualified technical representative to the Site, for the purpose of advising installer of proper procedures and precautions for the use of the materials.
3. Provide products from manufacturers who participate in ISO 9002 Quality Control Programs.
4. Colors and Patterns: Provide resilient floor tile and stair-covering units with uniformly distributed color and pattern throughout the thickness of the tile, except as otherwise specified. Variation in shades and off pattern matches between containers will not be acceptable.

D. Definitions:
1. Critical Radiant Flux (CRF): According to ASTM E 648, the measure of the ability of a floor covering to resist the spread of flames when located in a corridor exposed to flames and hot gases from a room fire. The higher the CRF value, the more resistant the material is to flame spread.
2. Excessive Wear: Loss of thickness of more than 0.0025-inches of rubber material per year based on specified traffic conditions.
3. Low Vibration Profile: The combination of resilient rubber compounds and tile profile design that will eliminate or noticeably reduce vibration of wheeled vehicles. Wheels of 4-inch diameter or greater should cause no vibration or noticeable sound and should not contribute to ambient noise.
4. Migrating Waxes: Waxes and soil-releasing agents that are chemically a component of the product's formulation, continually traveling to the product's surface when activated by use.
5. Non-Solvent Adhesives: Adhesives with a non-solvent base requiring no open time to permit solvent flash.
6. Optical Smoke Density: The optical density of smoke developed by burning a solid material, such as resilient flooring, established according to ASTM E 662.

E. Regulatory Requirements:
1. Wherever a flame spread, smoke development or CRF classification is shown or specified for resilient flooring (Class B, Class I and similar designations), provide components complying with applicable requirements for materials and installation established by ASTM, and other governing authorities having jurisdiction at the Site.

F. Mock-Ups:

1. Before proceeding with final purchase of materials and installation of resilient flooring systems, but after Engineer'S approval of Samples and Shop Drawings, install 100 square foot samples of each component of resilient flooring system, and one landing and run of stairs including all stair flooring components and accessory trim, indicating the final relationship and configurations of the various parts and components and the quality of workmanship that will be achieved in the Work. Locate mock-ups in areas selected by Engineer to show a representative installation of each type of resilient flooring system.
2. Incorporate materials and methods of installation that are identical to Project requirements.
3. Obtain Engineer'S acceptance of visual qualities of mock-up before start of resilient flooring system Work. Retain and protect mock-up during construction as a standard for judging completed resilient flooring. Do not alter or remove approved mock-ups.
4. Build as many mock-ups as required to obtain Engineer'S acceptance. Disassemble rejected mock-ups and remove all components from Site. Do not incorporate rejected mock-up components into the Work. Accepted mock-up may be incorporated into the finished Work.
5. Resilient flooring system Work that proceeds without approved mock-ups shall be stopped, and mock-ups prepared for Engineer'S approval.
6. Resilient flooring that does not meet the standard of workmanship on approved mock-ups shall be removed and replaced with new material.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Plans drawn to a scale of 1/4-inch equal to 1 foot-0 inch showing all flooring and all stair covering units and components accurately located in final positions as they will occur in the finished Work, and showing actual dimensions of areas to receive the Work. Show all patterns required for the Work and the location of each color and texture required for each tile pattern.
      b. Details drawn to a scale of 1-1/2-inches equal to 1 foot-0 inch showing all intersections of stair covering components with actual dimensions of stair treads, risers, landings and stringers and with all products accurately located and positioned as they will occur in the finished Work.
   2. Product Data:
      a. Copies of manufacturer's specifications and installation instructions for each type of resilient flooring, stair floor covering, auxiliary material and accessory required.
   3. Samples: Submit the following:
      a. Each type and color of resilient flooring and stair floor covering required. Provide full size samples of each type of flooring and stair covering product and 12-inch lengths of each auxiliary product and accessory specified.
      b. Samples shall show the full range of color and pattern variation. Sample submittals will be reviewed for color, texture and pattern only. Compliance with all other requirements is the responsibility of Contractor.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Product certificates signed by the manufacturer certifying materials comply with the specified performance characteristics and criteria, and physical requirements.
      b. Certified Installer.
   2. Test Results: Certified test reports showing compliance with specifiedperformance characteristics and physical properties.

3. Site Quality Control submittals:
    a. Existing Conditions Report.

C. Closeout Submittals: Submit the following:
1. Operations and Maintenance Data: Furnish five copies of manufacturer's instructions for recommended maintenance practices for each type of resilient flooring, including the following:
    a. Product name and number.
    b. Name, address and telephone number of manufacturer and local distributor.
    c. Detailed procedures for routine maintenance and cleaning.
    d. Detailed procedures for light repairs such as dents, scratches and staining

1.5 DELIVERY, STORAGE AND HANDLING

A. Comply with applicable requirements of referenced standards, Section 01 6500, Product Delivery Requirements and Section 01 6600, Product Storage and Handling Requirements.

1.6 JOB CONDITIONS

A. Existing Conditions:
1. the existing conditions effecting the surface preparation and installation of resilient flooring and submit a report to the Engineer before installation. Existing facilities must meet all the requirements listed in 1.6.B. below. All deficiencies must be corrected before beginning installation.

B. Environmental Requirements:
1. Do not begin installation until permanent environmental control systems are operating as needed to maintain consistent temperatures in installation areas. Continuously maintain temperature in areas to receive resilient flooring systems at 68°F for at least 48 hours prior to, during, and 48 hours after installation.
2. Perform moisture testing of cast-in-place concrete slabs when temperature in the spaces where resilient flooring will be installed is greater than 50°F.

C. Scheduling.
1. Schedule the arrival of materials to minimize storage on-Site and only as required by manufacturer to allow materials to acclimate to areas of installation.
2. Store only sufficient quantities of material on-Site as required to advance the Work without causing delays.
3. Close spaces to traffic during flooring installation and for time after installation recommended, in writing, by the resilient flooring manufacturer.
4. Install resilient flooring after other finishing operations, including painting, have been completed.
5. Where demountable partitions and similar demountable items are indicated for installation on top of resilient flooring, install resilient flooring before these items are installed.

1.7 WARRANTY

A. General Warranty: The special warranties specified in this Article shall not deprive Owner of other rights or remedies Owner may otherwise have under the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under the Contract Documents.

B. Special Warranties:
   1. Resilient Flooring Wear Warranty: Provide written warranty, signed by Contractor and manufacturer and running to benefit of Owner, agreeing to replace, for a period of ten years from the date of Substantial Completion, resilient tile units that show excessive wear, as specified.

1.8 EXTRA MATERIALS

A. Extra Materials:
   1. Furnish extra materials from the same manufactured lot as the materials installed.
   2. Unless otherwise directed by the Engineer, furnish two percent of each type and color of resilient flooring, stair floor covering, auxiliary material and accessory used in the Work and store in a secure area at the Site as directed by Owner.
   3. Do not provide partial containers or packages of materials. Round-up quantities to furnish only complete, unopened and undamaged containers and packages; with legible labels accurately representing contents of container or package indicating compliance with approved Samples and Shop Drawings, and matching materials actually installed.
   4. Submit quantities of each system component required for the Work, based on actual purchase order to manufacturer for materials to be used on this Project, with calculations establishing quantity of extra materials to be furnished to Owner.
   5. Do not furnish materials whose remaining shelf life will be less than six months, at the time of Substantial Completion. Furnish only materials that are accompanied by a documented record of proof of being continuously stored and handled according to manufacturer's recommended storage and temperature limitations.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Description:
   1. Resilient tile flooring systems shall include a system of vinyl flooring tile, sanitary cove base moldings and factory-pre-molded outside and inside sanitary cove base molding corners and all components for stair floor covering, including angles, stringers, risers, treads and nosings and all auxiliary and accessory products, adhesives and fillers.
   2. The system shall also include all necessary vapor retarders and underlayments, specified and installed under other Sections, and all surface preparation, and testing to provide a complete system, and acceptable performance, complying with the requirements of these Specifications.

B. Performance Criteria:
   1. Optical Smoke Density, ASTM E 662: Less than 450.
   2. Critical Radiant Flux (CRF), ASTM E 648: Not less than 0.45 watts per square centimeter; Class 1.

2.2 MATERIALS

A. General: Manufactured units shall contain no polyvinylchloride or other halogens, and shall be completely asbestos-free.

B. Vinyl Tile Flooring:

1. homogeneous solid vinyl tile and sheet flooring, composed of binder, filler and pigments compounded with suitable lubricants and processing aids. The binder consists of one or more polymers or copolymers of vinyl chloride, other modifying resins, plasticizers and stabilizers. Polymers or copolymers of vinyl chloride comprise at least 60 percent of the weight of the binder. Any copolymer of vinyl chloride used shall contain at least 85 percentvinyl chloride.
2. Standards:
    a. Tile: ASTM F 1700, Class I.
    b. Sheet: ASTM F 1913.
3. Physical Properties: Provide the following:
    a. Abrasion Resistance, ASTM C 501 (H-18 Wheel, 500-gram load, 1,000 cycles): 0.40-gram loss weight, maximum.
    b. Hardness, ASTM D 2240 (Shore A): 85, minimum.
    c. Slip Resistance: ASTM D 2047, equal to or no greater than .5.
    d. Chemical Resistance, ASTM F 925:

Reagent	Resistance - 24 Hours
Acetic Acid - 5 percent	No Change
Ammonia - 28 percent	No Change
Sodium Hydroxide - 5 percent	No Change
Sulfuric Acid – 5 percent	No Change
Concentrated Cleaners	No Change

4. Size and Thickness: 12-inches by 12-inches by 0.125-inches thick, minimum.
5. Colors:
    a. Complete selection of manufacturer's standard colors for final selection by Engineer.
    b. Engineer will select a maximum of 6 colors.
6. Products and Manufacturers: Provide one of the following:
    a. Vinyl Tile by Armstrong World Industries, Incorporated.
    b. Vinyl Tile Flooring by Johnsonite Incorporated a Tarkett Company Incorporated.
    c. Or Equal

C. Vinyl Cove Base: Vinyl, composed of binder, filler and pigments compounded with suitable lubricants and processing aids.; 0.125-inches thick with connection dimension matching final resilient tile thickness; approximate 4 foot-0 inch long sections, with matching end stops and pre-molded inside and outside corner units, as follows:
1. Standard: ASTM F 1861, Style B, Group TV
2. Physical Properties: Refer to 2.2.F.3.above.
3. Accessories:
4. Size: 4-inches high.
5. Colors:
    a. Complete selection of manufacturer's standard and custom colors for final selection by Engineer.
    b. Engineer will select a maximum of 4 colors.
6. Products and Manufacturers: Provide one of the following:
    a. Tandem Vinyl Cove Base and Sanitary Base by Armstrong World Industries, Incorporated.
    b. Vinyl Cove Base and Sanitary Base by Johnsonite Incorporated a Tarkett Company Incorporated.
    c. Equal

D. Vinyl Accessories:

1. Feature Strips: Complete selection of vinyl strips, including transitional reducers, thresholds, tile joiners and caps. Size and color as shown, of the same material composition and thickness as the adjacent tile units.
2. Edging Strips: 1/8-inch thick, homogenous, vinyl, tapered or bullnosed edge, color as selected by Engineer from manufacturer's standard colors.
3. Rods: Homogenous, vinyl, color as selected by Engineer from manufacturer's standard colors.
4. Physical Properties: Refer to 2.2.F.3.above.

E. Metal Edge Strips: Width shown, of required thickness to protect exposed edge of resilient flooring. Provide units of maximum available length, to minimize number of joints.
1. Material: Extruded aluminum with mill finish, unless otherwise shown.
2. Type: Butt-type metal edge strips for concealed anchorage.

F. Auxiliary Products:
1. Concrete Slab Primer: Non-staining type recommended by the resilient flooring manufacturer.
2. Cementitious Underlayment: As recommended by the resilient flooring manufacturer.
3. Sanitary Base Cove, Non-Solvent Adhesive: Provide a fortified acrylic emulsion recommended by the resilient flooring manufacturer, maximum VOC's of 50 g/l.
4. Flooring and Stair Floor Covering, Non-Solvent Adhesive: Provide a high performance, solvent-free, two-part polyurethane adhesive with excellent resistance to moisture, heat and humidity, maximum VOC's of 50 g/l.
5. Epoxy Nose-Filler and Adhesive: Provide solvent-free, non-sag epoxy as recommended by resilient flooring manufacturer to completely fill all stair nosings to prevent cracking or flexing of treads and nosings by uniformly molding a bonding support for the step, maximum VOC's of 50 g/l.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine the areas and conditions under which resilient flooring Work will be performed and notify Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 PREPARATION

A. Confirm that moisture barriers, recommended by the resilient flooring manufacturer, installed under other sections, are properly installed.

B. Do not install products until they are at the same temperature as the space where they are to be installed.

C. Ensure that surfaces to receive resilient flooring are sufficiently cured, dry and are ready to receive resilient flooring installation as recommended by manufacturer, in writing.

D. Prepare cast-in-place concrete slabs in compliance with ASTM F 710. Remove substances incompatible with resilient flooring and adhesives using methods recommended, in writing, by the resilient flooring manufacturer.

E. Test cast-in-place concrete for moisture, in compliance with ASTM D 4263 and in compliance with RFCI. Perform testing, as developed by the Rubber Manufacturers Association calcium chloride test, in order to determine that the maximum safe moisture-emission level recommended by the resilient flooring manufacturer's written installation limitations will not be exceeded, before installation of resilient flooring.
   1. Allow thirty days drying time for each 1-inch of cast-in-place concrete slab thickness before testing concrete.
   2. Perform minimum of one test for every 1,000 square feet of floor area to receive resilient flooring.
   3. If moisture tests indicate unacceptable levels of moisture remaining in the slab, do not install resilient flooring. Report existing conditions, along with recommendations, to Engineer, in writing. Allow additional time for slab to dry and retest.
   4. Contractor may, at their option and expense, dehumidify or provide additional heat, in order to speed the drying process. If, after remediation measures are implemented, retesting the cast-in-place concrete continues to indicate unacceptable levels of moisture, submit resilient flooring manufacturer's recommended penetrating-sealer and remedial moisture barrier product for Engineer'S approval.

F. Perform relative humidity testing, using in situ probes, ASTM F2170. Proceed with installation only after substrates have a maximum of 75 percent relative humidity measurement.

G. Perform one adhesive bond test for every 2,000 square feet of area receiving resilient flooring, but not less than one in each space, to verify acceptable adhesion of resilient flooring manufacturer's approved adhesive. Examine after 72 hours to determine whether bond is solid and no moisture is present. Do not proceed with Work until bond tests produce acceptable results.

H. Concrete pH Test: Perform pH test for every 2,000 square feet of area receiving resilient flooring, but not less than one in each space, to verify acceptable adhesion of linoleum flooring manufacturer's approved adhesive. If pH is greater than 10, concrete slab must be neutralized prior to beginning the installation.

I. Installation Surfaces:
   1. Survey surfaces to receive resilient flooring and verify tolerances are within limits specified. Do not install resilient flooring where surfaces are outside of allowable tolerances specified.
   2. Use leveling compound as recommended by resilient tile manufacturer for filling small cracks and depressions in installation surfaces.
   3. Level cast-in-place concrete surfaces, to receive resilient flooring, to provide concrete level to within 1/8-inch variation in ten-feet. Comply with recommendations of both the cementitious underlayment manufacturer's and resilient flooring manufacturer's written and approved recommendations for product compatibility and installation.
   4. Concrete floors with slick finish or with curing or hardening compounds shall be mechanically abraded using methods approved by the resilient flooring manufacturer.
   5. Prior to start of installation of resilient tile units, clean all surfaces to be covered with resilient flooring using high-efficiency particulate air filter vacuum cleaners and inspect the subfloor in accordance with manufacturer's instructions.

J. Concrete Primer: Apply concrete slab primer if recommended by resilient flooring manufacturer, prior to application of the adhesive. Apply in compliance with manufacturer's written and approved instructions.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Services: Upon Owner's request and with at least 72 hours notice, provide manufacturer's field representative with product use recommendations and periodic site visits for inspection of flooring installation, in accordance with manufacture's instructions.
   1. Site Visits: One before, during and after installation.

B. Allowable Tolerances:
   1. Surfaces to Receive Resilient Flooring Systems: Surface shall be smooth, level, at the required finish elevation, without more than 1/8-inch in ten feet variation from level, or slopes, shown. Provide surfaces free of depressions, raised areas, or other defects that may telegraph through installed flooring.

3.4 INSTALLATION

A. Place resilient flooring units using manufacturer's dry laying installation method with all embossed arrows pointing in the same direction and with adhesive cement mixed in strict compliance with the manufacturer's written and approved installation instructions. Follow all product use precautions as recommended by the manufacturer.

B. Butt resilient flooring units tightly to vertical surfaces, thresholds, nosings and edgings. Scribe around obstructions to produce neat joints, laid tight, even and in straight, parallel lines. Extend resilient flooring units into toe spaces, door reveals, and into closet and similar openings.

C. Maintain reference markers, holes, or openings that are in place or plainly marked for future cutting by repeating on the finish resilient flooring as marked on the subfloor. Use chalk or other non-permanent marking devices.

D. Install resilient flooring on covers for telephone, electrical ducts and floor hatches, and other such items as occur within the finished resilient flooring areas. Maintain the overall continuity of color, joints, and pattern with resilient flooring installed on these covers. Tightly cement edges of resilient flooring to perimeter of sanitary cove base.

E. Lay resilient flooring from center marks established with principal walls, discounting minor offsets, so that resilient flooring at opposite edges of the room are of equal width. Adjust as necessary to avoid use of cut widths less than 1/2 tile at room perimeters. Lay resilient flooring square to room axis, unless otherwise shown.

F. Match resilient floorings for color and pattern by using resilient flooring from cartons in the same sequence as manufactured and packaged. Cut resilient flooring neatly around all obstructions. Broken, cracked, chipped or deformed resilient flooring shall be replaced.

G. Apply resilient flooring to flooring surfaces using a full spread of adhesive applied to flooring surface to comply with resilient flooring manufacturer's written approved instructions, including those for notching, adhesive mixing, and adhesive open and working times.

H. Tightly cement resilient flooring to flooring surfaces without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks through resilient tile, or other surface imperfections.

I. Lay resilient flooring with grain in all resilient tiles running in the same direction.

J. Place resilient edge strips tightly butted to resilient flooring and secure with adhesive. Provide edging strips at all unprotected edges of resilient flooring, unless otherwise shown.

K. Cove Base: Apply to all columns, pilasters, casework and other permanent fixtures in rooms or areas where base is required. Install base in as long lengths as practicable, with preformed corner units. Tightly bond base to backing throughout the length of each piece, with continuous contact at horizontal and vertical surfaces.
   1. On masonry surfaces, or other similar irregular surfaces, fill voids along top edge of resilient wall-base with manufacturer's recommended adhesive filler material.
   2. Install pre-molded outside and inside corners before installing straight pieces.

L. Metal Edge Strips:
   1. Apply butt-type metal edge strips where shown and prior to installing resilient flooring. Secure units to substrate with countersunk stainless steel screws, complying with manufacturer's recommendations for the type of substrate.

M. Resilient Accessories:
   1. Apply resilient accessories so they are butted to adjacent materials and bond to surfaces with adhesive. Install reducer strips at edges of flooring that would otherwise be exposed.

3.5 CLEANING AND PROTECTION

A. Perform the following operations immediately after installing resilient products:
   1. Remove all adhesive and other surface blemishes from resilient flooring, using neutral-type cleaners as recommended by the resilient flooring manufacturer.
   2. Vacuum floor thoroughly.
   3. Do not wash floor until after time period recommended by resilient flooring manufacturer.
   4. Damp-mop floor to remove marks and soil.

B. Protect installed flooring from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during the remainder of the construction period and to Substantial Completion. Use protection methods recommended in writing by the resilient flooring manufacturer.

C. Do not move heavy or sharp objects directly over floor surfaces. Place plywood or hardboard panels over flooring and under objects while they are being moved. Slide or roll objects over panels without moving panels.

D. Clean floor surfaces not more than four days before scheduled inspection to determine Substantial Completion of the Work. Clean products according to manufacturer’s approved written recommendations.

E. Resilient flooring system components, damaged for any reason, shall be replaced with new, undamaged material, in compliance with the requirements of these Specifications, at no additional cost to the Owner.

END OF SECTION 09 6505

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 09 9100

PAINTING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment, and incidentals as shown, specified, and required to furnish and apply paint systems.
      a. Contractor is responsible for surface preparation and painting of all new and existing interior and exterior items and surfaces throughout the Project areas included in the general contract and other contracts described in this Section.
   2. Extent of painting includes the Work specified below. Painting shown in schedules may not provide Contractor with complete indication of all painting Work. Refer to Article 2.2 of this Section where all surfaces of generic types specified are specified for preparation and painting according to their status, intended function, and location, using the painting system for that surface, function, and location as specified, unless specifically identified on the Drawings as a surface not to receive specified painting system.
      a. Follow the Painting Schedule in Article 3.8.
      b. All new and specifically identified existing surfaces and items except where natural finish of material is specified as a corrosion-resistant material not requiring paint; or is specifically shown as indicated by written note, or specified as a surface not to be painted. Where items or surfaces are not specifically mentioned, paint them the same as adjacent similar materials or areas.
      c. Surface preparation and painting of all new and specifically identified existing items, both interior and exterior, and other surfaces, including items furnished by Owner, are included in the Work, except as otherwise shown or specified.
      d. Removal of all substances, top coats, primers and all intermediate coats of paint and other protective or decorative coatings on those items and surfaces to remain that are identified to receive a painting system under this Section, to provide surfaces acceptable for application of painting specified.

B. Coordination:
   1. Review installation, removal, and demolition procedures under other Sections and coordinate them with the Work specified in this Section.
   2. Coordinate painting of areas that will become inaccessible once equipment and similar fixed items have been installed.
   3. Furnish information to Engineer on characteristics of finish materials proposed for use and ensure compatibility with prime coats used. Provide barrier coats over incompatible primers or remove and repaint as required. Notify Engineer in writing of anticipated problems using specified painting systems with surfaces primed by others. Reprime equipment primed in factory and other factory-primed items that are damaged or scratched.

C. Related Sections:
   1. Section 07 9200, Joint Sealants.

D. Work Not Included: The following Work is not included as painting Work, or are included under other Sections or in other contracts:

1. Shop Priming: Shop priming of structural metal, miscellaneous metal fabrications, other metal items and fabricated components such as shop-fabricated or factory-painted process equipment, plumbing equipment, heating and ventilating equipment, electrical equipment, and accessories shall conform to applicable requirements of this Section but are included under other Sections.
2. Pre-finished Items:
    a. Items furnished with such finishes as baked-on enamel, porcelain, and polyvinylidene fluoride shall only be touched up at Site by Contractor using manufacturer's recommended compatible field-applied touchup paint.
    b. Items furnished with finishes such as chrome plating or anodizing.
3. Concealed Surfaces: Non-metallic wall or ceiling surfaces in areas not exposed to view, and generally inaccessible areas, such as furred spaces, pipe chases, duct shafts, and elevator shafts.
4. Concrete surfaces.
5. Concrete floors, unless specifically shown as a surface to be painted.
6. Face brick, glazed structural tile, and prefaced, ground-faced or split-faced concrete unit masonry.
7. Exterior face of architectural precast concrete.
8. Collector bearings, shafts and chains, wood flights, wood stop logs, and wood or fiberglass baffles.
9. Corrosion-Resistant Metal Surfaces: Where the natural oxide of item forms a barrier to corrosion, whether factory- or Site-formed, including such materials as copper, bronze, muntz metal, terne metal, and stainless steel.
10. Operating Parts and Labels:
    a. Do not paint moving parts of operating units, mechanical and electrical parts such as valve and damper operators, linkages, sensing devices, interior of motors, and fan shafts.
    b. Do not paint over labels required by governing authorities having jurisdiction at Site, or equipment identification, performance rating, nameplates, and nomenclature plates.
    c. Cover moving parts and labels during the painting with protective masking. Remove all protective masking upon completion of Work. Remove all paint, coatings, and splatter that comes in contact with such labels.
11. Structural and miscellaneous metals covered with concrete need not receive primers, intermediate, or finish coats of paint.
12. Existing structures, equipment, and other existing surfaces and items unless otherwise shown or specified.

E. Description of Colors and Finishes:
1. Color Selection:
    a. Engineer reserves the right to select non-standard colors for paint systems specified within ability of paint manufacturer to produce such non-standard colors. Provide such colors at no additional expense to Owner.
2. Color Coding of Pipelines, Valves, Equipment, and Ducts:
    a. Color-coding of pipelines, valves, equipment and ducts shall comply with applicable standards of ANSI A13.1, ANSI Z535.1, CFR 1910.144, Recommended Standards for Water Works, and Recommended Standards for Wastewater Facilities. For piping and equipment not covered by the above standards, conform to Owner’s color standards.
    b. For equipment located on roofs and equipment that is exposed-to-view, color will be selected by Engineer.

1.2 REFERENCES

A. Referenced Standards: Standards referenced in this Section are:
   1. ANSI A13.1, Scheme for Identification of Piping Systems.
   2. ANSI Z535.1, Safety Color Code.
   3. ASTM D16, Terminology for Paint, Related Coatings, Materials and Applications.
   4. ASTM D2200, Pictoral Surface Preparation Standards for Painting Steel Surfaces.
   5. ASTM D4262, Testing Method for pH of Chemically Cleaned or Etched Concrete Surfaces.
   6. ASTM D4263, Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method.
   7. ASTM D4541, Test Methods for Pull-Off Strength of Coatings Using Portable Adhesion-Testers.
   8. ASTM E329, Specification for Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction.
   9. Great Lakes Upper Mississippi River Board of Public Health and Environmental Managers (GLUMRB) Recommended Standards for Water Works.
   10. GLUMRB, Recommended Standards for Wastewater Facilities.
   11. Ozone Transport Commission, (OTC), OTC Model Rule for Architectural and Industrial Maintenance Coatings.
   12. SSPC PA 2, Measurement of Dry Coating Thickness with Magnetic Gages.
   13. SSPC VIS 1, Visual Standard for Abrasive Blast Cleaned Steel.
   14. SSPC VIS 2, Method of Evaluating Degree of Rusting/Painted Steel Surfaces.
   15. SSPC Volume 2, Systems and Specifications.

1.3 DEFINITIONS

A. Coating terms defined in ASTM D16 apply to this Section.

1.4 QUALITY ASSURANCE

A. Applicator Qualifications:
   1. Engage a single applicator regularly performing installation of painting systems, with documented skill and successful experience in installing types of products required and agrees to employ only tradesmen trained, skilled, and with successful experience in installing types of products specified.

B. Testing Agency Qualifications: Provide independent testing agency with experience and capability to satisfactorily conduct testing specified in accordance with ASTM E329. Testing agency shall be selected by Owner and paid for by Contractor.

C. Source Quality Control:
   1. Obtain products from manufacturers that will provide services of a qualified manufacturer's representative at Site at commencement of painting Work to advise on products, mock-ups, installation, and finishing techniques, at completion of the Work to advise Engineer on acceptability of completed Work, and during course of Work as requested by Engineer.
   2. Submit "or equal" products, when proposed, with direct comparison to products specified, including information on durability, adhesion, color and gloss retention, percent solids, VOC's grams per liter, and recoatability after curing.

3. "Or equal" manufacturers shall furnish same color selection as manufacturers specified, including intense chroma and custom pigmented colors in painting systems.
4. Color Pigments: Provide pure, non-fading, applicable types to suit surfaces and services indicated. Comply with the following:
    a. Lead and Chromate: Lead and chromate content shall not exceed amount allowed by authorities having jurisdiction.
    b. Through Contractor, paint manufacturer shall notify Engineer of colors that are not suitable for long-term color retention in areas subject to hydrogen sulfide fume exposure.
    c. Manufacturer shall identify colors that meet requirements of authorities having jurisdiction at Site for use in locations subject to contact with potable water or water that will be treated to become potable.
    d. Comply with paint manufacturers' recommendations on preventing coating contact with levels of carbon dioxide and carbon monoxide that may cause yellowing during application and initial stages of curing of paint coatings.

D. Regulatory Requirements:
1. Comply with VOC content limits of Ozone Transport Commission (OTC), Model Rule for Architectural and Industrial Maintenance Coatings.

E. Pre-Painting Conference:
1. Conduct a pre-painting conference at the Site to review specified requirements. Meeting attendees shall include painting applicator and its foreman, paint manufacturer's technical representative, installers of other work in and around painting that must follow painting Work, Engineer, and other representatives directly concerned with performance of painting Work.

1.5 SUBMITTALS

A. Action Submittals: Submit the following:
1. Product Data:
    a. Copies of manufacturer's technical data sheets, including surface preparation, number of coats, dry film thickness, test performance data including paint analysis, VOC and chemical component content in comparison to maximum allowed by the Contact Documents, and application instructions for each product proposed for use
    b. Submit proof of acceptability of proposed application techniques by paint manufacturer selected.
    c. Copies of Contractor's proposed protection procedures in each area of the Work explaining methods of protecting adjacent surfaces from splatter, for confining application procedures in a manner that allows other work adjacent to surface preparation and painting Work to proceed safely and without interruption, and for maintaining acceptable application, curing, and environmental conditions during and after painting systems application.
    d. List each material and cross-reference to the specific painting system and application, including a list of site-specific surfaces to which painting system will be applied. Identify by manufacturer's catalog number and general classification. State number of gallons of each product being purchased for delivery to Site and square foot area calculated to be covered by each painting system specified based on theoretical loss of 20 percent. Where actual area to be covered by paint system exceeds area submitted to Engineer for that system, proof of additional material purchase shall be provided to Engineer. Calculated coverage shall be as specified

for each component of each painting system specified. This requirement does not take precedence over Contractor's responsibility to provide dry film thickness required for each component of each painting system.

e. Identify maximum exposure times allowable for each paint system component before next coat of paint can be applied. Submit proposed methods for preparing surfaces for subsequent coats if maximum exposure times are exceeded.

f. Information on curing times and environmental conditions that affect curing time of each paint system component and proposed methods for accommodating variations in curing time. Identify this information for each painting system in the Work.

g. Specification for spray equipment with cross-reference to paint manufacturer's recommended equipment requirements.

2. Samples:

a. Copies of manufacturer's complete color charts for each coating system.

B. Informational Submittals: Submit the following:

1. Certificates:

a. Certificate from paint manufacturer stating that materials meet or exceed Contract Documents requirements.

b. Contractor shall provide notarized statement verifying that all painting systems are compatible with surfaces specified. All painting systems components shall be reviewed by an authorized technical representative of paint manufacturer for use as a compatible system. Verify that all painting systems are acceptable for exposures specified and that paint manufacturer is in agreement that selected systems are proper, compatible, and are not in conflict with paint manufacturer's recommended specifications. Show by copy of transmittal form that a copy of letter has been transmitted to paint applicator.

2. Test Reports:

a. Certified laboratory test reports for required performance and analysis testing in compliance with ASTM E329.

b. Adhesion testing plan and procedures.

c. Results of adhesion testing on existing surfaces containing paints or other coatings to be topcoated with paint systems specified. Prior to adhesion testing, submit a testing plan establishing methods, procedures and number of tests in each area where existing coatings are to remain and become substrate for painting Work. Based on results of adhesion testing, recommend methods, procedures, and painting system modifications, if necessary, for proceeding with Work.

d. Locations of and test methods for soil sampling before beginning Work and after Substantial Completion.

e. Proposed methods for testing, handling, and disposal of waste generated during Work.

f. Results of alkalinity and moisture content tests performed per ASTM D4262 and ASTM D4263.

g. Results of film thickness, holidays, and imperfections tests.

3. Manufacturer's Instructions: Provide paint manufacturer's storage, handling, and application instructions prior to commencing painting Work at Site.

4. Manufacturer's Site Reports: Provide report of paint manufacturer's representative for each visit to Site by paint manufacturer's representative.

5. Special Procedure Submittals:

a. Proposed protection procedures for each area of Work, explaining methods of protecting adjacent surfaces from splatter, for confining application procedures in a

manner that allows other work adjacent to surface preparation and painting Work to proceed safely and without interruption.
b. Site-specific health and safety plan.
c. Procedures for maintaining acceptable application, curing and environmental conditions during and after painting systems application.
d. Procedures for providing adequate lighting, ventilation, and personal protection equipment relative to painting Work.

6. Qualifications:
a. Applicator.
b. Testing laboratory

C. Closeout Submittals: Submit the following:
1. Maintenance Manual: Upon completion of the painting Work, furnish Engineer five copies of detailed maintenance manual including the following information:
a. Complete and updated product catalog of paint manufacturer's currently available products including complete technical information on each product. Identify product names and numbers of each product used in the painting Work.
b. Name, address, e-mail address and telephone number of manufacturer, local distributor, applicator and technical representative.
c. Detailed procedures for routine maintenance and cleaning.
d. Detailed procedures for light repairs such as dents, scratches and staining.
2. Statement of Application: Upon completion of the painting Work, submit a notarized statement to Engineer signed by Contractor and painting applicator stating that Work complies with requirements of the Contract Documents and that application methods, equipment, and environmental conditions were proper and adequate for conditions of installation and use.

1.6 DELIVERY, STORAGE AND HANDLING

A. Product Delivery Requirements: Deliver products to Site in original, new, and unopened packages and containers, accurately and legibly and accurately labeled with the following:
1. Container contents, including name and generic description of product.
2. Manufacturer's stock number and date of manufacture.
3. Manufacturer's name.
4. Contents by volume, for major pigment and vehicle constituents.
5. Grams per liter of volatile organic compounds.
6. Thinning instructions, where recommended.
7. Application instructions.
8. Color name and number.

B. Product Storage Requirements:
1. Store acceptable materials at Site.
2. Store in an environmentally controlled location as recommended in paint manufacturer's written product information. Keep area clean and accessible. Prevent freezing of products.
3. Store products that are not in actual use in tightly covered containers.
4. Comply with health and fire regulations of authorities having jurisdiction at Site.

C. Product Handling Requirements:
1. Handle products in a manner that minimizes the potential for contamination, or incorrect product catalyzation.

2. Do not open containers or mix components until necessary preparatory work has been completed and approved by Engineer and painting Work will start immediately.
3. Maintain containers used in storing, mixing, and applying paint in a clean condition, free of foreign materials and residue.

1.7 SITE CONDITIONS

A. Site Facilities:
1. Supplemental heat sources, as required to maintain both ambient and surface temperatures within range recommended by paint manufacturer for paint system applications, are not available at the Site.
2. Provision of supplemental heat energy sources, power, equipment, and operating, maintenance, and temperature-monitoring personnel is Contractor's responsibility.
3. Do not use heat sources that emit carbon dioxide or carbon monoxide into areas being painted. Properly locate and vent heat sources to exterior so that paint systems and personnel are unaffected by exhaust products.

B. Existing Conditions:
1. Existing surfaces to receive painting Work shall have their surfaces prepared to meet requirements of painting systems specified. Prior to initiating painting Work, perform adhesion tests on existing surfaces to be painted. Perform testing per ASTM D4541 or other method acceptable to Engineer. Number and location of tests shall be sufficient to determine the condition of existing coatings and suitability of existing coatings to remain to provide an acceptable substrate for new coatings. Submit testing plan prior to testing and provide Engineer the adhesion test results.
2. Provide abrasive blasting, scraping, or other abrading or surface film removal, or preparatory techniques accepted by Engineer.
3. Before commencing painting in an area, surfaces to be painted and floors shall be cleaned of dust using commercial vacuum cleaning equipment equipped with high-efficiency particulate air (HEPA) filters and dust containment systems.
4. After painting operations have started in a given area, cleaning only with commercial vacuum cleaning equipment with high-efficiency particulate air (HEPA) filters and dust containment systems.

C. Environmental Requirements:
1. Comply with manufacturer's published requirements.

D. Protection:
1. Cover or otherwise protect finished Work of other trades and those surfaces not being painted concurrently and not to be painted.
2. During surface preparation and painting, facility shall remain in operation. Use procedures that prevent contamination of process or cause or require facility shutdown.
3. Coordinate and schedule surface preparation and painting to avoid exposing personnel to hazards associated with painting Work. Provide required personnel safety equipment per requirements of authorities having jurisdiction at Site.
4. Submit protection procedures to be employed. Do not begin surface preparation and painting Work until Engineer accepts protection techniques proposed by Contractor.
5. When working with flammable materials, provide fire extinguishers and post temporary signs warning against smoking and open flame.

PART 2 - PRODUCTS

2.1 PAINTING SYSTEM MANUFACTURERS

A. Products and Manufacturers: Where referenced under painting systems, provide painting systems manufactured by the following:
   1. Tnemec Company, Incorporated (TCI).
   2. The Carboline Company, subsidiary of RPM International Inc (TCC).
   3. Sherwin-Williams Company (SWC).
   4. Or equal.

2.2 PAINTING SYSTEMS

A. New Ferrous Metals, Structural Steel, Miscellaneous Ferrous Metals, Exterior Surfaces of Valves, Exterior Surfaces of Ferrous Piping, and Exterior Surfaces of All Ferrous Metal; Non-submerged, Interior:
   1. Shop Primer:
      a. Generic Components:
         1) Minimum 67 percent volume solids, build, two-component, cycloaliphatic amine-catalyzed epoxy or polyamido-amine epoxy coating; 250 grams per liter VOC, maximum.
      b. Products and Manufacturers: Provide one of the following:
         1) Series N69 Hi-Build Epoxoline (TCI); Carboguard 954 HB (TCC): One coat, 4.0 to 6.0 dry mils.
   2. Field Primer and Touch-Up:
      a. Generic Components:
         1) Minimum 67 percent volume solids, build, two-component, cycloaliphatic amine-catalyzed epoxy or polyamido-amine epoxy coating; 250 grams per liter VOC, maximum
      b. Products and Manufacturers: Provide one of the following:
         1) Series N69 Hi-Build Epoxoline (TCI); Carboguard 954 HB (TCC); One coat, 4.0 to 6.0 dry mils.
   3. Finish: High-Gloss:
      a. Generic Components:
         1) Minimum 67 percent volume solids, build, two-component, cycloaliphatic amine-catalyzed epoxy or polyamido-amine epoxy coating; 250 grams per liter VOC, maximum.
      b. Products and Manufacturers: Provide one of the following:
         1) Series N69 Hi-Build Epoxoline (TCI); Carboguard 954 HB (TCC): One coat, 4.0 to 6.0 dry mils.

B. New and Existing Ferrous Metals, Galvanized Metals and Non-Ferrous Metals and Exterior Surfaces of Piping; Submerged and Intermittently Submerged, including up to 4.0 feet above liquid surface; Certified per ANSI/NSF Standard 61; Moderate VOC Content, Interior:
   1. Surface Preparation: Refer to Paragraphs 1.5.A.2, 3.2.A., 3.2.C.1., 3.2.C.2., 3.2.D. and 3.2.E.
   2. Primer/Finish:
      a. Generic Components:
         1) Minimum 100 percent solids, modified polyamine epoxy or flake-filled epoxy; 8 grams per liter VOC, maximum.
      b. Products and Manufacturers: Provide one of the following:
         1) Series 22 Pota-Pox 100 (TCI); Plastite 140 S (TCC); Dura-Plate UHS NSF (SWC): Two coats, 8.0 to 10.0 dry mils, per coat.

C. New and Existing Ferrous Metals, Non-Ferrous Metals, and Galvanized Metals; Low VOC Content, Non-Submerged, Exterior:
   1. Surface Preparation: Refer to Paragraphs 1.5.A.2., 3.2.A., 3.2.C.1., 3.2.C.2., 3.2.D., 3.2.E., and 3.2.F.
   2. Ferrous Metal Primer:
      a. Generic Components:
         1) Minimum 67 percent volume solids, build, two-component, cycloaliphatic amine-catalyzed epoxy coating; 250 grams per liter VOC, maximum.
      b. Products and Manufacturers: Provide one of the following:
         1) Series V69 Hi-Build Epoxoline (TCI); Carboguard 890 LT (TCC); Macropoxy HS (SWC): One coat, 4.0 to 6.0 dry mils.
   3. Ferrous Metal Touch-Up:
      a. Generic Components:
         1) For Low-temperature Curing Conditions: Minimum 80 percent solids, modified polyamido-amine or polyamine epoxy; 296 grams per liter VOC, maximum.
         2) For Warm-temperature Curing Conditions: Minimum 80 percent volume solids, modified polyamido-amine or polyamine epoxy; 296 grams per liter VOC, maximum.
      b. Products and Manufacturers: Provide one of the following:
         1) For Low-temperature Curing Conditions: Series 136, Chembuild FC (TCI); Carboguard 890 LT (TCC); Macropoxy HS Epoxy (SWC): One coat, 10.0 dry mils.
         2) For Warm-temperature Curing Conditions: Series 166 Epoxoline HS (TCI); Carboguard 1207 HB (TCC); Macropoxy HS Epoxy (SWC): One coat, 6.0 dry mils.
   4. Galvanized and Non-Ferrous Primer.
      a. Generic Components:
         1) Refer to Paragraph 2.2.R.2.a.1), above.
      b. Products and Manufacturers: Provide one of the following:
         1) Refer to Paragraph 2.2.R.2.b.1), above.
   5. Intermediate – Ferrous Metals Only:
      a. Generic Components:
         1) Refer to Paragraph 2.2.R.3.a.1), above.
         2) Refer to Paragraph 2.2.R.3.a.1), above.
      b. Products and Manufacturers: Provide one of the following:
         1) Refer to Paragraph 2.2.R.3.a.1), above.
         2) Refer to Paragraph 2.2.R.3.b.1), above.
   6. Finish: Gloss:
      a. Generic Components:
         1) Minimum 49 percent volume solids, two-component, waterborne acrylic polyurethane or aliphatic acrylic polyurethane coating; 247 grams per liter VOC, maximum.
      b. Products and Manufacturers: Provide one of the following:
         1) Series 1080 Endura-Shield WB (TCI); Carbothane 134 VOC (TCC); Centurion WB Urethane (SWC): Two coats, 2.0 to 3.0 dry mils.

D. New and Existing Galvanized Metal, Non-Ferrous Metal, and Fiberglass; Non-submerged, Interior:
   1. Surface Preparation: Refer to Paragraphs 1.5.A.2., 3.2.A., 3.2.D., 3.2.E. and 3.2.F.
   2. Primer:

a. Generic Components:
1) Minimum, 39 percent volume solids single-component, self-cross linking acrylic primer-sealer, 140 grams per liter VOC, maximum.
b. Products and Manufacturers: Provide one of the following:
1) Series 115 Uni-Bond DF (TCI); Galoseal Wash Primer (TCC); Pro-Cryl Universal Primer (SWC): One coat, 2.0 to 4.0 dry mils.

3. Finish: Satin:
a. Generic Components:
1) Minimum, 41 percent volume solids, single component, self-cross linking acrylic; 208 grams per liter VOC, maximum.
b. Products and Manufacturers: Provide one of the following:
1) Series 116 Uni-Bond (TCI); Carbocrylic 3359 (TCC); DTM Acrylic Coating (SWC): One coat, 2.0 to 4.0 dry mils.

E. New and Existing Aluminum in Contact with Dissimilar Materials:
1. Surface Preparation: Refer to Paragraphs 1.5.A.2., 3.2.A. and 3.2.D.
2. Primer/Finish:
a. Generic Components:
1) Minimum 100 percent volume solids, high-build, two-component, polyamido-amine or polyamine epoxy; 49 grams per gallon VOC, maximum.
b. Products and Manufacturers: Provide one of the following:
1) Series 165 Epoxoline 100 (TCI); Carboguard 954 HB (TCC); Dura-Plate UHS (SWC): Two coats, 8.0 to 15.0 dry mils, per coat.

F. New and Existing PVC and CPVC Piping and Fiberglass Insulation Covering; Non-submerged, Interior:
1. Surface Preparation: Refer to Paragraphs 1.5.A.2., 3.2.A. and 3.2.F.
2. Primer:
a. Generic Components:
1) Minimum 37 percent volume solids single-component, self-cross linking acrylic primer-sealer; 226 grams per liter VOC, maximum.
b. Products and Manufacturers: Provide one of the following:
1) Series 115 Uni-Bond DF (TCI); Carbocrylic 3358 (TCC); DTM Acrylic Primer/Finish (SWC): One coat, 2.0 to 4.0 dry mils.
3. Finish: Satin:
a. Generic Components:
1) Minimum 37 percent volume solids, single component, self-cross linking acrylic; 226 grams per liter VOC, maximum.
b. Products and Manufacturers: Provide one of the following:
1) Series 116 Uni-Bond (TCI); Carbocrylic 3358 (TCC); DTM Acrylic Primer/Finish (SWC): One coat, 2.0 to 4.0 dry mils.

G. New and Existing Exterior Surfaces of Steel Pipe; Buried Exterior:
1. Surface Preparation: Refer to Paragraphs 1.5.A.2., 3.2.A., 3.2.C.1., and 3.2.E.
2. Primer/Finish:
a. Generic Components:
1) Minimum 75 percent volume solids, build, coal tar polyamide epoxy coating; 330 grams per liter VOC, maximum.
b. Products and Manufacturers: Provide one of the following:
1) Series 46 Hi-Build H-413 Tneme-Tar (TCI); Bitumastic 300M (TCC); Targuard (SWC): Two coats, 9.0 dry mils, per coat.

H. New and Existing Concrete Unit Masonry Walls; Moderate Corrosion and Abrasion Resistant, Non-submerged, Interior:
1. Surface Preparation: Refer to Paragraphs 1.5.A.2., 3.2.A., 3.2.B.1., 3.2.B.2. and 3.2.B.8.
2. Filler, Surfacer and Patching Compound:
a. Generic Components:
1) Minimum 68 percent volume solids, high-build, three-component, waterborne cementitious acrylic block filler; 75 grams per liter VOC, maximum.
b. Products and Manufacturers: Provide one of the following:
1) Series 130 Envirofill (TCI); Sanitile 600 TG (TCC); Cement-Plex 875 (SWC): One coat, 10 to 14 dry mils.
3. Intermediate/Finish:
a. Generic Components:
1) Minimum 80 percent volume solids, high-build, chemical-resistant, high-gloss, modified, polyamine or polyamido-amine catalyzed epoxy finish; 180 grams per liter VOC, maximum.
b. Products and Manufacturers: Provide one of the following:
1) Series 280 Tneme-Glaze (TCI); Carboguard 890 LT (TCC); Cor-Cote HP (SWC):
a) Horizontal Surfaces: Two coats, 6.0 to 12.0 dry mils, per coat.
b) Vertical Surfaces: Two coats, 4.0 to 8.0 dry mils, per coat.

I. New and Existing Exterior Surfaces of Ductile Iron Process Pipe; Buried Exterior:
1. Refer to Section 40 0519, Ductile Iron Process Pipe.

2.3 CALKING AND SEALANTS

A. Refer to Section 07 9200, Joint Sealants.

2.4 INSTRUMENTS

A. Instruments:
1. Provide one new dry-film thickness gauge for checking film thickness, one holiday detector to detect holidays or holes in the coating, and one set of visual standards to check surface preparation. Calibrate dry film thickness gauge at Site using Bureau of Standards standard shim blocks Products and Manufacturers, provide the following:
a. Film Thickness Testers: Model FM-III manufactured by Mikrotest, or equal.
b. Holiday detector shall be Model M-1 as manufactured by Tinker & Rasor, or equal.
c. Visual Standards: ASTM D2200, Swedish Standards, SSPC VIS 1.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which painting Work is to be performed and notify Engineer in writing of conditions detrimental to proper and timely completion of Work. Do not proceed with Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Do not paint over existing paint where there is no assurance that existing paint will provide an acceptable surface for long-term adherence and durability of painting systems specified, or where

paint manufacturer requires removal of all existing paint to recommend use of specified painting system.

3.2 SURFACE PREPARATION

A. General:
   1. Comply with paint manufacturer's published recommendations for products, surface condition, and surface preparation.

3.3 PROTECTION OF PROPERTY AND STRUCTURES

A. Protect property and structures adjacent to the Work from waste residues resulting from cleaning, surface preparation, and painting Work.

B. Use shrouding, vacuum blasting, or other acceptable methods for cleaning and surface preparation of exterior surfaces.

C. During blast cleaning and surface preparation of interior and exterior surfaces, control exhausting of dust and grit using shrouding, negative-pressure containment/dust collection systems, or other means to protect adjacent property and structures and prevent dust and grit from escaping. Similarly, control removal and temporarily store residues to protect adjacent property and structures.

D. For painting of exterior surfaces, use rollers, shrouding, or other acceptable methods as required to protect adjacent property and structures from wind-blown paint residues.

E. Submit proposed procedures for cleaning, surface preparation, and paint application that describe in detail methods to be used to protect adjacent property and structures from residues. Do not proceed with cleaning, surface preparation, or painting until proposed procedures are accepted by Engineer.

3.4 MATERIALS PREPARATION

A. General: Mix and prepare painting products in strict accordance with paint manufacturer's product data sheets.

3.5 APPLICATION

A. General:
   1. Apply paint systems by brush, roller, or airless spray per paint manufacturer's recommendations and in compliance with Paint Application Specifications No. 1 in SSPC Volume 2, where applicable, and in strict accordance with paint manufacturer's product data sheets.
   2. Surfaces of items not normally exposed-to-view do not require same color as other components of system of which they are a part, but require same painting system specified for exposed surfaces of system.
   3. Paint interior surfaces of ducts, where visible through registers or grilles, with a flat, non-specular black paint before final installation of registers or grilles.
   4. Paint backs of access panels and removable or hinged covers to match exposed surfaces.
   5. Omit field-applied primer on metal surfaces that have been primed in the shop. Touch-up paint to shop-primed coats and pre-finished items only when approved by Engineer using

compatible primers and paint manufacturer's recommended compatible field-applied finishes.

6. Welds shall be stripe-coated with intermediate or finish coat of paint after application of prime coat.

B. Minimum/Maximum Paint Film Thickness: Comply with manufacturer's published recommendations for coating type and surface.

C. Scheduling Surface Preparation and Painting: Comply with manufacturer's published recommendations for coating type and surface.

D. Prime Coats: Recoat primed and sealed walls and ceilings where there is evidence of suction spots or unsealed areas in first coat, to result in a finish coat with no burn-through or other defects caused by insufficient sealing.

E. Pigmented (Opaque) Finishes: Completely cover to provide an opaque, smooth surface of uniform finish, color, appearance, and coverage.

F. Brush Application:
1. Brush-out and work all brush coats onto the surfaces in an even film. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections are unacceptable. Neatly draw all glass and color break lines.
2. Brush-apply all primer or first coats, unless otherwise allowed to use mechanical applicators.

G. Mechanical Applicators:
1. Use mechanical methods for applying paint when allowed by applicable ordinances, paint manufacturer, and approved by Engineer.
2. Limit roller applications, if approved by Engineer, to interior wall finishes for second and third coats. Apply each roller coat to provide equivalent hiding as brush-applied coats.
3. Where spray application is used, apply each coat to provide equivalent hiding of brush-applied coats. Do not double back with spray equipment for purpose of building up film thickness of two coats in one pass.

H. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or repaint Work not in compliance with specified requirements as required by Engineer.

3.6 FIELD QUALITY CONTROL

A. Notify Engineer after completing each coat of paint. After inspection and checking of film thickness, holidays, and imperfections, and after acceptance by Engineer, proceed with succeeding coat. Provide testing instruments specified in Article 2.4 of this Section for testing by Contractor. Testing instruments shall become property of Owner.
1. Engineer will witness all testing and shall be notified of scheduled testing at least twenty-four hours in advance.
2. Apply additional coats, if required, to produce specified film thickness and to correct holidays and to completely fill all surface air holes.

B. For magnetic substrates, measure thickness of dry film nonmagnetic coatings following recommendations of SSPC PA-2. These procedures supplement manufacturers' approved instructions for manual operation of measurement gauges and do not replace such instructions.

C. Record time, location, number of coats, dry film thickness, holidays, and other imperfections and submit testing results to Engineer.

3.7 ADJUSTMENT AND CLEAN-UP

A. Correct damage to work of other trades by cleaning, repairing or replacing, and repainting, as acceptable to Engineer.

B. During progress of the Work, remove from Site all discarded paint products, rubbish, cans, and rags at end of each workday.

C. Upon completion of painting, clean paint-spattered surfaces. Remove spattered paint by proper methods of washing and scraping, using care not to scratch or otherwise damage finished surfaces.

D. At completion of Work of other trades, touch-up and restore all damaged or defaced painted surfaces as determined by Engineer.

END OF SECTION 09 9100

SECTION 09 9600

HIGH PERFORMANCE COATINGS

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including, but not limited to, Division 1, General Requirements.

1.2 DESCRIPTION OF WORK

A. The Contractor shall provide all labor, materials and equipment necessary to install coating systems for water and wastewater facilities. Section includes surface preparation, shop coating and field coating of exterior and interior items and surfaces. Surface preparation, priming, and finish coats specified in this Section are in addition to shop priming and surface treatment specified in other Sections.

B. Paint all exposed new substrates listed in Part 2, except as follows:
   1. Corrosion-resistant surfaces such as aluminum, brass, and stainless steel.
   2. Concrete, except interior building walls, interior surface of wet well(s), and chemical containment(s). All concrete floors to be coated in accordance with Division 09, Section "Interior Painting" and in accordance with the room finish schedule on the Architectural Drawings.
   3. Equipment supplied with a factory finish coating equivalent to the coating specified in Part 2.

1.3 REFERENCES

A. Abbreviations and Acronyms:
   1. Dry Film Thickness (DFT): Thickness of a coat of paint in fully cured state measured in mils (1/1000 inch).

B. Definitions: ASTM D 16, unless otherwise specified.

C. Reference Standards:

1.	ASTM D16	Standard Terminology for Paint, Related Coatings, Materials and Applications
2.	ASTM D4263	Standard Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method.
3.	ASTM F1869	Standard Test Method for Measuring Moisture Vapor Emission Rate of Concrete Subfloor Using Anhydrous Calcium Chloride.
4.	ICRI Guideline No. 03732	Selecting and Specifying Concrete Surface Preparation for Sealers, Coatings, and Polymer Overlays
5.	NAPF 500-03	Surface Preparation Standard For Ductile Iron Pipe and Fittings in Exposed Locations Receiving Special External Coatings and/or Special Internal Linings
6.	SSPC-SP1	Solvent Cleaning
7.	SSPC-SP 2	Hand Tool Cleaning
8.	SSPC-SP 3	Power Tool Cleaning

9. SSPC-SP 5 White Metal Blast Cleaning
10. SSPC-SP 6 Commercial Blast Cleaning
11. SSPC-SP 10 Near-White Metal Blast Cleaning
12. SSPC-SP 11 Power Tool Cleaning to Bare Metal
13. SSPC-SP 12 Ultra-High-Pressure Water-Jetting
14. SSPC-SP 13 Surface Preparation of Concrete

1.4 ADMINISTRATIVE REQUIREMENTS

A. Coordination: Coordinate and ensure compatibility of shop-applied primers with the specified field-applied coatings.

B. Scheduling: Provide the paint submittals within 30 days of the Notice to Proceed.

1.5 SUBMITTALS

A. Action Submittals/Informational Submittals:
   1. Product Data: Submit manufacturer's product data for each coating, including generic description, complete technical data, surface preparation, storage requirements and application instructions.
   2. Color Samples: Submit manufacturer’s color samples showing full range of standard colors.
   3. Submit manufacturer’s certification that coatings comply with specified requirements and are suitable for intended application.
   4. Applicator’s Quality Assurance: Submit list of a minimum of five completed projects of similar size and complexity to this Work. Include for each project:
      a. Project name and location.
      b. Name of owner.
      c. Name of contractor.
      d. Name of engineer.
      e. Name of coating manufacturer.
      f. Approximate area of coatings applied.
      g. Date of completion.

1.6 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer:
      a. Specialize in manufacture of coatings with a minimum of 5 years of successful experience.
      b. Demonstrate successful performance on comparable projects.
      c. Single-Source Responsibility: Coatings and coating reducers shall be products of a single manufacturer.
   2. Applicator:
      a. Experienced in application of specified coatings for a minimum of 5 years on projects of similar size and complexity to this Work.
      b. Applicator's Personnel: Employ persons trained for application of specified coatings.

B. Job Mock-Up:

1. Minimum 10 sq. ft. application of each specified coating system on each type of substrate.
2. Mock-ups will serve as standard for acceptance of work.
3. Leave approved mock-ups in place as part of completed project.
4. Manufacturer's representative shall be available to advise applicator on proper application techniques and procedures.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Deliver materials to site in manufacturer's original, unopened containers and packaging. Paint material containers which do not display manufacturer's product identification will not be acceptable. Container labels to clearly identify:
1. Coating or material name.
2. Manufacturer.
3. Color name and number.
4. Batch or lot number.
5. Date of manufacture.
6. Mixing and thinning instructions.

B. Storage:
1. Store materials in a clean dry area and within temperature range shown on the manufacturer's written instructions.
2. Keep containers sealed until ready for use.
3. Do not use materials beyond manufacturer’s shelf life limits.

C. Handling: Protect materials during handling and application to prevent damage or contamination.

1.8 FIELD CONDITIONS

A. Weather:
1. Air and Surface Temperatures: Prepare surfaces and apply and cure coatings within air and surface temperature range in accordance with manufacturer’s written instructions.
2. Surface Temperature: Minimum of 5 degrees F (3 degrees C) above dew point.
3. Relative Humidity: Prepare surfaces and apply and cure coatings within relative humidity range in accordance with manufacturer’s instructions.
4. Precipitation: Do not prepare surfaces or apply coatings in rain, snow, fog, or mist.
5. Wind: Do not spray coatings if wind velocity is above manufacturer’s limit.

B. Ventilation: Provide ventilation during coating evaporation stage in confined or enclosed areas in accordance with AWWA D102.

C. Dust and Contaminants:
1. Schedule coating work to avoid excessive dust and airborne contaminants.
2. Protect work areas from excessive dust and airborne contaminants during coating application and curing.
3. Protect all surfaces not to be coated.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Carboline Company.

B. Sherwin Williams, Protective & Marine Coatings.

C. Tnemec Inc.

2.2 COATING SYSTEMS, GENERAL

A. The number of coats specified is the minimum required. If additional coats are required to achieve the specified dry film thickness or to provide complete coverage, provide additional coats at no additional cost to the Owner.

B. Material Compatibility: Provide block fillers, primers, and finish coat materials that are compatible with one another and with the substrates indicated under conditions of service and application as recommended by manufacturer, based on testing and field experience.

C. Material Quality: Provide manufacturer's best quality paint material of the various coating types specified that are factory-formulated and recommended by manufacturer for application indicated.

D. Colors: As selected by Engineer from manufacturer's full range, and as scheduled in Part 3.

2.3 COATING SYSTEMS FOR FERROUS METALS

A. Ferrous Metals, Interior, Non-Submerged (includes structural steel, miscellaneous steel and steel piping):
   1. Surface Preparation: SSPC-SP6 Commercial Blast
   2. Shop Primer:
      a. Carboline Carboguard 60 @ 3.0 - 5.0 DFT
      b. Tnemec 161-1211 Fascure @ 3.0 - 5.0 DFT
      c. Sherwin Williams Macropoxy 646 or Copoxy Shop Primer @ 3.0 - 5.0 DFT
   3. Field Preparation: SSPC-SP11 Power Tool Cleaning or Surface Preparation: SSPC-SP6 Commercial Blast
   4. Field Touch-Up:
      a. Carboline Carboguard 60 @ 3.0 - 5.0 DFT
      b. Tnemec 161-1211 Fascure @ 3.0 - 5.0 DFT
      c. Sherwin Williams Macropoxy 646 or Copoxy Shop Primer@ 3.0 - 5.0 DFT
   5. Finish:
      a. Carboline Carboguard 60 @ 4.0 - 6.0 DFT
      b. Tnemec 66-Color H.B. Epoxoline @ 4.0 – 6.0 DFT
      c. Sherwin Williams Macropoxy 646 @ 4.0 - 6.0 DFT
   6. Total DFT: 7.0 - 11.0 mils

B. Ferrous Metals, Interior or Exterior, Submerged or Intermittently Submerged in wastewater:
   1. Surface Preparation: SSPC-SP10 Near White Blast
   2. Shop Primer:
      a. Carboline Carboguard 635 @ 3.0 - 5.0 DFT

b. Tnemec 161-1211 Fascure @ 3.0 - 5.0 DFT
c. Sherwin Williams Dura-Plate 235 @ 3.0 – 5.0 DFT

3. Field Preparation: SSPC-SP10 Near White Blast
4. Field Spot Prime:
   a. Carboline Carboguard 635 @ 3.0 - 5.0 DFT
   b. Tnemec 161-1211 Fascure @ 3.0 - 5.0 DFT
   c. Sherwin Williams Dura-Plate 235 @ 3.0 – 5.0 DFT
5. Stripe Coat:
   a. Carboline Carboguard 635
   b. Tnemec 161-1255 Fascure
   c. Sherwin Williams Dura-Plate 235
6. Finish:
   a. Carboline Bitumastic 300 M @ 8.0 - 10.0 DFT
   b. Tnemec 46H-413 HB Tneme-Tar @ 8.0 - 10.0 DFT
   c. Sherwin Williams Hi-Mil Sher-Tar Epoxy @ 8.0 – 10.0 DFT
7. Total DFT: DFT 11.0 - 15 mils

C. Ferrous Metals, Encased in Concrete and Cementitious Substances:
1. Surface Preparation: SSPC-SP6 Commercial Blast
2. Primer/Finish:
   a. Carboline Carboguard 60 @ 4.0 - 6.0 DFT
   b. Tnemec 66 H.B. Epoxoline @4.0 - 6.0 DFT
   c. Sherwin Williams Macropoxy 646 @4.0 -6.0 DFT
3. Field Preparation: SSPC-SP11 Power Tool Cleaning
4. Touch-Up:
   a. Carboline Carboguard 60 @ 4.0 - 6.0 DFT
   b. Tnemec 66 H.B. Epoxoline @ 4.0 - 6.0 DFT
   c. Sherwin Williams Macropoxy 646 @4.0 -6.0 DFT
5. Total DFT: 4.0 - 6.0 mils

D. Ferrous Metals, Exterior, Non-Submerged:
1. Surface Preparation: SSPC-SP6 Commercial Blast
2. Shop Primer:
   a. Carboline Carbozinc 859 @ 2.5 - 3.5 DFT.
   b. Tnemec 90-97 Tneme-Zinc @ 2.5 - 3.5 mil
   c. Sherwin Williams Corothane I Galvapac @ 2.5 – 3.5 DFT
3. Field Preparation: SSPC-SP6 Commercial Blast or SSPC-SP11 Power Tool Cleaning
4. Field Touch-Up:
   a. Carboline Carbozinc 859 @ 2.5 – 3.5 DFT
   b. Tnemec 90-97 Tneme-Zinc @ 2.5 - 3.5 DFT
   c. Sherwin Williams Corothane I Galvapac @ 2.5 – 3.5 DFT
5. Field Intermediate:
   a. Carboline Carboguard 60 @ 2.0 - 3.0 DFT
   b. Tnemec 66 - Color Epoxoline @ 2.0 - 3.0 DFT
   c. Sherwin Williams Macropoxy 646 @ 2.0 – 3.0 DFT
6. Finish:
   a. Carboline Carbothane 133 HB @ 2.0 - 4.0 DFT
   b. Tnemec 1075 Endura-Shield @ 2.0 - 4.0 DFT
   c. Sherwin Williams Acrolon 218HS or Hi-Solids Polyurethane @ 2.0 – 4.0 DFT
7. Total DFT: 6.5 - 10.5 mils

E. Ferrous Metals, Buried, Exterior (structural & miscellaneous steel, piping):
1. Surface Preparation: SSPC-SP10 Near White Blast
2. Shop Primer:
   a. Carboline Bitumastic 300 M @ 8.0 - 10.0 DFT
   b. Tnemec 46H-413 Tneme-Tar @ 8.0 - 10.0 DFT
   c. Sherwin Williams Hi-Mil Sher-Tar Epoxy @ 8.0 – 10.0 DFT
3. Finish:
   a. Carboline Bitumastic 300 M @ 8.0 - 10.0 DFT
   b. Tnemec 46H-413 Tneme-Tar @ 8.0 - 10.0 DFT
   c. Sherwin Williams Hi-Mil Sher-Tar Epoxy @ 8.0 – 10.0 DFT
4. Total DFT: 16.0 - 20.0 mils

2.4 COATING SYSTEMS FOR DUCTILE AND CAST IRON PIPE

A. Ductile and Cast Iron Pipe - Interior Non-Submerged:
1. Surface Preparation: NAPF 500-03
2. Shop Primer:
   a. Carboline Carboguard 60 @ 3.0 - 5.0 DFT
   b. Tnemec 161 - 1211 Fascure @ 3.0 - 5.0 mils
   c. Sherwin Williams Macropoxy 646 @ 3.0 – 5.0 DFT
3. Field Preparation: NAPF 500-03-03 Power Tool Cleaning, NAPF 500-03-04 Abrasive Blast Cleaning for Ductile Iron Pipe or NAPF 500-03-05 Abrasive Blast Cleaning for Cast Ductile Iron Fittings
4. Field Touch-Up:
   a. Carboline Carboguard 60 @ 3.0 - 5.0 DFT
   b. Tnemec 161-1211 Fascure @ 3.0 - 5.0 DFT
   c. Sherwin Williams Macropoxy 646 @ 3.0 – 5.0 DFT
5. Finish:
   a. Carboline Carboguard 60 @ 4.0 - 6.0 DFT
   b. Tnemec 66-Color HB Epoxoline @ 4.0 - 6.0 DFT
   c. Sherwin Williams Macropoxy 646 @ 4.0 – 6.0 DFT
6. Total DFT: 7.0 - 11.0 mils

B. Ductile and Cast iron Pipe - Exterior Non-Submerged:
1. Surface Preparation: NAPF 500-03
2. Shop Primer:
   a. Carboline Carboguard 60 @ 3.0 - 5.0 DFT
   b. Tnemec 161 - 1211 Fascure @ 3.0 - 5.0 DFT
   c. Sherwin Williams Macropoxy 646 @ 3.0 – 5.0 DFT
3. Field Preparation: NAPF 500-03-03 Power Tool Cleaning, NAPF 500-03-04 Abrasive Blast Cleaning for Ductile Iron Pipe or NAPF 500-03-05 Abrasive Blast Cleaning for Cast Ductile Iron Fittings
4. Field Touch-Up:
   a. Carboline Carboguard 60 @ 3.0 - 5.0 DFT
   b. Tnemec 161-1211 Fascure @ 3.0 - 5.0 DFT
   c. Sherwin Williams Macropoxy 646 @ 3.0 – 5.0 DFT
5. Intermediate:
   a. Carboline Carboguard 60 @ 4.0 - 6.0 DFT
   b. Tnemec 66 - Color HB Epoxoline @ 4.0 - 6.0 DFT
   c. Sherwin Williams Macropoxy 646 @ 4.0 – 6.0 DFT
6. Finish:

a. Carboline Carbothane 133 HB @ 2.5 - 4.0 DFT
b. Tnemec 73 - Color Endurashield @ 2.5 - 4.0 DFT
c. Sherwin Williams Acrolon 218HS or Hi-Solids Polyurethane @ 2.5 – 4.0 DFT

7. Total DFT: 9.5 - 15.0 mils

C. Ductile and Cast iron Pipe – Submerged in Wastewater:
1. Surface Preparation: NAPF 500-03
2. Shop Primer:
a. Carboline Carboguard 635 @ 3.0 - 5.0 DFT
b. Tnemec 161-1211 Fascure @ 3.0 - 5.0 DFT
c. Sherwin Williams Dura-Plate 235 @ 3.0 – 5.0 DFT
3. Field Preparation: NAPF 500-03-03 Power Tool Cleaning, NAPF 500-03-04 Abrasive Blast Cleaning for Ductile Iron Pipe or NAPF 500-03-05 Abrasive Blast Cleaning for Cast Ductile Iron Fittings
4. Field Touch-Up:
a. Carboline Carboguard 635 @ 3.0 - 5.0 DFT
b. Tnemec 161-1211 Fascure @ 3.0 - 5.0 DFT
c. Sherwin Williams Dura-Plate 235 @ 3.0 – 5.0 DFT
5. Finish:
a. Carboline Bitumastic 300 M @ 8.0 - 10.0 DFT
b. Tnemec 46H-413 HB Tneme-Tar @ 8.0 - 10.0 DFT
c. Sherwin Williams Hi-Mil Sher-Tar Epoxy @ 8.0 – 10.0 DFT
6. Total DFT: 11.0 - 15.0 mils

2.5 COATING SYSTEMS FOR NON-FERROUS METALS

A. Non-Ferrous Metals, Submerged or Intermittently Submerged in Liquids:
1. Surface Preparation: SSPC-SP10 Near White Blast
2. Shop Primer:
a. Carboline Carboguard 61 @ 3.0 - 5.0 DFT
b. Tnemec FC20-1255 Pota-Pox @ 3.0 - 5.0 DFT
c. Sherwin Williams Macropoxy 646PW @ 3.0 – 5.0 DFT
3. Field Preparation: Spot SSPC-SP10 Near White Blast
4. Field Spot Prime:
a. Carboline Carboguard 61 @ 3.0 - 5.0 DFT
b. Tnemec 20-1255 Pota-Pox @ 3.0 - 5.0 DFT
c. Sherwin Williams Macropoxy 646PW @ 3.0 – 5.0 DFT
5. Finish:
a. Carboline Carboguard 61 @ 4.0 - 6.0 DFT
b. Tnemec 20-AA90 Pota Pox @ 4.0 - 6.0 DFT
c. Sherwin Williams Macropoxy 646PW @ 4.0 – 6.0 DFT
6. Total DFT: 7.0 - 11.0 mils

B. Galvanized, Aluminum and other Non-Ferrous Metals - Interior:
1. Surface Preparation: Oakite 747LTS and rinse
2. SSPC-SP3 Power Tool Cleaning for rust areas
3. Primer:
a. Carboline Carboguard 880 @ 2.0 - 3.0 DFT
b. Tnemec 66 HB Epoxoline @ 2.0 - 3.0 DFT
c. Sherwin Williams Macropoxy 646 @ 2.0 – 3.0 DFT
4. Finish:

a. Carboline Carboguard 60 @ 2.0 - 3.0 DFT
b. Tnemec 66 HB Epoxoline @ 2.0 - 3.0 DFT
c. Sherwin Williams Macropoxy 646 @ 2.0 – 3.0 DFT

5. Total DFT: 4.0 - 6.0 mils

C. Galvanized, Aluminum and Non-Ferrous Metals - Exterior:
1. Surface Preparation: Oakite 747LTS and rinse
2. SSPC-SSPC-SP7 or NACE 4- Brush-Off Blast Cleaning for rusted areas
3. Primer:
a. Carboline Carboguard 60 @ 2.0 - 3.0 DFT
b. Tnemec 66-Color Epoxoline @ 2.0 - 3.0 DFT
c. Sherwin Williams Macropoxy 646 @ 2.0 – 3.0 DFT
4. Finish:
a. Carboline Carbothane 133 HB @ 2.0 - 4.0 DFT
b. Tnemec 73 Endura-Shield @ 2.0 - 4.0 DFT
c. Sherwin Williams Acrolon 218HS or Hi-Solids Polyurethane @ 2.0 – 4.0 DFT
5. Total DFT: 4.0 - 7.0 mils

2.6 COATING SYSTEMS FOR CONCRETE AND CONCRETE BLOCK

A. Concrete Surfaces for Chemical Containment(s):
1. Surface Preparation: ICRI, International Concrete Repair Institute Guideline No. 310.2 and SSPC-SP13.
2. Primer:
a. Carboline Semstone 110 @ 8.0- 10.0 DFT
b. Tnemec 201 Epoxoprime @ 8.0 - 10.0 DFT
c. Sherwin Williams General Polymers 3579 @ 8.0 – 10.0 DFT
3. Finish:
a. Carboline Semstone 140 @ 25.0- 30.0 DFT
b. Tnemec 281 Tneme-Glaze @ 25.0 - 30.0 DFT
c. Sherwin Williams General Polymers . 3744 @ 25.0 – 30.0 DFT
4. Total DFT: 33.0 - 40.0 mils

B. Concrete Surfaces Submerged or Intermittently Submerged in Wastewater:
1. Surface Preparation: ICRI, International Concrete Repair Institute Guideline No. 310.2 and SSPC-SP13.
2. Primer:
a. Tnemec 46H-413 Tneme-Tar @ 8.0 - 10.0 DFT
b. Carboline Bitumastic 300M @ 8.0- 10.0 DFT
c. Sherwin Williams Hi-Mil Sher-Tar Epoxy @ 8.0 – 10.0 DFT
3. Finish:
a. Tnemec 46H-413 Tneme-Tar @ 8.0 - 10.0 DFT
b. Carboline Bitumastic 300M @ 8.0- 10.0 DFT
c. Sherwin Williams Hi-Mil Sher-Tar Epoxy @ 8.0 – 10.0 DFT
4. Total DFT: 16.0 - 20.0 mils

C. Cover all concrete surfaces in the wet well interior, including full-length of walls, floors, ceilings, pre-cast troughs, and grout fill areas.

2.7 COATING SYSTEMS FOR PVC

A. PVC Piping:

1. Surface Preparation: Sand lightly; wipe clean with xylene.
2. Primer:
    a. Carboline Carboguard 893 SG @ 2.0 - 3.0 DFT
    b. Tnemec N69-Color HB Epoxoline @ 2.0-3.0 DFT
    c. Sherwin Williams Macropoxy 646 @ 2.0 – 3.0 DFT
3. Finish:
    a. Carboline Carboguard 893 SG @ 2.0 - 3.0 DFT
    b. Tnemec N69-Color HB Epoxoline @ 2.0-3.0 DFT
    c. Sherwin Williams Macropoxy 646 @ 2.0 – 3.0 DFT
4. Total DFT: 4.0-6.0 mils

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which coating systems are to be applied. Notify Engineer of areas or conditions not acceptable. Do not begin surface preparation or application until unacceptable areas or conditions have been corrected.

3.2 PREPARATION

A. Protection of In-place Conditions: Protect surrounding areas and surfaces not scheduled to be coated from damage during surface preparation and application of coatings.

B. Surface Preparation: Prepare surfaces in accordance with this paragraph and the requirements listed in Part 2.
1. General
    a. Dislodge dirt, rust, plaster nibs, mortar spatter and other dry material by scraping or brushing. Remove dust and loose material by brushing, sweeping, vacuuming or blowing with compressed air.
    b. Remove oil, wax and grease by scraping off heavy deposits and cleaning with mineral spirits or a hot trisodium phosphate solution followed by a water rinse.
    c. Verify surfaces to be coated are dry, clean and free of dust, dirt, oil, wax, grease or other contaminants.
2. Non-Submerged Concrete, Masonry and Cement Stucco
    a. Allow new concrete and masonry to cure 28 days. Test for moisture in accordance with ASTM D 4263 and, if necessary, F 1869.
    b. Scrape and grind fins and protrusions flush with surface.
    c. Patch holes and cracks flush with surface.
    d. Rake mortar joints clean.
3. Plaster
    a. Remove nibs and other protrusions by scraping flush with surface.
    b. Patch voids and cracks with spackling compound to match texture or surface.
4. Gypsum Board
    a. Sand joint compound smooth and flush with surface using fine-grit sandpaper.
    b. Fill nicks, scratches, holes and uneven spots with spackling compound and sand flush with surface after dry.
5. Non-Ferrous Metal: SSPC-SP1 to remove all contaminants or detergent wash/rinse with "Add H2O" Hyperconcentrate.
6. Submerged steel shop-primed with epoxy must be lightly abraded or whipblasted.

7. Galvanized Metal: Remove contaminants by SSPC-SP1 Solvent Cleaning. Detergent clean with Oakite 747LTS. Lightly abrade for immersion service.
8. Wood
    a. Remove surface deposits of sap and pitch by scraping and cleaning with mineral spirits.
    b. Seal knots and pitch pockets with a product manufactured for this specific purpose.
    c. Sand rough spots of smooth siding and finish woodwork.
    d. After prime coat is dry, fill cracks and holes with a suitable wood filler or spackling compound and sand flush with surface when dry.
9. Concrete Floors and Submerged Concrete: Prepare in accordance with ICRI, International Concrete Repair Institute Guideline No. 03732 and SSPC-SP13 Surface Preparation of Concrete using the appropriate degree of preparation for the intended surface.

3.3 APPLICATION

A. Do not paint prefinished items, concealed surfaces, finished metal surfaces, operating parts, and labels, unless specifically noted otherwise.

B. Apply coatings in accordance with manufacturer's instructions.
1. For porous masonry surfaces and concrete, apply first coat to completely fill voids and surface irregularities and to eliminate all pinholes.
2. Allow each coat to dry thoroughly before recoating. Follow manufacturer's recommended recoat time.

C. Mix and thin coatings, including multi-component materials, in accordance with manufacturer’s instructions.

D. Keep containers closed when not in use to avoid contamination.

E. Do not use mixed coatings beyond pot life limits.

F. Use application equipment, tools, pressure settings, and techniques in accordance with manufacturer’s instructions.

G. Uniformly apply coatings at spreading rate required to achieve specified DFT.

H. Apply coatings to be free of film characteristics or defects that would adversely affect performance or appearance of coating systems.

I. Stripe-paint with brush critical locations on steel such as welds, corners, and edges using specified primer.

J. Immediately remove coatings that fall on surrounding areas and surfaces not scheduled to be coated.

K. Protect surfaces of coating systems from damage during construction.

3.4 REPAIR

A. Materials and Surfaces Not Scheduled to Be Coated: Repair or replace damaged materials and surfaces.

B. Damaged Coatings: Touch up or repair damaged coatings. Touch-up of minor damage will be acceptable where result is not visibly different from adjacent surfaces. Recoat entire surface where touch-up result is visibly different, either in sheen, texture, or color.

C. Coating Defects: Repair in accordance with manufacturer's instructions coatings that exhibit film characteristics or defects that would adversely affect performance or appearance of coating systems.

3.5 CLEANING

A. Remove temporary coverings and protection of surrounding areas and surfaces.

B. Remove paint spatters from glass, plumbing fixtures, and adjoining surfaces.

C. Remove debris from job site and leave storage areas clean.

3.6 SCHEDULES

A. Pipe Color Coding Schedule:
   1. Contents and direction of flow shall be stenciled on the piping in a contrasting color.

Piping and Abbreviation	**PIPING**	**LETTERING**	**BACKGROUND**
POTABLE WATER			
Potable water, cold	Dark blue	Black	Light Green
Potable hot water, supply	Dark blue / white bands	Black	Yellow
Potable hot water, return	Dark blue / aluminum bands	Black	Yellow
PROCESS (FOR NON-STAINLESS STEEL PIPE)			
Blended Water (BLW)	Dark Blue	Blue	White
Cleaning Solution Concentrate Return (CSCR)	Stencil process flow only	Red	White
Cleaning Solution Feed (CSF, CSF1, CSF2)	Stencil process flow only	Red	White
Cleaning Solution Permeate Return (CSPR)	Stencil process flow only	Red	White
NF Bypass (NFB)	Aqua	Black	White
NF Concentrate (NFC)	Light Brown	Black	White
NF Feed (NFF)	Blue	Black	White
NF Permeate (NFP)	Blue	Black	White
NF Permeate Dump (NFD)	Red / Light Blue Bands	Black	White
Raw Water (RW)	Olive green	Black	White
Sample lines	Same as sampled process	Black	White
Sanitary Drain	Dark Gray / Black Bands	Black	White
Vent (Plumbing)	Match Wall Color	Black	Yellow
Vent (Process)	Yellow	Blue	White

Piping and Abbreviation	PIPING	LETTERING	BACKGROUND
CHEMICALS			
Antiscalant (A.S.)	Stencil process flow only	Black	White
Fluoride (FLOUR.)	Stencil process flow only	Black	White
Corrosion Inhibitor (PHOS.)	Stencil process flow only	Black	White
Sodium Hydroxide (NaOH)	Stencil process flow only	Black	White
Sodium Hypochlorite (NaOCl)	Stencil process flow only	Black	White
Sodium Bisulfite ($NaHSO_3$)	Stencil process flow only	Black	White
MISCELLANEOUS (FOR NON-STAINLESS STEEL PIPE)			
Instrument Air (AIR)	Dark Green	Black	White
Fire Protection Piping	Red	White	Red
Natural Gas	Orange	White	Black

END OF SECTION 09 9600

SECTION 09 9673

COATING SYSTEMS FOR CHEMICAL FEED AREAS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 specifications sections apply to this Section.

1.2 DESCRIPTION OF WORK

A. Section includes coating systems for secondary containment for chemical feed storage areas in wastewater facilities, including below-grade concrete chemical containment trenches above-grade containment sumps and walls.

B. The following areas within each chemical feed area shall be coated:
   1. Floors
   2. Sumps
   3. Walls (up to top of secondary containment area)

1.3 DELIVERY, STORAGE, AND HANDLING

A. Comply with the requirements specified in Division 01, Section “Product Requirements”.

B. Material shall be delivered to project site in manufacturer's original unopened containers.

C. Material shall be stored indoors, protected from damage, moisture, direct sunlight, and temperatures below 40 deg F or above 90 deg F.

1.4 ENVIRONMENTAL CONDITIONS

A. Surface and surrounding air temperatures must exceed 55 deg F but must be less than 90 deg F with materials at not less than 70 deg F during application. Do not apply if the relative humidity is more than 90% or the surface temperature is less than 5% above the dew point of the air in the working area.

1.5 QUALIFICATIONS OF APPLICATOR

A. Installation shall be performed by an applicator having satisfactory experience in the application of these or similar materials or with on-site consultation by a qualified field service representative from the manufacturer.

1.6 SUBMITTALS

A. Submittals shall follow requirements of Division 01, Section “Submittal Procedures”.

B. Prior to commencing work, submit to owner, manufacturer's technical information and installation details describing materials to be used.

C. Owner, contractor, and manufacturer shall review and mutually agree upon color, grade, and final texture of coating system before starting installation. The acceptance of a sample will constitute the job standard by which installation will proceed.

PART 2 - PRODUCTS

2.1 MATERIALS (OPTION #1)

A. Surfacer: Series 218 Mortar Clad epoxy modified cement.

B. Primer: Series 201 Epoxoprime, penetrating polyamine cured epoxy primer.

C. Reinforced Coating: Series 275 Novolac Stranlok fiber reinforced coating.

D. Glaze Coat: Series 282 Tneme-Glaze, pigmented epoxy novolac.

E. Manufacturer
1. Tnemec Company, Incorporated
3974-A Brown Park Dr.
Hilliard , Ohio 43026-1168
1-800-890-7580
2. Carboline Company.
3. Sherwin Williams; Industrial and Marine Coatings (S-W).
4. PolySpec (Thiokol).
5. Sprayroq

2.2 MATERIALS (OPTION #2)

A. Primer: Dudick Inc, Primer 67

B. Resurfacer: Scratch Coat 300

C. Reinforced Coating: Protecto-Flex 100XT, Fiberglass mat reinforced with 100 mil crack protection guarantee.

D. Manufacturer
1. Dudick
1818 Miller Pkwy
Streetsboro, Ohio 44241
1-800-322-1970

PART 3 - EXECUTION

3.1 PREPARATION

A. Allow new concrete to cure for 28 days. Verify dryness by testing for moisture by using calcium chloride discs and with the "plastic film tape-down test". (Reference ASTM D 4263)

B. Preparation (Materials Option #1)
1. Degrease and clean to remove all surface contaminants as needed. Mechanically abrade all concrete by means of self-contained, blasting equipment or equal, to remove all

laitance and surface contaminants and provide a minimum profile similar to 40-60 grit sandpaper. (Reference ASTM D 4259 and ICRI CSP 4-5)

C. Preparation (Materials Option #2)
   1. Concrete must be prepared mechanically to remove surface laitance. Oils, grease or other contaminant must be removed prior to surface preparation. Concrete must be free of curing compounds and form release agents. Surface texture should be similar to 40-60 grit sandpaper or the visual standard, CSP-5 from the International Concrete Repair Institute with exposed pea gravel. The prepared surface should have a minimum tensile strength of 250 PSI per ASTM D-4541.

D. After mechanically abrading, verify that all surfaces are clean, dry, and free of any contaminants, which could adversely affect the adhesion of the flooring system.

3.2 SPECIFICATION FOR WALLS, FLOORS, SUMPS AND TRENCH DRAINS

A. Installation (Materials Option #1)
   1. Surfacing: Fill all bugholes, spalled areas and surface imperfections with 218 MortarClad. Concrete block to be filled using Series 130 Envirofill.
   2. Cove: Floor and wall transitions are to have a 2-inch cant or radius cove. This will provide a seamless wall to floor transition.
   3. Priming: Series 201 Epoxoprime primer shall be mechanically mixed and applied in accordance with manufacturer's printed instructions and applied uniformly at a film thickness of 6.0 to 8.0 dry mils DFT. It should be topcoated after 2 hours and within 16 hours.
   4. Fiber Reinforced Coating: Install Series 275 Stranlok by spray application or trowel in a minimum of 2 passes to a total dry film thickness of 40.0 – 60.0 mils DFT.
   5. Glaze Coat: Series 282 epoxy novolac glaze coat shall be mechanically mixed in accordance with manufacturer's printed instructions and applied in a single application at a film thickness 8.0 - 12.0 mils DFT.
   6. Joints: Active expansion, construction and control joints are to be honored unless determined otherwise by the owner or project engineer. Joints and epoxy floor terminations are to be keyed and shall be sawed through the Coating system and filled with an appropriate Polysulphide flexible sealant.

B. Installation (Materials Option #2)
   1. Priming: Dudick Inc Primer 67 shall be mechanically mixed and applied in accordance with manufacturer's printed instructions and applied uniformly at a film thickness of 3.0 to 5.0 dry mils DFT.
   2. Resurfacing: Mechanical preparation removes laitance, exposing honeycombs or voids beneath the surface which must be filled with Dudick Inc Scratch-Coat 300.
   3. Fiber Reinforced Coating: Protecto-Flex 100XT shall be an epoxy lining consisting of 1/16” trowel applied basecoat, one layer of fiberglass mat reinforcement, and a flake filled epoxy topcoat at 20 mils DFT.
   4. Joints: Active expansion, construction and control joints are to be honored unless determined otherwise by the owner or project engineer. Joints and epoxy floor terminations are to be keyed and shall be sawed through the Coating system and filled with an appropriate Polysulphide flexible sealant. Such as Dudick Caulk 149

C. Job Standard: Prior to commencing the installation, the contractor shall install, with the owner's approval, a mutually agreed upon test sample to show final color and appearance of the system. This test area shall serve as a job standard for the final installation.

D. Cleanup: Remove waste materials, rubbish, and debris and dispose of them at the owner's direction. Leave work areas in a clean condition.

E. Protection
   1. Protect the completed work from water, airborne particles or other surface contaminants until cured for a minimum of 24 hours after application.
   2. Protect from traffic, physical abuse, immersion and chemical exposure until the complete system has thoroughly cured for the minimum equivalent of 24 hours at 75°F. For different temperatures, consult the manufacturer's representative about curing times.

3.3 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01 7700.

END OF SECTION 09 9673

SECTION 09 9726

CEMENTITIOUS COATINGS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, appurtenances, specialty items and services as shown, specified and required to furnish and install the complete cementitious coatings Work.
   2. The extent of the cementitious coatings includes surface preparation and application of cementitious coating systems on the following substrates:
      a. Exterior concrete as shown.

B. Coordination:
   1. The manufacturer of the materials specified herein shall be required to review and satisfy all relevant requirements of other Sections and the requirements of the Drawings. Contractor, manufacturer, supplier, fabricator and/or subcontractors furnishing and/or installing materials, equipment, services and specialties associated with this Section shall fully coordinate their efforts.
   2. Review installation procedures under other Sections and coordinate the Work to produce substrate surfaces free from contaminants incompatible with the cementitious coatings Work, and substrates acceptable to the cementitious coatings installer for completely acceptable product performance.
   3. Contractor shall provide all labor, equipment, materials, appurtenances, specialty items and services not provided by Contractor’s manufacturers, suppliers, fabricators and/or subcontractors, but required to furnish and install the complete and operable systems.

C. Related Sections:
   1. Section 03 3000, Cast-In-Place Concrete.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American Society for Testing and Materials, (ASTM):
      a. ASTM C 672 - Standard Test Method for Scaling Resistance of Concrete Surfaces Exposed to Deicing Chemicals.
      b. ASTM D412 (modified) - Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers—Tension..
      c. ASTM E96 - Standard Test Methods for Water Vapor Transmission of Materials ("Wet Cup" Procedure)..
      d. Gemite ISO TP (Test Procedure) 005-97 - Tensile Properties of Thin Cement Composites.

1.3 QUALITY ASSURANCE

A. Installer Qualifications: Provide a single installer, approved by the approved cementitious coatings manufacturer who is regularly engaged in interior ceiling finish systems Work and has a minimum of five years experience in the installation of the types of materials specified.

B. Component Supply and Compatibility: Contractor shall obtain all materials from the same manufacturer and do the following:
   1. Provide the services of a qualified manufacturer's technical representative at the Site at the commencement of Work and during the time when the mock-up Work is being constructed to advise on materials, installation and finishing techniques.

C. Job Mock-Ups:
   1. Prior to the installation of the cementitious coatings Work, but after Engineer's approval of Shop Drawings, build free-standing 4 foot by 6 foot sample panels of each type of complete cementitious coatings on same substrate material that will be used in the Work, to show a representative installation of each complete cementitious coatings Work, including final texture and colors. Stage sample panel Work to leave exposed a 12-inch wide band of each component required in the Work. Obtain Engineer's acceptance of visual qualities of the mock-ups before start of cementitious coatings Work. Retain and protect mock-up during installation as a standard for judging completed cementitious coatings Work. Do not destroy mock-up until given permission by the Engineer.
   2. Cementitious coatings Work that does not meet the standard approved on the sample areas shall be removed and replaced by Contractor at Contractor's expense.
   3. Job Mock-ups that do not have an exposed portion of each system component shall be rejected.

D. Pre-Installation Meeting:
   1. Prior to the installation of the cementitious coatings Work Contractor shall schedule a Pre-Installation Meeting to review the following.
      a. Review project requirements, including all Contract Documents.
      b. Procedure for on-Site inspection and acceptance of cementitious coatings substrate and pertinent details (for example, mock-up installation).
      c. Contractor's plan for the coordination of Work of the various trades involved in providing cementitious coatings and other components.
   2. Pre-Installation Meeting shall be attended by Contractor, cementitious coatings manufacturer's technical representative, personnel directly responsible for installation of the cementitious coatings. Before beginning cementitious coatings Work, Contractor shall confirm, in writing, the resolution of conflicts among those attending the Pre-Installation Meeting.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Copies of manufacturer's specifications, recommendations and installation instructions. Include manufacturer's published data, indicating the material complies with the requirements and is intended for the application shown.
      b. Submit installer's qualifications in accordance with Article 1.4, above.

B. Informational Submittals: Submit the following:

1. Product Test Reports: Based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified testing agency or by a qualified testing agency, for each product formulation.

C. Closeout Submittals: Submit the following:
   1. Maintenance Data: Upon completion of the Work, furnish five copies of detailed maintenance manual including the following information:
      a. Product name and number.
      b. Name, address and telephone number of manufacturer and local distributor.
      c. Detailed procedures for routine maintenance and cleaning.
      d. Detailed procedure for light repair such as scratches and staining.
   2. Guarantee Documentation:
      a. Submit for approval written guarantee agreeing to replace the concrete hardener should it fail to perform as specified in Article 1.6, below.

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery of Materials:
   1. Deliver materials in cementitious coatings manufacturer's original unopened packages.
   2. Include the following information on the label:
      a. Name of material and supplier.
      b. Formula or specification number, lot number, color and date of manufacture.
      c. Mixing instructions, shelf life and curing time, when applicable.
   3. Failure to comply with these requirements shall be sufficient cause for rejection of the material in question, by Engineer, and require its removal from the Site. Supply new material conforming to the specified requirements at no additional cost to Owner.

B. Storage of Materials:
   1. Store materials so as to preclude the inclusion of foreign materials.
   2. Store in accordance with manufacturer's recommendations in a clean, dry, well-ventilated area.
   3. Store materials out of direct sunlight and at a temperature of not less than 40 degrees F.

C. Handling:
   1. Handle materials carefully to prevent inclusion of foreign materials.
   2. Do not open containers or mix components until necessary preparatory Work has been completed and installation will start immediately.
   3. Do not expose combustible or sensitive material to excessive heat or open flame.
   4. Materials shall be used in the Work only when the material being incorporated into the Work bears the same name and formulation as the container or package in which it is contained.
   5. Contractor shall not change containers or use material from unmarked or incorrectly labeled containers.
   6. Failure to comply with this requirement will be cause for the Engineer to require the product to be removed from the Site and the area wherein the product has been incorporated to be removed and rebuilt with material complying with the specified requirements. This requirement shall govern even if Contractor certifies or proves that the material was appropriate for incorporating into the Work.

1.6 JOB CONDITIONS

A. Environmental Conditions:
   1. Proceed with the cementitious coatings Work only when weather conditions will permit unrestricted use of materials and quality control of the Work being installed, complying with this Section's requirements and with the recommendations of the interior ceiling finish systems materials manufacturer.
   2. Apply coatings only when temperature of surfaces to be painted and ambient air temperatures are between 50 and 95 deg F.
   3. Do not apply coatings when relative humidity exceeds 85 percent; at temperatures less than 5 deg F above the dew point; or to damp or wet surfaces.
   4. Proceed only when Contractor and the installer are willing to guarantee the Work as required and without additional reservations and restrictions.

1.7 SCHEDULING

A. Proceed with and complete the Work only when materials, equipment and workers required for the installation of the cementitious coatings Work are at the Site and have sufficient materials and resources to complete the Work in a manner which shall reveal no inconsistencies of texture, color or allowable tolerance in the finished Work greater than that which has been approved on the sample panel by Engineer.

B. Protection:
   1. Do not allow cementitious coatings Work to overflow or spill onto adjoining surfaces or to migrate into the voids of adjoining materials.
   2. Draw all color break lines accurately and to the tolerances specified.
   3. Protect materials against damage by construction traffic.

1.8 WARRANTY

A. Contractor shall furnish an additional written warranty signed by the manufacturer, installer and Contractor, agreeing to replace cementitious coatings Work which fail in materials or workmanship within five years of the date of Final Acceptance.

PART 2 - PRODUCTS

2.1 CEMENTITIOUS COATINGS

A. Polymer-Modified Cementitious Coating: Containing portland cement, polymer, and hydrated lime or aggregates.

B. Product and Manufacturers: Provide one of the following
   1. Euclid Chemical Company, Tamms Industries; Tamoseal.
   2. Gemite Products, Inc.; Cem-Kote ST
   3. BASF Building Systems; Thoroseal with Acryl 60.
   4. Or Equal.

C. Performance Requirements: Comply with the following:
   1. Compressive Strength: Not less than 3500 psi at 28 days according to ASTM C 109/C 109M.
   2. Tensile Strength: Not less than 350 psi at 28 days according to ASTM C 109/C 109M.
   3. Flexural Strength: ASTM C 348: 810 psi at 28 days

4. Adhesion: <Insert value and test method>.
5. Permeance: ASTM E 514 (after coating leaking wall):
   a. Extent of damp area: 72 hours 0.0%
   b. Maximum Leakage: 1 hour: None
   c. Leakage Rate: ml/hr: None
   d. Permeance Rating: Excellent
6. Fungus Growth: Fed Test 141 Method 6272: Resistant
7. Weatherometer ASTM G96: 6,000 Hours, No crazing, cracking, chipping or flaking. Light chalking and color change. No other deterioration

D. Other Materials: Provide crack fillers, block fillers, and related materials that are compatible with cementitious finish-coat materials and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.

E. Colors: As selected by Engineer from manufacturer's full range.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and the installer shall examine the substrates to receive cementitious coatings Work, and the conditions under which the Work is to be performed, and notify Engineer, in writing, of any conditions detrimental to the proper and timely completion of the Work and performance of the cementitious coatings. Do not proceed with the cementitious coatings Work until unsatisfactory conditions have been corrected by Contractor.

B. Begin coating application only after unsatisfactory conditions have been corrected and surfaces are dry.
   1. Beginning coating application constitutes Contractor's acceptance of substrates and conditions.

3.2 PREPARATION

A. Comply with manufacturer's written instructions for mixing and preparing materials and as applicable to substrates indicated.

B. Remove plates, machined surfaces, and similar items already in place that are not to be coated. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and coating.
   1. After completing coating operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any.

C. Clean substrates of substances that could impair bond of coatings, including dirt, oil, grease, incompatible coatings, and loose substrate materials.

D. Cementitious Surfaces: Remove release agents, curing compounds, efflorescence, and chalk. Do not paint surfaces if moisture content or alkalinity of surfaces to be painted exceeds that permitted in manufacturer's written instructions.

E. Crack Repair: Fill cracks according to manufacturer's written instructions before coating surfaces.
   1. Cracks Larger Than 1/32 Inch: Cut out static cracks, voids, or honeycombing larger than 1/32 inch and patch with materials recommended in writing by coating manufacturer. Identify dynamic cracks and treat according to manufacturer's written instructions before beginning application.

3.3 APPLICATION

A. Apply coatings according to manufacturer's written instructions. Use applicators and techniques suited for coating and substrate indicated.
   1. Dampen substrate of surfaces to receive cementitious coatings one hour before beginning application to prevent surface drag. Immediately before applying coatings, redampen substrate. Substrates shall be saturated surface dry at time of application.
   2. Brushes: Use tampico or masonry brushes best suited for material being applied.
   3. Spray Equipment: Use spray equipment recommended in writing by manufacturer for material and texture required.

B. Apply each material at not less than manufacturer's recommended spreading rate. Provide total cured material thickness indicated or as recommended in writing by manufacturer.

C. Brush Application: Brush-out and work brush coats into surfaces in an even film, filling all pores and voids at rate recommended in writing by manufacturer to achieve cured material thickness indicated. Finish coat with smooth, horizontal strokes.

D. Spray Application: Apply each coat according to manufacturer's written instructions to provide the equivalent hiding of brush-applied coats. Follow spray application with a general light brooming of coated surface to impart a slight texture.

3.4 FIELD QUALITY CONTROL

A. Testing of Coating Materials: Owner reserves the right to invoke the following procedure at any time and as often as Owner deems necessary during the period when coating operations are being conducted:
   1. Owner will engage the services of a qualified testing agency to sample coating materials being used. Samples of material delivered to Project site will be taken, identified, sealed, and certified in presence of Contractor.
   2. Engineer may direct Contractor to stop coating application if test results show materials being used do not comply with requirements. Contractor shall remove noncomplying materials from Project site, pay for testing, and recoat surfaces coated with rejected materials. Contractor will be required to remove rejected materials from previously coated surfaces if, on recoating with complying materials, the two coatings are incompatible.

3.5 CLEANING AND PROTECTION

A. At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.

B. After completing coating application, clean spattered surfaces. Remove spattered coatings by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.

C. Protect work of other trades against damage from coating application. Correct damage to work of other trades by cleaning, repairing, replacing, and refinishing, as approved by Architect, and leave in an undamaged condition.

D. At completion of construction activities of other trades, touch up and restore damaged or defaced coated surfaces.

3.6 COATING SCHEDULE

A. General: Apply additional coats when undercoats or other conditions show through final coat until cured film is of uniform coating finish, color, and appearance.

B. Above-Grade Concrete: Two finish coats with total cured thickness not less than 40 mils
   1. First Coat: Apply polymer-modified cementitious coating material at the rate of 2 lb/sq. yd. to achieve a total cured thickness of 25 mils .
   2. Second Coat: Apply polymer-modified cementitious coating material at the rate of 1 lb/sq. yd. to achieve a total cured thickness of 15 mils.

END OF SECTION 09 9726

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 10 1100

VISUAL DISPLAY SURFACES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install visual display surfaces.

B. Related Sections:
   1. Section 09 2116, Gypsum Board Assemblies.
   2. Section 09 9100, Painting.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American Architectural Manufacturers Association, (AAMA).
      a. AAMA 611, Voluntary Standards for Anodized Architectural Aluminum.
      b. AAMA 2603, Voluntary Specification, Performance Requirements and Test Procedures for Pigmented Organic Coating on Aluminum Extrusions and Panels.
   2. American National Standards Institute, (ANSI).
      a. ANSI A117.1, Guidelines for Accessible and Useable Buildings and Facilities - Providing Accessibility and Usability for Physically Handicapped People (ICC/ANSI A117.1-1998).
   3. American Society for Testing Materials, (ASTM).
      a. ASTM E 84, Standard Test Method for Surface Burning Characteristics of Building Materials.
   4. Ohio Building Code.
   5. National Association of Architectural Metal Manufacturers, (NAAMM).
      a. NAAMM - Metal Finishes Manual for Architectural and Metal Products.

1.3 QUALITY ASSURANCE

A. Component Supply and Compatibility:
   1. Furnish all visual display surfaces from one manufacturer for the entire project. In addition to the requirements of this Section, comply with manufacturer's instructions and recommendations for all phases of the Work, including preparation of substrate, installation of grounds and anchors, and application of materials.

B. Requirements of Regulatory Agencies:
   1. Codes: Comply with applicable provisions of the following:
      a. Ohio Building Code.
      b. ANSI A117.1 and Americans with Disabilities Act of 1990 Title II ADAAG.
   2. Fire-Test-Response Characteristics: Provide vinyl-coated tackboards with the following surface-burning characteristics as determined by testing assembled materials composed of facings and backings identical to those required in this Section in accordance with the requirements of ASTM E 84 by a testing and inspecting agency acceptable to authorities

having jurisdiction. Identify vinyl-coated tackboards with appropriate markings of applicable testing and inspecting agency.
a. Flame Spread: 25 or less.
b. Smoke Developed: 10 or less.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Drawings for each type of visual display surface unit. Include full-scale sections of typical trim members and dimensioned elevations. Show anchors, grounds, reinforcement, accessories and installation details.
2. Product Data:
a. Submit for approval manufacturer's technical data and installation instructions for each material and component part. Include methods of installation for each type of substrate to receive units. Transmit copy of each instruction to the installer.
3. Samples:
a. Samples for each type and color of visual display surface, trim and accessories are required. Provide 4-inch square samples of sheet materials and 4-inch lengths of trim members. Engineer'S review of samples will be for color, pattern and texture only. Compliance with all other requirements is the exclusive responsibility of Contractor.

B. Closeout Submittals: Submit the following:
1. Warranty Documentation: Manufacturer's warranty.

1.5 WARRANTY

A. Porcelain-Enamel Marker-board Warranty: Submit a written warranty executed by manufacturer agreeing to replace porcelain enamel markerboards that do not retain their original writing and erasing qualities or become slick and shiny, or exhibit crazing, cracking, or flaking within the specified warranty period, provided the manufacturer's written instructions for handling, installation, protection, and maintenance have been followed.
1. Warranty Period: Life of the facility.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Porcelain-On-Metal Markerboards: Balanced, high-pressure laminated, 3-ply construction, with facing sheet, core and backing.
1. Porcelain Finish: Porcelain enamel over ground coat on writing surface with seal coat on reverse side. Furnish standard colors and special projection surface.
2. Face Sheet: Enameling steel, 24 gage.
3. Core: Plywood or hardboard, 3/8-inch thick.
4. Backing Sheet: Manufacturer's standard 0.015-inch aluminum sheet.
5. Color: Manufacturer's standard colors.
6. Products and Manufacturers: Provide one of the following:
a. 500 Series p3 Markerboard by PolyVision Corporation.
b. Series 185 LCS Markerboard by Claridge Products and Equipment, Incorporated.
c. Or equal.

B. Plastic Impregnated Cork Tackboards:
   1. Seamless sheet, 1/8-inch thick with washable vinyl finish, of ground natural cork compressed with resinous binder and integral color throughout entire thickness and laminated to burlap backing. Furnish rigid panels by factory-laminating under pressure to 3/8-inch thick plywood or hardwood backing.
   2. Color: Manufacturer's standard colors.
   3. Products and Manufacturers: Provide one of the following:
      a. Vinyl Plus Tackboard by PolyVision Corporation.
      b. No. 380A Tackboard by Claridge Products and Equipment, Incorporated.
      c. Or equal.

C. Markers: Manufacturer's standard set of 12 assorted colors specifically made for use with specified markerboard. Provide one set for each markerboard.

D. Combination Markerboard and Tackboard:
   1. Same materials specified above.
   2. Mounted as one unit.
   3. Products and Manufacturers: Provide one of the following:
      a. 500 Series p3 Markerboard and Tackboard, Type B by PolyVision, Corporation.
      b. Type BR Markerboard/Tackboard by Claridge Products and Equipment, Incorporated.
      c. Or equal.

E. Trim and Accessories:
   1. General: Fabricate frames and trim of not less than 0.062-inch thick aluminum alloy. Size and shape as specified, to suit type of installation. Provide straight, single-length units wherever possible and keep joints to a minimum. Miter corners to a neat, hairline closure.
      a. Provide manufacturer's standard wide trim units, approximately 1-1/2-inch wide, slip-on type.
      b. When structural support accessories are required for markerboards and tackboards, in addition to normal trim, provide the required additional support or modify trim to provide the necessary support.
   2. Markertrough: Finish continuous aluminum markertroughs for each markerboard, using box type, with slanted front and cast aluminum end closures.
   3. Finishes:
      a. General: Comply with NAAMM's “Metal Finishes Manual for Architectural and Metal Products” for recommendations relative to applying and designating finishes.
      b. Class II, Clear Anodic Finish: AA-M12C22A31 (Mechanical Finish: non-specular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, clear coating 0.010-mm or thicker) complying with AAMA 607.1.

F. Fabrication:
   1. Assembly: Provide factory-assembled markerboards, tackboards and combination markerboard and tackboard units.
      a. Make joints only between markerboard and tackboard.
      b. Provide mullion trim at joints between markerboard and tackboard.
      c. Markerboards: 4-feet 0-inches high by 4-feet 0-inches long.
      d. Tackboards: 4-feet 0-inches high by 4-feet 0-inches long

e. Combination Markerboards and Tackboards: 4-feet 0-inches high by 4-feet 0-inches long (4-feet 0-inches high by 2-feet 0-inches long for each section of the combination markerboard and tackboard).

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and his installer shall examine substrate and conditions under which the visual display surfaces Work is to be performed and notify Engineer, in writing, of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 INSTALLATION

A. Install display surfaces in locations and mounting heights as directed by Engineer and in accordance with the manufacturer's instructions. Provide all grounds, clips, backing materials, brackets and anchors, trim, and accessories for a complete installation.

B. Deliver factory-built vinyl display surfaces completely assembled in one piece without joints, whenever possible. Where dimensions exceed panel size, provide two or more pieces of equal length, as acceptable to Engineer. When overall dimensions require delivery in separate units, pre-fit at the factory, disassemble for delivery, and make final joint at a Site. Use splines at joints to maintain surface alignment and smooth joints.

C. Install units with concealed hangers plumb and level, in accordance with the manufacturer's printed instructions.

D. Coordinate job-assembled units with grounds, trim and accessories. Join all parts with neat, precision fit.

END OF SECTION 10 1100

SECTION 10 1400

SIGNAGE

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install signage.
      a. General Contractor shall be responsible for all signage throughout the Project as shown and as specified herein.
   2. Extent of signage is shown and, where indicated, as specified.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with, or before, the signage.
   2. Each prime Contractor shall review installation procedures under other Sections of its Contract, and in other Contracts, and coordinate the installation of items that must be installed with, or before, the signage.
   3. Coordinate adhesives and fasteners with mounting surfaces. Review other Sections in order to ensure compatibility of identification device mounting accessories for the various surfaces.

C. Related Sections:
   1. Section 09 9100, Painting.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. Aluminum Association, (AA).
      a. AA SAA-46, Standards for Anodized Architectural Aluminum.
      b. AA DSA-45, Designation System for Aluminum Finishes.
   2. American National Standards Institute, (ANSI).

      b. ANSI A117.1, Accessible and Usable Buildings and Facilities.
      c. ANSI Z535.1, Safety Color Code.
      d. ANSI Z535.2, Environmental and Facility Safety Signs.
      e. ANSI Z535.3, Criteria for Safety Symbols.
      f. ANSI Z535.4, Product Safety Signs and Labels.
      g. ANSI Z535.5, Accident Prevention Tags (for Temporary Hazards).
   3. American Society for Testing and Materials, (ASTM).
      a. ASTM A 167, Specification for Stainless and Heat-Resisting Chromium -Nickel Steel Plate, Sheet, and Strip.
      b. ASTM B 26, Specification for Aluminum-Alloy Sand Castings.
      c. ASTM B 584, Specification for Copper Alloy Sand Castings for General Applications.
      d. ASTM E 527, Practice for Numbering Metals and Alloys (UNS).
   4. Chemical Abstract Services, (CAS).

a. CAS Registry Numbers for Specific Chemical Identity.

5. Copper Development Association, (CDA).
   a. CDA, Properties of Cast Copper Alloys.
6. National Fire Protection Association, (NFPA).
   a. NFPA 704, Standard System for the Identification of the Hazards of Materials for Emergency Response.
7. Occupational Safety and Health Administration, (OSHA).
   a. OSHA 1970, Title 29, Code of Federal Regulations Part 1910.1200, Hazard Communication Standard.
   b. OSHA 1970, Title 29, Code of Federal Regulations Part 1910, Subpart Z, Toxic and Hazardous Substances.
   c. OSHA 1970, Title 29, Code of Federal Regulations Part 1910.144, Safety Color Code for Marking Physical Hazards.
   d. OSHA 1970, Title 29, Code of Federal Regulations Part 1910. 145, Specification for Accident Prevention Signs and Tags.
8. Public Law 101-36, The Americans with Disabilities Act of 1990, Title 28, Appendix A, Code of Federal Regulations Part 36, Accessibility Guidelines for Buildings and Facilities - ADAAG.

1.3 QUALITY ASSURANCE

A. Signage Manufacturers:
   1. Engage firms specializing in the production of the types of products specified, in compliance with specified standards, with a documented record of successful in-service performance, and who can provide sufficient production capacity to avoid delaying the Work.
   2. Submit name and experience record of manufacturers to Engineer.

B. Component Supply and Compatibility:
   1. Obtain each separate type of identification device from a single supplier and from a single manufacturer.
   2. Colors shall be brilliant, distinctive shades, matching the safety colors specified in ANSI Z535.1 and OSHA 1910.144.

C. Requirements of Regulatory Agencies:
   1. Permanent rooms and spaces, and directional and informational signage where specified as accessible to people with disabilities shall comply with ANSI A117.1 and ADAAG.
   2. All right-to-know labels, signs and tags shall use NFPA 704 “Diamond” hazard identification systems and shall comply with OSHA 1910.1200 and OSHA Subpart Z.
   3. All accident prevention signs and tags shall comply with OSHA 1910.145.
   4. All health, safety and warning signs shall comply with ANSI Z535.1, ANSI Z535.2, ANSI Z535.3 and OSHA 1910.144 and 1910.145, unless otherwise specified. The colors shall be those of opaque glossy samples as specified in Table 1 of ANSI Z535.1. Safety symbol pictograms shall be incorporated into each sign, in addition to text.

1.4 SUBMITTALS

A. Samples: Submit the following:
   1. Each color and finish of exposed materials and accessories required for signage.
   2. full-size sample of each type of permanent room and space identification sign and informational and directional sign incorporating all features specified; pipeline

identification sign and mounting accessories; equipment and structure nameplate, valve tags and accessories; and right-to-know signs, labels and tags. Stamp valve tag with information shown on valve schedules. Information on the type of coding system will be furnished to Contractor by Engineer.

3. Actual full-size representative sample of each individual-type letter and number specified, demonstrating alphabetic style, material, color and finish specified.
4. Engineer's review of samples will be for color and texture only. Compliance with all other requirements is the responsibility of Contractor.

B. Shop Drawings: Submit the following:
1. Copies of manufacturer's technical data for each product specified including fabrication and erection information for all signage. Show anchorages and accessory items. Furnish location template drawings for items supported or anchored to permanent construction.
2. Complete selection of each specified manufacturer's standard and custom colors, alphabetic styles, graphic layouts and pictograms. Include full-size graphic layouts for plaques, individual dimensional letters and numbers and other items where final graphic appearance must be established prior to fabrication, incorporating all required graphic features specified or shown.
3. Coordinate mounting position, method, and proposed mounting accessories and fasteners with actual Project conditions. Indicate required mounting accessories on plans showing locations of all required exit signs based on measurements taken at the Site. Show final location and identify type of mounting surface for each exit sign. Coordinate location of exit signs for non-interference with other Work and as required by governing authorities having jurisdiction at the Site.

1.5 PROJECT CONDITIONS

A. Field Measurements:
1. Verify dimensions in areas of installation. Take measurements at the Site before fabrication and indicate dimensions on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
2. Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating units without field measurements. Coordinate supports, adjacent construction, and fixture locations to ensure actual dimensions correspond to dimensions established for signage Work.

B. Scheduling:
1. Coordinate the delivery of templates, instructions and directions for installation of anchorage devices with other Work to avoid delay.

1.6 MAINTENANCE

A. Extra Materials:
1. Furnish extra materials from the same manufactured lot as the materials installed.
2. Contractor shall furnish the following spare parts and accessories:
    a. For every 20 pipeline identification signs installed:
        1) One complete mounting assembly.
    b. For every 20 nameplates installed:
        1) One complete nameplate mounting assembly.
    c. For every 20 valve identification tags:

1) One stainless steel cable and splice and store in a secure area at the Site as directed by Owner.

3. Do not provide partial containers or packages of materials. Round-up quantities to furnish only complete, unopened and undamaged containers and packages; with legible labels accurately representing contents of container or package indicating compliance with approved Samples and Shop Drawings, and matching materials actually installed.
   a. All spare parts and accessories shall be suitably boxed and marked for storage and reordering.

B. Submit quantities of each system component required for the Work, based on actual purchase order to manufacturer for materials to be used on this Project, with calculations establishing quantity of extra materials to be furnished to Owner.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Performance Criteria:
   1. Details for signage shown, such as alphabet representation, letter spacing, borders designs, and other graphic features, are generic and intended to establish text, general positions and symbols only.
   2. Contractor shall submit for approval complete, camera-ready, color graphic layouts based on specified requirements and recommendations from manufacturer.

B. Allowable Tolerances:
   1. Produce smooth, even, level sign panel surfaces, constructed to remain flat under installed conditions within a tolerance of plus or minus 1/16-inch measured diagonally.

2.2 PANEL SIGNS – ROOM IDENTIFICATION, INFORMATION, ENTRY, AND DIRECTIONAL

A. Products and Manufacturers: Provide one of the following:
   1. Graphic Blast MP and FG ADA System and Custom Design ADA Series, by Best Sign Systems, Inc.
   2. Blast Etched Fiberglass and Blast Etched Melamine Signs, by Visigraph Corporation.
   3. Or equal.

B. Panel Signs – Room Identification, Information, Entry, and Directional:
   1. Product Description: Provide unframed signs, surface-etched, 1/32-inch raised tactile lettering and pictograms, sandblasted on an opaque sheet.
   2. Materials:
      a. Interior Signs: Three-ply, self-extinguishing melamine plastic.
      b. Exterior Signs: One-piece fiberglass.
   3. Size and Thickness: 0.125-inch thick; eight inches by eight inches with 1/2-inch radiused corners.
   4. Graphics and Text: White, Standard Helvetica Medium characters and matching arrow type-face; upper and lower case letters, one-inch high capitals and, in addition, Grade 2 Braille alphabet for room designation, directional, entry, and information signs.
   5. Colors and Contrast: Background of signs shall be eggshell, matte, or other non-glare finish. Characters and symbols shall contrast by at least 70 percent with their background as determined by ADA formula in ADAAG Appendix A4.30.5.

2.3 PANEL SIGNS – HEALTH, SAFETY, WARNING, FLOOR LOADING, AND FIRE EXTINGUISHER LOCATION SIGNS

A. Product Description: Provide rigid fiberglass reinforced plastic signs with fade-resistant embedded graphics.

B. Size and Thickness: 0.125-inches thick; 10-inches by 14-inches, unless otherwise specified.

C. Graphics and Alphabet: Standard Helvetica Medium alphabet and matching arrow type-face; upper and lower case 1-inch high capitals and, in addition, Grade 2 Braille alphabet message designations and other text.

D. Exposure: Recommended by the manufacturer for both indoor and outdoor use and with an upper service temperature limit of 190°F. Average durability for outdoor use shall be 15 years.

E. Safety Instruction Signs: Standard color of the background shall be white; and the panel, green with white letters. All letters used against the white background shall be black. Provide 2 to be used throughout the project.

F. Caution Signs: Standard color of the background shall be yellow; and the panel, black with yellow letters. Provide 2 to be used throughout the project.

G. No Smoking Signs: Standard color of the background shall be white. All letters used against the white background shall be red. Provide 2 to be used throughout the project.

H. Biohazard Signs: Standard color of sign background shall be white; panel shall be black with white letters. Sign shall include red international biohazard pictogram on white background.

I. Floor Loading Signs: Standard color of the background shall be white; and the panel blue with white letters. All letters used against the white background shall be black. Provide 1 sign each Room.

J. Fire Extinguisher Location Signs (surface-mounted units only): Standard color of the background shall be red with white letters. Each sign shall incorporate an international fire extinguisher pictogram and a directional arrow indicating location of fire extinguisher. Provide 1 sign for each fire extinguisher.

K. NFPA Chemical identification Plaque: Provide NFPA diamond signs complying with NFPA Standard 704. Provide 3 signs to be used throughout the project.

L. Auxiliary Products:
   1. Mounting Brackets: Provide manufacturer's standard mounting brackets for hanging, projected or double-sided signs.

M. Products and Manufacturers: Provide one of the following:
   1. Graphic Blast Word and Picture Series by Best Manufacturing Sign Systems, Incorporated.
   2. Or equal.

2.4 PIPELINE IDENTIFICATION SIGNS

A. Pipeline Identification Signs:

1. Lettering of Titles:
   a. Letter size shall be as indicated in the following table:

LETTER SIZE TABLE

Outside Diameter of Pipe or Covering*	Size of Legend Letters
3/4-inches to 1-1/4 inches	1/2-inches
1-1/2-inches to 1-7/8--inches	3/4-inches
2-inches to 5-7/8-inches	1-1/4-inches
6-inches to 9-7/8-inches	2-1/2-inches
10-inches and Over	3-1/2-inches

*Outside diameter shall include pipe diameter plus insulation and jacketing.

   b. Text and symbols shall be Standard Helvetica Medium, all upper case. Signs shall include text with separate arrow signs indicating direction of flow and be located as specified in Part 3 of this Section.
2. Pipe Marker Materials:
   a. General: The following are applicable to all types of pipe markers furnished under this Section:
      1) Provide pipe markers with ultraviolet light-resistant, sealed, subsurface color graphics, recommended by sign manufacturer, suitable for both indoor and outdoor use.
      2) Pipe markers shall be resistant to abrasion, chemical reagents, and physical agitation such as washdowns and wind.
      3) Provide manufacturer's full selection of standard and custom sizes and graphics.
      4) Where manufacturer has established minimum order quantities for custom units provide minimum order quantities at no additional cost to Owner.
   b. Materials: Provide the following at Contractor's option, suitable for outside diameter of the associated pipe and pipe covering:
      1) Adhesive, Wrap-Around Pipe Markers: Adhesive pipe markers shall be coiled construction, 0.006-inch total thickness, PVF over laminated polyester, with peel-off backing. Suitable for service temperature ranging from -40 degrees F to 230 degrees F.
      2) Snap-on Pipe Markers: Snap-on pipe markers shall be cylindrically coiled, printed plastic sheets. Pipe marker total thickness for pipe and pipe covering from 3/4-inch to 2-3/8-inch outside diameter shall be not less than 0.020-inch. Pipe marker total thickness for pipe and pipe covering from 2.5-inch through six-inch outside diameter shall be not less than 0.030-inch. Suitable for service temperature ranging from -40 degrees F to 180 degrees F.
      3) Strap-on Pipe Markers: Provide strap-on pipe markers where pipe diameter is large enough to preclude overlap of pipe marker material around the circumference of the pipe. Strap-on pipe markers shall be flat, printed plastic sheets, not less than 0.020-inch total thickness, constructed to be attached to the pipe with bands. Suitable for service temperature ranging from -40 degrees F to 180 degrees F. Provide each pipe marker with two 1/4-inch wide band straps of nylon, plastic, or stainless steel, lengths as required by circumference of pipe and pipe covering. Provide manufacturer's recommended banding tools for banding.
3. Legend for Pipeline Identification Signs: Pipeline identification signs shall have the following text or abbreviations in the color combinations designated to identify the pipeline service.

TABLE 10 1400-A,
SCHEDULE OF PIPELINE IDENTIFICATION SIGNS*

Pipeline Legend	Lettering Color	Background Color	Spacing (feet)
WATER			
Potable Water	White	Blue	10
Cold Water	White	Blue	10
Domestic Hot Water	Black	Yellow	10
Tepid Water	White	Green	10
City Water	White	Green	10
Concentrate Water	Black	Orange	10
Filtered Water	White	Green	10
Permeate Water	White	Green	10
Blended Water	White	Green	10
Fire Water	White	Red	10
Sprinkler Water	White	Red	10
AIR AND GAS			10
Natural Gas	White	Brown	10
CHEMICALS			10
Acidic Cleaner	Black	Orange	10
Antiscalant	Black	Orange	10
Basic Cleaner	Black	Orange	10
Caustic Soda	Black	Orange	10
Chlorine Liquified	Black	Orange	10
Sodium Bisulfite	Black	Orange	10
PROCESS			10
Floor Drains	Black	Gray	10
Chemical Storage Tank Drains	Black	Orange	10
Chemical Storage Tank Overflow	Black	Orange	10
Storm Drains	White	Gray	10
Sump Drains	White	Gray	10
Wastewater	Black	Orange	10
VENTS			10
Break Tank Vent	Black	Orange	10

*Where shown or specified, the legend for blowoff, drain, metering, sump, vent and similar pipelines shall also include the equipment, structure or identification number to which the service applies. The number shall be provided in the same color as the service line.

B. Products and Manufacturers: Provide one of the following:
   1. Custom B-689 High Performance Pipe Markers by Brady USA, Incorporated Signmark Division.
   2. Or equal.

2.5 EQUIPMENT NAMEPLATES

A. Equipment Nameplates:
   1. Titles for Equipment:
      a. Titles shall be provided on all equipment using 1-inch high letters. Where more than one piece of the same type of equipment is shown or specified to be titled, the items shall be numbered consecutively as shown; for example Pump No. 1, Pump No. 2, etc., or as shown in the following schedule.
      b. Text and symbols shall be Standard Helvetica Medium, all upper case.
   2. Left-justify multiple line titles.
   3. Size and Material: Provide the following:
      a. Size: 1-1/2 inches by 4-inches, minimum.
      b. Material: Type 304 stainless steel; screen printed; 0.015-inches thick.

B. Products and Manufacturers: Provide one of the following:
   1. Screen Printed Stainless Steel Equipment Tags by Brady USA, Incorporated Signmark Division.
   2. Or equal.

2.6 FABRICATION

A. Shop Assembly:
   1. Fabricate and preassemble items in the shop to the greatest extent possible.
   2. Disassemble units only to the extent necessary for shipping and handling limitations.
   3. Clearly mark units for reassembly and coordinated installation.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor and his installer shall examine the substrates and conditions under which the signage are to be installed and notify Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 INSTALLATION

A. General:
   1. Install signage and components at the locations shown or, if not shown, as directed by Engineer, securely mounted with concealed very-high-bond acrylic foam tape or mechanical/chemical fasteners where specified. Attach signs to surfaces in accordance with the manufacturer's instructions, unless otherwise shown.
   2. Lightly mark and locate the position of all signage. Obtain Engineer’s approval of all locations before mounting. Install level, plumb, and at the proper height. Repair or replace damaged units as directed by Engineer.
   3. Install very-high-bond acrylic foam tape on back of signage using a full perimeter of specified tape. Leave no gaps in tape perimeter at back of signage; peel off second release liner and press onto surfaces.
   4. Install level, plumb, and at the specified height.

B. Pipe and Equipment Identification Signs, Nameplates and Tags:
   1. The name of the materials in each pipeline and, alongside this, an arrow indicating the direction of flow of fluids, shall be indicated on each pipeline system.

2. Titles shall not be located more than 30 linear feet apart and shall also appear directly adjacent to each side of all walls penetrated by pipeline, adjacent to each side of all valve regulators, flowcheck, strainer cleanouts, and all pieces of equipment. Arrows shall be located at intervals not to exceed 15 linear feet apart.
3. Titles shall identify contents by complete name. Identification title locations shall be determined by Engineer, but in general they shall be placed where the view is unobstructed and on the two lower quarters of pipe or covering when they are overhead. Title shall be clearly visible from operating positions especially those adjacent to control valves.
4. Signs on large valves shall be located on or adjacent to the valve itself. Tags for smaller valves shall be attached to bonnet or flange bolts. Do not attach tags or signs to handwheels of valves.
5. Locate nameplates on equipment bases and on structures at readily visible levels in such positions relative to the equipment and structures as to prevent damage to the nameplate.

3.3 PROTECTION AND CLEANING

A. After installation, clean soiled identification device surfaces according to manufacturer's instructions.

B. Protect units from damage until Final Completion by Owner.

END OF SECTION 10 1400

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 10 2805

TOILET AND BATH ACCESSORIES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install toilet and bath accessories Work.
   2. Extent of toilet and bath accessories is shown and specified.

B. Coordination:
   1. Furnish inserts and anchoring devices to be set in concrete or built into masonry and recycled gypsum wallboard for installation of toilet and bath accessories. Refer to concrete and masonry Specifications for installation of inserts and anchorage devices.
   2. Coordinate toilet and bath accessory locations with other work to prevent interference with clearances required for access by people with disabilities, and for proper installation, adjustment, operation, cleaning, and servicing of toilet and bath accessories
   3. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before toilet and bath accessories Work.

C. Related Sections:
   1. Section 08 7100, Door Hardware.
   2. Section 10 2113, Toilet Compartments.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ANSI/ICC A117.1, Accessible and Usable Buildings and Facilities.
   2. NFPA 70, National Electric Code.

1.3 QUALITY ASSURANCE

A. Component Supply and Compatibility:
   1. Provide products of the same manufacturer for each type of bath accessory unit and for units exposed in the same areas.

B. Regulatory Requirements:
   1. Comply with the following:
      a. Building code specified in Section 01 4200, References.
      b. Requirements of authorities having jurisdiction
      c. ANSI/ICC A117.1
      d. Americans with Disabilities Act of 1990 (Public Law 101-336), Appendix A, to 28 CFR Part 36 - Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG).

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Schedule of toilet and bath accessories indicating proposed location for each item.
   2. Product Data:
      a. manufacturer's published literature, technical data, and specifications for each toilet and bath accessory item.
   3. Samples:
      a. Standard and custom color charts for color selection by Engineer. Submit for each item under this Section where color or finish is not specified.

B. Informational Submittals: Submit the following:
   1. Manufacturer's Instructions:
      a. Setting drawings, templates, instructions, and directions for installing anchorage devices in other work.
      b. Instructions for storing and installing materials furnished.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. General:
   1. Components and materials shall be suitable for their intended use and environment.
   2. Stamped names or labels on exposed faces of units are unacceptable.
   3. Provide locks with the same keying for each type of toile and bath accessory units in the Project, where possible. Furnish two keys for each lock.
   4. Electrical components, devices, and accessories shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 SURFACE-MOUNTED PAPER TOWEL DISPENSER

A. Products and Manufacturers: Provide one of the following:
   1. No. 0210, by American Specialties, Inc.
   2. B-262, by Bobrick Washroom Equipment, Inc.
   3. Or equal.

B. Requirements:
   1. Size to dispense not less than 400 c-fold towels with interchangeable paper drop.
   2. Construction: Cabinet and door not less than 22-gage stainless steel, No. 4 satin finish, all-welded construction, without mitered corners. Hang door with concealed, full-length stainless steel piano hinge
   3. Provide with tumbler-lockset.

2.3 SURFACE-MOUNTED WASTE RECEPTACLE

A. Products and Manufacturers: Provide one of the following:
   1. No. 0826, by American Specialties, Inc.
   2. B-275, by Bobrick Washroom Equipment, Inc.
   3. Or equal.

B. Construction: Fabricated from not less than 22-gage stainless steel, No. 4 satin finish, all-welded construction, without mitered corners. Top and bottom hemmed, interior liner hooks, 12-gallon capacity.

2.4 SURFACE-MOUNTED SANITARY NAPKIN DISPOSAL UNIT

A. Products and Manufacturers: Provide one of the following:
   1. No. 0473-A by American Specialties, Inc.
   2. No. B-254 by Bobrick Washroom Equipment, Inc.
   3. Model 4722-15 by Bradley Corporation.
   4. Or equal.

B. Requirements:
   1. Fabricate disposal units from not less than 22-gage stainless steel, with flange of one-piece seamless construction without metered corners.
   2. Provide self-closing upper door equipped with full-length stainless steel piano hinge and lift handles on each end.
   3. Trap door shall have hidden stainless steel spring tensioned self-catching lock and be hinged on front face. Provide fold-down stainless steel purse shelf of 22-gage stainless steel.

2.5 Requirements:

1. Dispenser Capacity: Simultaneously dispenses both napkins and tampons:
   a. Napkins: 15 napkins: four-inch by three-inch by 1-1/8-inch.
   b. Tampons: 23 tampons; five-inch; cylinder.
2. Construction: Fabricate units from not less than 16-gage stainless steel, with full-face door, and 18-gage stainless steel body with no exposed fastening devices or spot weld seams. Provide stainless steel door mounted on full-length heavy-duty stainless steel piano hinge with pin tumbler locks.
3. Operation: Gratis.

2.6 TOILET TISSUE DISPENSERS

A. General: Provide toilet tissue dispensers at each water closet.

B. Products and Manufacturers: Provide one of the following:
   1. No. 0697-GAL, by American Specialties, Inc.
   2. B-2840, by Bobrick Washroom Equipment, Inc.
   3. Model 5263, by Bradley Corporation.
   4. Or equal.

C. Multi-roll Toilet Tissue Dispenser and Ash Tray: Fabricate shelf of not less than 18-gage stainless steel, to store and dispense not less than two 4.5-nch by 4.5-inch core tissue rolls. Fabricate flange from a single piece, with seamless construction.

2.7 TOILET SEAT TISSUE DISPENSERS

A. General: Provide surface-mounted toilet seat tissue dispenser at each water closet.

B. Products and Manufacturers: Provide one of the following:
   1. No. 0477-SM, by American Specialties, Inc.

2. B-221, by Bobrick Washroom Equipment, Inc.
3. Model 583, by Bradley Corporation.
4. Or equal.

C. Surface-mounted Toilet Seat Tissue Dispenser: Satin-finish stainless steel. Dispenses 250 single- or half-fold toilet seat covers.

2.8 MIRRORS

A. Accessible Tilt Mirrors:
1. General: Provide accessible tilt mirror above each accessible lavatory.
2. Products and Manufacturers: Provide one of the following:
   a. No. 0535-B, by American Specialties, Inc.
   b. B-293, by Bobrick Washroom Equipment, Inc.
   c. Model 740-1836, by Bradley Corporation.
   d. Or equal.
3. Stainless Steel Frame: Fabricate frame from 20-gage, Type 304L stainless steel, welded and ground smooth, no shelf. Mirrors shall be 1.5 feet by three feet size, with tilting frame tapered from 1.5 inches at bottom to 4.5 inches at top.

B. Custom Sized Angle Framed Mirrors:
1. General: Provide single pane, polished tempered glass mirrors continuous above each non-handicapped lavatory.
2. Products and Manufacturers: Provide one of the following:
   a. Custom Sized 0600-B Mirrors by American Specialties, Inc.
   b. Custom Sized B-290 Mirrors, by Bobrick Washroom Equipment, Inc.
   c. Model 780-2, by Bradley Corporation.
   d. Or equal.
3. Stainless Steel Frames: Fabricate frames from 3/4-inch by 3/8-inch 18-gage, Type 304 stainless steel angle with corners heliarc welded, ground and polished smooth to uniform satin finish. Provide all mirrors installed on concealed hanging brackets that lock onto top and bottom of frame by tamper-proof set screws.

2.9 GRAB BARS

A. General: Provide grab bars where shown. Provide custom specials where required or specified.

B. Products and Manufacturers: Provide one of the following:
1. 3200 P Series custom Type 56 with 54-inch leg and 36-inch leg, by American Specialties, Inc.
2. B-68137.99, by Bobrick Washroom Equipment, Inc.
3. Model 812-2, Type 059 by Bradley Corporation.
4. Or equal.

C. Custom Stainless Steel Grab Bars:
1. Provide stainless steel knurled grab bars, 1.5-inch outside diameter, 16-gage.
2. Mounting: Concealed, with manufacturer’s standard flanges and anchorages for type of installation.
3. Provide custom dimensions specified.

2.10 SURFACE-MOUNTED HORIZONTAL LIQUID SOAP DISPENSER/SHELVES

A. General: Provide surface-mounted liquid soap dispensers, one per lavatory.

B. Products and Manufacturers: Provide one of the following:
   1. No. 0318, by American Specialties, Inc.
   2. B-2014, by Bobrick Washroom Equipment, Inc.
   3. Model 66, 1 by Bradley Corporation.
   4. Or equal.

C. Liquid Soap Dispenser:
   1. Units shall be 20 inches long by 2.5 inches high by 4-5/10 inches wide, with one liquid soap dispensing valve
   2. Capacity: 80 fluid ounces.
   3. Fabricate units of 20-gage stainless steel, with pin-type tumbler locking device. Provide 20-gage stainless steel shelf using one-piece construction, with integral sides. Dispense liquid soap in measured quantity by pump action with stainless steel internal springs, ABS piston, stainless steel push button and internal parts. Cabinet shall have no exposed fastening devices.
   4. Locking: Pin-type tumbler lock.

2.11 MISCELLANEOUS ITEMS

A. Combination Shelf with Utility Hook and Mop Strip:
   1. Products and Manufacturers: Provide one of the following:
      a. No. 1304-A, by American Specialties, Inc.
      b. B-239x34, by Bobrick Washroom Equipment, Inc.
      c. Model 9934, by Bradley Corporation.
      d. Or equal.
   2. Provide 18-gage stainless steel shelf with 3/4-inch lip, five 18-gage stainless steel hook strips, and four mop holders. Shelf shall be 34 inches wide and eight inches deep.

B. Pail Hooks:
   1. Products and Manufacturers: Provide one of the following:
      a. No. 1307-3, by American Specialties, Inc.
      b. B-232X24, by Bobrick Washroom Equipment, Inc.
      c. Model 9943, by Bradley Corporation.
      d. Or equal.
   2. One-piece channel strip fabricated from 20-gage stainless steel. Provide heavy-duty hooks fabricated from 11-gage stainless steel. Shelf shall be 26 inches long with three hooks.

C. Surface-Mounted Soap Dishes:
   1. Products and Manufacturers: Provide one of the following:
      a. No. 7320, by American Specialties, Inc.
      b. B-7680, by Bobrick Washroom Equipment, Inc.
      c. Model 9014-63, by Bradley Corporation.
      d. Or equal.
   2. Material: Drawn, one-piece stainless steel.

D. Undersink Guards:
   1. Description: Insulating pipe covering for supply and drain piping assemblies that prevent direct contact with and burns from piping; allow service access without removing coverings.

2. Product and Manufacturer: Provide one of the following:
    a. HANDY SHIELD–MAXX, by Plumberex Specialty Products, Inc.
    b. Truebro Lav Guard 2, by IPS Corporation.
    c. Or Equal.
3. Material and Finish: Anti-microbial, molded plastic, white.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine the areas and conditions under which toilet and bath accessories will be installed and notify Engineer in writing of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Install items required to meet accessibility codes in accordance with Laws and Regulations, and ANSI/ICC A117.1.

B. Determine that substrates are completed and ready to accept surface-mounted or recessed accessories.

C. Use concealed fastenings where possible.

D. Provide anchorage devices, fasteners, and other necessary anchorages, and attach accessories securely to walls, floors, and partitions in locations as shown and as required.

E. Install concealed mounting devices and fasteners fabricated of the same material as the accessories as recommended by manufacturer.

F. Install exposed mounting devices and fasteners finished to match the accessories.

G. Provide theft-resistant fasteners for all mountings.

H. Secure and install toilet and bath accessories in accordance with the manufacturer’s instructions for each item and each type of substrate construction.

I. Lock grab bars to concealed mounting plate installed in wall.

3.3 ADJUSTMENT AND CLEANING

A. Adjust toilet and bath accessories for proper operation.

B. After completion of installation, clean and polish all exposed surfaces.

C. Deliver keys and instruction sheets to Owner in accordance with Section 08 7100, Door Hardware.

END OF SECTION 10 2805

SECTION 10 4400

FIRE PROTECTION SPECIALTIES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install all fire protection specialties Work.
   2. Extent of fire protection specialties Work is shown and specified.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate installation of items that must be installed with or before fire protection specialties.

C. Related Sections:
   1. Section 10 1400, Signage.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. UL Fire Classification Rating.

1.3 QUALITY ASSURANCE

A. Component Supply and Compatibility:
   1. Provide fire protection specialties products from one manufacturer.

B. Regulatory Requirements: Provide fire protection specialties approved and labeled by UL.

1.4 SUBMITTALS

A. Action Submittals:
   1. Product Data: Submit the following:
      a. Manufacturer’s technical data, certification of UL rating, and installation instructions for fire protection specialties.

PART 2 - PRODUCTS

2.1 FIRE EXTINGUISHERS

A. General: Provide manufacturer’s standard mounting brackets for portable fire extinguishers size as specified.

B. Multi-Purpose Dry Chemical Fire Extinguishers:
   1. Ten-pound capacity, enameled steel container with pressure-indicating gauge, for Class A, Class B, Class C fires, UL rating 4A-60 BC.
   2. Products and Manufacturers: Provide one of the following:
      a. Cosmic Model 10E by J.L. Industries.

b. Or equal.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine substrates and conditions under which fire protection specialties will be installed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with Work until unsatisfactory conditions have been corrected in manner acceptable to Engineer.

3.2 INSTALLATION OF FIRE EXTINGUISHERS

A. When exact locations of fire protection specialties are not shown on Drawings, locate as directed by Engineer.

B. Securely fasten products to structure, square and plumb, per Supplier's instructions. Mounting heights shall be:
   1. Install fire extinguishers with gross weight greater than 40 pounds with top of fire extinguisher no more than 3.5 feet above finished floor.
   2. Install fire extinguishers with gross weight less than 40 pounds with top of fire extinguisher no more than 4.0 feet above finished floor.
   3. Clearance between bottom of fire extinguisher and finished floor shall be at least four inches.

C. Identification Devices: Provide signs level and plumb directly above surface mounted portable fire extinguishers, securely mounted, attached to substrate per sign manufacturer's instructions. Signage shall be per Section 10 1400, Signage.

D. Recharge fire extinguishers provided under this Contract so that most recent inspection date coincides as nearly as possible with date of Substantial Completion. Inform Owner in writing of next required inspection and recharging date.

END OF SECTION 10 4400

SECTION 12 2100

WINDOW BLINDS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install all window blind Work.
   2. Extent of window blind units is shown.
   3. Types of products required include the following:
      a. Manually-operated horizontal window blinds.
      b. Miscellaneous accessories and materials.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate with the Work of this Section.
   2. Provide inserts and anchoring devices to be set in concrete or built into masonry and gypsum wallboard for installation of window blinds. Coordinate delivery with other work to avoid delay.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. GANA, Glazing Manual.
   2. NFPA 701, Methods of Fire Tests for Flame Propagation of Textiles and Films.
   3. WCMA A100.1, American National Standard for Safety of Corded Window Covering Products.

1.3 QUALITY ASSURANCE

A. Component Supply and Compatibility:
   1. Provide all window blinds of each type of blinds required as complete units produced by one manufacturer, including hardware, accessory items, mounting brackets, and fastenings.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Shop Drawings for special window blind components THAT are not fully dimensioned or detailed on manufacturer's product data. Include elevation layout indicating proposed division between window blind units and meeting edges at corners.
      b. Coordinated drawings showing required clearances to window obstructions and other obstructions that would interfere with window blind operation. Coordinate pocket size and mounting with manufacturer's proposed products and show details and all dimensions on Shop Drawings.
      c. Data sheets for wndow blinds proposed for use.

2. Product Data:
3. Manufacturer's published literature, catalog sheets, and specifications for each type of window blind proposed for use.Samples:
    a. Submit six-inch Samples of window blinds in all standard colors for selection by Engineer.
    b. Engineer's review of Samples will be for color and texture only. Compliance with other requirements of the Contract Documents is Contractor's responsibility.

B. Informational Submittals: Submit the following:
1. Certificates:

C. Closeout Submittals: Submit the following:

D. Maintenance Material Submittals: Submit the following:
1. Extra Stock Materials: Furnish extra materials**,** from the same product run as the materials furnished and installed**,** that match the materials installed and that are packaged with protective covering for storage and identified with labels describing contents.
    a. Window Blinds: Full-size units equal to five percent of the quantity installed for each size, color, texture, pattern, and gloss installed, but no fewer than one unit of each size, color, texture, pattern, abnd gloss.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling, and Unloading:
1. Deliver window blinds in factory packaging, marked with manufacturer, product name, and installation location using same designations indicated on the Drawings.

1.6 FIELD CONDITIONS

A. Environmental Limitations: Do not install window blinds until construction and wet and finish work in spaces, including painting, is complete and dry and ambient temperature and humidity conditions are maintained at the levels indicated for the Project when occupied for its intended use.

B. Field Measurements: Where window blinds are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Allow clearances for operating hardware of operable glazed units through entire operating range. Advise Engineer in writing of installation conditions that vary from those required in the Contract Documents.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Horizontal Window Blinds:
1. Products and Manufacturers: Provide one of the following:
    a. Riviera 1/2-inch Mini-Blinds, by Levolor Window Fashions, a Newell Rubbermaid Company.
    b. Décor 1/2-inch Solids Mini-Blinds, by Hunter Douglas Contract, Hunter Douglas, Inc.
    c. Or equal.

2. Head Channel: 0.025-inch thick tomized steel, U-shaped one-inch high by 1-9/16-inch wide with flanged edges at top, and coated with a baked-on finish. All hardware shall be enclosed in the metal head.
3. Tilter: 0.042-inch tomized steel with automatically disengaging worm and gear mechanism to eliminate overdrive and prevent strain or damage to window blinds.
4. Tilt Wand: Transparent with hexagonal cross section of 5/16-inch across flats.
5. Drum and Cradle: One for each window blind ladder as follows:
    a. Drum shall be 0.031-inch tomized steel having two holes with rolled edges to anchor barbs on both ladder ends.
    b. Cradles shall be 0.042-inch thick tomized steel, having two holes with rolled edges to guide cords through bottom of head channel without abrasion.
6. Tilt Rod: U-shaped with a circular radius of approximately 1/8-inch designed to achieve minimum torsional deflection. For window blinds greater than five feet wide and less than 6.67 feet long, or greater than 4.583 feet wide and greater than 6.67 feet long tilt rod shall be a solid D-shaped rod with an average cross section of 1/4-inch designed to achieve minimum torsional deflection.
7. End Braces: 0.037-inch thick tomized steel with reinforcing ribs and field adjustable tabs.
8. Installation Brackets: Provide brackets with a rivet-hinged safety locking front cover not less than 0.048-inch thick tomized steel with baked-on finish matching head channel.
9. Intermediate Brackets: 0.050-inch tomized steel installed with window blinds greater than five feet wide and less than 6.67 feet long, or greater than 4.583 feet wide and greater than 6.67 feet long.
10. Ladders (slat supports): Braided polyester yarn designed from maximum strength and flexibility combined with minimum stretch. Rungs shall consist of not less than two crossed cables interbraided with the vertical components. Ladders shall support the slats without visible distortion. Distance between ladders shall not exceed two feet for window blinds up to 6.67 feet long. For window blinds over 6.67 feet long, distance between ladders shall be not greater than 22 inches.
11. Slats: Virgin high magnesium aluminum, alloyed for maximum strength and corrosion resistance. Slats shall be nominally eight-gage, 1/2-inch wide with an elliptical crown formed after coating and curing. Slat ladder support distances shall prevent visible sag or bow after continued use indoors. Slats shall be unperforated.
12. Bottom Rail: 0.031-inch tomized steel formed after coating provided with color-compatible molded plastic ladder and end caps.
13. Lift Cord: Braided of high-strength flexible polyester fiber cord with minimum stretch and maximum abrasion resistance characteristics. Cord shall be of sufficient length, equalized to properly control raising and lowering of window blinds and spaced not more than 3.83 feet between cords.
14. Colors: Complete selection of manufacturer's standard colors. Engineer will select a maximum of three colors for the Work.
15. Accessories: Provide the following:
    a. Pocket installation brackets.
    b. Projection brackets to clear window hardware.
    c. Two-tone slats with neutral white on outside face.

2.2 FABRICATION AND OPERATION

A. Product Safety Standard: Fabricate vertical louver blinds to comply with WCMA A100.1 including requirements for corded, flexible, looped devices; lead content of components; and warning labels.

B. Prior to fabrication, verify actual opening dimensions by accurate Site measurements. Adjust dimensions for proper fit at all openings.

C. Fabricate components of window blinds from non-corrosive, non-staining, non-fading materials which are compatible with each other, and which do not require lubrication during normal expected life. Use dissimilar metals or plastics for contact surfaces which slide against each other in operation of window blinds.

D. Fabricate window blind units to completely fill the openings as shown, from head-to-sill and jamb-to-jamb. For continuous window wall installations, fabricate window blinds so that ends occur only at mullions or other defined vertical separations, unless otherwise shown.

E. Gear all operating equipment for reduction of the ratio of hand-movement to window blind-movement, so that window blinds operate easily and can be set accurately and smoothly.

F. Concealed Components:
   1. Noncorrodible or corrosion-resistant-coated materials.
   2. Rotation-and-Traverse Mechanisms: With permanently lubricated moving parts.

G. Installation Brackets: Constructed for easy removal and reinstallation of blind, for supporting headrail and operating hardware and for bracket positions and blind mounting method indicated.

H. Installation Fasteners: Not less than two fasteners per bracket, fabricated from metal noncorrosive to brackets and adjoining construction; type designed for securing to supporting substrate; and supporting blinds and accessories under conditions of normal use.

I. Color-Coated Finish: For metal components exposed to view unless anodized or plated finish is indicated. Apply manufacturer's standard baked finish complying with manufacturer's written instructions for surface preparation including pretreatment, application, baking, and minimum dry film thickness.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine the substrates and conditions under which the window blinds Work will be installed and notify Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. General:
   1. Install window blinds where shown and in accordance with manufacturer's instructions. Position units plumb and true, securely anchored in place with proper clips, brackets, and bolts for the type of mounting required.
   2. Locate so exterior vane edges are not closer than two inches from interior faces of glass and not closer than 1.5 inches from interior faces of glazing frames through full operating ranges of blinds, in accordance with GANA Glazing Manual.
   3. Install mounting and intermediate brackets to prevent deflection of headrails.

4. Install with clearances that prevent interference with adjacent blinds, adjacent construction, and operating hardware of glazed openings, other window treatments, and similar building components and furnishings.

B. Divisions between window blinds are allowed only at mullions of continuous windows or openings where more than one window blind for one opening occurs.

3.3 ADJUSTING

A. Adjust window blinds to operate free of binding and malfunction through full operating ranges.

3.4 CLEANING AND PROTECTION

A. Prior to Substantial Completion, clean window blind surfaces in accordance with manufacturer's written instructions.

B. Provide final protection and maintain conditions in a manner acceptable to manufacturer and that ensures that window blinds are without damage or deterioration at Substantial Completion.

C. Prior to Substantial Completion, replace damaged window blinds that cannot be acceptably repaired.

END OF SECTION 12 2100

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 13 3419

METAL BUILDING SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Contractor shall provide all professional services, labor, materials, tools, equipment and incidentals as shown, specified and required to design, furnish, and install all metal building systems of the width, eave height, and roof pitch indicated, capable of withstanding specified structural loads and exposure to weather without excessive deflection, or water infiltration, as shown on the Drawings and in accordance with the Specifications.
   2. Included are:
      a. Building into metal building systems required items and providing openings, closures and escutcheons for metal building systems to accommodate the Work under this and other Sections and attaching to the metal building systems all items such as sleeves, hoods, supports, fasteners and all items required, for which provision is not specifically included under other Sections.
   3. Extent and basic layout of metal building systems work is shown on the Drawings.
   4. Types of products required include the following:
      a. Primary framing system.
      b. Secondary framing system.
      c. Glass-fiber blanket roof and wall insulation.
      d. All auxiliary system components and miscellaneous accessories, fasteners, trim, framed openings, flashing closures, base moldings, gutters, downspouts, vapor retarders and all other items not specified under this or other Sections, but required to provide a completely watertight and functioning building.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with, or before, the metal building systems.
   2. Coordinate the locations of equipment, piping, heating and ventilating ductwork, electrical conduit, and similar items in order to provide required clearances and supports for such items without modification of metal building system components at the Site.

C. Related Sections:
   1. Section 08 1116, Aluminum Doors and Frames.
   2. Section 08 3323, Overhead Coiling Doors.
   3. Section 08 7100, Door Hardware.
   4. Section 08 9000, Louvers and Vents.
   5. Section 09 9100, Painting.
   6. Section 26 0526, Grounding.
   7. Section 41 2200, Cranes and Hoists.

1.2 REFERENCES

A. Standards referenced in this Section are:

1. AAMA/WDMA/CSA 101/I.S.2/A440, Standard/Specification for Windows, Doors, and Unit Skylights.
2. AAMA 701/702, Combined Voluntary Specification for Pile Weatherstripping and Voluntary Specification for Replacement Fenestration Weatherseals.
3. AAMA 2603, Voluntary Specification, Performance Requirements and Test Procedures for Pigmented Organic Coatings on Aluminum Extrusions and Panels.
4. AISC Specifications for Structural Joints using ASTM A325 or ASTM A490 Bolts, approved by RCSC.
5. AISC, AISC 360, Specification for Structural Steel Buildings.
6. AISI, AISI S100, North American Specification for the Design of Cold-Formed Steel Structural Members.
7. Architectural Metal Products Division of NAAMM, Metal Finishes Manual for Architectural and Metal Products.
8. ANSI A250.4, Test Procedure and Acceptance Criteria for Physical Endurance for Steel Doors, Frames, Frame Anchors, and Hardware Reinforcings.
9. ANSI A250.8, Standard Steel Doors and Frames.
10. ANSI/SDI A250.10, Test Procedure and Acceptance Criteria for Prime Painted Steel Surfaces for Steel Doors and Frames.
11. ASCE 7, Minimum Design Loads for Buildings and Other Structures.
12. ASTM A36/A36M, Specification for Carbon Structural Steel.
13. ASTM A53/A53M, Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
14. ASTM A153/A153M, Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
15. ASTM A307, Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength.
16. ASTM A325, Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.
17. ASTM A475, Specification for Zinc-Coated Steel Wire Strand.
18. ASTM A500/A500M, Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
19. ASTM A529/A529M, Specification for High-Strength Carbon-Manganese Steel of Structural Quality.
20. ASTM A563, Specification for Carbons and Alloy Steel Nuts.
21. ASTM A572/572M, Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel.
22. ASTM A653/A653M, Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
23. ASTM A755/A755M, Specification for Sheet Steel, Metallic Coated by the Hot-Dip Process and Prepainted by the Coil-Coating Process for Exterior Exposed Building Products.
24. ASTM A792/A792M, Specification for Sheet Steel, 55% Aluminum-Zinc Alloy Coated by the Hot-Dip Process.
25. ASTM A992/A992M, Specification for Structural Steel Shapes.
26. ASTM A1011/A1011M, Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
27. ASTM A1008/A1008M, Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable.
28. ASTM B221, Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.

29. ASTM B695, Specification for Coatings of Zinc Mechanically Deposited on Iron and Steel.
30. ASTM C423, Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.
31. ASTM C920, Specification for Elastomeric Joint Sealants.
32. ASTM C991, Specification for Flexible Fibrous Glass Insulation for Metal Buildings.
33. ASTM C1136, Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation.
34. ASTM D523, Test Method for Specular Gloss.
35. ASTM D4214, Test Method for Evaluating Degree of Chalking of Exterior Paint Films.
36. ASTM E84, Test Method for Surface Burning Characteristics of Building Materials.
37. ASTM E96/E96M, Test Methods for Water Vapor Transmission of Materials.
38. ASTM E119, Test Methods for Fire Tests of Building Construction and Materials.
39. ASTM E136, Test Method for Behavior of Materials in a Vertical Tube Furnace at 750^0 C.
40. ASTM E283, Test Method for Determining the Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen.
41. ASTM E329, Specification for Agencies Engaged in Construction Inspection, Testing, or Special Inspection.
42. ASTM E331, Test Method for Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Uniform Static Air Pressure Difference.
43. ASTM E1646, Test Method for Water Penetration of Exterior Metal Roof Panel Systems by Uniform Static Air Pressure Difference.
44. ASTM E1680, Test Method for Rate of Air Leakage Through Exterior Metal Roof Panel Systems.
45. ASTM E2190, Specification for Insulating Glass Unit Performance and Evaluation.
46. ASTM F436, Specification for Hardened Steel Washers.
47. AWS D1.1/D1.1M, Structural Welding Code-Steel.
48. AWS D1.3/D1.3M, Structural Welding Code-Sheet Steel.
49. BMHA Standards.
50. FEMA 320, Taking Shelter From the Storm: Building a Safe Room for Your Home or Small Business.
51. FEMA 361, Design and Construction Guidance for Community Safe Rooms.
52. International Accreditation Service, Inc (IAS), AC472, Accreditation criteria for Inspection Programs for Manufacturers of Metal Building Systems.
53. MBMA, Metal Building Systems Manual.
54. NFPA 80, Standard for Fire Doors and Other Opening Protectives.
55. NFPA 252, Standard Methods of Fire Tests of Door Assemblies.
56. SMACNA, Architectural Sheet Metal Manual.
57. SSPC, Steel Structures Painting Manual Vol. 2.
58. U.L. Standard for Safety – UL 10C, Positive Pressure Fire Tests of Door Assemblies.
59. U.L. Standard for Safety - UL 580, Tests for Uplift Resistance of Roof Assemblies.

1.3 TERMINOLOGY

A. Terminology used in this Specification shall comply with MBMA's, "Metal Building Systems Manual" for definitions of terms for metal building systems construction, and the following:
   1. The term "bay spacing" shall mean the dimension between main frames measured normal to frame (at centerline of frame) for interior bays, and dimension from centerline of first interior main frame measured perpendicular to end wall (outside face of end wall girt).

2. The term “building length” shall mean the dimension of the building measured perpendicular to main framing from end wall to end wall (outside face of girt to outside face of girt).
3. The term “building width” shall mean the dimension of the building measured parallel to main framing from sidewall to sidewall (outside face of girt to outside face of girt).
4. The term “clear span” shall mean the distance between supports of beams, girders, or trusses (measured from lowest level of connecting area of a column and a rafter frame, or knee).
5. The term “clear height under structure” shall mean the vertical dimension from finished floor to lowest point of any part of primary or secondary structure, not including crane supports, located within clear span.
6. The term “eave height” shall mean the vertical dimension from finished floor to eave (the line along the sidewall formed by intersection of the planes of the roof and wall).

1.4 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer’s Qualifications:
      a. Metal building system shall be the product of a recognized metal building systems manufacturer who has been in practice of manufacturing metal buildings of the size and complexity of the building shown on the Contract Drawings, for a period no less than five years. The manufacturer shall be chiefly engaged in the practice of designing and fabricating metal building systems and shall be a member of MBMA and be accredited per the requirements of IAS AC472.
   2. Professional Engineer:
      a. Contractor or metal building system manufacturer shall retain a registered professional engineer legally qualified to practice in the same state as the Site. Professional engineer shall have at least five years’ experience in designing metal building systems.
      b. Responsibilities include:
         1) Reviewing metal building system performance and design criteria stated in the Contract Documents.
         2) Preparing written requests for clarifications or interpretations of performance or design criteria for submittal to Engineer by Contractor.
         3) Preparing or supervising preparation of design calculations and related Shop Drawings.
         4) Signing and sealing all design calculations and Shop Drawings.
         5) Certifying that:
            a) Design of metal building systems has been performed in accordance with performance and design criteria stated in the Contract Documents, and
            b) Design conforms to all applicable local, state, and federal Laws and Regulations, and to prevailing standards of practice.
   3. Installer:
      a. Engage a single installer skilled, trained and with documented experience in the erection of metal building systems, who is acceptable to the metal building system manufacturer, and with specific skill and successful experience in the erection of the types of components required.
   4. Testing Laboratory:

a. Retain the services of independent testing laboratory to perform testing and determine compliance with the Contract Documents of the materials specified in this Section.
b. Testing laboratory shall comply with the requirements of Section 01 4529.13, Testing Laboratory Services Furnished by Contractor, and demonstrate to Engineer's satisfaction, based on evaluation of criteria submitted by testing agency, that it has the experience and capability to satisfactorily conduct the testing indicated, in accordance with ASTM E329.

5. Welding:
a. Qualify procedures and personnel according to AWS D1.1/D1.1M and AWS D1.3/D1.3M, as applicable.
b. Submit certification that each welder employed on or to be employed for the Work possesses current AWS certification in the welding process with which welder will be working. Certifications shall be current and valid throughout the Work.

B. Component Supply and Compatibility:
1. Obtain all metal building system components through a single source and from a single manufacturer.
2. Metal building system manufacturer shall review and approve, or prepare all Shop Drawings and other submittals for all components furnished under this Section.
3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by metal building system manufacturer.

C. Regulatory Requirements:
1. Fabricate and label structural framing to comply with material verification and special inspection requirements of the governing Building Code and Authorities Having Jurisdiction at the Site.

D. Pre-installation Conference:
1. Prior to erection of metal building system components and associated Work, Contractor shall schedule and meet at the Site with the metal building system erector, the installer of each component of associated Work, the installers of substrate construction to receive the metal building systems Work, the installers of other Work in and around metal building system that follows the metal building system Work, including mechanical Work, Engineer and other representatives directly concerned with performance of the Work. Review foreseeable methods and procedures related to the metal building system Work, including but not necessarily limited to, the following:
a. Review Project requirements and the Contract Documents.
b. Review required submittals, both completed and yet to be completed.
c. Review status of foundation work, including approval of surface preparations, structural loading limitations and similar considerations.
d. Review construction schedule and availability of materials, tradesmen, equipment and facilities needed to make progress and avoid delays.
e. Review environmental conditions, other Project conditions, and procedures for coping with unfavorable conditions.
f. Review regulations concerning code compliance, environmental protection, health, safety, fire and similar considerations.
g. Review procedures needed for protection of metal building systems during the remainder of the construction period.
h. Review required inspection, testing, and certifying procedures.

2. Record the discussions of the conference and the decisions and agreements or disagreements reached, and furnish a copy of the record to each party attending.
3. Record all revisions or changes agreed upon, reasons therefore, and parties agreeing or disagreeing with them.
4. Reconvene the meeting at the earliest opportunity if additional information must be developed in order to conclude the subjects under consideration.

1.5 SUBMITTALS

A. Action Submittals:
1. Shop Drawings:
a. Submit foundations loads and anchor bolt plans in advance of erection drawings.
1) Drawings showing all vertical and horizontal reactions on foundation. Include direction and location of each load application.
2) Include diameter, projection, and a plan showing location relative to column center line of all anchor bolts required to attach metal building to foundation. Column center line numbering shall be as shown on the Drawings. Plans shall show location of Project north.
3) Completely dimensioned plans, elevations and cross-sections of the metal building system completely coordinated with all required equipment and building service clearances. All details shall be drawn at a scale of not less than 1-1/2 inches equal to 12 inches. Accurately locate, show and dimension the following:
4) Complete erection drawings showing structural framing system including sidewall, endwall, roof framing, and the center lines of the bottom of all columns. Plans shall show the location of Project north. Show complete fabrication of primary and secondary framing. Indicate standard designation, configuration, sizes, spacing, and location of girts and purlins, including framing around all door and window openings. Show the location, size, and connection details for diagonal bracing or portal frames for walls and roof. Include transverse cross-sections.
5) Provide details of all standard and modified steel connections indicating all shop welded, field welded, and bolted connections.
6) Show layouts of wall, roof and liner panels on support framing, details of edge conditions, joints, panel profiles, corners, custom profiles, supports, anchorages, trim, flashings, closures, and special details to clearly indicate the proper assembly of building components. Distinguish between factory- and Site-assembled Work.
7) Insulations.
8) Vapor-retarders.
9) All required wall and roof penetrations.
10) Include details of ventilators, gutters and downspouts and similar auxiliary and accessory system components.
b. Contractor shall note Work not supplied by metal building systems manufacturer and who is to supply such Work.
2. Product Data:
a. Manufacturer's complete product information, specifications and installation instructions for metal building components and accessories. Include material descriptions, dimensions and profiles of individual system.
3. Samples:
a. 6.0-inch square sample of vapor retarders.

b. Sealant color samples.
c. Engineer's review will be for color and profile, only. Compliance with all other requirements is the responsibility of Contractor.

B. Delegated Design Submittals:
1. Design Data: Submit the following:
a. Design Calculations:
1) Complete calculations for the building framing, cold formed members, roofing and siding, as one package with the Shop Drawings. Structural calculations shall include all specified performance criteria, required load cases and load combinations used in the design and resulting member forces, reactions, deflections, story drift, and other anticipated movements in the metal building system. The magnitude of maximum column reactions on foundations from all critical load combinations shall be tabulated separately. Critical load combinations used in the final sizing of members shall be emphasized. All calculations and assumptions shall be presented so that Engineer can easily follow the progress and logic of Contractor's professional engineer. The design analysis shall include the name and office phone number of the designer to answer questions during the shop drawing review.
2) Design calculations shall be signed, sealed, and dated by Contractor's professional engineer. State of professional engineer's registration, registration number, and name on seal shall be clearly legible.

C. Informational Submittals: Submit the following:
1. Certificates.
a. Certification by professional engineer that metal building system design is in accordance with performance and design criteria stated in the Contract Documents, and that design conforms to applicable local, state, and federal Laws and Regulations, and to prevailing standards of practice. This letter shall state the following:
1) Name and location of Project.
2) Order number.
3) Name of manufacturer.
4) Name of Contractor.
5) Building dimensions, including width, length, height, and roof slope.
6) Indicate compliance with AISC standards for hot-rolled steel and AISI standards for cold-rolled steel, including edition dates of each standard.
7) Governing building code and year of edition.
8) Design Loads: Include dead load, roof live load, collateral loads, impact loads, roof snow load, deflection, wind loads/speeds and exposure, design spectral response accelerations at short and 1-second periods (SDS & SD1), seismic importance factor (I), response modification factor (R), seismic response coefficient (Cs), and auxiliary loads, such as loading superimposed on the system by erection equipment.
9) Load Combinations: Indicate that loads were applied acting simultaneously with concentrated loads, according to governing authorities having jurisdiction.
10) Building-Use Category: Indicate category of building use and its effect on load importance factors.
2. Test and Evaluation Reports:

a. Material Test Reports: From a qualified testing laboratory indicating and interpreting material test results of structural steel bolts, structural steel, wall and roof panels, for compliance with requirements specified.
b. Product Test Reports: Based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified testing laboratory, indicating the following current products comply with requirements:
1) Insulation and Vapor-Retarders: Include reports for thermal resistance, fire test response characteristics, water vapor transmission, and water absorption.

3. Manufacturer's Instructions: Provide the following:
a. Indicate preparation requirements and assembly sequence.
b. Installation data.
c. Instructions for handling, start-up, and troubleshooting.
4. Qualification Statements: Submit qualifications for the following:
a. Manufacturer.
1) MBMA certificate verifying membership and accreditation per IAS AC472.
b. Professional Engineer.
c. Manufacturer's representative.
d. Installer.
e. Testing Laboratory.
f. Provide certification that all welders employed on the fabrication of the metal building systems have satisfactorily passed AWS qualification tests within the previous twelve months. Manufacturer shall ensure that all certifications are kept current.
5. Field Quality Control Submittals:
a. Report of field testing results.

1.6 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling, and Unloading:
1. Deliver components to the Site in manufacturer's original, unopened and undamaged packages, legibly labeled and accurately representing contents, indicating materials and components submitted on approved Shop Drawings. Clearly identify manufacturer, brand name, contents, color stock number, and order number on each package.
2. Deliver products to Site to ensure uninterrupted progress of the Work. Deliver anchorage products that are to be embedded in concrete or masonry in ample time to prevent delaying the Work.
3. Inspect all products upon delivery to Site and notify Engineer in writing of loss or damage to products. Metal building system components that are damaged during delivery or while being handled shall not be stored on Site. Promptly remove, replace or remedy damage to new condition in accordance with manufacturer's instructions prior to installation. Do not erect components that become dented, scratched or damaged in any way. Damaged panels erected into the finished Work shall be removed immediately and replaced with new, undamaged material.
4. Do not open packages or remove markings until packages are inspected and accepted. Packages showing indications of damage that may affect condition of contents will not be acceptable. Packages with illegible or removed labels will be rejected for use in the Work.
5. Inspect materials, account for the presence of all hardware, auxiliary items and other accessories required for the Work, and reject components differing from approved Samples and Shop Drawings. Immediately remove rejected components from the Site.
6. Unload, store, and erect wall panels and other metal building system components in a manner that prevents bending, warping, twisting, and surface damage. Stack metal panels

horizontally on platforms or pallets, covered with suitable weathertight and ventilated covering. Store metal panels to ensure dryness, with positive slope for drainage of water. Do not store metal panels in contact with other materials that might cause staining, denting, or other surface damage.

7. Comply with Section 01 6500, Product Delivery Requirements.

B. Storage and Protection:

1. Materials shall be stored out of contact with the ground. Materials other than framing and structural members shall be covered with weathertight coverings and kept dry.
2. Storage accommodations for roof and wall coverings shall provide good air circulation and protect from surface staining.
3. If crated system components become wet, remove all system components from the pallet crate immediately, separate and allow drying under protective cover meeting the requirements of this Specification.
4. Do not expose plastic insulation to sunlight, except to extent necessary for period of installation and concealment.
5. Protect plastic insulation against ignition at all times. Do not deliver plastic insulation materials to Site before it is required to be built into the Work.
6. Comply with 01 66 00, Product Storage and Handling Requirements.

1.7 PROJECT CONDITIONS

A. Environmental Conditions:

1. Weather Limitations: Proceed with erection only when weather conditions permit roof and wall panel installation to be performed according to manufacturer's written instructions and warranty requirements.

B. Site-Measurements:

1. Verify dimensions in areas of erection by taking measurements at the Site before fabrication. Indicate dimensions on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delay.
2. Where Site-measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating components without Site-measurements. Coordinate supports, adjacent construction, equipment and locations of openings to ensure actual dimensions correspond to dimensions established for metal building system Work.

1.8 SCHEDULING

A. Schedule the arrival of metal building system components, auxiliary items and accessories to minimize the time they are stored at the Site before erection.

B. Do not proceed with the erection of metal building systems until Contractor can provide finished Work complying with all requirements of the Specifications.

C. Where metal building systems require the building-in of plates, inserts, anchors and other items, furnish required inserts to avoid delay in the Work of other trades. Provide setting drawings, templates, and directions for installation of plates, inserts and anchors, required by the Work of this Section but installed under other Sections.

D. Coordinate with other Work by furnishing Shop Drawings, inserts and similar items at the appropriate times for proper sequencing of construction without delays.

E. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

1.9 WARRANTY

A. General Warranty: The special warranties specified in this Article shall not deprive Owner of other rights or remedies Owner may otherwise have under the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under the Contract Documents. The obligations of Contractor under the Contract Documents shall not be limited in any way by the provisions of the specified special warranties.

B. Special Warranties:
   1. Panel Coating Wear Warranty: Furnish a written warranty, signed by the manufacturer and running to benefit of Owner, agreeing to replace, for a period of 20 years from the date of Substantial Completion, wall, roof and auxiliary system components and accessories finish that shows excessive wear, as specified, and stating that the coil and spray coated polyvinylidene fluoride based coating specified complies with the following:
      a. Coating will not blister, peel, flake, check nor chip; and shall also be warranted against excessive color change, chalking and cracking, spalling, crazing, or from otherwise losing adhesion for a period of twenty years from the date of installation, to the extent that such shall create unsightly conditions, impair the intended architectural qualities of the building or otherwise fail to meet performance criteria specified, when viewed from a distance of 5 feet from the item.
      b. In the event that the coil coated polyvinylidene fluoride based coating fails to meet the specified standards the manufacturer shall, at his own expense, replace or field paint, at the discretion of Owner, all areas affected by the failure. In the event that repainting is selected, it shall be done at mutually agreeable intervals throughout the term of the warranty.
      c. The warranty does not apply where any failure is caused by accidents, or any external conditions or forces beyond the control of the manufacturer.
   2. Aluminum-zinc Coating Roof and Wall Panel Warranty: Furnish a written warranty, signed by the manufacturer and running to benefit of Owner, agreeing to replace, for a period of 25 years from the date of Substantial Completion, wall, roof and auxiliary system components and accessories finish that shows excessive wear, as specified.
   3. Material and Workmanship Warranty: Furnish a written warranty, signed by the manufacturer and running to benefit of Owner, agreeing to replace metal building system components that fail in material or workmanship within three years of the date of Substantial Completion. Failure of materials or workmanship shall include, but is not limited to, leakage or air infiltration, deflections, or deterioration of metal in excess of normal weathering, and in excess of performance criteria specified; and defects in, and improper arrangement of, the various parts, accessories, weatherstripping, and other components of the system.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE

A. System description, general:
   1. Metal building systems include complete, integrated sets of components and assemblies, capable of withstanding structural and other loadings, thermally induced movements, and exposure to weather in the area of the Site, without failure or infiltration of water into the

building interior. The system includes primary and secondary framing, roof and wall panels, auxiliary system components and all associated trim, complying with requirements shown and specified, all requirements of the metal building systems manufacturer, and governing authorities having jurisdiction at the Site.

2. Metal building systems also include all internal reinforcements and supports, fasteners, closure plates, flashing, fascias, and all other components necessary to complete the Work in a manner that provides a completely functioning system.
3. In some cases incidental accessories necessary to the proper functioning of the specified system or component may not be mentioned in the Specifications. Contractor shall follow the recommendations of the specified metal building system manufacturer and provide systems and components with all required incidental accessories and component items necessary for the proper functioning of the metal building or other building systems, at no additional expense to Owner. Provide materials matching the specified material and finish of similar items.
4. Provide specified material gages, or heavier gages, if calculations based on performance criteria indicate the need for heavier gage material. Where compliance with performance criteria indicates that materials of lesser gage, or size, may be adequate, provide specified gages and sizes as minimum acceptable standard.
5. Do not change material gages, system components or construction details after approval of Shop Drawing by Engineer.

B. Design Criteria:
   1. General:
      a. Provide metal building systems capable of withstanding controlling effects of gravity and lateral loads in accordance with basic load and load combinations in accordance with Laws and Regulations. Comply with applicable standards, recommendations and specified publications of MBMA, AISC, and ASCE 7, except to the extent more stringent requirements are specified or required by governing authorities having jurisdiction at the Site.
      b. Structural steel members and their connections shall be designed in accordance with AISC 360 for design requirements and allowable stresses.
      c. Structural cold-formed steel framing members and their connections shall be designed in accordance with AISI S100, for design requirements and allowable stresses.
   2. Dead Load:
      a. Dead load shall consist of the weight of the structural frame and all other materials of the metal building system.
   3. Live Loads:
      a. Roof live loads shall be determined and applied in accordance with the minimum applicable Building Code, but shall not be lower than a non-reducible minimum of 30 pounds per square foot.
   4. Roof Snow Loads:
      a. Loads induced by the weight of snow, including, but not limited to, balanced, unbalanced, drift, sliding loads, rain-on-snow loads, as determined in accordance with minimum applicable Building Code requirements and the Contract Drawings for the roof slope indicated.
   5. Rain Loads:
      a. Rain loads shall be computed and applied in accordance with the minimum applicable Building Code requirements and the Contract Drawings.
   6. Collateral loads:

a. Collateral load consisting of 5 pounds per square foot shall be applied to the entire structure to account for the weight of additional permanent materials other than the building system, including, but not limited to, sprinklers, mechanical systems, electrical systems, and ceilings. This allowance does not include the weight of hung equipment weighing 50 pounds or more. Any concentrated equipment loads larger than or equal to 50 pounds shall be investigated by the building manufacturer and the structure shall be strengthened as required. Contractor is responsible for providing the metal building system manufacturer the magnitude and location of all concentrated loads larger than or equal to 50 pounds.

7. Wind Loads:
   a. Wind loads on main lateral force resisting systems and components and cladding shall be computed and applied in accordance with the minimum applicable Building Code requirements and the Contract Drawings.
8. Coiling Door Frame Loads:
   a. Contractor shall obtain all superimposed loads resulting from overhead coiling doors from the manufacturer and provide all required information to the metal building system manufacturer in an expedite manner, to avoid metal building system design delays. Manufacturer's framing design shall consider all vertical and lateral loads imposed by the doors, including catenary forces.
9. Concentrated loads indicated on the Contract Drawings shall be applied at the locations shown.
10. Monorail beam support: Runway beam and runway beam supports for the monorail hoist shown and specified in Section 41 2200, Cranes and Hoists shall be designed as part of the building frame. Contractor shall provide all approved hoist loads to metal building manufacturer.
11. Seismic Performance: Provide metal building systems capable of withstanding the effects of seismic forces determined in accordance with the applicable Building Code using seismic design factors shown on the Drawings.
12. Foundation Design Requirements:
    a. Pinned connections shall be assumed at all column bases.
    b. The size of the building column base plates shall not exceed the pier and wall sizes indicated in the Contract Drawings and shall be configured to provide minimum anchor bolt edge distances indicated.

C. Performance Criteria:
1. General:
   a. The metal building system requirements shown are based on the specific system shown. Other manufacturer's systems with equal performance characteristics may be considered. Within these limitations Contractor shall be responsible for the structural adequacy, detailing and fabrication of the entire metal building system, including anchorage, and to make whatever modifications of, and additions to, the details as may be required to fulfill the performance requirements as acceptable to Engineer. Maintain the visual design concept as shown, including member sizes, profiles, support locations and alignment of components, as judged solely by Engineer. Clearly identify, in a manner that is highlighted to Engineer, all proposed substitutions, modifications, variations, unspecified features and "or equal" products. Provide complete comparative data, with specified products, at time of Shop Drawing submission.
2. Primary Frame Type:
   a. Rigid Clear Span: Solid member structural framing system without interior columns.
3. End Wall Framing:

a. For end walls not required to be expandable, provide manufacturer's standard primary frame, capable of supporting one half of a bay design load, and end wall wind columns.
b. For end walls designated to be expandable in the Contract Drawings, provide primary frame, capable of supporting full bay design loads, and end wall wind columns.

4. Secondary Frame Type:
   a. Contractor and pre-engineered building manufacturer shall design and provide additional secondary framing members as shown to resist the minimum loading shown on the Drawings.
      1) Carbon steel wide flange masonry wall lateral support perimeter girt.
         a) Maximum lateral load deflection: L/600
      2) Carbon steel Wide flange PC Plank support.
         a) Maximum live load deflection: L/360
5. Eave Height: As indicated in the Contract Drawings.
6. Bay Spacing: As indicated in the Contract Drawings.
7. Roof Slope: As indicated in the Contract Drawings.
8. Roof System: Manufacturer’s standard Vertical-rib, standing seam metal roof panels, with insulation.
9. Exterior Wall System: Manufacturer's standard site-assembled, insulated.
10. Provide vapor barrier conforming to ASTM E96/E96M.
11. Deflection Limits: Design component assemblies to withstand design loads with deflections no greater than the following:
    a. Roof elements not supporting ceilings: Vertical live load deflection of L/180 of the span.
    b. Roof elements supporting plastered ceilings: Vertical live load deflection of L/360 of the span.
    c. Roof elements supporting nonplaster ceilings: Vertical live load deflection of L/240 of the span.
    d. Steel framing above and along the sides of framed door openings shall be limited to L/360 of the opening width.
    e. Girts: Horizontal deflection of L/180 of the span.
    f. Framing providing lateral support for masonry cladding shall be L/600 of the framing span.
    g. Roof Panels: Vertical deflection of L/180 of the span. The design analysis shall establish that the roof, when deflected under applicable load combinations, will not result in a negative slope.
    h. Wall Panels: Horizontal deflection of L/180 of the span.
12. Drift limits:
    a. Lateral deflections, or drift, at the roof level in relation to the finished floor elevation shall be calculated based on a 50-year mean recurrence interval and shall not exceed H/400 or the working limits of the architectural and mechanical components.
    b. Design secondary framing system to accommodate deflection of primary structure, construction tolerances, and to maintain clearances at openings.
13. Thermal Movements: Provide metal roof and wall panel systems designed for thermal movements. Employ detailing and fabrication techniques that prevent buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects resulting from the following maximum change (range) in ambient and surface temperatures.
14. Thermal Performance: Provide metal building roof and wall assemblies with the following thermal resistance values (R value):

a. Roof Assemblies: R-19+R-11.
b. Wall Assemblies: R-13+R-13.

15. Air Infiltration:
    a. Roof Panels: Provide roof panel assemblies with permanent resistance to air leakage through assembly of not more than 0.09 cfm/sq. ft. of fixed roof area when tested according to ASTM E1680 at a static air pressure difference of 4 pounds per square foot.
    b. Wall Panels: Provide wall panel assemblies with permanent resistance to air leakage through assembly of not more than 0.09 cfm/sq. ft. of fixed wall area when tested according to ASTM E283 at a static air pressure difference of 4 pounds per square foot.
16. Water Penetration:
    a. Roof Panels: Refer to specification Section 07 4113, Roof Panels.
17. Wind Uplift Resistance: Provide metal building systems capable of withstanding the effects of wind forces determined in accordance with the governing codes using wind design factors shown on the Contract Drawings. Provide roof panel assemblies that meet the requirements of UL 580 for the following wind uplift resistance:
    a. Class 90.

2.2 STRUCTURAL FRAMING MATERIALS

A. Hot-Rolled Structural Shapes: ASTM A36/A36M, A529/A529M, A572/A572M, or A992/A992M.

B. Hollow Structural Sections: ASTM A500/A500M, Grade B.

C. Steel Pipe: ASTM A53/A53M, Grade B.

D. Steel Plate, Bar or Strip: ASTM A36/A36M, A529/A529M, or A572/572M.

E. Structural Steel Sheet: Hot-rolled, ASTM A1011/1011M, or cold-rolled, ASTM A1008/A1008M.

F. Metallic-Coated Steel Sheet: ASTM A653/653M, structural steel quality, Grade 50, with G60 coating designation; mill-phosphatized.

G. Metallic-Coated Steel Sheet Pre-painted with Coil Coating: Steel sheet metallic coated by the hot-dip process and prepainted by the coil-coating process to comply with ASTM A755/A755M and the following requirements.
    1. Zinc Coated (Galvanized) Steel Sheet: ASTM A653/653M, G90 coating designation; structural steel quality.
    2. Aluminum-Zinc Alloy-Coated Steel Sheet: ASTM A792/792M, Class AZ50 coating, Grade 40; structural steel quality.

H. Non-High-Strength Bolts, Nuts, and Washers: ASTM A307, Grade A; carbon steel, hex-head bolts; carbon steel nuts; and flat, unhardened steel washers.
    1. Finish: Hot-dip zinc coating, ASTM A153/A153M, Class C.

I. High-Strength Bolts, Nuts, and Washers: ASTM A325, Type 1, heavy hex steel structural bolts, ASTM A563 heavy hex carbon steel nuts, and ASTM F436 hardened carbon steel washers.
    1. Finish: Hot-dip zinc coating, ASTM A153/A153M, Class C.

J. Anchor Bolts:
   1. Conform to the requirements of section 05 0533, Anchor Systems.

K. Primers: As selected by manufacturer for compatibility with finish paint systems specified in Section 09 9100, Painting, and capable of providing a sound substrate for Site-applied topcoats, despite prolonged exposure without topcoat protection.

2.3 INSULATION MATERIALS

A. Fire-Test-Response Characteristics for Insulation: Provide insulation with the fire-test-response characteristics indicated, as determined by testing identical products in compliance with test methods specified below by a testing and inspecting agency acceptable to governing authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency.
   1. Surface-Burning Characteristics: ASTM E84.
   2. Combustion Characteristics: Type I, ASTM E136.

B. Glass-Fiber-Blanket Insulation: Thermal insulation shall be flexible, resilient, odorless, incombustible; complying with ASTM C991, Type I, of 0.5-pound per cubic foot density, thickness as shown, with a flame-spread rating of 25 or less, and 2-inch wide, continuous, vapor-tight edge tabs.

C. Vapor-Retarder Facing: Complying with ASTM C1136, with permeance not greater than the following when tested according to ASTM E96, Desiccant Method.
   1. Composition: Polypropylene-faced, fiberglass-polyester-blend fabric backing, with permeance not greater than 0.02 perm.

D. Retainer Strips: 0.019-inch thick, formed, galvanized steel or polyvinlychloride retainer clips colored to match insulation facing.

E. Vapor-Retarder Tape: As recommended by the manufacturer.

2.4 FABRICATION, GENERAL

A. Shop-fabricate bearing plates, and other plates as required for building erection, to the required sizes, sections and profiles, complete with base plates welded in place, and with all required holes for anchoring or connections shop-drilled, or punched, to template dimensions.
   1. Shop Connections:
      a. Unless otherwise shown or indicated, shop connections may be welded or bolted connections. Welds shall be 3/16-inch minimum.
   2. Site Connections:
      a. Field connections, unless otherwise shown or indicated, shall be made with high-strength bolts, and shall be bearing-type connections.
      b. Use field welding only where shown or indicated or where approved by Engineer.

B. Fabricate components, and necessary field connections required for erection, to permit easy assembly and disassembly. Fabricate components such that once assembled they may be disassembled, repackaged and reassembled with a minimum amount of labor and maximum salvageability.

C. Clearly and legibly mark each piece and part of the assembly to correspond with previously prepared erection drawings, diagrams, and instruction manuals.

D. Fabricate framing to produce clean, smooth cuts and bends. Punch holes of proper size, shape, and location. Cold-formed members shall be free of cracks, tears, and ruptures.

E. Shop-Painting: Clean surfaces to be primed of loose mill scale, rust, dirt, oil, grease, and other matter that might interfere with paint bond. Follow procedures and substrate preparation recommendations of the painting manufacturers for the paint systems specified in Section 09 9100, Painting.

F. Factory-Priming for Site-Painted Finish: Apply the specified primer immediately after cleaning and pretreating.

2.5 STRUCTURAL FRAMING FABRICATION

A. Primary Framing:
   1. Primary framing includes transverse and lean-to frames; rafter, rake, and canopy beams; sidewall, intermediate, end-wall, and corner columns; and wind and seismic bracing.
      a. Shop-fabricate framing components to indicated size and section with baseplates, bearing plates, stiffeners, and other items required for erection welded into place. Cut, form, punch, drill, and weld framing for bolted Site-assembly.
      b. Provide frame span and spacing indicated. Slight variations in span and spacing may be acceptable, if necessary to meet manufacturer's standard, as approved by Engineer.
   2. Rigid Clear-Span Frames: I-shaped frame sections fabricated from shop-welded, built-up steel plates or structural steel shapes.
   3. Rigid Modular Frames: I-shaped frame sections fabricated from shop-welded, built-up steel plates or structural steel shapes. Provide interior columns fabricated from round steel pipe or tube, or shop-welded, built-up steel plates.
   4. Frame Configuration: Gable.
   5. Exterior Column Type: Tapered depth.
   6. Rafter Type: Tapered.
   7. Join flanges to webs of built-up members by a continuous submerged arc-welding process.
   8. Brace compression flange of primary framing by angles connected between frame web and purlin or girt web, so flange compressive strength is within allowable limits for any combination of loadings. Location of bracing shall be per the requirements of the building designer.
   9. Brace webs against buckling in beam-column connections of moment frames.
   10. Weld clips to frames for attaching secondary framing members.

B. Secondary Framing:
   1. Provide metal building system manufacturer's standard structural secondary framing members, including purlins, girts, eave struts, flange bracing, base members, gable angles, clips, headers, jambs, and other miscellaneous structural members. Fabricate framing from cold-formed, structural steel sheet or roll-formed, metallic-coated steel sheet prepainted with coil coating, unless otherwise shown or specified.
   2. Purlins: C- or Z-shaped sections; fabricated from minimum 0.0598-inch thick steel sheet, built-up steel plates, or structural steel shapes; minimum 2-1/2-inch wide flanges.
      a. Depth: To meet system performance requirements.

~~3. Girts: C- or Z-shaped sections; fabricated from minimum 0.0598-inch thick steel sheet, built-up steel plates, or structural steel shapes. Form ends of Z-sections with stiffening lips angled 45 to 50 degrees to flange and with minimum 2-1/2-inch wide flanges.~~

~~a. Depth: To meet system performance requirements.~~

~~4.~~3. Eave Struts: Unequal-flange, C-shaped sections; fabricated from minimum 0.0598-inch thick steel sheet, built-up steel plates, or structural steel shapes; to provide adequate backup for both roof and wall panels.

~~5.~~4. Flange and Sag Bracing: Minimum 1-5/8-inch by 1-5/8-inch structural steel angles, with a minimum thickness of 0.0598-inch, to stiffen primary frame flanges.

a. Lateral bracing shall be provided for both flanges. Flange bracing shall be located as indicated and as required by analysis, but no less than at quarter points of the member's span. Antiroll clips shall be provided at each support.

~~6.~~5. Base or Sill Angles: Minimum 3-inch by-2-inch by 0.0747-inch thick, zinc-coated (galvanized) steel sheet.

~~7.~~6. Purlin and Girt Clips: Minimum 0.0747-inch thick, zinc-coated (galvanized) steel sheet.

~~8.~~7. Secondary End-Wall Framing: Manufacturer's standard sections fabricated from minimum 0.0747-inch thick, zinc-coated (galvanized) steel sheet.

~~9.~~8. Framing for Openings: Channel shapes; fabricated from minimum 0.0598-inch thick, cold-formed, structural steel sheet or structural steel shapes, as required by analysis. Frame head and jamb of door openings, and head, jamb, and sill of other openings.

~~10.~~9. Miscellaneous Structural Members: Manufacturer's standard sections fabricated from cold-formed, structural steel sheet; built-up steel plates; or zinc-coated (galvanized) steel sheet; designed to withstand required loads.

C. End-Wall Framing:

1. Provide metal building system manufacturer's standard primary end-wall framing fabricated for Site-bolted assembly.
2. End-Wall and Corner Columns: I-shaped sections fabricated from structural-steel shapes; shop-welded, built-up steel plates; or C-shaped, cold-formed, structural steel sheet; with minimum thickness of 0.0747-inch.
3. End-Wall Rafters: C-shaped, cold-formed, structural steel sheet; with minimum thickness of 0.0598-inch.

D. Bracing: Provide bracing using any method specified below, at manufacturer's option, unless a specific type of bracing is noted on the Contract Drawings. Bracing shall be located as to not interfere with any exterior wall openings, such as duct locations, doors, and appurtenances.

1. Rods: ASTM A36/A36M; ASTM A572/A572M, Grade D; or ASTM A529/A529M, Grade 50; 1/2 inch diameter steel; threaded full length or threaded a minimum of 12 inches at each end.
2. Cable: ASTM A475, 1/4 inch diameter, extra high strength grade, Class B zinc coated, seven strand steel; with threaded end anchors.
3. Rigid Portal Frames: Fabricate from shop welded, built up steel plates or structural steel shapes to match primary framing; of size required to withstand design loads.

E. Bolts: Provide stainless steel bolts, unless structural framing components are in direct contact with roof and wall panels. Provide galvanized bolts when structural framing components are in direct contact with roof and wall panels.

2.6 ROOF PANEL FABRICATION

A. Provide roof panels in accordance with Section 07 4113, Roof Panels.

2.7 FASCIA AND SOFFIT PANEL FABRICATION

A. Fascia Panels: Manufacturer's standard panels complying with the following:
   1. Match roof panel profile and material.

B. Soffit Panels: Manufacturer's standard panels complying with the following:
   1. Match wall panel profile and material.
   2. Flat Panels: Fabricate from 50-ksi steel sheets, factory-formed to provide flat panel with 16-inch coverage. Panel shall be 1-inch deep. Design side laps for mechanical attachment to structure by interlocking panel edges and securing panels with concealed fasteners. Factory-apply sealant at each interlocking joint. Comply with the following:
      a. Material: Aluminum-zinc alloy-coated steel.
      b. Metal Thickness: 24 gage.

C. Finish panel surfaces to match adjacent panels as follows:
   1. Fascia Panels: Color to be selected by Engineer.
   2. Soffit Panels: Color to be selected by Engineer.

2.8 DOOR AND FRAME FABRICATION

A. Doors: Provide doors in accordance with Section 08 1116, Aluminum Doors and Frames.

B. Finish Hardware: Provide finish hardware in accordance with Section 08 7100, Door Hardware.

2.9 LOUVER FABRICATION

A. Louvers: Refer to Section 08 9000, Louvers and Vents.

2.10 AUXILIARY SYSTEM COMPONENTS AND MISCELLANEOUS ACCESSORIES

A. Accessories shall be as specified in Section 8 of the Recommended Guide Specifications in the MBMA Manual, including gutters and downspouts.
   1. Provide sheet metal accessories of same material and in same finish as roof and wall panels, unless otherwise specified.

B. Gutters and Downspouts: Provide the following:
   1. Form from 26 gage, zinc-coated (galvanized) steel sheet or aluminum-zinc alloy-coated steel sheet prepainted with coil-coating. Match profile of roof fascia and rake trim
   2. Gutters: Formed in sections not less than 8 feet in length, complete with end pieces, outlet tubes, and all special pieces that may be required and sized according to SMACNA's "Architectural Sheet Metal Manual." Unless otherwise shown, provide expansion-type slip joint at the center of runs. Furnish gutter supports spaced at 36 inches on centers, constructed of same metal as gutters. Provide standard aluminum wire ball strainers at each outlet.
   3. Downspouts: Formed from 26 gage, zinc-coated (galvanized) steel sheet or aluminum-zinc alloy-coated steel sheet prepainted with coil-coating, in sections approximately 10 feet long, complete with elbows and offsets. Join sections with minimum 1-1/2 inches telescoping joints. Provide fasteners at top, bottom and at 5 foot centers designed to securely hold downspouts not less than 1 inch away from walls. Finish downspouts to match wall panels.

4. Provide preformed rubber weatherseals to completely fill roof corrugation voids prior to installation of contour gutter.
5. Provide 26-gage galvanized steel closures to close corrugations in wall panels prior to installation of gutters.

C. Contour Eave and Gable Trim: Provide the following:
1. Gable and eave trim shall be contour type fabricated from 26-gage galvanized steel, ASTM A653/A653M, G90 coating.
2. Gable and eave trim shall have a factory applied paint finish.
3. Install preformed corner closures to match the configuration of the gable and eave trim.
4. Install preformed rubber weatherseals to completely fill the roof panel corrugation voids prior to installation of eave trim.
5. Install preformed wall closures to completely fill the wall panel corrugation voids prior to installation of eave and gable trim. Wall closures shall be 26-gage galvanized steel factory painted in slate black.

D. Flashing and Trim:
1. Trim and wall panel transitions and other wall accessories for doors and windows and other openings through the metal panels shall be as required to coordinate with doors, window walls and other components specified in other Sections and Contracts.
2. Trim and wall panel transitions and other wall accessories for doors and windows and other openings through the metal panels shall be as required to coordinate with doors, window walls and other components specified in other Sections and Contracts.
3. Provide manufacturer's standard profiles to the extent possible. Custom fabricate profiles where required, or shown, and to accommodate the Work of other Sections and Contracts. Provide extruded aluminum trim with polyurethane thermal break for all window wall openings.
4. Form flashing and trim from 26 gage, zinc-coated (galvanized) steel sheet or aluminum-zinc alloy-coated steel sheet prepainted with coil-coating.
5. Provide flashing and trim as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, eaves, rakes, corners, bases, framed openings, ridges, fasciae, and fillers. Finish flashing and trim with same finish system as adjacent roof or wall panels.
6. Door Head and Jamb Opening Trim: Minimum 24 gage steel sheet. Trim head and jamb of door openings, and head, jamb, and sill of other openings.
7. Base Molding Trim: Provide continuous interior base moldings in all perimeter wall areas except toilet rooms, fabricated from 22-gage galvanized steel. Finish shall be slat black. Provide base molding 3-7/8-inches high by 3/4-inch wide with a sloping top.

E. Louver, Personnel and Overhead Door Openings: Provide framing for all openings, consisting of properly designed galvanized steel headers and posts, drip gutters and door post flashing and trim all coordinated with selected metal wall panel system for type and location. Provide size shown.

F. Fasteners:
1. Sheet Panel Fasteners: Manufacturer's standard system of self- tapping screws, bolts and nuts, self-locking rivets, self-locking bolts, end-welded studs, and other suitable fasteners designed to withstand design loads.
2. Provide metal-backed neoprene washers under heads of fasteners bearing on weather side of panels.

3. Locate and space fastenings for true vertical and horizontal alignment. Use appropriate fastening tools to obtain controlled uniform compression, for positive seal without rupture of neoprene washer.
4. Provide fasteners with heads matching color of roofing or siding sheets by means of plastic caps or factory-applied coating. Provide self-tapping screws, bolts, nuts, self-locking rivets and bolts, end-welded studs, and other suitable fasteners designed to withstand design loads. Comply with the following:
5. Fasteners for Roof and Wall Panels: Self-drilling or self-tapping Type 410 stainless steel or zinc-alloy steel hex washer head, with EPDM or PVC washer under heads of fasteners bearing on weather side of panels.
6. Fasteners for Flashing and Trim: Blind stainless steel rivets or stainless steel self-drilling screws with hex washer head.

2.11 SOURCE QUALITY CONTROL

A. Fabrication Tolerances:
   1. Comply with MBMA's "Low Rise Building Systems Manual," Chapter IV, Section 9, "Fabrication Tolerances."

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine the areas and conditions under which the metal building systems are to be erected and notify Engineer in writing of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.2 PREPARATION

A. Clean substrates of all substances, including grease, oil, rolling compounds, incompatible primers, and loose mill scale, that may impair bond of materials.

B. Clean and prepare items to be finished with field-applied coatings in compliance with Section 09900, Painting.

C. Survey the footings and foundations to assure conformance with approved shop drawings. Correct all deficiencies before beginning structural steel erection.

3.3 ERECTION OF STRUCTURAL FRAMING

A. Place and secure metal building systems in accordance with approved Shop Drawings, and the Contract Documents.

B. Do not field cut, drill, or alter structural members without written approval from Engineer.

C. Set structural framing in locations and to elevations indicated and according to AISC specifications. Maintain structural stability of frame during erection.

D. Baseplates, Leveling Plates and Bearing Plates: Clean concrete bearing surfaces of bond-reducing materials and roughen surfaces before setting baseplates and bearing plates. Clean bottom surface of baseplates and bearing plates.
   1. Set baseplates and bearing plates for structural members on wedges, shims, or setting nuts.
   2. Tighten anchor bolts after supported members have been positioned and plumbed. Do not remove wedges or shims but, if protruding, cut off flush with edge of baseplate or bearing plate before packing with grout.
   3. Pack grout solidly between bearing surfaces and plates so no voids remain. Finish exposed surfaces, protect installed materials, and allow to cure.
      a. Comply with manufacturer's written instructions for proprietary grout materials.

E. Align and adjust framing members before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact. Make adjustments to compensate for discrepancies in elevations and alignment.
   1. Level and plumb individual members of structure.
   2. Splice members only where shown or specified.
   3. Establish required leveling and plumbing measurements on mean operating temperature of structure. Make allowances for difference between temperature at time of erection and mean temperature at which structure will be when completed and in service.

F. Secondary Framing: Erect framing true to line, level, plumb, rigid, and secure. Fasten secondary framing to primary framing using clips with field connections using non-high-strength bolts. Hold rigidly to a straight line by sag rods.
   1. Provide rake or gable purlins with tight-fitting closure channels and fascia.
   2. Locate and space wall girts coordinated with door and window arrangements and heights.
   3. Provide supplemental framing at entire perimeter of openings, including doors, windows, louvers, ventilators, and other penetrations of roof and walls.

G. Bracing: Install bracing in roof and sidewalls where shown and as required by design. Tighten rod and cable bracing, if used, to avoid sag.

3.4 FASCIA AND SOFFIT PANEL INSTALLATION

A. General: Provide panels full width of fascia and soffits. Install panels perpendicular to support framing.
   1. Arrange and nest side-lap joints so prevailing winds blow over, not into, lapped joints. Install panels with vertical edges plumb. Lap ribbed or fluted panels one full rib corrugation. Apply panels and associated items for neat and weathertight enclosure. Avoid "panel creep" or application not true to line.
   2. Site-cutting of fascia and soffit panels with a torch is not permitted.
   3. Fasten flashing and trim around openings and similar elements with self-tapping screws.
   4. Install screw fasteners with power tools having controlled torque adjusted to compress neoprene washer tightly without damage to washer, screw threads, or panels. Install screws in predrilled holes.
   5. Use stainless steel fasteners for exterior applications and galvanized fasteners for interior applications.
   6. Locate and space fastenings in true vertical and horizontal alignment.

B. Fascia Panels: Align bottom of panels and fasten with blind rivets, bolts, or self-tapping screws. Flash and seal panels with weather closures where fascia meet soffits, along lower panel edges, and at perimeter of all openings.

C. Soffit Panels: Flash and seal panels with weather closures where soffit meets walls and at perimeter of all openings.

3.5 INSULATION INSTALLATION

A. General: Install insulation concurrently with panel installation, according to manufacturer's written instructions and as follows:
   1. Two-Layers-between-Purlin-with-Spacer-Block Installation: Extend insulation and vapor retarder between purlins. Carry vapor-retarder-facing tabs up and over purlin, overlapping adjoining facing of next insulation course and maintaining continuity of retarder. Install layer of filler insulation over first layer to fill space between purlins formed by thermal spacer blocks. Hold in place with bands and crossbands below insulation.
   2. Thermal Spacer Blocks: Where metal roof panels attach directly to purlins, install thermal spacer blocks.
   3. Retainer Strips: Install retainer strips at each longitudinal insulation joint, straight and taut, nesting with secondary framing to hold insulation in place.
   4. Blanket Wall Insulation: Extend insulation and vapor retarder over and perpendicular to top flange of secondary framing. Hold in place by metal wall panels fastened to secondary framing.
   5. Retainer Strips: Install retainer strips at each longitudinal insulation joint, straight and taut, nesting with secondary framing to hold insulation in place.
   6. Sound-Absorption Insulation: Where sound-absorption requirement is indicated for metal liner panels, cover insulation with polyethylene film and provide inserts of wire mesh to form acoustical spacer grid.

3.6 DOOR, HARDWARE, AND LOUVER INSTALLATION

A. General: Comply with manufacturer's written instructions for installing components. Coordinate installation with wall flashings and other building system components.

B. Doors and Frames: Refer to Section, 08 1613, Fiberglass Reinforced Plastic Doors and Frames.

C. Overhead Doors: Refer to Section, 08 3323, Overhead Coiling Doors.

D. Windows: Install windows in accordance with manufacturer’s written instructions and approved shop drawings. Install windows plumb, rigid, properly aligned, without warp or rack of frames or sash, and securely fasten in place according to manufacturer's written instructions. Coordinate installation with wall flashings and other components. Seal perimeter of each window frame with elastomeric sealant used for metal wall panels:

E. Finish Hardware: Install hardware in accordance with manufacturer’s written instructions and approved shop drawings. Mount units at heights indicated in DHI's "Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames.”

F. Louvers: Refer to Section 08 9000, Louvers and Vents.

3.7 AUXILIARY SYSTEM COMPONENTS AND ACCESSORY INSTALLATION

A. General: Install gutters, downspouts, ventilators, and other accessories according to manufacturer's written instructions and approved shop drawings, with positive anchorage to building and weathertight mounting. Coordinate installation with flashings and other components.

B. Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide for thermal expansion of metal units; conceal fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.
   1. Install exposed flashing and trim that is without excessive oil canning, buckling, and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof and weather-resistant performance.
   2. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped or bayonet-type expansion provisions cannot be used or would not be sufficiently weather resistant and waterproof, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with mastic sealant (concealed within joints).
   3. Pipe Flashing: Form flashing around pipe penetration and roof panels. Fasten and seal to roof panel as recommended by manufacturer.
   4. Dissimilar Materials: Separate metal from incompatible metal or corrosive substrates by coating concealed surfaces, at locations of contact, with asphalt mastic or other permanent separation as recommended by manufacturer.

C. Gutters: Join sections with riveted and soldered or lapped and sealed joints. Attach gutters to eave with gutter hangers spaced not more than 4 feet on centers using manufacturer's standard fasteners. Provide end closures and seal watertight with sealant. Provide for thermal expansion.

D. Downspouts: Join sections with 1-1/2-inch telescoping joints. Provide fasteners designed to hold downspouts securely 1 inch away from walls; locate fasteners at top and bottom and at approximately 60 inches on centers in between.
   1. Tie downspouts to underground drainage system indicated.

3.8 FIELD QUALITY CONTROL

A. Site Tests and Inspections: Materials and erection procedures shall be subject to inspection and tests at the Site conducted by qualified testing laboratory. Such inspections and tests do not relieve Contractor of responsibility for providing the Work in accordance with the Contract Documents.
   1. Contractor shall employ testing laboratory to inspect high-strength bolted connections and welded connections and to perform tests and prepare test reports.
      a. Testing laboratory shall conduct and interpret tests, prepare and state in each report of results whether test specimens comply with the Contract Documents and specifically state all deviations.
      b. High-strength Bolted Connections: All high-strength bolted connections shall be visually inspected. Inspection shall determine whether the Work conforms to Sections 2, 3, and 8 of AISC Specifications for Structural Joints Using ASTM A325 or A490 Bolts.
         1) For connections that are slip-critical or subject to axial tension, inspector shall verify proper pre-tensioning.
         2) For connections that are not slip critical and not subject to direct tension, bolt does not need to be inspected for bolt tension, but shall be visually inspected to verify that plies of connected elements are in snug contact.
         3) Where bolts or connections are defective, correct defective workmanship, remove and replace, or correct as required all defective bolts and connections.

Contractor shall pay for correcting defective Work and tests required to confirm integrity of corrected Work.

c. Welds: All welds shall be visually inspected.
   1) Where visually defective welds are evident, further test welds using non-destructive methods. If welds are determined to be acceptable, Owner shall pay for non-destructive testing. When welds are defective, Contractor shall pay for non-destructive testing.
   2) Correct, or remove and replace, defective Work as directed by Engineer.
   3) Contractor shall pay for corrections and subsequent tests required to determine weld conformance with the Contract Documents.

B. Manufacturer's Services:
   1. Provide at the Site services of qualified manufacturer's representative, who is familiar with the design of the building supplied and experienced in the erection of metal buildings, from the start of the structural framing erection until completion of the installation of exterior covering, to ensure that the building meets the specified requirements.

3.9 ADJUSTING, CLEANING AND PROTECTION

A. Protection of Aluminum from Dissimilar Materials:
   1. Coat surfaces of aluminum that will contact dissimilar materials such as concrete, masonry, and steel, in accordance with Section 09 9100, Painting.

B. Touchup Painting: Immediately after erection, clean, prepare, and prime or reprime welds, bolted connections, and abraded surfaces of prime-painted primary and secondary framing, accessories, and bearing plates, as specified in Section 09 9100, Painting.

END OF SECTION 13 3419

SECTION 21 1010

FIRE PROTECTION SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
1. Fire protection riser piping from building entrances to distribution systems, including alarm valves, flow switches, and alarm horns.
2. Fire protection distribution piping from risers to sprinkler heads, including access to valves in enclosed ceilings and walls.
3. Contractor shall determine volume and pressure of incoming water supply from water flow test data and then design each system to NFPA 13 occupancy requirements as indicated.

1.2 SYSTEM DESCRIPTION

A. Design Requirements:
1. Water Supply: Water supply availability is indicated on Drawings and by requirements of this section. The owner shall provide the following information:
a. Static Pressure in psig.
b. Residual Pressure in psig at gpm flow.
c. Source: Hydrant No. indicated on Drawing.
d. Date of Test.
e. "Test Conducted by" information.
2. System No. 1 – Membrane Bldg. - Chemical Rooms:
a. Occupancy Classification: Ordinary Hazard, Group 2
b. System Type: Wet Pipe.
c. Area of Sprinkler Operation: 1500 sq ft.
d. Density of Water Application: 0.2 gpm/sq ft.
e. Maximum Area of Sprinkler Coverage: As required by NFPA 13
f. Allowance for Outside Hose: 250 gpm.
3. System No. 2 – Membrane Bldg. - Basement:
a. Occupancy Classification: Ordinary Hazard, Group 1
b. System Type: Wet Pipe.
c. Area of Sprinkler Operation: 1500 sq ft.
d. Density of Water Application: 0.15 gpm/sq ft.
e. Maximum Area of Sprinkler Coverage: As required by NFPA 13
f. Allowance for Outside Hose: 250 gpm.
4. System No. 3 – Chemical Feed Bldg. – Polyortho Room:
a. Occupancy Classification: Ordinary Hazard, Group 2
b. System Type: Wet Pipe.
c. Area of Sprinkler Operation: 1500 sq ft.
d. Density of Water Application: 0.2 gpm/sq ft.
e. Maximum Area of Sprinkler Coverage: As required by NFPA 13
f. Allowance for Outside Hose: 250 gpm.
5. System No. 4 – Chemical Feed Bldg. – Fluoride Room (existing):
a. Occupancy Classification: Ordinary Hazard, Group 2
b. System Type: Wet Pipe.

c. Area of Sprinkler Operation: 1500 sq ft.
d. Density of Water Application: 0.2 gpm/sq ft.
e. Maximum Area of Sprinkler Coverage: As required by NFPA 13
f. Allowance for Outside Hose: 250 gpm.

1.3 SUBMITTALS

A. Schedule below identifies information required for each item of material or equipment.

Unit Type	Submittal Information Item
Piping	1, 2
Hangers, Supports and Anchors	1, 2
Valves	1
Switches, Horn, Meters and Gauges	1

B. Submittal Information.
1. Product Data: Submit manufacturer's data for fire protection systems, materials, and products.
2. Shop Drawings: Submit in accordance with Division 15 mechanical co-ordination section.
3. Approved Installation Drawings: Complete installation drawings showing piping sizes, sprinkler head locations and hydraulic flow calculations. Drawings shall be approved and signed by Local Fire Authority having Jurisdiction.
4. Qualifications:
   a. Provide copy of Automatic Sprinkler Contractor's State of Ohio License.
   b. Provide copy of Fire Protection Designer's State of Ohio Designer License.

C. Certificate of Installation: Submit certificate upon completion of fire protection piping work which indicates work has been tested in accordance with NFPA Nos. 13, 14, and 20, and that system is operational, complete, and has no defects.

D. Submit in accordance with Section 01 3300.

1.4 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in manufacture of fire protection piping systems products, of types, materials, and sizes required, whose products have been in satisfactory use in similar service for not less than 5 yrs.

B. Installer: A firm with at least 3 yrs of successful installation experience on projects with fire protection piping systems work similar to that required for Project.

C. Regulatory Requirements:
1. National Fire Protection Association (NFPA): Comply with NFPA Nos. 13, 14, and 20.
2. Factory Mutual (FM) Compliance: Comply with FM "Approval Guide."
3. Factory Mutual (FM) Labels: Provide sprinkler products bearing FM approval labels.
4. Underwriter's Laboratories (UL) Labels: Provide fire sprinkler piping products which have been approved and labeled by Underwriters Laboratories.
5. Local Fire Department/Marshall Regulations: Comply with governing regulations pertaining to fire sprinkler piping.

6. Insurance Compliance: Comply with regulations and requirements of OWNER'S insurance carrier. Where discrepancies exist between requirements of insurance carrier and local Fire Marshall, most stringent requirement governs.

1.5 FIRE PROTECTION PERMIT

A. Fire Protection installer shall be a licensed Automatic Sprinkler contractor in the state of Ohio.

B. Fire Protection installer to receive the Fire Suppression System permit from the Warren County Building Regulations Division and pay associated fees.
   1. Expected fees are as follows:
      a. $150 to register with the County
      b. $35 for the permit

C. Fire Protection installer to receive separate permit as required by the State Fire Marshal office and pay associated fees.

1.6 MAINTENANCE

A. Extra Materials:
   1. For each style and temperature range required, furnish additional sprinkler heads, amounting to 1 unit for every 100 installed units, but not less than 5 units of each.
   2. Furnish replacement heads with tools necessary for removal and replacement of heads in red colored, lockable carrying case.

PART 2 - PRODUCTS

2.1 FIRE PROTECTION PIPING MATERIALS AND PRODUCTS

A. Provide piping materials and factory fabricated piping products of sizes, types, pressure ratings, temperature ratings, and capacities indicated.

B. Where not indicated, provide proper selection determined by CONTRACTOR to comply with installation requirements.

C. Provide sizes and types matching piping and equipment connections; provide fittings of materials which match pipe materials used in fire protection piping systems.

D. Where more than 1 type of materials or products are indicated, selection is CONTRACTOR'S option.

2.2 BASIC IDENTIFICATION

A. Comply with Section 22 05 53 and following.
   1. Fire Protection Piping: Plastic pipe markers.
   2. Fire Protection Valves: Plastic valve tags.

2.3 BASIC PIPE, TUBE AND FITTINGS

A. Comply with Section 22 00 10 and following.

B. Non-Corrosive Areas:

1. Interior Piping:
    a. Black Steel Pipe:
        1) Pipe Weight: Schedule 10 for 5 in. and smaller; 0.134 in. wall thickness for 6 in. and 0.188 in., wall thickness for 8 in. and 10 in.
        2) Fittings: Mechanical grooved pipe couplings and fittings; roll groove or mechanical locking type.
    b. Copper Tube:
        1) Wall Thickness: Type M, hard drawn temper.
        2) Fittings: Wrought copper, solder joints.

C. Chemical Rooms:
1. Corrosive areas to be schedule 10, 316 stainless steel pipe with press joint fittings.
2. Press Joint Fittings: 316 stainless steel by Victaulic or Grinnel.
3. Grooved mechanical couplings shall consist of two ASTM A536 ductile iron housings, pressure-responsive, synthetic rubber gasket, and plated steel bolts and nuts.
    a. Rigid Type: Housings shall be cast with offsetting, angle-pattern bolt pads to provide system rigidity and support and hanging in accordance with NFPA 13.
        1) 1-1/4-inch through 8-inch: “Installation Ready” stab-on-design, for direct “stab” installation onto grooved end pipe without prior field disassembly and no loose parts. Victaulic FireLock EZ Style 009H (1-1/4 inch to 4 inch) and Victaulic Style 107H QuickVic (2 inch to 8 inch).
        2) 10-inch and larger: Victaulic Style 07 Zero-Flex® standard rigid coupling.
    b. Flexible Type: Use in seismic areas where required by NFPA 13.
        1) 2 inch through 8 inch: “Installation Ready” stab-on design, for direct “stab” installation onto grooved end pipe without prior field disassembly and no loose parts. Victaulic Style 177 QuickVic.
        2) 10 inch and larger: Victaulic Style 75 or 77 standard flexible couplings.

2.4 PIPING SPECIALTIES

A. Comply with Section 22 00 10 and provide following.
1. Pipe escutcheons.
2. Dielectric unions.
3. Sleeves.
4. Sleeve seals.

2.5 BASIC HANGERS, SUPPORTS AND ANCHORS

A. Comply with Section 22 00 10 and following.
1. Adjustable steel clevises, adjustable steel band hangers, and adjustable band hangers for horizontal piping hangers and supports.
2. Two bolt riser clamps for vertical piping supports.
3. Steel turnbuckles and malleable iron sockets for hanger rod attachments.
4. Concrete inserts, top beam C clamps, side beam or channel clamps, and center beam clamps for building attachments.
5. Copper flashings for piping penetrations.
6. Pipe hangers located within corrosive areas (chemical rooms) shall be constructed of 316 stainless steel matching piping material.

2.6 BASIC VALVES

A. Comply with Section 22 00 10 and following.
   1. Interior Valves:
      a. Sectional: Rising stem gate valves.
      b. Check: Swing check valves.

2.7 SPECIAL VALVES

A. Fire Department Connections:
   1. Type: Storz flush mounted wall type with brass finish, threaded dust cap and chain of matching material and finish. Size to match Local Fire Department.
   2. Label: "Sprinkler - Fire Department Connection".
   3. Drain: 3/4 inch automatic drip, outside.

B. Double-Check Backflow Preventer
   1. Manufacturers:
      a. Watts Regulator Company.
      b. FEBCO, Division of CMB Industries.
      c. Hersey Products, Inc., A Grinnell Company.
      d. Conbraco Industries, Inc.
      e. Or equal.
   2. Double check backflow preventer: Factory-assembled and tested assemblies including inlet and outlet shutoff gate valves w/ OS&Y, inlet strainer, test cocks, and 2 positive check valves. Pressure Class: 175 psig.
      a. 2-1/2 in. Through 10 in.: Watts No. 709, or equal.
      b. Chain and locks to secure indicating valves in Open position.

2.8 BASIC METERS AND GAUGES

A. Comply with Section 22 00 10 and following.
   1. Pressure Gauges: 0 to 250 psi range.

2.9 FIRE PROTECTION SPECIALTIES

A. Manufacturers:
   1. Allen (W.D.) Manufacturing Division, J.W. Moon, Inc.
   2. Automatic Sprinkler Corporation of America.
   3. Chemetron Corporation.
   4. Elkhart Brass Manufacturing Company.
   5. Grinnell Fire Protection Systems Company, Inc.
   6. Viking Corporation.
   7. Western Fire Equipment Company.
   8. Or equal.

B. UL listed and in accordance with following list. Provide sizes and types which mate and match piping and equipment connections.
   1. Water Flow Indicators: Vane type water flow detectors.
   2. Exterior Alarm Horn: UL listed, weatherproof, red enameled finish120 Volt.
   3. Supervisory Switches: As recommended by manufacturer for use in service indicated.
   4. Automatic Sprinklers: Type indicated on Drawings, and in accordance with following list. Provide fusible links for 165° F (74° C) unless otherwise indicated.
      a. Upright.

b. Pendent.
c. Vertical sidewall.
d. Conventional; 40% discharge upward, 60% downward.
e. Flush pendent.
f. Concealed pendent.
g. Horizontal sidewall.
1) Finish: Chrome plate for occupied areas; cast brass for unoccupied areas.

5. Provide stainless steel construction materials in corrosive areas.
6. Sprinkler Cabinet and Wrench: Steel, baked red enameled sprinkler box with capacity to store ten sprinklers and wrench sized to sprinklers.

PART 3 - EXECUTION

3.1 INSTALLATION OF BASIC IDENTIFICATION

A. Install mechanical identification in accordance with Section 22 05 53.

B. Install fire protection signs on piping in accordance with NFPA Nos. 13, 14, and 20 requirements and in accordance with requirements of authority having jurisdiction and OWNER'S insurance carrier. Where conflicting requirements exist, install in accordance with most stringent requirements.

3.2 INSTALLATION OF PIPE, TUBE, AND FITTINGS

A. Install in accordance with Section 22 00 10. Do not weld sprinkler distribution piping. Join by means of flanged or mechanical grooved type joints. Headers, risers, feed mains, cross mains may be shop welded in accordance with ASME B31.1 by welders certified under Section IX, ASME Code.

B. Fire Sprinkler Piping Systems:
1. Comply with requirements of NFPA No. 13 for installation of fire sprinkler piping materials. Install fire sprinkler piping products where indicated in accordance with manufacturer's written instructions, and in accordance with recognized industry practices, to ensure fire sprinkler piping complies with requirements and serves intended purposes.
2. Coordinate with other work, including plumbing piping, as necessary to interface components of fire sprinkler piping properly with other work.
3. Install sectional valves in inlet piping at bottom of each riser and in loops as indicated.
4. Mount supervisory switches on each sectional valve.
5. Install valved hose connections of sizes indicated or 3/4 in. size if not otherwise indicated, on sprinkler at ends of branch lines and cross mains at locations where indicated.
6. Install air vents at high points of sprinkler piping.
7. Install drain piping at low points of fire sprinkler piping. Extend main drains to hub drains. Extend local drains to safe location where water drained will not damage property, injure personnel or create nuisance.
8. Install manual shutoff at each audible alarm station.
9. Label sprinkler piping, valves, and specialties.

3.3 INSTALLATION OF AUTOMATIC SPRINKLERS

A. Provide necessary swing fittings in drop pipes to permit final adjustment of sprinkler location when ceiling tiles are being installed.

B. Layout piping system and center sprinkler in ceiling tiles of gridded ceiling system.

3.4 INSTALLATION OF PIPING SPECIALTIES

A. Install in accordance with Section 22 00 10.

3.5 INSTALLATION OF SUPPORTS, ANCHORS AND SEALS

A. Install in accordance with Section 22 00 10.

3.6 INSTALLATION OF VALVES

A. Install in accordance with Section 22 00 10.

3.7 INSTALLATION OF METERS AND GAUGES

A. Install in accordance with Section 22 00 10.

3.8 INSTALLATION OF FIRE PROTECTION SPECIALTIES

A. Install as indicated, and in accordance with NFPA Nos. 13 and 14.

3.9 CLEANING

A. Sprinkler Piping Flushing: Prior to connecting sprinkler risers for flushing, flush water feed mains, lead in connections and control portions of sprinkler piping. After fire sprinkler piping installation complete and before piping is placed in service, flush entire sprinkler system, as required to remove foreign substances, under pressure as specified in NFPA No. 13. Continue flushing until water is clear and check to ensure debris has not clogged sprinklers.

3.10 FIELD QUALITY CONTROL

A. Hydrostatic Testing: After flushing system, test fire sprinkler piping hydrostatically, for 2 hrs, at not less than 200 psi or at 50 psi in excess of maximum static pressure when maximum static pressure is in excess of 150 psi. Check system for leakage of joints. Measure hydrostatic pressure at low point of each system or zone being tested.
   1. Repair or replace piping system required to eliminate leakage in accordance with NFPA standards for “no visible leakage,” and retest as specified to demonstrate compliance.
   2. Notify ENGINEER and OWNER’S insurance carrier and Wisconsin code authority 48 hrs in advance of time and date of tests.

END OF SECTION 21 1010

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 22 0010

PLUMBING SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
1. Domestic Water Piping Systems:
a. Domestic cold water piping.
b. Domestic hot water piping.
2. Waste and Vent Piping Systems:
a. Above ground, soil, waste, and vent piping within buildings including soil stacks, vent stacks, horizontal branches, traps, and connections to fixtures and drains.
b. Underground building drain piping including mains, branches, traps, connections to fixtures and drains, and connections to stacks terminating at connection to sanitary sewers 5 ft. outside inner face of foundation wall.
3. Drainage piping products.
4. Valves and accessories.
5. Fixtures and trim.
6. Plumbing equipment.
7. Insulation.
8. Pipe specialties.

1.2 SUBMITTALS

A. Schedule below identifies information required for each item of material or equipment.

	Unit Type	Submittal Information Item
1.	Valves	1
2.	Hose Bibbs and Wall Hydrants	1
3.	Combination Shower/ Eyewash Units	1
4.	Drainage and Vent Products	1
5	Backflow Preventer	1
6.	Sump Pumps	1, 2, 3
7.	Electric Water Heater	1, 2, 3
8.	Fixtures and Trim	1, 2
9.	Insulation	1
10.	Domestic Hot Water Recirculating Pumps	1, 2, 3
11.	Pipe Specialties	1

B. Submittal Information:
1. Product Data: Manufacturer's specifications for units showing dimensions, weights, capacities, ratings, performance characteristics, gauges, color, and finished of materials, and installation instructions.
2. Shop Drawings, Assembly Drawings: Show unit dimensions, rough-in elevations, construction details, and field connection details.

3. Shop Drawings, Wiring Diagrams: Manufacturer's electrical requirements for power supply wiring to units.

C. Submit items in accordance with Section 01 3300.

D. Information submitted by CONTRACTOR, but not designated to be submitted will be returned without action by ENGINEER.

1.3 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in manufacture of plumbing systems products of types, materials, and sizes required, whose products have been in satisfactory use in similar service.

B. Plumbing Code Compliance: Comply with applicable portions of building codes pertaining to plumbing materials, construction, and installation of products.
1. Ohio Plumbing Code (2017).

C. PDI Compliance: Comply with applicable PDI standards pertaining to products and installation of soil and waste piping systems.

1.4 PLUMBING PERMIT

A. Plumber must be a licensed plumber in the state of Ohio

B. Plumber to receive the plumbing permit from Warren County and pay associated fees.
1. Expected fees are as follows:
a. $55 for the permit (up to 10 fixtures)
b. Additional $5 per plumbing fixture
c. $45 for water service connection
d. $45 for sewer service connection
e. $10 for back-flow preventer (each)

PART 2 - PRODUCTS

2.1 GENERAL

A. Where more than one type is indicated, selection is CONTRACTOR'S option or compliance with governing regulations.

B. Size system drain piping as shown or, if not shown, as required to properly drain piping systems, including valves and equipment.

C. Manufacturer's equipment used as basis of design for project is name indicated in Specifications for particular type of equipment or application contained in these Contract Documents. If no manufacturer listed, basis of design is industry standard indicated.

D. All newly installed or replacement pipes, pipe fittings, plumbing fittings, fixtures, faucets, backflow preventers and valves that are installed on potable water systems or systems that are designed to distribute water for potable water use, are required to meet the new Reduction of Lead in Drinking Water Act, which establishes a maximum lead content of 0.25 percent by weighted average of wetted surfaces.

2.2 WATER SUPPLY SYSTEM

A. Tube Size 2-1/2 in. and smaller, interior non-chemical room areas:
   1. Copper Tube: ASTM B88, Type L.
   2. Fittings: Wrought copper solder joint.
   3. Valves: Class 125 bronze ball valve.

B. Tube Size 2-1/2 in. and smaller, interior chemical rooms:
   1. Chlorinated Polyvinyl Chloride Tube, (CPVC): Schedule 80, ASTM 2846.
   2. Fittings: CPVC Schedule 40 socket type.
   3. Valves: CPVC ball valve.
   4. CPVC plastic pipe must meet Plumbing Code for potable drinking water.
   5. Solvent weld joints must include a primer of contrasting color to the pipe and cement, or a one-step solvent cement complying with ASTM F493 and ASTM D2826.

2.3 WASTE, VENT AND STORM SYSTEMS PIPING

A. Pipe Sizes 6 in. and smaller, above grade:
   1. Poly Vinyl Chloride (PVC) plastic pipe.
   2. Pipe Weight: Type DWV, ASTM D2665, D2949 or F891.
   3. Fittings: PVC plastic, Type DWV, socket type, solvent cement joints.

B. Pipe Size 6 in. and smaller, below grade:
   1. Poly Vinyl Chloride (PVC) plastic pipe.
   2. Pipe Weight: AWWA C900, Class 150, DR-18.
   3. Fittings: Ductile iron or cast iron in accordance with AWWA C110/A21.10.
   4. Joints: Push-on with integral bell and slip-type elastomeric gasket.

2.4 SUMP PUMP PIPING

A. Pipe Size 1-1/4 in.:
   1. Steel Pipe: ASTM A53/A53M, galvanized, Schedule 40.
   2. Fittings: Class 125 galvanized cast iron threaded drainage.

2.5 DRAINAGE PIPING PRODUCTS

A. Floor Cleanout (FCO):
   1. Manufacturers:
      a. Zurn Model Z1400 “Level-Trol”.
      b. J.R. Smith.
      c. Or equal.
   2. Cast iron body, round adjustable, scoriated secured nickel bronze top, straight thread gasket seal closure plug.

B. Wall Cleanouts (WCO):
   1. Manufacturers:
      a. J.R. Smith, Figure 4422C.
      b. Zurn.
      c. Or equal.
   2. Cast bronze body adaptable to pipe with taper thread countersunk plug and shallow cover.

C. Flashing Flanges:
   1. Products recommended by manufacturer for use in service indicated.
   2. Include clamping device.

D. Floor Drain (FD-1):
   1. Manufacturers:
      a. Zurn Model Z415B.
      b. J.R. Smith.
      c. Or equal.
   2. Vandal proof cast iron floor drain, in sizes indicated, with combination invertible membrane clamp, 8 in. polished bronze strainer and adjustable collar with seepage slots.
   3. Screw anchors matching strainer finish.

E. Floor Drain (FD-2):
   1. Manufacturers:
      a. Zurn Model Z415E.
      b. J.R. Smith.
      c. Or equal.
   2. Vandal proof cast iron floor drain, in sizes indicated, with combination invertible membrane clamp, 8 in. polished bronze strainer, adjustable collar with seepage slots and 4" diameter funnel.
   3. Screw anchors matching strainer finish.

F. Floor Drain (FD-3):
   1. Manufacturers:
      a. Zurn, Figure ZM1752.
      b. J.R. Smith.
      c. Or equal.
   2. 12-in. by 12-in. Sani-flor receptor, 10-in. deep, 16 gage 316 stainless steel, bottom outlet, inside caulk, in sizes indicated, 3/4 grate, anti-splash stainless steel interior dome strainer.

G. Trench Drain (TD-1):
   1. Manufacturers:
      a. Zurn Model Z890-DGE.
      b. ACO
      c. Or equal.
   2. Modular channels are 60" long, 7-inch wide reveal with 4-inch throat, #16 ga. stainless steel modular channel conforming to ASTM A-240, type 304. Channels have bolted, flanged connection between channel sections and will stay connected during installation. Channels have smooth, 1-1/2-in. radiused self-cleaning bottom with a Manning's coefficient of 0.009 and 1.04% or neutral 0% built in slope.
   3. Provide No-hub bottom outlet or end outlet connection as shown on drawings.
   4. Provide closed end caps.
   5. Provide gasket between flanged connections.
   6. Provide ductile iron slotted grates, Zurn P6-DG, 20-in. x 5-3/8-in., conforming to DIN rating Class E, ANSI rating of Special-Duty, H-20 load rated, FAA load rated and ASTM A536 Grade 80-55-06. Grates shall lock down to frame.
   7. Provide trench drain lengths and invert depths as indicated on drawings.

H. Trench Drain (TD-2):
   1. Manufacturers:

a. Zurn Model Z706-HDS-DGE-USA.
b. ACO
c. Or equal.

2. Provide frame and grate system to be used with cast-in-place concrete trench, sloped at a min. 1/16-in per ft. See Structural drawings for trench drain details.
3. Frame and grate system shall be 120 in. long, 6-in wide and have a clear opening. Frame shall mechanically lock into the concrete surround every 10-in.
4. Frame: Heavy-duty stainless-steel frame assembly, 0.105 in. thick, conforms to ASTM A-240, Type 304, with twelve 4-in long concrete anchors per 120 in. length of trench.
5. Grate: Provide ductile iron slotted grate, Zurn DGE-USA, supplied in 20-in nominal lengths with 5/16 in wide slots and ¾-in bearing depth, conforming to DIN rating Class E, ANSI rating of Special-Duty, H-20 load rated, FAA load rated and ASTM A536 Grade 80-55-06.
6. Grate lockdown bars shall be integral to frame.
7. All welds must be performed by certified welder per ASTM standard AWS D1.6.
8. Provide No-hub bottom outlet or end outlet connection as shown on drawings.
9. Provide trench drain lengths and invert depths as indicated on drawings.

2.6 BALL VALVES

A. Ball Valves 3/4 in. and smaller:
1. Manufacturers:
a. Nibco, Figure T-585-Y.
b. Wolverine Brass.
c. Or equal.
2. Bronze body, screwed, brass or stainless-steel ball, full port, Teflon seat rings, 125 psi WP steam.

B. Ball Valves 1 in. through 2 in.
1. Manufacturers:
a. Nibco, Figure T-580-Y.
b. Wolverine Brass.
c. Or equal.
2. Bronze body, screwed, brass or stainless-steel ball, conventional port, Teflon seat rings.
3. 125 psi WP steam.

C. Ball Valves 1 in. through 2 in. (Chemical Rooms).
1. Manufacturers:
a. Nibco, Chemtrol CPVC Tru-Bloc, Tru-Union, Model D.
b. Spears.
c. Or equal.
2. CPVC body, includes socket and threaded end connections, CPVC ball, full port, O-ring beneath the PTFE seat.
3. 125 psi WP steam.

2.7 GATE VALVES

A. All gate valves shall have resilient seats rather than brass seats. Operating rods shall have O-Ring water seals rather than packing glands.

B. Manufacturers:
1. Stockham Valves and Fittings.

2. NIBCO, Inc.
3. Milwaukee Valve Company, Inc.
4. Or equal.

C. 2 in. and Smaller: ASTM B62 Class 125, bronze, screw-in bonnet, rising stem, ASTM B62 solid bronze wedge.
1. Threaded Ends: Stockham Figure B-100, or equal.
2. Solder Ends: Stockham Figure B-109, or equal.

D. MSS Compliance:
1. Cast Iron Valves: MSS SP-70.
2. Bronze Valves: MSS SP-80.

E. ANSI Compliance:
1. Dimensions: ANSI B16.10.

2.8 DRAIN VALVES:

A. Manufacturers:
1. Conbraco Industries, Inc.
2. NIBCO, Inc.
3. Woodford Manufacturing Company.
4. Or equal.

B. Drain Valves: Provide 3/4 in. drain valves where indicated.
1. Threaded Ends: Conbraco 31 Series, or equal.

C. ASSE Compliance: ASSE 1005.

2.9 HOSE BIBBS (HB):

A. Manufacturers:
1. Woodford Manufacturing Company.
2. +Wilkins Regulator, Division of Zurn Industries, Inc.
3. Wolverine Brass, Citation-Walther Corporation.
4. Or equal.

B. Indoor Application: ASTM B62 brass construction, renewable composition disc, wheel handle, 3/4 in. inlet, 3/4 in. hose outlet, with integral vacuum breaker-backflow preventer.
1. Threaded Ends: Woodford Model 24P, or equal.
2. Solder Ends: Woodford Model 24C, or equal.

C. ASSE Compliance: ASSE 1011.

2.10 WALL HYDRANTS (WH):

A. Manufacturers:
1. Woodford Manufacturing Company.
2. Wilkins Regulator, Division of Zurn Industries, Inc.
3. Or equal.

B. Projecting Non-freeze Wall Hydrants: Cast ASTM B62 brass wall hydrant, powder-coated, die cast aluminum handle, Adjustable polycarbonate wall flange automatic draining with 1-piece valve plunger, stainless steel seat, integral vacuum breaker, 3/4 in. inlet, 3/4 in. hose outlet. Provide length suitable for wall thickness. Provide wall faucet mounting sleeve, Woodford Model WF-MS.
   1. Threaded Ends: Woodford Model 17CP3, or equal.
   2. Solder Ends: Woodford Model 17C, or equal.
   3. ASSE Compliance: ASSE 1011.

2.11 REDUCED PRESSURE PRINCIPLE BACKFLOW PREVENTERS

A. Manufacturers:
   1. Watts Regulator Company.
   2. FEBCO, Division of CMB Industries.
   3. Hersey Products, Inc., A Grinnell Company.
   4. Conbraco Industries, Inc.
   5. Or equal.

B. Reduced Pressure Principle Backflow Preventors: Factory-assembled and tested assemblies including inlet and outlet shutoff valves, inlet strainer, test cocks, and pressure differential relief valve located between 2 positive check valves. Pressure Class: 175 psig.
   1. 3/4 in. Through 10 in.: Watts No. 909, or equal.

C. ASSE Compliance: ASSE 1013.

2.12 ACCESSORIES

A. Bellows Air Cushions:
   1. Bellows type, pre-charged compression chamber, stainless steel casing and bellows.
   2. Provide sizes complying with PDI-WH-201.

B. Water Shock Absorbers (Water Hammer Arresters):
   1. Manufacturers:
      a. Watts.
      b. Smith (Jay R.) Manufacturing Company.
      c. Wade, Division of Tyler Pipe.
      d. Zurn Industries, Inc., Hydromechanics Division.
      e. Or equal.

C. Piston Type water shock absorbers, Type L copper casing, pressure rated for 250 psi, tested and certified in accordance with PDI-WH-201.

D. Water Meter: Water meter will be furnished by Owner and installed by Contractor.

2.13 FIXTURES

A. General:
   1. Provide factory fabricated fixtures of size, type, rating, and capacity indicated.
   2. Where not indicated, provide proper selection, as determined by CONTRACTOR, to comply with installation requirements.
   3. Provide sizes and types matching piping and equipment connections.

4. The finish of fittings, accessories, and supplies exposed to view shall be chromium-plated per ASME A112.187.1M.
5. Fixtures and faucets shall meet the requirements of the Reduction of Lead in Drinking Water Act.
6. Use of manufacturer's name and model or catalog number is for purpose of establishing standard of quality and general configuration desired only. Products of other manufacturers will be considered in accordance with manufacturers listed in this section.

B. HANDICAPPED WATER CLOSETS (WC-1):
1. Kohler Kingston K-4325, wall supported, flush valve, white vitreous china siphon jet elongated bowl, with 2-1/8 in. passageway, 1-1/2 in. top spud, 1.28 gpf or 1.6 gpf depending on flushometer specified, ASME A112.19.2.
2. Kohler Lustra K-4666-C, white elongated closet seat, with open front, check hinge.
3. Sloan 113-1.6, 1.6 gpf flush valve with 1 in. IPS stop, vacuum breaker, ADA Compliant non-hold open handle, adjustable tailpiece, and 1-1/2 in. spud coupling conforming to ASSE 1037.
4. J.R. Smith 0100-0600 Series carrier.

C. URINAL (U-1):
1. Kohler Bardon K-4904-ET, white vitreous china, wall hung, washout flushing, 3/4 in. top spud with beehive strainer, 0.125 gpf to 1.0 gpf.
2. Sloan 186-0.5, 0.5 gpf flush valve with 3/4 in. IPS stop, vacuum breaker, ADA Compliant non-hold open handle, adjustable tailpiece, and 3/4 in. spud coupling conforming to ASSE 1037.
3. J.R. Smith 0600 Series carrier.

D. WALL HUNG LAVATORY (L-1):
1. Kohler Greenwich K-2032, white vitreous china 20 in. by 18 in. drilled for concealed arm carrier.
2. Chicago Faucet No. 802-665ABCP, manual metering faucet, 4 in. centers, 2.2 gpm aerator, vandal proof metering push handles, adjustable cycle time closure, integral spout, chrome plated.
3. Kohler K-8999, 1-1/4 in. by 1-1/2 in. cast brass p-trap with cleanout plug, chrome plated.
4. Kohler K-7131-A, 1-1/4 in. cast brass offset drain with grid strainer, chrome plated.
5. Kohler K-7605-P-CP, 3/8 in. IPS supply connections, chrome plated brass, four-arm handle stop.
6. J.R. Smith 0700-0900 Series carrier.
7. Kohler K-99799, thermostatic tempering valve, (set at 100°F), built-in check valves on cold water inlet and hot water inlet, tamper resistant locking nut to prevent accidental mis-adjustment.
8. Truebro Lav Guard 2, under sink piping covers, rigid high impact stain resistant white PVC, 1/8 in. nominal wall thickness, tear to fit trim feature, E-Z grip fasteners, fits all 1-1/4 in. or 1-1/2 in. tubular P-traps and 3/8 in. or 1/2 in. angle stop assemblies.

E. SERVICE SINK (SS-1):
1. Kohler Bannon K-6719, 24 in. by 20 in., wall mounted, acid resistant enameled cast iron, blank back, with stainless steel rim guard.
2. Kohler K-6673, adjustable trap for 3 in. iron pipe connection with cleanout plug and strainer.

3. Chicago Faucet No. 917-RCF, service sink faucet with rough chrome finish, raised atmospheric vacuum breaker, vandal proof lever handles, double pipe supports, rigid spout with hose threads, pail hook and wall brace.
4. Provide (2) 1/2 in. by 60 in. rough chrome finish riser pipes for each faucet.
5. Provide 4-ft length of garden hose with female fitting for each faucet.

F. EMERGENCY SHOWER AND EYE/FACE WASH (ESEW-1):
1. Manufacturers:
   a. Haws Model 8330.
   b. Bradley
   c. Guardian.
   d. Or equal.
2. Barrier free, 1-1/4 inch stainless steel pipe stand with safety yellow coating, chrome-plated brass stay-open shower and eye/face wash ball valves, plastic shower head, halo eye/face wash with stainless bowl and cover, stainless steel activation handle.
3. Thermostatic Mixing Valve: Model 9201H or equal, liquid filled thermostat, integral strainer, check stops on inlets, adjustable set point within temperature range, accurate temperature control, built-in cold water by-pass, positive shut-off of hot supply when cold supply is lost, dial thermometer and wall mounting bracket.
4. Alarm Flow Switch Model SP154DPDT.
5. Certification: Emergency eyewash/ showers shall comply with ANSI Z358.1-2014.

G. EMERGENCY SHOWER AND EYE/FACE WASH - FREEZE PROTECTED (ESEW-2):
1. Manufacturers: Haws Corporation; Model 8317CTFP
   a. Haws Corporation; Model 8317CTFP
   b. Bradley Corporation.
   c. Encon Safety Products.
   d. Speakman Company.
   e. Or equal.
2. Piping: Galvanized steel.
   a. Unit Supply: NPT 1-1/4 inch.
   b. Mounting: Floor mounted.
3. Heating System: Electric, 120V ac; insulation enclosed in a protective jacket with thermostat.
   a. Design Ambient Temperature: Minus 30 deg F.
4. Shower:
   a. Shower Capacity: Not less than 20 gpm for at least 15 minutes. Maximum flow not to exceed 25 gpm when within compliant pressure ranges.
   b. Supplied with flow regulator and stay-open control valve.
   c. Control-Valve Actuator: Pull rod.
   d. Shower Head: 10-1/2-inch- diameter, plastic.
5. Eye/Face Wash Unit:
   a. Capacity: Not less than 3 gpm for at least 15 minutes.
   b. Control-Valve Actuator: Paddle.
6. Appurtenances:
   a. Flow switch with dry contacts for remote alarm.

H. WALL-MOUNTED EMERGENCY SHOWER (ES-1)
1. Manufacturers:
   a. Haws Model 8133H.
   b. Bradley

c. Guardian.
d. Or equal.

2. Horizontally mounted drench shower shall include stainless steel showerhead with 20 gpm flow control, type 316 stainless steel schedule 40 pipe and fittings. Includes stainless stay-open ball valve, pull rod with triangular handle, universal sign and 1" NPT supply.
3. Thermostatic Mixing Valve: Model 9201E or equal, liquid filled thermostat, integral strainer, check stops on inlets, adjustable set point within temperature range, accurate temperature control, built-in cold water by-pass, positive shut-off of hot supply when cold supply is lost, dial thermometer and wall mounting bracket.
4. Alarm Flow Switch Model SP154DPDT.
5. Certification: Emergency eyewash/ showers shall comply with ANSI Z358.1-2014.

I. WALL-MOUNTED EMERGENCY EYE/FACE WASH (EEW-1)

1. Manufacturers:
   a. Haws Model 7360.
   b. Bradley
   c. Guardian.
   d. Or equal.
2. Wall-mounted eye/face wash shall include a 11" round stainless-steel bowl with 3.7 gpm flow control, type 316 stainless steel schedule 40 pipe and fittings. Includes stainless stay-open ball valve, in-line 50 mesh strainer, pop-off dust cover, universal sign and 1/2" NPT supply.
3. Thermostatic Mixing Valve: Model 9201EW or equal, liquid filled thermostat, integral strainer, check stops on inlets, adjustable set point within temperature range, accurate temperature control, built-in cold water by-pass, positive shut-off of hot supply when cold supply is lost, dial thermometer and wall mounting bracket.
4. Alarm Flow Switch Model SP154DPDT.
5. Pipe 1-1/2" drain down to 12" above floor.
6. Certification: Emergency eyewash/ showers shall comply with ANSI Z358.1-2014.

2.14 PLUMBING EQUIPMENT

A. ELECTRIC WATER HEATER: (EWH-1)

1. Manufacturers:
   a. Rheem Model E175A-72-G.
   b. A.O. Smith.
   c. American Standard
   d. Ruud
   e. State
   f. Or equal.
2. Commercial water heater, heavy duty, 175 gal storage capacity, seamless glass lined welded tank construction, ASME construction certified, maximum hydrostatic working pressure of 160 psi, foam insulation, dual magnesium anode rods for corrosion resistance, 2-1/2" NPT water connections, cold water bottom side inlet, hot water top outlet, 72-kw or 245,678 Btu/hr. electric input, recovery of 298 gal/hr. at 100° F rise, stainless steel "screw-in" type elements, immersion thermostats, internal power circuit fusing, control circuit fusing, magnetic contactors, 120Vcontrol circuit transformer and surface mounted thermostat or immersion thermostats with manual reset high limit control, and System Sentinal diagnostic panel with LED's that correspond to the number, location, and status of each heating element.

3. Water heater shall meet the thermal efficiency and standby loss requirements of the U.S. Department of Energy and current edition ASHRAE/IES 90.1.
4. Pre-wired, accessible control box with multiple knock-outs on side in size selections to match NEC, grounding screw, terminal block, 480V/3ph power supply.
5. Adjustable water temperature up to 180°F, set water temperature at 160°F. Contractor shall verify that all plumbing fixtures are provided with Thermostatic Mixing Valves.
6. Provide properly sized ASME pressure and temperature relief valve.
7. Full-port, full-flow, brass drain valve.
8. Provide thermal expansion tank: Amtrol Model ST-12C or equal.
9. Provide vacuum relief valve: Watts Model LFN-36-M1-3/4" or equal.
10. Manufacturer 3-year limited warranty on tank and1-year limited parts warranty.

B. SUMP PUMPS (SP-1 & SP-2):
1. Manufacturers:
   a. Zoeller Pump Co.
   b. Weil.
   c. Hydr-O-Matic, Marley Pump Co.
   d. Or equal.
2. Pump Selection:
   a. Pumps shall operate at or near point of peak efficiency allowing for operation at capacities of approximately 25% beyond design capacity.
   b. Design impeller diameter so design capacity of each pump (gpm and TDH) shall not exceed 90% of capacity obtainable with maximum impeller diameter at design speed for that model and motor RPM.
   c. Pump curve shall be continuously rising from maximum capacity up to shutoff point.
   d. Motor shall be non-overloading at any point on the curve.
3. General:
   a. Motors:
      1) Comply with requirements of Sections 26 0505 and 26 2000, except as modified herein.
      2) Stainless steel impeller shaft with permanently lubricated bearings.
      3) Cast iron motor housing and volute, factory mounted and finished with corrosion resistant epoxy coating.
      4) Sealed 20 ft power cord with rated twist-lock plug at control panel.
   b. Sump Basin
      1) Provide cast-in-place reinforced concrete sump basin as shown on drawings, integral to the building structure as detailed on Structural drawings. Submit shop drawings for approval.
      2) Provide aluminum or cast-iron gastight cover with threaded or flanged openings to accommodate pump discharge piping, vent connection, and rubber grommeted fittings to pass power and float cords. Cover to include bolt-down hand holes to permit removal of either pump and servicing of floats, without removing full cover.
   c. Alternator Control Panel:
      1) Sequence alternator control panel, factory wired and tested, except as modified herein.
      2) Wall mounted NEMA 4 enclosures for non-rated areas.
      3) 2 combination magnetic starters, green "pump run" indicator lights, Hand/Off/Auto switch for each pump, high water alarm (with light, horn and silencer), non-powered contact for remote alarm, and automatic alternator

circuit which will change pump lead after each draw-down cycle, except as modified herein.

4) Control circuitry shall be 115v, 1 ph, 60 Hz with integral control transformer factory wired.

5) Switches, lights, alternators, and panel components shall be in accordance with requirements of Section 26 0900.

6) Remote Alarm; Auxiliary set of dry contacts to be sent to SCADA by Division 40.

d. Float Switch and Float:

1) 4 strap-mounted mercury float switches, except as modified herein.

2) Floats shall be double wall, totally sealed, chemical-resistant plastic with internal molybdenum contact mercury switch and 20 ft neoprene jacketed power cord with rated twist-lock plug, except as modified herein.

4. Duplex Pump System (SP-1 and SP-2):

a. Zoeller high head submersible effluent pumps. Rated for continuous duty and capable of passing 1/2 in. solids. Shutoff head at least 50% greater than TDH at scheduled rated flow.

1) SP-1: Model 151 - Rated for continuous duty at 29 gpm against 20 ft TDH and capable of passing 1/2 in. solids. 1/3 horsepower at 3450 rpm, 115 Volts, single phase.

2) SP-2: Model 161 - Rated for continuous duty at 79 gpm against 20 ft TDH and capable of passing 1/2 in. solids. 1/2 horsepower at 3450 rpm, 115 Volts, single phase.

b. Pump Control Settings:

1)	6" Drain Invert EL.	742.50
2)	High Water Alarm EL.	743.00
3)	Both Pumps On EL.	742.00
4)	Lead Pump On EL. (Pumps Alternate)	741.50
5)	Both Pumps Off EL.	741.17
6)	Bottom of Sump EL.	740.50

C. DOMESTIC HOT WATER RECIRCULATING PUMPS (RP-1):

1. Manufacturers:

a. Taco

b. Armstrong

c. Bell & Gossett

d. Grundfos

e. Watts

f. Or equal.

2. RP-1; Model 008-B6, Plumb n' Plug, pre-wired domestic water recirculating pump, 3/4-in sweat connection, 1/25-hp, 115V/1-ph, 60 Hz., 0.84 amps, 7-day digital timer controller, isolation ball valves, unions, discharge check valve, air purge valve. Rated for continuous duty at 12 gpm against 5 ft TDH.

2.15 INSULATION

A. Fibrous Glass Insulation:

1. Manufacturers:

a. Owens-Corning.

b. Manville.

c. Or equal.

2. 3.5 lb density with laminated white vapor barrier jacket, thickness as scheduled.
3. Ratings not exceeding flame spread of 25 and smoke developed of 50 (Test Method ASTM E84).
4. Fiberglass Insulation PVC Jacketing: ASTM C547, high temperature, preformed, jacket with matching pre-molded PVC fitting covers. (For use in chemical room spaces.)

B. Flexible Unicellular Pipe Insulation (Below Grade):
1. Manufacturers:
a. Manville.
b. Rubatex.
c. Or equal.
2. ASTM C534, Type I, density 4.5 to 8.5 pcf., thickness as scheduled.
3. Maximum ASTM C96 permeability = 0.3 perm-in.
4. Maximum k = 0.30 Btu-in./hr-sq ft-° F, at 75° F to 200° F, with fittings sealed at joints.

2.16 PIPING SPECIALTIES

A. Mechanical Sleeve Seals:
1. Manufacturers:
a. Thunderline Corporation.
b. Or equal.
2. Modular mechanical type consisting of interlocking synthetic rubber links shaped to continuously fill annular space between pipe and sleeve. Connected with bolts and pressure plates which cause rubber sealing elements to expand when tightened, providing watertight seal and electrical insulation. Select to withstand 40-ft hydrostatic head of water.

B. Pipe Sleeves and Wall Collars:
1. Provide pipe sleeves and wall collars of one of following:
a. Sheet Metal: Fabricate from galvanized sheet metal; round tube closed with snaplock joint, welded spiral seams, or welded longitudinal joint. Fabricate from following gauges; 3 in. and smaller; 20 ga; 4 in. to 6 in. 16 ga; over 6 in. 14 ga.
b. Steel Pipe: Fabricate from Schedule 40 carbon steel pipe. Provide welded center flange and hot-dipped galvanized finish for water stoppage.
c. Iron Pipe: Provide cast iron or ductile iron pipe with integrally cast intermediate collar in exterior, water supporting, and water retaining walls and slabs.
d. Plastic Pipe: Fabricate from Schedule 80 PVC plastic pipe; remove burrs.

C. Dielectric Unions:
1. Manufacturers:
a. B & K Industries, Inc.
b. Rockford, Eclipse Division.
c. Or equal.
2. Provide standard products recommended by manufacturer for use in service indicated which effectively isolate ferrous from nonferrous piping (electrical conductance), prevent galvanic action, and stop corrosion.

D. Pipe Escutcheons:
1. Manufacturers:
a. Jones Manufacturing Co., Inc.
b. Or equal.

2. Provide pipe escutcheons with inside diameter closely fitting pipe outside diameter, or outside of pipe insulation where pipe is insulated. Select outside diameter of escutcheon to completely cover pipe penetration hole in floors, walls or ceilings and pipe sleeve extension, if any. Furnish pipe escutcheons with nickel or chrome finish for occupied areas. Prime paint finish for unoccupied areas.
3. Pipe Escutcheons for Moist Areas: For waterproof floors and areas where water and condensation can be expected to accumulate, provide cast brass or sheet brass escutcheons, solid or split hinged.
4. Pipe Escutcheons for Dry Areas: Provide sheet steel escutcheons, solid or split hinged.
5. Pipe Escutcheons for Chemical Areas: Provide 316 stainless steel escutcheons.

PART 3 - EXECUTION

3.1 GENERAL

A. Trench, backfill, and compact in accordance with Section 31 2305.

B. Install pipe hangers, supports, and anchors in accordance with Section 22 0529.

C. Install wall pipes, sleeves, and seals in accordance with this section.

3.2 PIPING INSTALLATION

A. General:
1. Install pipe, tube, and fittings in accordance with recognized industry practices achieving permanently leakproof piping systems, capable of performing each indicated service without piping failure.
2. Install each run with minimum joints and couplings, but with adequate and accessible unions for disassembly and maintenance or replacement of valves and equipment.
3. Reduce sizes (where indicated) by use of reducing fittings.
4. Align piping accurately at connections, within 1/16 in. misalignment tolerance.
5. Comply with ASME B31.9 - Building Service Piping.
6. Installation of water piping must comply with IAMPO Installation Standard 20 98; Including provisions for expansion and contraction.

B. Pipe Locations:
1. Locate piping runs, except as otherwise indicated, vertically and horizontally (pitched to drain), and avoid diagonal runs wherever possible.
2. Orient horizontal runs parallel with walls and column lines.
3. Locate runs, as shown or described by diagrams, details, and notations or, if not otherwise indicated, run piping in shortest route which does not obstruct usable space or block access for servicing building and equipment.
4. Hold piping close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building; limit clearance to 1/2 in. where furring is shown for enclosure to concealment of piping, but allow for insulation thickness, if any.
5. Where possible, locate insulated piping for 1.0 in. clearance outside insulation.
6. Wherever possible in finished and occupied spaces, conceal piping from view by locating in column enclosures, hollow wall construction or above suspended ceilings; do not encase horizontal runs in solid partitions, except as indicated.

C. Electrical Equipment Spaces:

1. Do not run piping through transformer vaults and other electrical or electronic equipment spaces and enclosures unless unavoidable.
2. Install drip pan under piping that must be run through electrical spaces.

D. Expansion Compensation:
1. Install piping including mains, branches, and runouts with sufficient offsets to allow for free expansion and contraction and sufficient to prevent leaks and overstressing of piping system.

E. Bellows Air Cushion:
1. Install units at top of each riser and at end of each branch, as required, to comply with PDI-WH-201.

F. Installation of Waste, Vent and Storm Piping:
1. Install horizontal piping on constant grade, avoiding pockets. Minimum grade of 1/8 in./ft for mains and 1/4 in./ft for branches.
2. Cleanouts:
   a. Install cleanout plugs at each 90° change in direction in suspended horizontal piping.
   b. Where not otherwise indicated, install cleanouts at 50 ft intervals in piping 3 in. and smaller, and 100 ft intervals in piping 4 in. and larger.
   c. Install floor and wall cleanouts at locations indicated.
3. Flashing Flanges:
   a. Install flashing flange and clamping device with each cleanout passing through waterproof membrane.
4. Testing:
   a. Test waste and vent piping system in accordance with the Section 22 0810 – Testing Piping Systems and the Ohio Plumbing Code.

3.3 VALVES

A. Except as otherwise indicated, comply with following requirements.
1. Install valves where required for proper operation of piping and equipment, include shut-off valves in branch lines where necessary to isolate sections of piping. Locate valves so accessible and separate support can be provided when necessary.
2. Install valves with stems pointed up, in vertical position where possible, but in no case with stems pointed downward from horizontal plane unless unavoidable.

B. Insulation: Where insulation is indicated, provide extended stem valves arranged to receive insulation.

C. Select and install ball valves as specified in applicable system sections. When not otherwise specified, furnish and install in accordance with following.

D. Two-Piece Construction:
1. Branch main isolation.

3.4 FIXTURES

A. Water Heaters:
1. Install in accordance with manufacturer's written instructions in locations shown. Pipe discharge from relief valve down to 6 in. from floor.

B. Plumbing Fixtures:
   1. Install in accordance with manufacturer's written instructions and as called for and required by codes.
   2. Verify locations and coordinate with architectural designs and other devices and equipment, as approved by ENGINEER before roughing-in connections.
   3. Operation of fixtures shall be tested for proper operation and adjusted for field connections and service use, as required.

C. Sump Pumps:
   1. Install in accordance with manufacturer's written instructions, provide discharge with union and check valves.

D. Domestic Hot Water Recirculating Pumps:
   1. Install in accordance with manufacturer's written instructions, provide isolation ball valves, unions, discharge check valve, and air purge valve.

3.5 PLUMBING PIPING SYSTEM INSULATION

A. Install in accordance with manufacturer's written instructions, install after testing and acceptance of piping system, and insulate each continuous run of piping with full-length units. Do not use cut pieces or scraps abutting each other, maintain integrity of vapor barrier jacket on pipe insulation.

B. Insulation Omitted: Omit insulation on exposed plumbing fixture runouts from faces of wall or floor to fixture; on unions, flanges, strainers, flexible connections, and expansion joints.

C. Cover valves, fittings, and similar items in each piping system with equivalent thickness and composition of insulation, install factory molded or precut on job fabricated units.

D. Install insulation on domestic hot and cold.

E. Provide PVC jacketing with formed fitting covers on all plumbing piping in chemical room spaces.

F. Replace damaged insulation which cannot be repaired.

G. Cold Piping (40°F to 55°F):
   1. Application Requirements: Insulate following cold piping systems.
      a. Domestic cold water piping systems.
      b. Interior above ground storm water piping systems.
   2. Insulate each piping system specified above with 1 of following types and thicknesses in accordance with Schedule 1.
      a. Insulation: Fiberglass with vapor barrier jacket (above grade) (PVC over-jacket where exposed).
      b. Insulation: Flexible unicellular (buried).

H. Hot Piping (120°F to 200°F):
   1. Application Requirements: Insulate following hot piping systems.
      a. Domestic hot water piping systems.
      b. Domestic hot water return piping systems.
   2. Insulate each piping system specified above with 1 of following types and thicknesses in accordance with Schedule 1.

a. Insulation: Fiberglass with vapor barrier jacket (above grade) (PVC over-jacket where exposed).
b. Insulation: Flexible unicellular (buried).

3.6 PIPING SPECIALTIES

A. Pipe Sleeves and Wall Collars: Install pipe sleeves of types indicated where piping passes through walls, floors, and roofs. Verify size, location, and type of penetration prior to pouring concrete or placing masonry. Do not install sleeves through structural members of work, except as shown on Drawings or as approved by ENGINEER. Install sleeves accurately centered on pipe runs. Size sleeves so piping and insulation (if any) will have free movement in sleeve, including allowance for thermal expansion but not less than pipe sizes larger than piping run. Where insulation includes vapor barrier jacket, provide sleeve with sufficient clearance for installation. Install length of sleeve equal to thickness of construction penetrated, and finish flush to surface except floor sleeves. Extend floor sleeves 2 in. above level floor finish. Provide temporary support of sleeves during placement of concrete and other work around sleeves and provide temporary closure to prevent concrete and other materials from entering sleeves. Center sleeve intermediate collar seepage ring in wall or slab and align with bolt holes in flanges straddling centerlines horizontally and vertically. Do not allow reinforcing steel to contact wall pipes.
1. Install sheet metal sleeves at interior partitions and ceilings other than suspended ceilings.
2. Install iron pipe sleeves at exterior penetrations; above and below grade before concrete or masonry placed.
3. Install steel or plastic pipe sleeves except as otherwise indicated.

B. Sleeve Seals: Install in annular space between pipes and sleeve walls in exterior water supporting walls, foundation, exterior walls, and retaining walls to form watertight seals.

C. Pipe Escutcheons: Install pipe escutcheons on each pipe penetration through floors, walls, partitions, and ceilings where penetration exposed to view and on exterior of building. Secure escutcheon to pipe or insulation so escutcheon covers penetration hole and is flush with adjoining surface.

D. Dielectric Unions: Install at each piping joint between ferrous and nonferrous piping. Comply with manufacturer's installation instructions.

3.7 CLEANING AND STERILIZATION

A. Clean and sterilize domestic water piping system as required by health authorities having jurisdiction and in accordance with Ohio Plumbing Code.

B. Plate count must be less than 10 spc/ml.

3.8 TESTING PIPING SYSTEMS

A. The plumbing systems shall be tested, in accordance with Ohio Plumbing Code.

SCHEDULE 1 TO SECTION 22 0010 Insulation Thicknesses in In. for Pipe Sizes							
Piping System Types	**Fluid Temp. Range °F.**	**Runouts up to 2 in. (2)**	**1 in. and Less**	**1-1/4 to 2 in.**	**2-1/2 to 4 in.**	**5 to 6 in.**	**8 in. and Larger**
Hot Systems:

END OF SECTION 22 0010

SECTION 22 0529

PIPE HANGERS, SUPPORTS AND ANCHORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. System of pipe supports and anchors with necessary inserts, bolts, nuts, restraining and hanger rods, washers, miscellaneous steel, and other accessories.

1.2 DEFINITIONS

A. Submerged: At or below point 1 ft., 6 in. above peak (maximum) water surface elevations in water holding structure.

1.3 SYSTEM DESCRIPTION

A. Design Requirements:
   1. Design, detail and installation of pipe support system shall be responsibility of CONTRACTOR.
   2. Pipe support system components shall withstand dead loads imposed by weight of pipes filled with water plus insulation, plus live loads due to thermal expansion, vibration, internal test pressures, and have minimum safety factor of 5.
   3. Absence of pipe supports and details on Drawings shall not relieve CONTRACTOR of responsibility for providing them throughout plant.
   4. Supply design loading criteria to pre-engineered metal building manufacturer for piping supported from steel members.

1.4 SUBMITTALS

A. Shop Drawings:
   1. Pipe supporting system, including manufacturer’s product data, dimensions, sizes, types, location, maximum loadings, thrust anchorage, and installation instructions.

B. Submit in accordance with Section 01 3300.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Fee and Mason.

B. Grinnell.

C. Carpenter-Patterson.

D. Unistrut.

E. Superstrut.

F. Or equal.

2.2 GENERAL

A. MSS types indicated are typical of types and quality of standard pipe supports and hangers to be employed.

B. Provide factory fabricated piping hangers and supports, clamps, hanger rod attachments, building attachments, saddles, shields, thrust anchorage, and other miscellaneous products of MSS SP-69 type indicated or shop fabricated supports; comply with MSS SP-58 and manufacturer's published product information. Where MSS type not indicated, provide proper selection for installation requirements and comply with MSS SP-69, MSS SP-89 and manufacturer's published product information.

2.3 MATERIALS

A. Hangers, rods, clamps, protective shields, metal framing, support components, and hanger accessories shall be galvanized unless otherwise noted.

B. Hangers, rods, clamps, protective shields, metal framing, support components, and hanger accessories in submerged locations in wet wells, tanks, channels or tank covers, locations outdoors, and located in Chemical Rooms shall be Type 316 stainless steel.

2.4 HORIZONTAL PIPING HANGERS AND SUPPORTS

A. General:
1. Unless otherwise shown or specified, hangers for 2-1/2 in. and smaller pipe shall be split-ring, adjustable swivel, clevis or roller type, hangers for 3 in. pipe or greater shall be clevis or roller type.
2. Hangers for use with spring supports shall be split-ring or clamp type.
3. Hangers for fiberglass reinforced pipe shall be saddle type.
4. Each hanger shall be designed to permit at least 1-1/2 in. vertical adjustment after installation.

B. Adjustable Swivel Split-Ring Hanger: MSS Type 6.

C. Adjustable Clevis Hanger: MSS Type 1, fabricated from steel.

D. Adjustable Band Hanger: MSS Type 7, fabricated from steel.

E. Adjustable Swivel-Band Hanger: MSS Type 10.

F. Clamp: MSS Type 4.

G. Single Roll Support: MSS Type 41, including axle roller and threaded sockets.

H. Adjustable Roller Hanger: MSS Type 43, including axle roller and clevis.

I. Roll/Stand: MSS Type 44, including roller, stand, and axle.

J. Adjustable Roll/Base: MSS Type 46, including roller, adjustable base, and stand.

K. Steel Brackets: Welded structural steel shapes complying with following.
   1. Light Duty: MSS Type 31.
   2. Medium Duty: MSS Type 32.
   3. Heavy Duty: MSS Type 33.

L. Adjustable Saddle Support:
   1. MSS Type 38, including saddle, pipe, and reducer.
   2. Fabricate base support from steel pipe and include cast iron flange or welded steel plate.

M. Stanchion Saddle Support:
   1. MSS Type 37, including saddle and U-bolt.
   2. Fabricate base support from steel pipe and include cast iron flange or welded steel plate.

N. Strap or wire hangers not acceptable.

2.5 VERTICAL PIPING CLAMPS

A. 2-Bolt Riser Clamp: MSS Type 8, galvanized or plastic coated.

B. 4-Bolt Riser Clamp: MSS Type 42, include pipe spacers at inner bolt holes, galvanized or plastic coated.

2.6 HANGER RODS AND ATTACHMENTS

A. Hanger Rods:
   1. ASTM A36/A 36M, threaded both ends or continuous threaded.
   2. Rods shall conform to following sizes.

Pipe Size	Minimum Rod Diameter (in.)
Up to 2 in.	3/8
2-1/2 in and 3 in.	1/2
4 in.	5/8
6 in.	3/4
8 in. to 12 in.	7/8
14 in. and Up	1
Trapeze Hangers	As Required

B. Turnbuckles: MSS Type 13.

C. Weldless Eye Nut: MSS Type 17.

D. Eye Socket: MSS Type 16.

E. Clevis: MSS Type 14.

2.7 BUILDING ATTACHMENTS

A. Individual Concrete Inserts:

1. MSS Type 18, malleable iron.
2. MSS Type 19, steel.
3. Minimum Safe Load: 1,100 lbs.

B. Continuous Concrete Inserts:
1. Unistrut, P-3200 Series.
2. Fee and Mason, Figure 9000.
3. Superstrut.
4. Or equal.

C. Top Beam C-Clamp: MSS Type 19.

D. C-Clamps: MSS Type 23, steel.

E. Single-Side Clamp: MSS Type 25.

F. Top I-Beam Clamp: MSS Type 25.

G. Side Beam Clamp: MSS Type 20.

H. Concrete Anchors:
1. Comply with Section 05 0533.
2. Minimum Safety Factor: 5.

2.8 SADDLES AND SHIELDS

A. Protection Saddles: MSS Type 39.

B. Protection Shields: MSS Type 40.

C. Wood Insulation Saddle:
1. Elcen Metal Products Company.
2. Or equal.

2.9 MISCELLANEOUS MATERIALS

A. Metal Framing Systems:
1. Unistrut, galvanized.
2. Fee and Mason, galvanized.
3. Or equal.

B. Shop-Fabricated Anchors and Supports:
1. Steel Plates, Shapes, and Bars: ASTM A36/A 36M.
2. Restraining Rods: ASTM A307.

PART 3 - EXECUTION

3.1 GENERAL

A. Proceed with installation of hangers, supports, and anchors after required building structural work is complete and concrete support structure has reached 28 day compressive strength as specified in Section 03 3000.

B. Install hangers, supports, clamps, and attachments from building structure. Comply with MSS SP-69. Group parallel runs of horizontal piping to be supported together on trapeze type hangers where possible.

C. Install supports to provide indicated pipe slopes and maximum pipe deflections allowed by ASME B31.1 are not exceeded.

D. Except as otherwise indicated for exposed continuous pipe runs, install hangers and supports of same type and style as installed for adjacent similar piping.

E. Do not support piping from other piping.

F. Prevent contact between dissimilar metals. Where concrete or metal pipe support is used, place 1/8 in. thick teflon, neoprene rubber or plastic strip under piping at point of bearing. Cut to fit entire area of contact between pipe and support.

G. Prevent electrolysis in support of copper tubing by use of hangers and supports which are copper plated, plastic coated or by other recognized industry methods. Electrician's tape is not an acceptable isolation method.

H. Apply anti-seize compound to nuts and bolts.

3.2 INSTALLATION OF BUILDING ATTACHMENTS

A. Support piping from structural framing, unless otherwise noted.

B. Concrete Inserts:
   1. Locate inserts so total load on insert does not exceed manufacturer's recommended maximum load. Location of inserts shall be approved by ENGINEER.
   2. Where necessary to anchor supports to hardened concrete or completed masonry, use concrete anchors.

C. Attach to structural steel with beam clamps.

3.3 THRUST ANCHORS AND GUIDES

A. Thrust Anchors:
   1. For suspended piping, center thrust anchors as closely as possible between expansion joints and between elbows and expansion joints. Anchors shall hold pipe securely and be sufficiently rigid to force expansion and contraction movement to take place at expansion joints or elbows and preclude separation of joints.
   2. Provide thrust anchors as required to resist thrust due to changes in diameter or direction or dead ending of pipe lines. Anchorage shall be required wherever bending stresses exceed allowable for pipe. Wall pipes may be used as thrust anchors.
   3. Restraining rod size and number shall be as shown on Drawings.

B. Pipe guides shall be provided adjacent to sliding expansion joints in accordance with recommendations of National Association of Expansion Joint Manufacturers.

3.4 PIPE SUPPORT

A. Spacing:

Type of Pipe	Maximum Pipe Support Spacing (ft)
Steel	
10 in. and over	22
8 in.	19
6 in.	17
5 in.	16
4 in.	14
3-1/2 in.	13
3 in.	12
2-1/2 in.	11
2 in.	10
1-1/2 in.	9
1 in.	7
3/4 in.	6
1/2 in.	5
Copper	
4 in.	12
3-1/2 in.	11
3 in.	10
2-1/2 in.	9
2 in.	8
1-1/2 in.	8
1-1/4 in.	7
1 in.	5
3/4 in.	5
1/2 in.	5
Plastic (Schedule 80 at 100°F)	
8 in.	4
6 in.	4
4 in.	4
3 in.	4
2 in.	4
1-1/2 in.	4
1 in.	4
3/4 in.	4
1/2 in.	4
(For plumbing application plastic piping shall be supported at maximum of 4 ft-0 in. spacing.)	
Stainless Steel	
1 in. and smaller	6

Type of Pipe	Maximum Pipe Support Spacing (ft)
1-1/2 in. through 4 in.	8
6 in.	8
8 in. and 10 in.	10
12 in.	10
14 in.	12
16 in.	12
18 in. and larger	14
Cast Iron and Ductile Iron	
1 in. and smaller	6
1-1/4 in. through 2-1/2 in.	8
3 in. and 4 in.	10
6 in.	12
8 in.	12
10 in. and 12 in.	14
14 in.	16
16 in. and 18 in.	16
20 in.	18
24 in. and larger	18
(For cast iron soil pipe plumbing applications, support at 5 ft-0 in. spacing.)	

B. Where piping of various sizes is to be supported together, space supports for smallest pipe size or install intermediate supports for smaller diameter pipe.

C. Provide minimum of 2 pipe supports for each pipe run.

D. Where piping connects to equipment, support by pipe support and not by equipment, unless approved by equipment manufacturer.

E. Unless otherwise shown or authorized by ENGINEER, place piping running parallel to walls approximately 1-1/2 in. out from face of wall and at least 3 in. below ceiling.

F. Pedestal pipe supports shall be adjustable with stanchion, saddle, and anchoring flange.

G. Piping supports for vertical piping passing through floor sleeves shall be galvanized steel riser clamps.

H. Piping passing through sleeves or openings in interior wall sleeves shall be carried by supports or hangers. Do not rest on wall.

I. Support piping in manner preventing undue strain on valve, fitting or equipment. Provide pipe supports at changes in direction or elevation, adjacent to flexible couplings, adjacent to nonrigid joints, and where otherwise shown. Do not install pipe supports and hangers in equipment access areas or bridge crane runs.

J. Install supports to allow controlled movement of piping systems, permit freedom of movement between pipe anchors, and facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

K. Piping shall be free to move when expands or contracts, except where fixed anchors are indicated. Where adequate hanger rod swing length cannot be provided or where pipe movement based on expansion of 1 in./100 ft for each 100°F change in temperature exceed 1/2 in., provide approved roller supports.

L. Support piping 6 in. and larger on trapeze hangers with rollers.

3.5 INSULATED PIPING

A. Attach clamps, including spacers (if any), to piping with clamps projecting through insulation; do not exceed allowable pipe stresses.

B. Where low compressive strength insulation or vapor barriers are indicated on cold or chilled water piping, install coated protective shields. For pipe 8 in. and over, install wood insulation saddles.

C. Where insulation without vapor barrier is indicated, install protection saddles on piping 2 in. and larger.

3.6 BURIED PIPING

A. Provide unlugged bell and spigot or bell tees, Y-branches, and bends deflecting 11-1/4° or more and plugs with reaction blocking, anchors, joint harness or other acceptable means for preventing movement of pipe and joints caused by internal pressure.

B. Concrete Blocking:
1. Extend from fitting to solid undisturbed earth and installed so joints accessible for repair.
2. Bearing area of concrete reaction blocking shall be as shown on Drawings.
3. If adequate support against undisturbed ground cannot be obtained, install metal harness anchorages consisting of steel rods across joint and securely anchored to pipe and fitting or other adequate anchorage facilities to provide necessary support.
4. Should lack of solid vertical excavation face be due to improper trench excavation, cost of furnishing and installing metal harness anchorages in excess of Contract value of concrete blocking replaced by such anchorages shall be borne by CONTRACTOR.

C. Provide reaction blocking, anchorages or other supports for fittings installed in fills or other unstable ground or above grade as shown on Drawings.

END OF SECTION 22 0529

SECTION 22 0553

PIPING AND EQUIPMENT IDENTIFICATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Plastic pipe markers.
   2. Painted ductwork identification materials.
   3. Plastic duct markers.
   4. Underground type plastic line marker.
   5. Valve tags.
   6. Plastic equipment markers.
   7. Piping system color coding schedule.

B. Identification furnished as part of equipment is specified as part of equipment assembly in other sections and shall comply with requirements of this section.

C. Refer to Division 26 sections for identification requirements of electrical and instrumentation work, not work of this section.

1.2 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and installation instructions for each identification material and device required. Submit listing of each flow stream identifier with associated color coding.

B. Samples: Submit samples of each color, lettering style, and other graphic representation required for each identification material or system.

C. Shop Drawings:
   1. Submit valve schedule for each piping system. Tabulate valve number, piping system, system abbreviation (as shown on tag), location of valve (room or space), and variations for identification (if any). Mark valves intended for emergency shut-off and similar special uses, by special flags in schedule margin. In addition to mounted copies, furnish extra copies for maintenance manuals.

D. Submit in accordance with Section 01 3300.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of identification devices of types and sizes required, whose products have been in satisfactory use in similar service for not less than 5 yrs.

B. Regulatory Requirements:
   1. ANSI Standards: Comply with ASME A13.1 for lettering size, length of color field, colors, and viewing angles of identification devices.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Allen Systems, Inc.

B. Brady (W.H.) Company, Signmark Division.

C. Marking Services, Inc.

D. Industrial Safety Supply Company, Inc.

E. Seton Name Plate Corporation.

F. Or equal.

2.2 MECHANICAL IDENTIFICATION MATERIALS

A. Provide manufacturer's recommended products as specified for each application.

B. Where more than single type is specified for application, selection is installer's option, but provide single selection for each product category.

C. Bands, markers, and identification materials used in all locations shall be rated for exterior application and suitable for withstanding occasional wash down.

2.3 LETTERING AND GRAPHICS

A. Coordinate names, abbreviations, and other designations used in mechanical identification work with corresponding designations shown, specified or scheduled. Provide numbers, lettering, and wording as indicated or if not indicated, as recommended by manufacturers or required for proper identification and operation and maintenance of mechanical systems and equipment.

B. Multiple Systems: Where multiple systems of same generic name are shown or specified, provide identification indicating individual system number as well as service (i.e., Boiler No. 3, Air Supply Unit No. 10-ASU-2, etc.).

2.4 PLASTIC PIPE MARKERS

A. Snap-On Type: Provide preprinted, semi-rigid snap-on, color coded pipe markers complying with ASME A13.1.

B. Pressure Sensitive Type: Provide preprinted, permanent adhesive, color coded, pressure sensitive vinyl pipe markers complying with ASME A13.1. Dot matrix printing is not acceptable.

C. Small Pipes: For external diameters less than 6 in. (including insulation, if any), provide full band pipe markers, extending 360 degrees around pipe at each location, fastened by 1 of following methods:
   1. Snap-on application of pre-tensioned, semi-rigid plastic pipe marker.
   2. Adhesive lap joint in pipe marker overlap.

3. Taped to pipe (or insulation) with color coded plastic adhesive tape not less than 4 in. wide, full circle at both ends of pipe marker, tape lapped 1-1/2 in.

D. Large Pipes: For external diameter 6 in. and larger (including insulation, if any), provide either full band or strip type pipe markers not narrower than 3 times letter height (and of required length), fastened by one of following methods:
1. Taped to pipe (or insulation) with color coded plastic adhesive tape, not less than 4 in. wide, full circle at both ends of pipe marker, tape lapped 3 in.
2. Strapped to pipe (or insulation) application of semi-rigid type with manufacturer's standard stainless-steel bands.

E. Lettering: Comply with piping system nomenclature as specified, scheduled or shown and abbreviate only as necessary for each application length, and only with approval of ARCHITECT/ENGINEER. Lettering height shall be as follows:

Outside Pipe Diameter (in.)	Minimum Letter Height (in.)	Minimum Length of Marker (in.)
3/4 to 1-1/4	1/2	8
1-1/2 to 2	3/4	8
2-1/2 to 6	1-1/4	12
8 to 10	2-1/2	24
over 10	3-1/2	32

F. Arrows: Print each pipe marker with arrows indicating direction of flow, either integrally with piping system service lettering (to accommodate both directions), or as separate unit of plastic.

G. Label and band colors in accordance with Section 09 9600, and the following:
1. Lettering and arrows:
   a. Black on yellow background for inherently hazardous materials.
   b. White on blue (gaseous) or green (liquid) for low hazard materials.
   c. White on red background for fire quenching materials.
2. Banding: Colors and band spacing as scheduled or as shown on Drawings.

2.5 UNDERGROUND TYPE PLASTIC LINE MARKERS

A. Permanent, bright colored, continuous printed plastic tape, intended for direct burial service; not less than 6 in. wide by 4 mils thick. Provide tape with printing most accurately indicating type of service of buried pipe.

B. Provide multi-ply tape consisting of solid aluminum foil core between 2 layers of plastic tape.

2.6 PLASTIC EQUIPMENT MARKERS

A. 2-ply, 1/8 in. thick laminated engraved plastic.
1. Color: Black letters on white background.

B. Nomenclature: Include following, matching terminology on schedules as closely as possible:
1. Equipment name (i.e. electric water heater No. 1).
2. Equipment Tag No. (i.e. EWH-1).

C. Size: Provide approximate 3 in. by 6 in. (minimum) for equipment.

1. 1 in. high letters for equipment tag number.
2. 1/2 in. high letters for descriptive equipment name.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Coordination: Where identification is to be applied to surfaces requiring insulation, painting or other covering or finish including valve tags in finished mechanical spaces, install identification after completion of covering and painting. Install identification prior to installation of acoustical ceilings and similar removable concealment.

3.2 PIPING SYSTEM IDENTIFICATION

A. Locate pipe markers with arrows and color bands as follows wherever piping exposed to view in occupied spaces, machine rooms, accessible maintenance spaces (shafts, tunnels, plenums), and exterior non-concealed locations.
   1. Near each valve and control device.
   2. Near locations where pipes pass through walls or floors, ceilings or enter non-accessible enclosures.
   3. At access doors, manholes, and similar access points permitting view of concealed piping.
   4. Near major equipment items and other points of origination and termination.
   5. Spaced intermediately at maximum spacing of 30 ft along each piping run, except reduce spacing to 20 ft in congested areas of piping and equipment.
   6. On piping above removable acoustical ceilings, except omit intermediately spaced markers.

B. Locate color bands at each marker and at intermediate spacing not to exceed 10 ft between bands, and at lesser spacing as indicated or as required by local codes.

C. Locate directional arrows at each marker. Provide 2 arrows at each tee or branch fitting.

D. Where piping is normally visible from more than 1 side, provide 2 or 3 labels and arrows spaced at 120 degree intervals around pipe in accordance with ASME A13.1.

E. Painting or Coating:
   1. Painting of piping, ductwork, and equipment is work of Section 09 9600.
   2. For piping scheduled to be color-coded, but not scheduled for complete painting (such as some plastic piping or aluminum jacked insulation) provide additional banding to represent background color. At each banding location provide following sequence:
      a. 8 in. wide tape of scheduled pipe color.
      b. 4 in. wide tape of scheduled band color.
      c. 8 in. wide tape of scheduled pipe color.

3.3 UNDERGROUND PIPING IDENTIFICATION

A. During backfilling/top soil placement of each exterior underground piping systems, install continuous underground type plastic line marker located directly over buried line at 6 to 8 in. below finished grade. Where multiple small lines buried in common trench and do not exceed overall width of 16 in., install single line marker. For tile fields and similar installations, mark only edge pipe lines of field.

3.4 MECHANICAL EQUIPMENT IDENTIFICATION

A. Install engraved plastic equipment marker on or near each major item of mechanical equipment and each operational device, if not otherwise specified for each item or device. Provide signs for each unit having equipment tag number on Drawings or in Specifications.

3.5 ADJUSTING AND CLEANING

A. Adjusting: Relocate any mechanical identification device visually blocked.

B. Cleaning: Clean face of identification devices and glass frames of valve schedules.

3.6 FIELD QUALITY ASSURANCE

A. Final Survey and Repairs:
   1. 1 yr after date of substantial completion, CONTRACTOR shall perform walk-through survey of mechanical identification systems and shall remove and replace any bands, labels, tags or markers that are loose, discolored, or defective.
   2. Replacement materials shall be provided by CONTRACTOR, not drawn from OWNER'S extra material.

END OF SECTION 22 0553

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 22 0810

TESTING PIPING SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Hydrostatic pressure testing.
   2. Low pressure air testing.
   3. High pressure air testing.

B. Other sections identify new piping systems to be tested, identify type of test to be performed, specify test pressure, and reference this section for detailed testing requirements.

1.2 SUBMITTALS

A. Test report for each piping system tested.

B. Submit in accordance with Section 01 3300.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 GENERAL

A. Pressure test in presence of ENGINEER.

B. Furnish water required for testing and provide necessary piping connections between section of piping being tested and nearest available source of water or air supply, together with test pressure equipment, meters, pressure gauge, and other equipment, materials, and facilities necessary to perform specified tests.

C. Provide bulkheads, flanges, valves, bracing, blocking or other temporary sectionalizing devices that may be required.

D. Remove temporary sectionalizing device after tests complete.

E. Perform tests on exposed piping after piping completely installed, including supports, hangers, and anchors.

F. Perform tests on piping before insulation installed.

G. Perform tests on piping that is clean and free of dirt, sand or other foreign material.

H. Plug pipe outlets with test plugs. Brace each plug securely to prevent blowouts.

I. Add test fluid slowly.

J. Include regulator set to avoid over-pressurizing and damaging piping.

K. Perform pressure testing in accordance with local, state, and federal requirements.

L. Cost of testing including water, personnel, equipment, and materials shall be CONTRACTOR'S responsibility.

M. Correct leaks or defects and retest at no additional cost to OWNER.

3.2 HYDROSTATIC PRESSURE TESTING

A. Perform hydrostatic pressure testing for piping systems identified in other sections to be hydrostatically pressure tested. Test pressure shall be as specified in other sections.

B. Open vents at high points to purge air pockets while piping system is filling. Venting may also be provided by loosening flanges or with equipment vents.

C. Testing:
1. After section of piping to be tested has been filled with water, apply test pressure by means of force pump of such design and capacity that required pressure can be applied and maintained without interruption for duration of test.
2. Measure test pressure by means of tested and properly calibrated pressure gauge acceptable to ENGINEER.
3. Maintain test pressure for sufficient length of time to permit ENGINEER to observe piping under test but not less than 2 hrs.
4. If repairs required, repeat pressure test until pipe installation conforms to specified requirements and is acceptable to ENGINEER.

D. With exception of buried piping with mechanical joints or push-on joints, piping systems shall show no visual evidence of weeping or leaking.

E. Maximum allowable leakage for buried piping with mechanical joints or push-on joints is as follows.

$$L = \frac{NDP^{1/2}}{7{,}400}$$

Where:
L = Leakage, gallons per hr
N = Number of joints under test
D = Nominal diameter of piping, in.
P = Average pressure during test, lbs per sq in.

3.3 LOW PRESSURE AIR TESTING

A. General:
1. Perform low pressure air testing for gravity sewer and drainage piping systems identified in other sections to be low pressure air tested.
2. Air Test Procedure: Test pipes between adjacent manholes. Test time for air pressure to drop 1 psig.

a. For pipes 4 in. through 24 in.: Comply with Table 1.
b. Pipe diameters above 36 in. will not be accepted by means of low pressure air test. In all cases, ignore length of laterals.

TABLE 1
LOW PRESSURE AIR TEST TIME

Specification time (min:sec) required for loss of air pressure From 3.5 psig to 2.5 psig for size and length of pipe indicated.

A	B	C	D	E	F
Pipe Dia (in.)	**Time/Ft up to Length in Column C (sec)**	**Test Length (ft)**	**Test Time for Length Between Columns C & E (min:sec)**	**Length Time in Column F Applies (ft)**	**Time/Ft for Total Length (sec)**
4	0.18	636	1:54	1,432	0.08
6	0.40	424	2:50	955	0.18
8	0.71	318	3:47	716	0.32
10	1.11	255	4:43	573	0.49
12	1.60	212	5:40	477	0.71
15	2.50	170	7:05	382	1.11
18	3.62	141	8:30	318	1.61
21	4.92	121	9:55	273	2.19
24	6.42	106	11:20	239	2.85
27	8.14	94	12:45	212	3.62
30	10.00	85	14:10	191	4.44
33	12.14	77	15:35	174	5.40
36	14.37	71	17:00	159	6.39

B. Preparation:
1. Isolate pipe section to be tested by plugging each end with air tight plugs. Plug ends of branches, laterals and wyes which are to be included in test section.
2. Brace plugs to prevent slippage and blowout due to internal pressure.
3. One plug shall have inlet tap or other provision for connecting supply air hose.
4. Connect one end of air hose to plug used for air inlet; other end to portable air control equipment.
5. Air control equipment shall consist of valves and pressure gauges to control rate at which air flows into test section and gauges to monitor air pressure inside pipe.
6. Connect air hose between source of compressed air and control equipment.

C. Testing:
1. If pipe to be tested is submerged in groundwater, determine height of groundwater above spring line of pipe at each end of test section and compute average. For every foot of groundwater above pipe's spring line, increase gauge test pressures by 0.43 lbs/sq in.
2. Add air slowly to test section until pressure inside pipe is raised to 4.0 psig greater than average back pressure of groundwater that may be over pipe.
3. After pressure of 4.0 psig obtained, control supply of air so internal pressure maintained between 3.5 and 4.0 psig (above average groundwater back pressure) for minimum of 2 min to allow temperature of air to come into equilibrium with temperature of pipe walls.
4. Determine rate of air lost by time pressure drop method.
   a. After temperature stabilized for 2-min period, disconnect air supply. Allow pressure to decrease to 3.6 psig. At this pressure, start stopwatch to determine time required

for pressure to drop 1 psig. Time required for loss of 1.0 psig is then compared to Table 1. If time is equal or greater than times indicated in table, test shall be acceptable.

3.4 HIGH PRESSURE AIR TESTING

A. Perform high pressure air testing for piping systems as specified in other sections. Test pressure shall be as specified in other sections.

B. Perform preliminary test at not greater than 25 psig. Examine for leakage at joints with soap solution and visual detection of soap bubbles. Correct visible leaks.

C. Perform final test at test pressure. Pressure in system shall be gradually increased and in small increments until test pressure reached. Test pressure shall be maintained for minimum of 10 min and additional time necessary to conduct soap bubble examination of each joint for leakage.

D. Piping system shall show no evidence of leakage.

3.5 TEST REPORT

A. Prepare and submit test report for each piping system tested. Include following information in test report.
   1. Date of test.
   2. Description and identification of piping system tested.
   3. Type of test performed.
   4. Test fluid.
   5. Test pressure.
   6. Type and location of leaks detected.
   7. Corrective action taken to repair leaks.
   8. Results of retesting.

END OF SECTION 22 0810

SECTION 23 0593

TESTING, ADJUSTING, AND BALANCING

PART 1 - GENERAL

1.1 SUMMARY

A. Extent of testing, adjusting, and balancing (TAB) work required by this section indicated on Drawings, schedules, and by requirements of this section. Defined to include, but not necessarily limited to, air distribution systems, hydronic distribution systems, and associated equipment and apparatus of mechanical work. Work consists of setting speed and volume (flow) adjusting facilities provided for systems, recording data, conducting tests, preparing and submitting reports, and recommending modifications to Work as required by Contract Documents.

B. Section Includes:
   1. Fans.
   2. Ductwork systems.
   3. Circulating Pumps.
   4. Water Source Heat Pumps.
   5. Coils and other Hydronic Equipment.

C. Equipment sections describe installation and startup of equipment to be tested, adjusted, and balanced.

D. Piping system sections describe pressure testing of piping and ductwork systems.

1.2 SUBMITTALS

A. Tests:
   1. Submit certified test reports signed by test and balance supervisor performing TAB work.
   2. Include identification and types of instruments used and most recent calibration date with submission of final test report.
   3. Submit biographical data on ENGINEER directly supervising testing, adjusting, and balancing work.

B. Shop Drawings:
   1. Submit sample test data forms complete with certifying agency logo, identifying required test data, date, page number, system designation, system location, Project name, and balancer's name.

C. Operation and Maintenance (O&M) Data:
   1. Include copies of certified test reports, identification of instruments, and data on ENGINEER.

D. Submit in accordance with Section 01 3300.

1.3 QUALITY ASSURANCE

A. Tester's Qualifications: Firm certified by NEBB in testing and balancing disciplines similar to those required for Project, not installer of system to be tested, and otherwise independent of Project.

B. Regulatory Requirements:
   1. NEBB Compliance: Comply with NEBB'S Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems, as applicable to mechanical air and hydronic distribution systems and associated equipment and apparatus.

C. Industry Standards: Comply with ASHRAE recommendations pertaining to measurements, instruments, and testing, adjusting, and balancing except as otherwise indicated.

1.4 PROJECT/SITE CONDITIONS

A. Do not proceed with testing, adjusting, and balancing work until system complete and operable. Ensure no later residual work still to be completed.

B. Do not proceed until Work scheduled for testing, adjusting, and balancing clean and free from debris, dirt, and discarded building materials.

PART 2 - PRODUCTS

2.1 PATCHING MATERIALS

A. Except as otherwise indicated, use same products as used in original construction for patching holes in insulation, ductwork, and housings cut or drilled for test purposes, including access for test instruments, attaching jigs, and similar purposes.
   1. At tester's option, plastic plugs with retainers may be used to patch drilled holes in ductwork and housings.

2.2 TEST INSTRUMENTS

A. Utilize test instruments and equipment for TAB work required of type, precision, and capacity as recommended in following TAB standards.
   1. NEBB'S Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine installed Work and conditions under which testing to be done to ensure Work complete, clean, and operable. Do not proceed with TAB work until unsatisfactory conditions corrected in manner acceptable to tester.

3.2 ADJUSTMENT

A. Test, adjust, and balance environmental systems and components as indicated, in accordance with procedures outlined in applicable standards.
   1. Adjust flows to within -0% to +10% of scheduled values, or as otherwise instructed by ENGINEER.

B. Test, adjust, and balance system during summer season for air conditioning systems and during winter season for heating systems, including minimum period of operation at outside conditions within 5°F wet bulb temperature of maximum summer design condition, and within 10°F dry bulb temperature of minimum winter design condition. When seasonal operation does not permit measuring final temperatures, then take final temperature readings when seasonal operation permits.

C. Patch holes in insulation, ductwork, and housings cut or drilled for test purposes in same manner as original construction.

D. Mark equipment settings including damper control positions, valve indicators, fan speed control levers, and similar controls and devices to show final settings at completion of TAB work. Provide markings with paint or other suitable permanent identification materials.

E. Retest, adjust, and balance systems subsequent to significant system modifications and resubmit test results.
   1. Provide services of qualified testing and balancing technician for random checking of systems by ENGINEER. If, during spot checking by ENGINEER, performance less than 10% of installation falls outside of specified performance parameters, rebalance entire installation.

3.3 REPORT PREPARATION

A. Prepare report of test results including instrumentation calibration reports, in format recommended by applicable standards.

B. Prepare report of recommendations for correcting unsatisfactory mechanical performances when system cannot be successfully balanced including, where necessary, modifications exceeding requirements of Contract Documents for mechanical work.

END OF SECTION 23 0593

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 23 0700

HVAC INSULATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Ductwork System Insulation:
      a. Cold ductwork.
      b. Dual temperature ductwork.
   2. HVAC Piping:
      a. Condensate drain piping.
      b. Geothermal/ Raw water piping associated with WSHP's.

1.2 SUBMITTALS

A. Schedule below identifies information required for each item of material or equipment.

UNIT TYPE	SUBMITTAL INFORMATION ITEM
Ductwork System Insulation	1
HVAC Piping Insulation	1

B. Submittal Information:
   1. Product Data: Submit manufacturer's specifications and installation instructions for each type of mechanical insulation. Submit schedule showing manufacturer's product number, thickness, and furnished accessories for each mechanical system requiring insulation.

C. Submit in accordance with Section 01 3300.

D. Information submitted by CONTRACTOR, but not designated to be submitted will be returned without actions by ENGINEER.

1.3 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in manufacture of mechanical insulation products of types and sizes required whose products have been in satisfactory use in similar service for not less than 3 yrs.

B. Installer: Firm with at least 5 yrs successful installation experience on projects with mechanical insulations similar to that required for Project.

C. Flame-Smoke Ratings: Provide composite mechanical insulation (insulation, jackets, coverings, sealers, mastics, and adhesives) with flame spread rating of 25 or less, and smoke developed rating of 50 or less, tested in accordance with ASTM E84.

D. Requirements of Regulatory Agencies:
   1. Ohio Mechanical Code (2017).
   2. International Energy Conservation Code (2012).

3. ASHRAE 90.1 (2010).

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver insulation, coverings, cements, adhesives, and coatings to site in containers with manufacturer's stamp or label affixed, showing fire hazard ratings of products.

B. Protect insulation against dirt, water, chemical, and mechanical damage. Do not install damaged insulation; remove from Project site.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturer's equipment used as basis of design for Project is name indicated in Specifications for particular type of equipment or application contained in these Contract Documents. If no manufacturer listed, basis of design is industry standard indicated.

2.2 GENERAL

A. Provide materials and products complying with NFPA No. 90A and meeting requirements for flames spread of less than 25, smoke developed rating of less than 50, and fuel contributed of less than 50 when tested in accordance with ASTM E84.

2.3 FIBERGLASS INSULATION MATERIALS

A. Manufacturers:
1. Certainteed Corporation.
2. Schuller International, Inc.
3. Knauf Fiberglass Corporation.
4. Owens-Corning Fiberglass Corporation.
5. Or equal.

B. FGP-1, Fiberglass Insulation: ASTM C547, high temperature, preformed, fibrous glass with jacket type specified, Schedule 1 minimum thickness, and class for service temperatures indicated.
1. Piping:
a. Class 1: To 450°F, maximum k = 0.27 Btu in./hr sq ft F at 100°F.
b. Class 2: To 650°F, maximum k = 0.33 Btu in./hr sq ft F at 100°F.
c. Class 3: To 1,200°F, maximum k = 0.36 Btu in./hr sq ft F at 100°F.
2. Fittings:
a. Fiberglass Pipe Fitting Insulation: with matching premoulded PVC fittings.

C. Rigid Fiberglass Ductwork Insulation: ASTM C612, high temperature, rigid fibrous glass board with Schedule 2 jacket type and minimum thickness, and class for service temperatures indicated.
1. FGD-1 (Non-load Bearing): ASTM C612, Class 1; ASTM C547, ASTM C553, ASTM C592, and ASTM C612, Form A, Class 1, average density 1.5 pcf, maximum k = 0.24 Btu in./hr sq ft °F, to 400°F.
2. FGD-2 (Load Bearing): ASTM C612, Class 2; ASTM C547, ASTM C553, ASTM C592, and ASTM C612, Form A, Class 2, average density 3.0 pcf, maximum k = 0.23 Btu in./hr sq ft °F, to 400°F.

2.4 FLEXIBLE UNICELLULAR INSULATION MATERIALS

A. Manufacturers:
   1. Armstrong World Industries, Inc.
   2. Halstead Industrial Products.
   3. Schuller International, Inc.
   4. Rubatex Corporation.
   5. Or equal.

B. UP-1, Flexible Unicellular Pipe Insulation: ASTM C534, Type I, density 4.5 to 8.5 pcf, maximum ASTM E96 permeability = 0.3 perm in., maximum k = 0.30 Btu in./hr sq ft °F at 75°F, to 200°F.

C. US-1, Flexible Unicellular Sheet Insulation: ASTM C534, Type II, density 4.5 to 8.5 pcf, maximum ASTM E96/E96M permeability = 0.3 perm in., maximum k = 0.30 Btu in./hr sq ft °F at 75°F, to 200°F.

2.5 VAPOR BARRIER AND JACKETING MATERIALS

A. JK-1, Kraft Paper Faced Vapor Barrier Material: FS HH-B-100B, Type I, all service type aluminum foil and fiberglass yarn reinforced kraft paper. Manville Type AP, or equal.
   1. Maximum water vapor permeability, ASTM E96/E96M, 0.02 perms.
   2. Minimum tensile strength, ASTM D828, 40 lbs/in. width.
   3. Minimum Mullen burst pressure, ASTM D774/D774M, 70 psi.

B. JK-2, Kraft Paper Faced Vapor Barrier Material: ASTM C 1136, Type I, all service type aluminum foil and fiberglass yarn reinforced kraft paper with pressure sensitive closure system. Manville Type AP-T, or equal.
   1. Maximum water vapor permeability, ASTM E96/E96M, 0.02 perms.
   2. Minimum tensile strength, ASTM D828, 40 lbs./in. width.
   3. Minimum Mullen burst pressure, ASTM D774/D774M, 70 psi.

C. JA-1, Aluminum Foil Faced Vapor Barrier Material: ASTM C 1136, Type II, all service type aluminum foil and fiberglass yarn reinforced kraft paper. Manville Type FSK, or equal.
   1. Maximum water vapor permeability, ASTM E96/E96M, 0.02 perms.
   2. Minimum tensile strength, ASTM D828, 40 lbs./in. width.
   3. Minimum Mullen burst pressure, ASTM D774/D774M, 70 psi.

D. Weatherproof Rigid Metal Jacket Materials:
   1. JRA, 0.016 in. aluminum, with Pittsburg seam, butt joint strips, matching fitting covers, and weatherproof mastic.

2.6 INSULATION ACCESSORIES

A. Ductwork Insulation Accessories: Provide staples, wires, bands, wire netting, stud pins, and metal cover tape, anchors, corner angles, and similar accessories as recommended by insulation manufacturer for application indicated.

B. Insulating Compounds: Provide fire retardant, moisture resistant, mildew resistant, and verminproof cements, mastics, sealers, protective finishes, and similar compounds as recommended by insulation manufacturer for applications intended.
   1. Insulation Bonding and Lap Adhesives: Benjamin Foster No. 85-20, or equal.

2. Vapor Barrier Coatings: Benjamin Foster No. 30-35, or equal.
3. Lagging Adhesives: Benjamin Foster No. 30-36, or equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's written instructions and recognized industry practices to ensure insulation serves intended purpose.

B. Install insulation materials with smooth and even surfaces and on clean and dry surfaces. Butt insulation joints together to ensure complete and wrinkle-free fit over surfaces to be covered. Do not use mastic or joint sealer as filler for gaping joints and excessive voids resulting from poor workmanship. Apply insulation using staggered joint method for both single and double layer construction, where feasible. Where multiple layers required, apply each layer of insulation separately.

C. Maintain integrity of vapor barrier of insulation and protect to prevent puncture and other damage.

D. Extend insulation without interruption through walls, floors, and similar penetrations, except where otherwise indicated.

E. Install insulation on systems and equipment subsequent to testing and acceptance tests. Do not apply insulation to hot surfaces.

F. Insulate each continuous run of piping with full length units of insulation, with single cut piece to complete run. Do not use cut pieces or scraps abutting each other.

G. Cover insulated equipment surfaces with glass cloth jacketing wrinkle-free and positively secured. Lap seams at least 2 in. Apply over vapor barrier where applicable. Do not insulate boiler manholes, handholes, cleanouts, ASME stamps or manufacturer's nameplates. Provide beveled edge at interruptions of insulation.

H. Trowel insulated surfaces with layer of insulating cement, leaving smooth continuous surface. Fill in scored block, seams, chipped edges, and depressions and cover over wire netting and joints with cement.

I. Cover valves, fittings, and similar items in each piping system with equivalent thickness and composition of insulation as applied to adjoining pipe run. Install factory molded, precut or job fabricated fittings, at installer's option, except where specific form or type indicated.

J. Provide removable insulation sections to cover parts of equipment which will be opened periodically for maintenance. Include metal vessel covers, fasteners, flanges, frames, and accessories.

K. Corner Angles: Except for oven and hood exhaust duct insulation, install corner angles on external corners of insulation on ductwork in exposed finished spaces before covering with jacketing.

L. Install protective metal shields and insulated inserts wherever needed to prevent compression of insulation.

M. Pipe Hanger Insulation Inserts: Butt pipe insulation against pipe hanger insulation inserts. For hot piping, apply 3 in. wide vapor barrier tape or band over butt joints. For cold piping, apply wet coat of vapor barrier lap cement on butt joints and seal joints with 3 in. wide vapor barrier tape or band.

N. Insulation Exposed to Weather: Protect from weather by installing Type JRA jacketing.

3.2 HVAC PIPING SYSTEM INSULATION

A. Insulation Omitted: Do not provide insulation on hot piping within radiation enclosures or unit cabinets; on cold piping within unit cabinets provided piping located over drain pan; on heating piping beyond control valve, located within heated space; on condensate piping between steam trap and union; and on unions, flanges, strainers, flexible connections, and expansion joints.

B. Cold Piping (40°F to 65°F):
   1. Application Requirements:
      a. Geothermal/ raw water piping systems associated with WSHP's.
      b. Condensate drain piping.
   2. Insulate each piping system specified above with 1 of following types and thicknesses in accordance with Schedule 1.
      a. Insulation: Fiberglass (FGP-1) with Type JK-2 jacket.
      b. Flexible Unicellular Insulation (UP-1), condensate drain piping only.

C. Insulation of Piping Exposed to Weather: Protect outdoor piping insulation from weather by installing Type JRA jacketing.

D. Insulation Thickness: Schedule 1.
   1. Thicknesses specified are minimums based on insulation having thermal resistance in range of 4.0°F sq ft hr/Btu in. to 4.6°F sq ft hr/Btu in. of thickness on flat surface at mean temperature of 75°F. In accordance with Schedule 1.
      a. For piping exposed to outdoor ambient temperatures, increase thickness by 1/2 in.
      b. Runouts not exceeding 12 ft in length to individual terminal units.

3.3 DUCTWORK AND EQUIPMENT INSULATION

A. Insulate ductwork and equipment in accordance with Schedule 2.

3.4 PROTECTION AND REPLACEMENT

A. Replace damaged insulation which cannot be repaired satisfactorily, including units with vapor barrier damage and moisture saturated units.

B. Protection: Protect insulation work during remainder of construction period to avoid damage and deterioration.

SCHEDULE 1 TO SECTION 23 0700 Insulation Thicknesses in In. for Pipe Sizes			
Piping System Types	**Fluid Temp. Range °F.**	**1-1/2 in. and Less**	**2 in. and Larger**
Geothermal/ Raw Water Supply & Return Piping	40-65	1-1/2	1-1/2
Condensate Drain Piping	Any	3/4	1

SCHEDULE 2 TO SECTION 23 0700 Ductwork and Equipment Insulation Thickness (in.)			
Item	**Insulation Type**	**Jacket Type**	**Insulation Thickness**
Outside Air Ductwork (Up to damper)	FGD-1	JK-1 / JA-1	1-1/2
	FGD-2	JK-1 / JA-1	1-1/2
	US-1	JK-1 /JA-1	1-1/2
Supply and Return Air Ductwork (Concealed, located above acoustical ceiling tile)	FGD-1	JK-1/ JA-1	1-1/2
	FGD-2	JK-1/JA-1	1-1/2

END OF SECTION 23 0700

SECTION 23 0933

AUTOMATIC TEMPERATURE CONTROL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Control sequences are specified in Section 23 0993.

B. Provide following electrical work as Work of this section, complying with requirements of Division 26.
   1. Control and power wiring, of all voltages, between field-installed control elements, indicating devices, and unit control panels.

C. Products furnished but not installed under this section:
   1. Refer to following sections for damper installation requirements:
      a. Air Distribution Systems: Section 23 3010.

D. Work by Electrical:
   1. Power supply wiring for HVAC Equipment and Automatic Temperature Control Panels.

1.2 DEFINITIONS

A. Point Chart:
   1. System Description: Particular system to which following points apply.
   2. Point Type:
      a. Supervised Binary: Point type having 2 conditions or values and no intermediate units. Change of state initiates alarm or advisory sequence and requires acknowledgment of alarm condition and initiates alarm or advisory sequence. Provide software definable advisory sequence.
      b. Binary: Point type having 2 conditions or values and no intermediate values.
      c. Analog: Point type having continuous range of values. Accomplish analog sensing by RTD sensing elements located directly in medium to be measured. Locate temperature sensors within wells when measuring liquid temperatures.
      d. Start/Stop: Point type changing binary state of controlled variable.
      e. Adjust: Point type changing analog condition of controlled variable.

B. Analog Indication: Type of readout provided for analog points accessed by operator.

C. Binary Indication: Type of readout provided for binary points accessed by operator or alarming condition.

D. Applications/Programs: Building automation system/direct digital control processes to be applied to system or point identified under point type.

1.3 SUBMITTALS

A. Product Data:

1. Submit manufacturer's technical product data for each control device furnished indicating dimensions, capacities, performance characteristics, electrical characteristics, finishes of materials, and installation and startup instructions.
2. Motors: For poly-phase motors 5 hp and larger, submit in accordance with requirements of Section 26 2000. For single-phase, definite purpose, special purpose and general purpose poly-phase motors less than 5 hp, submit NEMA design types, construction, insulation class, NEMA frame size, horsepower, voltage and amp draw characteristics, and service factor for each common application.

B. Shop Drawings: Submit ladder type wiring diagram for each control device, general control system diagrams, and connections provided by others.
1. Represent each system with schematic flow diagram showing each active system component in relative position and other devices present, but not necessarily affected by control system. Show field-mounted control devices.
2. Represent panel mounted control components within designated panel section of Drawings. Provide one-line detailed schematic of wiring and piping.
3. Provide one-line schematic for starters affected by control system showing interlocks between starters and control system and other interlocks not necessarily provided as part of control system.
4. Label each control device with setting or adjustable range of control.
5. Indicate required electrical wiring. Differentiate between portions of wiring factory-installed and portions field-installed.
6. Details of faces of control panels including controls, instruments, and labeling.
7. Written description of sequence of operation.
8. Dampers: Submit leakage and flow characteristics of dampers, and size schedule for controlled dampers.

C. Miscellaneous:
1. Maintenance agreement.

D. Operating and Maintenance (O&M) Data:
1. Submit preventive maintenance data and spare parts list for each type of control device; detailed instructions for operations associated with man-machine interface; and operator's reference table listing connecting input points, output points, and unguarded software parameters. Include this data in maintenance manual.
   a. Include Shop Drawings of control system, revised to reflect system in as-built condition.
2. Programmer’s Manual: Submit programming data for necessary information to perform programming function; language manual describing language used and routines, modules, used by system; program flow charts for system energy management software and custom software; and complete program listing and parameter listing files for programs.

E. Submit in accordance with Section 01 3300.

1.4 QUALITY ASSURANCE

A. Manufacturer’s Qualifications: Firms regularly engaged in manufacture of electrical and direct digital control equipment of type, architecture, and sizes similar to required equipment, and in satisfactory service.

B. Installer's Qualifications: Firms specializing and experienced in electrical and direct digital control system installations.

C. Regulatory Requirements:
   1. Provide electrical products tested, listed, and labeled by UL and complying with NEMA standards for electrical requirements of areas in which controls are installed.
   2. Refer to Drawings for specific area classifications impacting control system design.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Ship each piece of equipment and control device in factory cartons. Provide factory-applied plastic end caps on each length of pipe and tube.

B. Maintain cartons and end caps through shipping, storage, and handling as required to prevent equipment and pipe end damage and eliminate dirt and moisture from equipment and inside of pipe and tube.

C. Store equipment indoors in clean, dry area until ready for installation.

1.6 MAINTENANCE

A. Within 30 days after Substantial Completion, present to OWNER for consideration, preventive maintenance contract to cover service incidental to continued proper performance of system and devices during guarantee period.

B. Maintenance of system components are not CONTRACTOR'S responsibility during and after guarantee period, unless contracted for by OWNER.

C. Provide schedule of maintenance tasks necessary to keep CONTRACTOR guarantee in effect through guarantee period.

D. Provide list of recommended preventive maintenance procedures including task frequency and tools required to perform tasks. Provide instructions for each task in O&M data.

E. OWNER will keep records, schedules, and other reports documenting OWNER-performed prescribed maintenance procedures during guarantee period. CONTRACTOR not liable for defective systems, devices or components or repair, if OWNER-performed required preventive maintenance procedures not performed and documented.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturer's equipment used as basis of design for Project is name indicated in Specifications for particular types of equipment or application. If no manufacturer listed, basis of design is industry standard indicated.

B. Manufacturers:
   1. Automated Logic Controls.
   2. Johnson Controls.
   3. Honeywell.

4. Siemens.
5. Trane.
6. Or equal.

2.2 GENERAL

A. Provide automatic temperature control products and supporting system components of type, architecture, size, and capacities indicated, conforming to manufacturer's standard materials and components as published in product information; designed and constructed as recommended by manufacturer and required for application indicated to meet the intended control sequence of operations for each piece of equipment specified.

2.3 ACTUATORS

A. Electric Operators: Size motors to operate with sufficient reserve power to provide smooth modulating action or 2-position action.
   1. Provide permanent split capacitor or shaded pole type motors with gear trains completely oil immersed and sealed. Equip spring return motors, where indicated on Drawings or in operational sequence, with integral spiral spring mechanism. Furnish entire spring mechanism in housings designed for easy removal for service or adjustment of limit switches, auxiliary switches or feedback potentiometer.
   2. Equip motors for outdoor locations and outside air intakes with O-ring gaskets designed to make motors completely weatherproof, and internal heaters permitting normal operation at -40°F.
   3. Furnish multiple spring return motors for dampers larger than 25 sq ft. Size spring return motors for running torque rating with minimum 3 to 1rated to required torque ratio.
   4. Furnish modulating electric operators with control circuitry designed to accept 4-20 mA, 2 to 10 vdc, or pulse width modulation input control signals, appropriate to application.

2.4 INPUT DEVICES

A. Room Thermostats:
   1. Provide solid state thermostats with user adjustable temperature setpoints, deadbands, and offsets.
   2. Thermostat shall include capabilities for use of local and remote temperature sensors.
   3. Thermostat shall incorporate a time clock function with user defined occupied and unoccupied periods and corresponding heating and cooling setpoints.
   4. Thermostat shall include a user accessible, timed unoccupied override function.
   5. Thermostat shall include a local display of space temperature, mode of operation, active temperature setpoints, and simple alarms.
   6. Thermostat shall incorporate battery backup and password protected lockable keypad.
   7. Thermostat shall incorporate heat anticipation and system on/off selector.

B. Temperature Sensors:
   1. Provide temperature sensing elements of nickel wire, electric resistance type for space, well, or duct insertion application.
   2. Elements shall have reference resistance of 1,000 ohms/°F, with reference resistance of 1,000 ohms at 70°F, with temperature coefficient of 3 ohms/°F.
   3. Resistance tolerances shall be 1.0% at 70°F.
   4. Minimum ambient temperature range shall be -40°F to 216°F.

2.5 OUTPUT DEVICES

A. Relays and Contactors:
   1. UL listed units rated for 100,000 cycles with resistive loads. Equip with replaceable molded coils and replaceable silver cadmium oxide contacts. Coat core laminations with heat resistant inorganic film to reduce core losses.
   2. For line and load terminals on contactors with higher than 35 amp rating, provide 1-piece formed and welded pressure type.
   3. For 35 amp or lower rating, provide screw type contactors.
   4. Equip field-mounted contactors with suitable steel enclosures.

2.6 CONTROLLERS

A. Electronic Controllers:
   1. Provide electronic controllers designed as individual components and fully protected by steel enclosures.
   2. Provide individual controllers of multiple input type with provisions for user adjustment.
   3. Identify adjustments clearly on controllers including proportional band and authority.
   4. Where single electronic controller required for specific application, can be built-in as integral part of control motor, but only where provided with easily accessible control adjustment.
   5. Provide 2-position or proportional electric controller power output as required by specified sequence of operations.

B. Step Controllers:
   1. Provide step controllers for control sequencing or control of staged outputs with heavy duty switching rated to handle loads.

2.7 PANELS

A. Local Control Panels/Temperature Control Panels (TCP): Provide control panels with suitable brackets for wall or floor mounting for each supply fan and miscellaneous control systems. Locate panel adjacent to systems served.
   1. Fabricate panels of 14 ga furniture quality steel or 6063-T5 extruded aluminum alloy, totally enclosed with hinged doors and keyed lock, NEMA-4X rating, with manufacturer's standard shop painted finish and color. Provide UL listed and certified cabinets for use with line voltage devices.
   2. Panel-Equipment: Include temperature and humidity controllers, relays, and automatic switches except exclude low temperature protection thermostats, firestats, and other devices excluded in sequence of operation. Fasten devices with adjustments accessible through front of panels.
   3. Door-Mounted Equipment: Flush-mount (on hinged door) manual switches including damper Minimum-Off positioning switches, Summer-Winter switches, and Manual-Automatic switches, including dial thermometers.
   4. Graphics: Where specified, provide color coded graphic laminated plastic displays on doors to schematically show system being controlled. Provide protective sheet of clear plastic bonded to entire door to prevent damage to symbols.
   5. Temperature control panels shall contain all the necessary control components and control wiring to meet the functional HVAC control descriptions specified in Section 23 0993.

B. Central (Master) Control Panels: Provide central control panels of fully enclosed steel cubical type with locking doors or locking removable backs. Match finish of panels and provide multi-color graphic displays schematically showing system being controlled.

2.8 VALVES

A. Control Valves:
   1. General:
      a. Provide factory-fabricated, electrically actuated control valves of type, body material, and pressure class required.
      b. Where type or body material not indicated, provide selection as determined by manufacturer for installation requirements and pressure class based on maximum pressure and temperature in piping system.
      c. Equip control valves with heavy duty actuators and proper shut-off rating for each individual application.
   2. Water Service Valves: Equal percentage characteristics with rangeability of 50 to 1.
   3. Single Sealed Valves: Cage type trim providing seating and guiding surfaces for plug on top and bottom guided plugs.
   4. Double Seated Valves: Balanced plug type with cage type trim providing sealing and guiding surfaces on top and bottom guided plugs.
   5. Valve Trim and Stems: All sizes, polished stainless steel.
   6. Packing: Spring loaded Teflon, self-adjusting.
   7. Valve Pressure Drop: Size valves for following.
      a. 3-Way Valves: Valve pressure drop shall equal or exceed pressure drop of terminal devices served. Pressure drops of valves in secondary piping bridge circuits shall not exceed 5 ft of water column.
      b. 2-Way Valves: Valve pressure drop shall not exceed 5 ft of water column.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which electric control systems to be installed. Do not proceed with Work until unsatisfactory conditions corrected.

3.2 INSTALLATION

A. Install system and materials in accordance with manufacturer's instructions, roughing-in drawings, details on Drawings, and approved submittals. Install electrical components and use electrical products complying with requirements of applicable Division 26 sections of these Specifications. Mount controllers at convenient locations and heights.

B. Installation of Mechanical Devices: Refer to other Division 23 sections for installation of valve bodies, control sensor wells, and dampers.

3.3 EQUIPMENT AND WIRING

A. Control Wiring: Install and color code control wiring without splices between terminal points. Install in accordance with NFPA No. 70 and applicable sections of Division 26. Install wiring incidental to system installation.
   1. Install circuits over 25 v with color coded minimum No. 12 wire in electric metallic tubing.

2. Install circuits under 25 v with color coded minimum No. 18 wire with 0.031 in. high temperature (105°F) plastic insulation on each conductor and plastic sheath over all.
3. Install electronic circuits with color coded minimum No. 22 wire with 0.023 in polyethylene insulation on each conductor with plastic jacketed copper shield over all.
4. Install low voltage circuits, located in concrete slabs and masonry walls or exposed in occupied areas, in electric conduit.
5. Do not install digital bus wiring in same conduit with line voltage wiring or other conductors with highly inductive loads.
6. Enclose line voltage wiring in rigid galvanized steel conduit. Enclose low voltage wiring in plastic/AMT conduit.

B. Installation of Damper Operator Motor: Power damper motor from line voltage power or from dedicated transformer. Do not power damper motor from MCC motor starter control transformer.

C. Installation of Relay and Starters: Where relays or motor starters are required to control single phase motors, damper operators and other loads, mount relays or starters in temperature control panels or dedicated electrical cabinets in accordance with UL 50 and Sections 26 0505 and 26 0900.

3.4 FINAL ADJUSTMENT OF EQUIPMENT

A. After completion of installation, adjust thermostats, control valves, motors, and similar equipment provided under this section.

B. Verify programming for proper control action and adjust operating setpoints to achieve optimum system operation.

C. Include computer programming, record drawings, labor for adjusting and validating, and checkout necessary for operational system.

D. Provide specially trained personnel for final adjustment Work.

E. Startup, test, and adjust control systems. Demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Services:
1. Supplier’s or manufacturer’s representative for equipment specified herein shall be present at jobsite or classroom designated by OWNER for mandays indicated, travel time excluded, for assistance during construction, startup, and training of OWNER’S personnel for equipment operation. Include:
   a. 1/2 manday for Instructional Services.

B. Operator Instruction:
1. Provide hands-on operator instruction to OWNER’S operating personnel during system commissioning and at such time acceptable performance of DDC hardware and software established. Provide instruction during normal working hours by CONTRACTOR’S representative familiar with system software, hardware, and accessories. Demonstrate compliance meeting the intended control sequence of operations for all equipment specified.

2. At mutually agreed upon time during system commissioning, provide instruction to OWNER'S designated personnel on operation of equipment within electric control and DDC system and describe intended use with respect to programmed functions specified.
3. Include overall operational program, equipment functions (individually and as part of total integrated system), commands, advisories, and appropriate operator intervention required in responding to system operation. Include in O&M data.

3.6 CLEANING

A. Clean factory finished surfaces. Repair marred or scratched surfaces with manufacturer's touch-up paint.

END OF SECTION 23 0933

SECTION 23 0993

AUTOMATIC CONTROL SEQUENCES

PART 1 - GENERAL

1.1 SUMMARY

A. Operating equipment, devices, and system components required for automatic temperature control systems which are specified herein**.**

1.2 DEFINITIONS

A. Control Sequences: Manner and method by which automatic temperature controls function. Requirements for each type of operation are described in this section.

B. Normal Mode: Mode or position-controlled device assumes without power.

C. Automatic Mode: Mode or position-controlled device assumes when under control of automatic system of controls.

D. Manual Mode: Mode or position-controlled device assumes when under manual control. Unless otherwise specified, manual mode implied and affects only device for which manual mode or position identified.

1.3 SUBMITTALS

A. Shop Drawings:
1. Schematic flow diagram of system showing fans, pumps, coils, dampers, valves, and control devices.
2. Label each control device with setting or adjustable range of control.
3. Indicate pneumatic piping, factory and field wiring.
4. Indicate each control panel required with internal and external piping and wiring clearly indicated. Provide detail of panel face including controls, instruments, and labeling.
5. Include written description of sequence of operation.

B. Submit in accordance with Section 01 3300.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 VARIABLE SPEED EXHAUST EQUIPMENT (CONTINUOUS VENTILATION)

A. Control Sequence - Exhaust Fan:
1. Units Served:
a. EF-1: Interlocked with CD-1 and CD-5. (TCP-1)
b. EF-2: Interlocked with CD-2 and CD-6. (TCP-1)
c. EF-3: Interlocked with CD-3 and CD-7. (TCP-1)
d. EF-4: Interlocked with CD-4 and CD-8. (TCP-1)

e. EF-7: Interlocked with CD-10 and CD-11. (TCP-3)

2. Normal Mode: Off.
   a. Fan: Off.
   b. Outside Air Damper: Closed.
   c. Exhaust Air Damper: Closed.
3. On Mode:
   a. Provide maintain type fan START, non-powered, contact closure(s) for VFD motor start inputs provided and installed by Division 23. Provide 4-20 mAdc analog signals to VFD for fan speed control and accept 4-20 mAdc signals for speed indication at TCP.
   b. VFDs provided and installed by Division 23. Mount VFD's on exterior wall near TCP and fans.
   c. Manually start and stop fans through Hand/Off switch located at TCP. In the hand position, open outside air and exhaust air dampers, send fan Start Signal to VFD and start exhaust fan, adjust fan speed and outside air damper position automatically based on outside air temperature:
      1) When outside air temperature is below 45°F (field adjustable), match minimum air-flows shown on drawings.
      2) When outside air temperature is above 45°F (field adjustable), match maximum air-flows shown on drawings.
   d. Fan Status: Provide illuminated (Green LED) pilot light mounted at TCP to indicate fan energized. Monitor fan status through differential pressure switch and illuminated warning (Red LED) pilot light mounted at TCP. Provide local alarm condition when fan motor starter engaged and air-flow not present.

3.2 DEPENDENTLY CONTROLLED EXHAUST EQUIPMENT (CONSTANT SPEED)

A. Control Sequence - Exhaust Fan:
   1. Units Served:
      a. EF-5: Interlocked with WSHP-6. (TCP-2)
      b. EF-6: Interlocked with WSHP-6. (TCP-2)
   2. Normal Mode: Off.
      a. Fan: Off.
   3. Automatic Mode:
      a. Start fan through Hand-Off-Automatic switch located at TCP.
      b. Provide maintain type fan START, non-powered contact closure(s) for motor start inputs provided by Division 26.
      c. Automatic Mode: When run signal received from WSHP, send fan Start signal to Electrical and start fan. When run signal removed, reverse procedure.
      d. Exhaust fans are provided with solid state speed controllers. Adjust fan speed manually to match scheduled air-flow.
      e. Fan Status: Provide illuminated (Green LED) pilot light mounted at TCP to indicate fan energized. Monitor fan status through differential pressure switch and illuminated warning (Red LED) pilot light mounted at TCP. Provide local alarm condition when fan motor starter engaged and air-flow not present.
   4. Hand Mode: On.
      a. In the hand position, send fan Start signal to Electrical, start fan, and run continuous. On shutdown, reverse procedure.

3.3 MANUALLY ACTUATED CEILING FANS

A. Control Sequence - Ceiling Fans:
   1. Units Served:
      a. CF-1.
      b. CF-2.
      c. CF-3.
      d. CF-4.
      e. CF-5.
      f. CF-6.
   2. Normal Mode: Off
      a. Ceiling Fans: Off.
   3. On Mode:
      a. Manually Start and Stop ceiling fans through manufacturer provided solid state speed controller. Manually adjust fan speed as desired.

3.4 ELECTRIC HEATERS

A. Control Sequence – Electric Unit Heaters:
   1. Units Served:
      a. EH-1.
      b. EH-2.
      c. EH-3.
      d. EH-4.
      e. EH-7.
      f. EH-8.
      g. EH-9.
      h. EH-10.
      i. EH-11.
      j. EH-12.
   2. Normal Mode: Off.
      a. Power: Off.
   3. Automatic Mode: On.
      a. Provide unit with complete system of factory or remote installed controls suitable for use with manufacturer furnished control power transformer and low voltage thermostat with fan-off-heat sub-base.
      b. Fan Mode: Start unit fan and operate continuously. Lockout electric heating element when fan mode engaged.
      c. Heat Mode: On call for heat from manufacturer provided thermostat, set at 55°F (field adjustable) normally open contact closes and electric heating element turns on in stages. Start fan through manufacturer provided time delay relay. On satisfaction of space heating demand, contact opens. Stop fan when all heat has been dissipated.

B. Control Sequence – Electric Wall Heaters:
   1. Units Served:
      a. EH-5.
      b. EH-6.
   2. Normal Mode: Off.
      a. Power: Off.
   3. Automatic Mode: On.
      a. Provide unit with complete system of factory-installed controls including single pole integral thermostat and bi-metallic, snap action type, fan control and thermal cutout.

b. Heat Mode: On call from heat from integral thermostat, set at 70ºF, field adjustable, activate fan after heating element reaches operating temperature, and continue to operate fan after thermostat is satisfied and until all heat has been dissipated.
c. Thermal cutout shall shut off power to heating element in the event of overheating.

3.5 DEHUMIDIFIER

A. Control Sequence - Dehumidifier (Manufacturer-Supplied Controls):
1. Unit Served:
a. D-1.
b. D-2.
c. D-3.
d. D-4.
e. D-5.
f. D-6.
2. Normal Mode: Off.
a. Fan: Off.
b. Compressor: Off.
c. Condensate Pump: Off
3. Automatic Mode: On.
a. Fan shall be controlled by "On-Auto" fan switch. With switch in "Auto" position and on call for dehumidification from humidistat, set at 50% relative humidity, field adjustable, fan and compressor shall start. When relative humidity of space is below set-point, de-energize fan and compressor.
b. With fan switch in "On" position, fan shall operate continuously while compressor cycles "On" and "Off" to satisfy relative humidity set-point.
c. Condensate pump shall cycle "On" and "Off" as required.
d. Unit shall be provided with manufacturer provided controls.

3.6 EMERGENCY SHOWER/EYEWASH MONITORING – WATER FLOW ALARM

A. Areas Served:
1. R107 Corrosion Inhibitor. (ES-1 and EEW-1)
2. R108 Sodium Hydroxide. (ES-1 and EEW-1)
3. R109 Sodium Bisulfite (ES-1 and EEW-1)
4. R110 Antiscalant (ESEW-1)
5. Outside chemical fill areas; two locations (ESEW-2)

B. Emergency Shower/ Eyewash Monitoring: Monitor emergency shower/ eyewash operation through flow switch mounted on the water supply line serving fixture provided/ installed by Division 22 and illuminated red LED warning light located at TCP-1. Provide alarm condition when flow switch is activated and send “ESEW – Chemical Room Name/Location” signal to plant’s SCADA (Division 40).

3.7 HEATING AND AIR CONDITIONING SYSTEM – WATER SOURCE HEAT PUMPS

A. Control Sequence – Water Source Heat Pumps (WSHP):
1. Units Served:
a. WSHP-1.
b. WSHP-2.
c. WSHP-3.

d. WSHP-4.
e. WSHP-5.
f. WSHP-6. Interlocked with exhaust fans (EF-5 & 6) and outside air damper (CD-9).

2. General:
   a. Each Water Source Heat Pump shall be equipped with factory installed stand-alone controls as specified in Section 23 8146.
   b. Additional HVAC controls as specified herein shall be provided within Temperature Control Panel (TCP-2).
   c. Solenoid water control valves shall fail in the fully closed position upon loss of power.
   d. Electric actuated three-way valves (diverting type) shall be open to the Water-to-Refrigerant Heat Exchanger upon loss of power. During economizer mode; WSHP to operate 3-way valve open to Water Source Economizer.
   e. The space thermostat shall be low-voltage, digital type, with room temperature readout.
   f. Provide smoke detector in return air duct and send "smoke detection" signal to building Fire Alarm panel. See Section 28 3100.
   g. Each WSHP shall be provided with a "Run Enable" signal from plant's SCADA (Division 40) that allows WSHP to operate when the plant is operational and raw water pipe has available flow/pressure.
   h. Filter Status: Indicate filter pressure drop through panel mounted differential pressure switch and illuminated (Red LED) pilot light at TCP-2. When filter pressure drop exceeds 0.50 in. w.c., indicate a "dirty filter" alarm condition.
   i. Smoke control: Provide smoke detector mounted in return air duct. Upon smoke detection shut down supply fan and send "Smoke Detection" alarm signal to building Fire Alarm panel.

3.8 PRIMARY CIRCULATING PUMPS – BUILDING RAW WATER LOOP (VARIABLE SPEED)

A. Control Sequence – Circulating Pump, CP:
   1. Units Served:
      a. CP-1: Run with VFD; Leed Pump (TCP-2).
      b. CP-2: Run with VFD; Lag Pump (TCP-2).
   2. Normal Mode: Off.
      a. Pump: Off.
   3. General:
      a. Pump run signal to be received from WSHP(s) through TCP when WSHP(s) are calling for heating/cooling.
   4. Automatic Mode: On.
      a. Pump Control: Start and stop pumps automatically through TCP, variable frequency drive, and raw water differential pressure sensor and transmitter. When TCP calls for heating/cooling, start pump at minimum operating speed, set at 35% (field adjustable), operate pump continuously and for 1-hour (field adjustable) after run signal is removed. Adjust pump speed automatically by adjusting pump's VFD frequency to maintain differential pressure set-point set at +8-ft. (field adjustable) to meet system demand.
      b. Provide maintain type pump Start, non-powered contact closure(s) for VFD motor start inputs provided by Division 23. Provide 4-20 mAdc analog signals to VFD for pump speed control and accept 4-20 mAdc signals for speed indication at TCP.
      c. VFD's provided and installed by Division 23.

d. Lead/Lag Operation: Provide Lead/Lag pump control through BAS. Operate Lead pump for duration of 48 hours (field adjustable) with Lag pump as stand-by. Alternate Lead/Lag pump assignments every 48 hours (field adjustable). If Lead pump does not satisfy heating water flow demand, allow Lag pump to operate. Monitor and record pump run time at TCP.

e. Back-pressure Flow Control Valve: Set back-pressure flow control valve to open when pressure reaches 120 ft. head (field adjustable).

END OF SECTION 23 0993

SECTION 23 2113

HYDRONIC PIPING SYSTEMS

PART 1 - GENERAL

1.1 SUBMITTALS

A. Schedule below identifies information required for each item of material or equipment.

Unit Type	Submittal Information Item
Piping	1, 2, 3
Valves	1, 4

B. Submittal information:
   1. Product Data: Submit manufacturer's technical product data and installation instructions for piping materials and products.
   2. Shop Drawings: Submit scaled layout drawings of hydronic piping systems including, but not necessarily limited to, pipe and tube sizes, locations, elevations, and slopes of horizontal runs, wall and floor penetrations, and connections. Show interface and spatial relationship between piping and equipment.
   3. Record Drawings: At Project closeout, submit record drawings of installed piping and piping products in accordance with Section 01 7700.
   4. Operation and Maintenance (O&M) Data:
      a. Submit maintenance data and parts lists for hydronic piping materials and products.

C. Submit in accordance with Section 01 3300.

D. Information submitted by CONTRACTOR, but not designated to be submitted will be returned without action by ENGINEER.

1.2 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of hydronic piping products of types, materials, and sizes required whose products have been in satisfactory use in similar service for not less than 5 yrs.

B. Installer's Qualifications: Firm with at least 3 yrs successful installation experience on projects with hydronic piping work similar to required for Project.

C. Regulatory Requirements:
   1. ASME Compliance: Fabricate and install hydronic piping in accordance with ASME B31.9.
   2. UMC Compliance: Fabricate and install hydronic piping in accordance with Ohio International Mechanical Code (2017).

PART 2 - PRODUCTS

2.1 MATERIALS AND PRODUCTS

A. Provide piping materials and factory-fabricated piping products of sizes, types, pressure ratings, temperature ratings, and capacities as indicated. Where not indicated, provide proper selection as determined by CONTRACTOR complying with installation requirements.

B. Comply with ASME B31.9 where applicable; base pressure rating on hydronic piping systems maximum design pressures.

C. Provide sizes and types matching piping and equipment connections and provide fittings of materials matching pipe materials used in hydronic piping systems.

D. Where more than one type of materials or products indicated, selection CONTRACTOR'S option.

E. Insulation: Comply with Section 23 0700.

2.2 IDENTIFICATION

A. Comply with Section 22 0553 and provide following:
1. Hydronic Piping: Plastic pipe markers.
2. Hydronic Valves: Plastic valve tags.

2.3 PIPES AND PIPE FITTINGS

A. Comply with following:
1. Pipe Size 2 in. and Smaller: Galvanized steel pipe, Schedule 40, Class 125 galvanized cast iron fittings with threaded joints.
2. Tube Size 3 in. and Smaller: Copper tube, Type L, hard drawn temper, wrought copper fittings with soldered joints.
3. Pipe Size 2-1/2 in. and Larger: Galvanized steel pipe, Schedule 40, grooved joint fittings, Victualic Rigid or equal.

2.4 PIPING SPECIALTIES

A. Comply with Section 22 0010 and following:
1. Pipe escutcheons.
2. Pipe line strainers.
3. Dielectric unions.
4. Drip pans.
5. Sleeves.
6. Sleeve seals.

2.5 SUPPORTS AND ANCHORS

A. Comply with Section 22 0529 and following:
1. Adjustable steel clevises, pipe saddle supports, single pipe rolls, and roller hangers for horizontal piping hangers and supports.
2. 2-bolt riser clamps for vertical piping clamps.
3. Steel turnbuckles for hanger rod attachments.
4. Concrete inserts, C-clamps, malleable beam clamps, and steel brackets for building attachments.
5. Protection saddles for saddles and shields.

2.6 VALVES

A. Comply with following:
   1. Sectional Valves:
      a. 2 in. and Smaller: Gate valves.
      b. 2 in. and Smaller: Ball valves.
      c. 2-1/2 in. and Larger: Gate valves.
      d. 2-1/2 in. and Larger: Butterfly valves.
   2. Shutoff Valves:
      a. 2 in. and Smaller: Gate valves.
      b. 2 in. and Smaller: Ball valves.
      c. 2-1/2 in. and Larger: Gate valves.
      d. 2-1/2 in. and Larger: Butterfly valves.
   3. Heating/Cooling Terminal Outlet Valves:
      a. 2 in. and Smaller: Gate valves and calibrated balance valves.
      b. 2 in. and Smaller: Ball valves and calibrated balance valves.
      c. 2-1/2 in. and Larger: Gate valves and balance cocks with flow meters.
      d. 2-1/2 in. and Larger: Butterfly valves and balance cocks with flow meters.
   4. Drain Valves:
      a. 2 in. and Smaller: Gate valves.
      b. 2 in. and Smaller: Ball valves.
      c. 2-1/2 in. and Larger: Gate valves.
   5. Check Valves:
      a. All sizes: Swing check valves.
      b. 2 in. and Smaller: Silent check valves.
      c. 2-1/2 in. and Larger: Wafer check valves.

2.7 BACKPESSURE FLOW CONTROL VALVES

A. Manufactures:

   1. Emerson, Series 6853.
   2. Bell and Gossett ITT, Fluid Handling Division.
   3. Dunham-Bush, Inc.
   4. Taco, Inc.
   5. Or equal.

B. Rate for 125 psi, contain globe style assembly automatically opening by means of excess upstream flow pressure, and automatically maintain setpoint pressure. Provide with means to manually open in case of pump failure.

C. Threaded Ends 2 in. and Smaller: Cast iron body, bronze check mechanism, screw-in bonnet, straight or angle pattern.

D. Threaded and Flanged Ends 2-1/2 in. Through 4 in.: Cast iron body, bronze check mechanism, screw-in bonnet, straight or angle pattern.

2.8 EXPANSION COMPENSATION

A. Comply with following and industry standard:
   1. Packless expansion joints.
   2. Flexible ball pipe joints.

3. Expansion joints for grooved piping.
4. Pipe alignment guides.

2.9 METERS AND GAUGES

A. Comply with following and industry standard:
1. Temperature gauges and fittings.
2. Pressure gauges and fittings.
3. Flow measuring meters.

2.10 VIBRATION CONTROL

A. Comply with following and industry standard:
1. Isolation hangers.
2. Riser isolators.
3. Riser support isolators.
4. Flexible pipe connectors.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which hydronic piping systems materials and products installed. Do not proceed with Work until unsatisfactory conditions corrected.

3.2 INSTALLATION OF BASIC IDENTIFICATION

A. Comply with Section 22 0553.

B. Apply piping labels and flow arrows on clean, dry insulated piping systems.

C. Install labels and flow arrows at equipment connections, branch fittings and at 20 ft intervals.

3.3 INSTALLATION OF HYDRONIC PIPING

A. Install eccentric reducers where pipe reduced in size in direction of flow, with tops of both pipes and reducer flush.

B. Install piping with no pitch.

C. Connect branch feed piping to mains at horizontal centerline of mains and run piping out to branches at horizontal centerline of branches.

D. Locate groups of pipes parallel to each other, spaced to permit applying full insulation and servicing of valves.

E. Insulate system in accordance with Section 23 0700.

F. Install fire seals in each fire rated wall and floor opening applying putting or caulking in accordance to manufacturer’s instructions.

3.4 INSTALLATION OF PIPING SPECIALTIES

A. Comply with Section 40 0543.

3.5 INSTALLATION OF SUPPORTS AND ANCHORS

A. Comply with Section 22 0529.

3.6 INSTALLATION OF VALVES

A. Sectional Valves: Install on each branch and riser, close to main, where branch or riser serves 2 or more hydronic terminals or equipment connections, and elsewhere as indicated.

B. Shut-Off Valves: Install on inlet and outlet of each mechanical equipment item, on inlet of each hydronic terminal, and elsewhere as indicated.

C. Hydronic Terminal Outlet Valves: Install on outlet of each hydronic terminal and elsewhere as indicated.

D. Drain Valves: Install on each mechanical equipment item located to completely drain equipment for service or repair. Install at base of each riser, each rise or drop in piping system, and elsewhere as indicated or required to completely drain hydronic piping system.

E. Check Valves: Install wafer or silent check valves on discharge side of each pump and elsewhere as indicated. Install swing check valves in horizontal piping as indicated.

F. Back Pressure Flow Control Valves: Install back pressure control valves on bypass lines to allow flow back to pumps when pressure reaches 110 to 115% of system pressure, field adjustable.

G. Install temperature control valves furnished under Section 23 0933.

3.7 EQUIPMENT CONNECTIONS

A. Connect hydronic piping system to mechanical equipment as indicated and comply with manufacturer's instructions where not otherwise indicated. Install shut-off valve and union on supply and return, drain valve on drain connection.

B. Hydronic Terminals: Install hydronic terminals with hydronic terminal balancing valve and union on outlet; union, shut-off valve on inlet. Install manual air vent valve on element in accordance with manufacturer's instructions. Locate valves and balancing cocks behind valve access doors for ease of maintenance. Where indicated, install automatic temperature control valve with unions between shut-off valve and element on supply line.

C. Install dielectric adaptors between dissimilar metals within hydronic system.

3.8 FIELD QUALITY CONTROL

A. Testing:
   1. Perform pneumatic pressure test isolating equipment, pressure relief valves, pressure reducing valve, and compression tank. Pressurize system to 50 psi for 4 hrs without pressure loss.
   2. If system fails test, locate leaks and retest until leaks eliminated. Replace system components which cannot be fixed with new components.

3.9 CLEANING

A. Flush entire system with clean, clear water, portable water quality, until discharge water runs clear, with no trace of sediment. Clean strainers in air separator and pump suction diffusers and refill system. Operate 1 primary pump and both secondary pumps for minimum of 8 hrs with system valves open, then clean strainers again. If noticeable sediment found in strainers, repeat flushing entire system. Repeat above 8 hr circulation test and check strainers. If strainers have noticeable sediment, repeat flushing and circulation tests until strainers remain clean.

3.10 BALANCING

A. Do not proceed with testing and balancing work until system complete and operable. Ensure no later residual work is still to be completed.

B. Furnish calibrated flow meter and hoses, with suitable conversion charts to set balancing valve installed.

C. Set balancing valves for each boiler, pump, coil, coil bypass, finned tube section, and unit heater for flows indicated on schedules. Mark each balancing valve at set point. Flows $\pm$5% of schedule will be accepted.

D. Balancing Reports:
   1. Provide data on test equipment used and most recent calibration date with submission of test report.
   2. Provide test report signed by test and balance supervisor performing Work, showing scheduled and balanced flow for each balancing valve.

END OF SECTION 23 2113

SECTION 23 2123

HVAC PUMPS

PART 1 - GENERAL

1.1 SCOPE

A. Furnish and install pump and variable speed control systems as required to provide a complete and satisfactory installation.

1.2 SECTION INCLUDES

A. Variable Speed Pump Package.
   1. Horizontal End Suction Pump
   2. Variable Frequency Drives
   3. TEFC or ODP motor
   4. Integral Controls Platform

B. Refer to Division 26 for following; not Work of this section.
   1. Power supply wiring from power source to power connection on pumps. Include starters, disconnects, and required electrical devices, except where specified as furnished or factory-installed by manufacturer.
   2. Interlock wiring between pumps and between pumps and field-installed control devices.
      a. Interlock wiring specified as factory-installed is Work of this section.

C. Provide following electrical work as Work of this section complying with requirements of Division 26.
   1. Control wiring between field-installed controls, indicating devices, and pump control panels.
      a. Control wiring specified as work of Division 23 for Automatic Temperature Controls is Work of that section.

D. See Section 23 0993 for sequence of operation.

1.3 SUBMITTALS

A. Schedule below identifies information required for each item of material or equipment.

	Unit Type	Submittal Information Item
1.	End-suction pumps	1, 2, 3, 4

B. Submittal Information:
   1. Product Data: Manufacturer's pump specifications installation and startup instructions, and current accurate pump characteristic performance curves with selection points clearly indicated.
   2. Shop Drawings: Manufacturer's assembly type shop drawings indicating dimensions, weight loadings, required clearances, and methods of assembly for each model of pump to be provided.

3. Motors: For poly-phase motors 5 hp or larger, submit in accordance with requirements of Section 26 2000 For single-phase motors and poly-phase motors less than 5 hp, submit NEMA design types, construction, insulation class, NEMA frame size, horsepower, voltage and amp draw characteristics, and service factor.
4. Operating and Maintenance (O&M) Data:
    a. Maintenance instructions including lubrication instructions, filter replacement, motor and drive replacement, and spare parts list.
    b. Include O&M data, product data, and Shop Drawings in single-bound manuals.

C. Submit in accordance with Section 01 3300.

D. Information submitted by CONTRACTOR, but not designated to be submitted will be returned without action by ENGINEER.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of general use centrifugal pumps with characteristics, sizes, and capacities required, whose products have been in satisfactory use in similar service for not less than 5 yrs.

B. Regulatory Requirements:
1. HI Compliance: Design, manufacture, and install HVAC pumps in accordance with HI Standards" and UL 778.
2. UL and NEMA Compliance: Provide electric motors and components listed and labeled by UL and complying with NEMA standards.

C. Certification, Pump Performance: Provide pumps whose performances, under specified operating conditions, are certified by manufacturer.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Handle HVAC pumps and components to prevent damage, breaking, denting, and scoring. Do not install damaged HVAC pumps or components; replace with new.

B. Store HVAC pumps and components in clean, dry place. Protect from weather, dirt, fumes, water, construction debris, and physical damage.

C. Comply with manufacturer's rigging and installation instructions for unloading HVAC pumps and moving them to final location.

1.6 WARRANTY

A. Manufacturer's warranty: The entire package shall carry a 18 month parts warranty. The drive will carry a parts and labor warranty. The motor will carry a 12 month parts and labor warranty but must be delivered to a local authorized motor warranty shop by the installing contractor. Manufacturer's warranty is in addition to and not intended to limit other rights Owner may have under Contract Conditions.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with these specifications, the following manufacturers shall be acceptable:
   1. Taco, Inc. – SFI Self-Sensing Series with ProBalance.
   2. Approved Equal.

2.2 MANUFACTURED UNITS

A. The self-sensing product shall consist of a factory supplied base mounted flex-coupled pump with motor and preprogrammed drive with integral controls package.

B. The drive shall be separate and apart to the pump and motor. The mounting of the drive shall be done in a manner consistent with the manufacturer's instructions and all applicable codes.

C. The performance speed of the pump and VFD combination shall be 1750 RPM nominal as standard. Exceptions for 1150 RPM and 3600 RPM shall be noted in the schedules. 3600 RPM shall NOT be an allowable substitution for a specified 1750 RPM or 1150 RPM package. 1750 RPM shall not be an allowable substitution for a specified 1150 RPM or 3600 RPM package. Alternative RPM products might be considered as a substitution for the Specified RPM products only if that manufacturer provides a spare motor, drive, and seal for each pumping unit.

D. Pump logic controller, variable frequency drives, sensor/transmitters and related equipment shall be installed by the mechanical contractor as shown on the plans.

2.3 COMPONENTS

A. Pump Logic Controller.
   1. The controller operation shall operate the system using a tested and proven program that safeguards against undesirable or damaging conditions including:
      a. Motor overload
      b. Pump flow surges
      c. Hydraulic cycling (hunting).
      d. End of curve unstable operation: The pump logic controller, through a factory pre-programmed algorithm, shall be capable of protecting the pumps from hydraulic damage due to operation beyond their published end-of-curve. This feature requires a flow meter for activation. The operator interface shall include an owner adjustable flow set point to set the parameters for this routine.
   2. The pump logic controller shall be capable of starting, unloading, and stopping pumps based on a system performance program that will minimize energy consumption, provide reliable performance and bumpless transitions.
   3. The pump logic controller shall be capable of running four different hydronic optimization sub-routines
      a. Setup one: This subroutine shall allow the pump package to track a quadratic system curve and will optimize a secondary distribution loop. It shall use a technology that allows the pump, drive, and motor package to translate the hydronic data from both a pump and system curve and translate it to electrical data. This allows the drive to know exactly where it is in the hydronic world.
      b. Setup two: This subroutine shall allow two pumps to run as backup for each other and shall alternate the pumps based on a real time clock
      c. Setup three: This subroutine shall allow the package to run in a customer defined flow rate. The package will always seek to run at the user defined flow even with fouling causing system changes. It shall use a technology that allows the pump, drive, and motor package to translate the hydronic data from both a pump and system curve and

translate it to electrical data. This allows the drive to know exactly where it is in the hydronic world.

d. Setup four: This subroutine shall allow the use of a Modulating Pump Controller and shall allow for up to 4 self-sensing pumps to operate in a parallel self-sensing mode.

4. The control platform shall include a subroutine equal to the Taco Self-Sensing Series with ProBalance™. This subroutine shall allow for the automatic balancing of secondary system distribution pumps. The package shall automatically run system distribution pumps to a user defined duty point and will recognize that duty point and hold the pumps at a speed that matches the actual installed system quadratic system curve. The package will then use this data to set up a new duty point as the max point for the quadratic control curve. Use of external balancing devices or contractors will not be needed.
5. The package shall serve as a flow metering device and will display pump flow at the user interface.

B. PUMPS (See pump schedule on plans for exact model, type, and duty points.)

1. Base Mounted Flex Coupled Pumps
   a. Pumps shall be Taco Model FI or approved equal. The pumps shall be single stage end suction rear pull out design. The bearings and seal shall be serviceable without disturbing the piping connections. The capacities and characteristics shall be as called for in the plans/schedules.
   b. Pump casing shall be constructed of ASTM A48 class 30 cast iron. The pump casing/volute shall be rated for 250 psi working pressure for all jobs. The pump flanges shall be matched to suit the working pressure of the piping components on the job, with either ANSI Class 125 flanges or ANSI class 250 flanges. The pump casing shall be drilled and tapped for gauge ports on both the suction and discharge connections and for a drain port at the bottom of the casing. The casing shall have an additional tapping on the discharge connection to allow for the installation of a seal flush line. The pump cover shall be drilled and tapped to accommodate a seal flush line which can be connected to the corresponding tapping on the discharge connection, or to an external source to facilitate cooling and flushing of the seal faces.
   c. All casings shall be flanged. Threaded casings not allowed unless extra unions and fittings are provided with that pump to allow servicing.
   d. Pump volute shall be foot mounted. Overhung cantilevered design not allowable.
   e. The pump shall be center line discharge for both positive air venting and allowance for better load distribution.
   f. The pump casing inlet shall have an integrally cast anti-rotational vane.
   g. The impeller shall be ASTM B584-836/875 bronze and hydraulically balanced. The impeller shall be dynamically balanced to ANSI Grade G6.3 and shall be fitted to the shaft with a key. The impeller shall be cast by the hydraulically efficient lost foam technique to ensure repeatability of high quality.
   h. The pump shall incorporate a dry shaft design to prevent the circulating fluid from contacting the shaft. The pump shaft shall be AISI 1045 carbon steel with field replaceable bronze SAE 660 shaft sleeve. In order to improve serviceability and reduce the cost of ownership the shaft sleeve must be slip on (press on not allowable) and must be easily replaced in the field.
   i. The pump shall be fitted with a single mechanical seal, with EPT elastomers and Carbon/Ceramic faces, rated up to 250ºF. This seal must be capable of being flushed externally via a tapping in the pump cover adjacent to the seal cavity. Any pump used on an open system shall be furnished with a seal flush line and a Cuno / Kynar / Purocell #900 replaceable cartridge filter or separator with shut-off isolation valve installed in the seal flushing line. The filter shall have the ability to remove particles

down to five microns in size. The entire pump line shall use no more than three different sizes of seals.

j. All pumps to be provided with a fully welded, rigid structural steel base. The base shall include closed ends and top openings to allow for grouting. The base shall include an integral drain pan fabricated from steel with a minimum thickness of 0.1875" and shall contain an integral ¾" drain connection.

k. The pump bearing frame shall incorporate maintenance free permanently lubricated and sealed bearings with an L10 life of 60,000 hours. Bearing frame shall be equipped with Forsheda seals to protect bearings from moisture and airborne contaminants. The entire line of pumps shall use no more than four different sizes of bearing frames.

l. The pump shall be flexibly coupled to a NEMA standard T frame motor. The coupler shall be suitable for across the line starting as well as variable speed conditions associated with variable frequency drives. The coupling shall be equal to a Woods Dura-Flex coupler. Any pump manufacturer providing a mechanically inferior coupler design, especially in variable torque applications, shall extend the warranty of the coupler for an additional two years in addition to their own standard warranty. The coupling and shafts shall be covered by a metal guard. Pump shall be aligned upon receipt at job, during installation, and after system fill by contractor.

m. In order to both simplify and reduce the total cost of ownership, the manufacturer shall standardize on no more than three sizes of mechanical seals and four sizes of bearing frames throughout the entire range of the family of pumps. The manufacturer shall not use multiple part numbers for the same part.

C. VARIABLE FREQUENCY DRIVES

1. The VFD shall convert incoming fixed frequency three-phase ac power into an adjustable frequency and voltage for controlling the speed of three-phase ac motors. The motor current shall closely approximate a sine wave. Motor voltage shall be varied with frequency to maintain desired motor magnetization current suitable for the driven load and to eliminate the need for motor derating. When properly sized, the VFD shall allow the motor to produce full rated power at rated motor voltage, current, and speed without using the motor's service factor. VFDs utilizing sine weighted/coded modulation (with or without 3rd harmonic injection) must provide data verifying that the motors will not draw more than full load current during full load and full speed operation.
2. The VFD shall include an input full-wave bridge rectifier and maintain a fundamental (displacement) power factor near unity regardless of speed or load.
3. The VFD shall have a dual 5% impedance DC link reactor on the positive and negative rails of the dc bus to minimize power line harmonics and protect the VFD from power line transients. The chokes shall be non-saturating. Swinging chokes that do not provide full harmonic filtering throughout the entire load range are not acceptable. VFDs with saturating (non-linear) dc link reactors shall require an additional 3% AC line reactor to provide acceptable harmonic performance at full load, where harmonic performance is most critical.
4. The VFD's full load output current rating shall meet or exceed NEC table 430-150. The VFD shall be able to provide full rated output current continuously, 110% of rated current for 60 seconds and 120% of rated torque for up to 0.5 second while starting.
5. The VFD shall provide full motor torque at any selected frequency from 20 hz to base speed while providing a variable torque v/Hz output at reduced speed. This is to allow driving direct drive fans without high speed derating or low speed excessive magnetization, as would occur if a constant torque v/Hz curve was used at reduced speeds. Breakaway current of 160% shall be available.

6. A programmable automatic energy optimization selection feature shall be provided standard in the VFD. This feature shall automatically and continuously monitor the motor's speed and load to adjust the applied voltage to maximize energy savings.
7. The VFD must be able to produce full torque at low speed to operate direct drive fans.
8. Output power circuit switching shall be able to be accomplished without interlocks or damage to the VFD.
9. An automatic motor adaptation algorithm shall measure motor stator resistance and reactance to optimize performance and efficiency. It shall not be necessary to run the motor or de-couple the motor from the load to perform the test.
10. Galvanic isolation shall be provided between the VFD's power circuitry and control circuitry to ensure operator safety and to protect connected electronic control equipment from damage caused by voltage spikes, current surges, and ground loop currents. VFDs not including either galvanic or optical isolation on both analog i/o and discrete digital i/o shall include additional isolation modules.
11. VFD shall minimize the audible motor noise through the use of an adjustable carrier frequency. The carrier frequency shall be automatically adjusted to optimize motor and VFD operation while reducing motor noise. VFDs with fixed carrier frequency are not acceptable.
12. All VFDs shall contain integral EMI filters to attenuate radio frequency interference conducted to the ac power line.
13. The drive enclosure shall be standard as NEMA 1 (IP 21) for ODP motors and NEMA 12 (IP 55) for TEFC motors. See schedules for project requirements.
14. Protective features
    a. A minimum of class 20 i2t electronic motor overload protection for single motor applications shall be provided. Overload protection shall automatically compensate for changes in motor speed.
        1) Protection against input transients, loss of AC line phase, output short circuit, output ground fault, over voltage, under voltage, VFD over temperature and motor over temperature. The VFD shall display all faults in plain language. Codes are not acceptable.
        2) Protect VFD from input phase loss. The VFD should be able to protect itself from damage and indicate the phase loss condition. During an input phase loss condition, the VFD shall be able to be programmed to either trip off while displaying an alarm, issue a warning while running at reduced output capacity, or issue a warning while running at full commanded speed. This function is independent of which input power phase is lost.
        3) Protect from under voltage. The VFD shall provide full rated output with an input voltage as low as 90% of the nominal. The VFD will continue to operate with reduced output, without faulting, with an input voltage as low as 70% of the nominal voltage.
        4) Protect from over voltage. The VFD shall continue to operate without faulting with a momentary input voltage as high as 130% of the nominal voltage.
        5) The VFD shall incorporate a programmable motor preheat feature to keep the motor warm and prevent condensation build up in the motor when it is stopped in a damp environment by providing the motor stator with a controlled level of current.
        6) VFD shall include a "signal loss detection" algorithm with adjustable time delay to sense the loss of an analog input signal. It shall also include a programmable time delay to eliminate nuisance signal loss indications. The functions after detection shall be programmable.

7) VFD shall function normally when the keypad is removed while the VFD is running. No warnings or alarms shall be issued as a result of removing the keypad.
8) VFD shall catch a rotating motor operating forward or reverse up to full speed without VFD fault or component damage.
9) Selectable over-voltage control shall be provided to protect the drive from power regenerated by the motor while maintaining control of the driven load.
10) VFD shall include current sensors on all three output phases to accurately measure motor current, protect the VFD from output short circuits, output ground faults, and act as a motor overload. If an output phase loss is detected, the VFD will trip off and identify which of the output phases is low or lost.
11) If the temperature of the VFD's heat sink rises to 80°c, the VFD shall automatically reduce its carrier frequency to reduce the heat sink temperature. It shall also be possible to program the VFD so that it reduces its output current limit value if the VFD's temperature becomes too high.
12) In order to ensure operation during periods of overload, it must be possible to program the VFD to automatically reduce its output current to a programmed value during periods of excessive load. This allows the VFD to continue to run the load without tripping.
13) The VFD shall have temperature control cooling fan(s) for quiet operation, minimized losses, and increased fan life. At low loads or low ambient temperatures, the fan(s) may be off even when the VFD is running.
14) The VFD shall store in memory the last 10 alarms. A description of the alarm, and the date and time of the alarm shall be recorded.
15) When used with a pumping system, the VFD shall be able to detect no-flow situations, dry pump conditions, and operation off the end of the pump curve. It shall be programmable to take appropriate protective action when one of the above situations is detected.

15. Internal Control Algorithm
    a. This is a standard HVAC drive that has been upgraded and modified by pump experts for hydronic applications. It is set up with a closed loop internal control sequence that will optimize life cycle, system comfort, and minimize energy consumption.
16. Interface Features
    a. Hand, off and auto keys shall be provided to start and stop the VFD and determine the source of the speed reference. It shall be possible to either disable these keys or password protect them from undesired operation.
        1) There shall be an "info" key on the keypad. The info key shall include "on-line" context sensitive assistance for programming and troubleshooting.
        2) The VFD shall be programmable to provide a digital output signal to indicate whether the VFD is in hand or auto mode. This is to alert the building automation system whether the VFD is being controlled locally or by the building automation system.
        3) Password protected keypad with alphanumeric, graphical, backlit display can be remotely mounted. Two levels of password protection shall be provided to guard against unauthorized parameter changes.
        4) All VFDs shall have the same customer interface. The keypad and display shall be identical and interchangeable for all sizes of VFDs.
        5) To set up multiple VFDs, it shall be possible to upload all setup parameters to the VFD's keypad, place that keypad on all other VFDs in turn and download the setup parameters to each VFD. To facilitate setting up VFDs of various

sizes, it shall be possible to download from the keypad only size independent parameters. Keypad shall provide visual indication of copy status.

6) Display shall be programmable to communicate in multiple languages including English, Spanish and French.
7) A red fault light, a yellow warning light and a green power-on light shall be provided. These indications shall be visible both on the keypad and on the VFD when the keypad is removed.
8) A quick setup menu with factory preset typical HVAC parameters shall be provided on the VFD. The VFD shall also have individual fan, pump, and compressor menus specifically designed to facilitate start-up of these applications.
9) A four-feedback PID controller to control the speed of the VFD shall be standard. This controller shall accept up to four feedback signals. It shall be programmable to compare the feedback signals to a common set point or to individual set points and to automatically select either the maximum or the feedback signal as the controlling signal. It shall also be possible to calculate the controlling feedback signal as the average of all feedback signals or the difference between a pair of feedback signals.
10) The VFD shall be able to apply individual scaling to each feedback signal.
11) For fan flow tracking applications, the VFD shall be able to calculate the square root of any or all individual feedback signals so that a pressure sensor can be used to measure air flow.
12) The VFD's PID controller shall be able to actively adjust its set point based on flow. This allows the VFD to compensate for a pressure feedback sensor which is located near the output of the pump rather than out in the controlled system.
13) The VFD shall have three additional PID controllers which can be used to control damper and valve positioners in the system and to provide set point reset.
14) Floating point control interface shall be provided to increase/decrease speed in response to contact closures.
15) Five simultaneous meter displays shall be available. They shall include at a minimum, frequency, motor current, motor voltage, VFD output power, VFD output energy, VFD temperature in degrees, among others.
16) Programmable sleep mode shall be able to stop the VFD. When its output frequency drops below set "sleep" level for a specified time, when an external contact commands that the VFD go into sleep mode, or when the VFD detects a no-flow situation, the VFD may be programmed to stop. When the VFD's speed is being controlled by its PID controller, it shall be possible to program a "wake-up"feedback value that will cause the VFD to start. To avoid excessive starting and stopping of the driven equipment, it shall be possible to program a minimum run time before sleep mode can be initiated and a minimum sleep time for the VFD.
17) A run permissive circuit shall be provided to accept a "system ready" signal to ensure that the VFD does not start until dampers or other auxiliary equipment are in the proper state for VFD operation. The run permissive circuit shall also be capable of initiating an output "run request" signal to indicate to the external equipment that the VFD has received a request to run.
18) VFD shall be programmable to display feedback signals in appropriate units, such as inches of water column (in-wg), pressure per square inch (psi) or temperature (°f).

19) VFD shall be programmable to sense the loss of load and signal this condition via a keypad warning, relay output and/or over the serial communications bus. To ensure against nuisance indications, this feature must be based on motor torque, not current, and must include a proof timer to keep brief periods of no load from falsely triggering this indication.

17. Standard Control and Monitoring Inputs And Outputs
    a. Six dedicated, programmable digital inputs shall be provided for interfacing with the systems control and safety interlock circuitry.
        1) Two terminals shall be programmable to act as either as digital outputs or additional digital inputs.
        2) Two programmable relay outputs, Form C 240 V AC, 2 A, shall be provided for remote indication of VFD status.
        3) Each relay shall have an adjustable on delay / off delay time.
        4) Two programmable analog inputs shall be provided that can be either direct-or-reverse acting.
        5) Each shall be independently selectable to be used with either an analog voltage or current signal.
        6) The maximum and minimum range of each shall be able to be independently scalable from 0 to 10 V dc and 0 to 20 mA.
        7) A programmable low-pass filter for either or both of the analog inputs must be included to compensate for noise.
        8) The VFD shall provide front panel meter displays programmable to show the value of each analog input signal for system set-up and troubleshooting,
        9) One programmable analog current output (0/4 to 20 mA) shall be provided for indication of VFD status. This output shall be programmable to show the reference or feedback signal supplied to the VFD and for VFD output frequency, current and power. It shall be possible to scale the minimum and maximum values of this output.
        10) It shall be possible through serial bus communications to read the status of all analog and digital inputs of the VFD.
        11) It shall be possible to command all digital and analog output through the serial communication bus.
18. A real-time clock shall be an integral part of the VFD.
    a. It shall be possible to use this to display the current date and time on the VFD's display.
        1) Ten programmable time periods, with individually selectable ON and OFF functions shall be available. The clock shall also be programmable to control start/stop functions, constant speeds, PID parameter set points and output relays. Is shall be possible to program unique events that occur only during normal work days, others that occur only on non-work days, and others that occur on specific days or dates. The manufacturer shall provide free PC-based software to set up the calendar for this schedule.
        2) All VFD faults shall be time stamped to aid troubleshooting.
        3) It shall be possible to program maintenance reminders based on date and time, VFD running hours, or VFD operating hours.
        4) The real-time clock shall be able to time and date stamp all faults recorded in the VFD fault log.
19. The VFD shall be able to store load profile data to assist in analyzing the system demand and energy consumption over time.

20. The VFD shall include a sequential logic controller to provide advanced control interface capabilities. This shall include:
    a. Comparators for comparing VFD analog values to programmed trigger values
        1) Logic operators to combine up to three logic expressions using Boolean algebra
        2) Delay timers
        3) A 20-step programmable structure
21. The VFD shall include a cascade controller which allows the VFD to operate in closed loop set point (PID) control mode one motor at a controlled speed and control the operation of 3 additional constant speed motor starters.
22. Serial communications
    a. The VFD shall include a standard eia-485 communications port and capabilities to be connected to the following serial communication protocols at no additional cost and without a need to install any additional hardware or software in the VFD:
        1) Johnson Controls Metasys N2
        2) Modbus RTU
        3) Siemens FLN
        4) BACnet MS/TP
        5) Optional communication shall include:
            a) LonWorks Free Topology (FTP)
            b) VFD shall have standard rs-485 port for direct connection of personal computer (pc) to the VFD. The manufacturer shall provide no-charge pc software to allow complete setup and access of the VFD and logs of VFD operation through the rs-485 port. It shall be possible to communicate to the VFD through this usb port without interrupting VFD communications to the building management system.
            c) The VFD shall have provisions for an optional 24 v DC back-up power interface to power the VFD's control card. This is to allow the VFD to continue to communicate to the building automation system even if power to the VFD is lost.
23. Adjustments
    a. The VFD shall have a manually adjustable carrier frequency that can be adjusted in 0.5 khz increments to allow the user to select the desired operating characteristics. The VFD shall also be programable to automatically reduce its carrier frequency to avoid tripping due to thermal loading.
        1) Four independent setups shall be provided.
        2) Four preset speeds per setup shall be provided for a total of 16.
        3) Each setup shall have two programmable ramp up and ramp down times. Acceleration and deceleration ramp times shall be adjustable over the range from 1 to 3,600 seconds.
        4) Each setup shall be programmable for a unique current limit value. If the output current from the VFD reaches this value, any further attempt to increase the current produced by the VFD will cause the VFD to reduce its output frequency to reduce the load on the VFD. If desired, it shall be possible to program a timer which will cause the VFD to trip off after a programmed time period.
        5) If the VFD trips on one of the following conditions, the VFD shall be programmable for automatic or manual reset: external interlock, under-voltage, over-voltage, current limit, over temperature, and VFD overload.

6) The number of restart attempts shall be selectable from 0 through 20 or infinitely and the time between attempts shall be adjustable from 0 through 600 seconds.
7) An automatic "start delay" may be selected from 0 to 120 seconds. During this delay time, the VFD shall be programmable to either apply no voltage to the motor or apply a DC braking current if desired.
8) Four programmable critical frequency lockout ranges to prevent the VFD from operating the load at a speed that causes vibration in the driven equipment shall be provided. Semi-automatic setting of lockout ranges shall simplify the set-up.

24. Optional features
    a. All optional features shall be built and mounted by VFD manufacturer. All optional features shall be UL listed by the VFD manufacturer as a complete assembly and carry a UL label.
        1) All panels shall be marked for their short circuit current rating in compliance with UL.
25. Service conditions
    a. Ambient temperature, continuous, full speed, full load operation:
        1) 10 to 45°C (14 to 113°F) through 125 hp @ 460 and 600 volt, through 60 hp @ 208 volt
        2) 10 to 40°C (14 to 104°F) 150 hp and larger
        3) 0 to 95% relative humidity, non-condensing.
        4) Elevation to 3,300 feet without derating.
        5) AC line voltage variation, -10 to +10% of nominal with full output.
        6) No side clearance shall be required for cooling.
        7) All power and control wiring shall be done from the bottom.
        8) All VFDs shall be plenum rated.

2.4 MOTORS

A. Except where more stringent requirements indicated in unit Specifications or equipment schedules, provide manufacturer's standard motor complying with following requirements.

B. Definite-Purpose Motors: Provide in accordance with NEMA MG 1-18.

C. General Purpose, Poly-Phase Motors 5 hp and Larger: Provide in accordance with NEC requirements.

D. Singe-Phase Motors: Unless otherwise indicated, for motor requirements less than 1/2 hp, provide single-phase motors conforming to following.
1. Type: Continuous duty, squirrel cage, induction, fractional horsepower motors, rated in accordance with NEMA MG1-10.33.
    a. 1/6 to 1/3 hp: Permanent-split capacitor with internal overload protection, NEMA N or O as determined appropriate for application by equipment manufacturer.
    b. 1/3 hp and Larger: 2-valve capacitor, NEMA L, M, N or O as determined appropriate for application by equipment manufacturer.
2. Enclosure Classification: Open, drip-proof machine, as defined in NEMA MG-1, unless otherwise indicated.
3. Insulation Class Rating:
    a. Fractional horsepower motors: Class A.
    b. Integral horsepower motors: Class B.

c. Definite purpose motors: Class A, B, F or H as determined appropriate for application by equipment manufacturer.

E. Poly-Phase Motors:
1. Type: Continuous duty, squirrel cage, induction, fractional and integral horsepower motors, rated in accordance with NEMA MG1-10.33.
a. 1/3 to 3 hp: NEMA B or C as determined appropriate for application by equipment manufacturer.
b. Where rated motor loads produce uncorrected motor power factors less than 0.90, provide capacitors for power factor correction to 0.95.
2. Enclosure Classification: Open, drip-proof machine, as defined in NEMA MG-1, unless otherwise indicated.
3. Insulation Class Rating: Suitable for continuous operation in 40°C environment, tested in accordance with IEEE 112 and 114.
a. Fractional horsepower motors: Class A.
b. Integral horsepower motors: Class B.
c. High starting torque motors: Class F.
d. Definite purpose motors: Class A, B, F or H as determined appropriate for application by equipment manufacturer.

F. Service Factor: Minimum 1.15 for NEMA A, B, and C poly-phase motors, in accordance with NEMA MG1-12.47 for fractional horsepower motors.

G. Bearings: Permanently lubricated ball or regreasable sleeve bearings with inner and outer shaft seals, designed to resist thrust loadings.

H. Efficiency: Provide high efficiency poly-phase motors in accordance with IEEE 112, Test Method B.

I. Variable Frequency Drive Applications: Provide special purpose, high efficiency motors specifically constructed for use with, and matched to, variable frequency drive. NEMA B, Class F insulation with non-wicking motor leads and copper windings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which HVAC pumps to be installed. Do not proceed with Work until unsatisfactory conditions corrected.

3.2 INSTALLATION OF PUMPS

A. Install HVAC pumps in accordance with manufacturer's written installation instructions, complying with recognized industry practices to ensure HVAC pumps comply with requirements and serve intended purposes.

B. Access: Provide access space around HVAC pumps for service as indicated, but in no case less than recommended by manufacturer.

C. Support:

1. On Grade/ Basement Concrete Floors: Install base-mounted pumps on minimum 4 in. high concrete base equal or greater than 3 times total weight of pump and motor with anchor bolts poured in-place. Set and level pump and grout under pump base with non-shrink grout.
2. In-line pumps: Support from piping system.

D. Electrical Wiring: Install electrical devices furnished by manufacturer but not specified to be factory-mounted.
1. Verify electrical wiring installation is in accordance with manufacturer's submittal and installation requirements of Division 26.

E. Piping Connections: Provide full line size isolation valve and strainer or suction diffuser on pump suction. Provide full line size check valve, balance valve, and flow measuring device on pump discharge.

F. Where pump connection size and indicated line size are not identical, provide concentric reducers for vertical and eccentric reducers for horizontal connections. Install eccentric reducers with top of pipe level.

3.3 ADJUSTING AND CLEANING

A. Alignment: Check alignment and, where necessary, realign shafts of motors and pumps within misalignment tolerances recommended by manufacturer, but not exceeding 0.004 in. in axial and angular planes. Align in presence of manufacturer's service representative.

B. Startup: Lubricate pumps before startup. Startup in accordance with manufacturer's instructions.

C. Refer to Section 23 0593 for pump system balancing.

D. Cleaning: Clean factory-finished surfaces. Repair marred or scratched surfaces with manufacturer's touch-up paint.

3.4 DEMONSTRATION

A. The control package manufacturer's factory trained representative shall provide start-up of the packaged pumping system. This start-up shall include verification of proper installation, system initiation, adjustment and fine tuning. Start-up shall not be considered complete until the sequence of operation, including all alarms, has been sufficiently demonstrated to the Owner or Owner's designated representative. This jobsite visit shall occur only after all hook-ups, tie-ins, and terminations have been completed and signed-off on the manufacturer's start-up request form.

B. The pump control package manufacturer's factory trained representative shall provide on-site training for owner's personnel. This training shall fully cover maintenance and operation of all system components.

END OF SECTION 23 2123

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 23 3010

AIR DISTRIBUTION SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
1. Metal ductwork.
2. Equipment housings.
3. Control dampers.
4. Manual dampers.
5. Fire Dampers
6. Turning vanes.
7. Duct hardware.
8. Duct access doors.
9. Flexible connections.
10. Registers and grilles.
11. Louvers.

1.2 DEFINITIONS

A. Low Pressure Ductwork: Ductwork subjected to velocities of 2,500 fpm or less, or operating pressures of 2 in. or less, positive or negative.

1.3 SUBMITTALS

A. Schedule below identifies information required for each item of material or equipment.

Description	Submittal Information Item
Metal ductwork	1
Control dampers	1,2
Fire dampers	1
Turning vanes	1
Duct hardware	1
Duct access doors	1
Flexible connections	1
Registers and grilles	1,2
Louvers	1,2

B. Submittal Information:
1. Product Data: Manufacturer's specifications for equipment showing dimensions, weights, capacities, ratings, performance characteristics, gauges, color and finish of materials, and installation instructions.
2. Shop and Assembly Drawings: Show unit dimensions, construction details, and field connection details.

C. Submit in accordance with Section 01 3300.

1.4 QUALITY ASSURANCE

A. Installer's Qualifications: Firm with at least 3 years of successful installation experience on projects with nonmetallic ductwork systems similar to that required for Project.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect shop-fabricated and factory-purchased ductwork, accessories, and purchased products from damage during shipping, storage, and handling. Prevent end damage and dirt and moisture from entering ducts and fittings.

B. Where possible, store ductwork inside and protect from weather. Where necessary to store outside, store above grade and enclose with waterproof wrapping.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturer's equipment used as basis of design for Project is name indicated in schedule. Where schedule not provided, basis of design is name indicated in Specification for particular type of equipment or application contained in these Contract Documents. If no manufacturer listed, basis of design is industry standard indicated.

2.2 METAL DUCTWORK

A. Provide metal ductwork as noted on the drawings and as specified below:
   1. Sheet Metal: Comply with ASTM A527, lock-forming quality, with ASTM A525, G90 zinc-coating; mill phosphatized for exposed locations.
   2. Aluminum Sheet: Comply with ASTM B209, Alloy 3003, Temper H14.
   3. Stainless Steel Sheet: Comply with ASTM A167, ANSI type 316 with No. 2B finish.
   4. Duct Sealant: Non-hardening, non-migrating mastic or liquid elastic sealant (type applicable for fabrication/installation detail) as compounded and recommended by manufacturer specifically for sealing joints and seams in ductwork.
   5. Duct Cement: Non-hardening migrating mastic or liquid neoprene based cement (type applicable for fabrication/installation detail) as compounded and recommended by manufacturer specifically for cementing fitting components, or longitudinal seams in ductwork.
   6. Ductwork Support Materials:
      a. For galvanized steel ductwork, provide hot-dipped galvanized steel fasteners, anchors, rods, trim and angles for support of ductwork.
      b. For aluminum ductwork, provide aluminum support materials except where materials electrolytic ally separated from ductwork.
      c. Provide matching stainless steel support materials for exposed stainless steel ductwork.

B. Shop or Factory Fabrication:
   1. Fabricate shop or manufactured duct fittings to match adjoining ducts and to comply with duct requirements as applicable to fittings. Fabricate mitered fittings to include turning vanes unless noted without turning vanes.
   2. Fabricate ductwork of gauges and reinforcement complying with SMACNA "Low Pressure Duct Standards for 2.0 in. wg Pressure Class." unless otherwise indicated.

3. Ductwork shall be sealed at all joints/ connections, both transverse and longitudinal seams complying with IMC and IECC sealing requirements. All ductwork shall be sealed using Class B seal.
4. Fabricate ductwork with accessories installed during fabrication to greatest extent possible.
5. Fabricate fan housings and air plenums with minimum 16 gauge thickness of materials specified.

C. Application:
1. Provide galvanized steel ductwork for:
   a. Outside air intake and exhaust.
   b. Intake/exhaust air plenums.
   c. Fan housings.
   d. Dual temperature ductwork located inside Membrane Room and Electrical Room.
2. Provide aluminum ductwork for:
   a. Toilet Room exhaust.
3. Provide stainless steel ductwork for:
   a. Rectangular exhaust/outside air intakes located inside Chemical Rooms.
4. Provide PVC ductwork for:
   a. Chemical Room exhaust; See Section 23 3116 – Non-metallic Ductwork.

2.3 MOTOR OPERATED CONTROL DAMPERS – RECTANGULAR, LOW LEAKAGE, HIGH PERFORMANCE

A. Manufacturers:
1. Ruskin Manufacturing.
2. Arrow United Industries.
3. Louver and Dampers; A Mastek Company.
4. Or equal.

B. Motor Operated Dampers: Provide low leakage, high performance dampers. Dampers to be constructed of materials listed below. Provide dampers of similar or matching materials as adjoining ductwork, or as indicated on drawings.
1. Model CD30VG1:
   a. Frame: 3-in. x 1-in. x 12 gage stainless steel U channel. Provide mounting flanges on both sides of frame.
   b. Blades: 16 gage 304 stainless steel triple-V groove, 8-in wide.
   c. Seals: EPDM blade seals. Blade seals shall be mechanically fastened to the blade. Leakage shall not exceed 4.3 CFM per square foot at 1-in. SP.
   d. Bearings: Stainless steel pressed into frame.
   e. Linkage: Stainless steel face linkage in airstream.
   f. Axles: 1/2-in. diameter 304 stainless steel.
   g. Operator: Stainless steel mounting plate for operator and stainless steel mounting hardware.
   h. Blade operation: Opposable blade for modulating control, Parallel blade for 2 position dampers.
   i. Operating Temperature Range: -76°F to 250°F.

2.4 VOLUME DAMPERS – ROUND, PVC

A. Manufacturers:
   1. Harvel Plastics, Inc. - Easton, PA.
   2. Harrison Machine and Plastic Corporation - Garrettsville, OH.
   3. Viron International Corporation - Owosso, MI.
   4. Or equal.

B. Provide butter fly balancing dampers of size indicated on Drawings, constructed of all PVC, ASTM D - 1784. Butterfly balancing dampers shall be provided with locking quadrant to permanently position damper blade.

2.5 FIRE DAMPERS

A. Manufacturers:
   1. Ruskin Manufacturing.
   2. Or equal.

B. Fabricated Fire Dampers: Provide dampers constructed in accordance with SMACNA "Fire Damper and Heat Stop Guide" and UL listed.

C. Fire Dampers: Provide curtain type dynamic fire dampers of sizes and ratings indicated on drawings. Fire dampers can be installed either vertically in walls or horizontally in masonry floors. Provide fire dampers of similar or matching materials as adjoining ductwork, or as indicated on drawings.

D. Model DIBD2 or DIBD2SS Style A.
   1. Rating: 1-1/2 hour.
   2. Frame and Blade: Galvanized Steel or Stainless Steel.
   3. Closure Spring: 301 stainless steel constant force or spring clip type.
   4. Fusible link: 165ºF closure temperature.
   5. Provide factory sleeve to meet UL installation requirements.
   6. Provide G Style for grille mounting applications as indicated on drawings.

E. Provide duct access door at each fire damper location.

2.6 TURNING VANES

A. Manufacturers:
   1. Aero Dyne Company.
   2. Duro Dyne Corporation.
   3. Or equal.

B. Manufactured Turning Vanes: Provide turning vanes constructed of 1-1/2 in. wide curved blades set at 3/4 in. on center, supported with bars perpendicular to blades set at 2 in. on center, and set into side strips suitable for mounting in ductwork. Material to match ductwork.

2.7 DUCT HARDWARE

A. Manufacturers:
   1. Ventfabrics, Inc.

2. Young Regulator Company.
3. Duro Dyne Corporation.
4. Or equal.

B. Test Holes: Provide in ductwork at fan inlet, outlet, and elsewhere as indicated, duct test holes consisting of slot and cover for instrument tests.

C. Quadrant Locks: Provide for each manual damper, quadrant lock device on one end of shaft and end bearing plate on other end for damper lengths over 12 in. Provide extended quadrant locks and end extended bearing plates for externally insulated ductwork.

2.8 DUCT ACCESS DOORS

A. Manufacturers:
1. Ruskin Manufacturing Company.
2. Duro Dyne Corporation.
3. Ventfabrics, Inc.
4. Or equal.

B. Construction: Construct of same or greater gauge as ductwork served, provide insulated doors for insulated ductwork. Provide flush frames for uninsulated ductwork, extended frames for externally insulated duct. Provide one side hinged, other side with 1 handle type latch for doors 12 in. high and smaller, 2 handle type latches for larger doors.

2.9 FLEXIBLE CONNECTIONS

A. Manufacturers:
1. Duro Dyne Corporation.
2. Ventfabrics, Inc.
3. Or equal.

B. Provide flexible duct connections wherever ductwork connects to vibration isolated equipment. Construct flexible connections of neoprene-coated flameproof fabric crimped into duct flanges for attachment to duct and equipment. Make airtight joint. Provide adequate joint flexibility to allow for thermal, axial, transverse, and torsional movement, and also capable of absorbing vibrations of connected equipment.

2.10 REGISTERS AND GRILLES

A. Manufacturers:
1. Titus Products, Division of Philips Industries, Inc.
2. C.G. Carnes Company, Division of Wehr Corporation.
3. Or equal.

B. Provide manufacturer's standard wall registers and grilles where shown of size, shape, capacity, and type indicated constructed of materials and components as scheduled and required for complete installation.

C. Performance: Provide wall registers and grilles having, as minimum, temperature and velocity traverses, air throw, pressure drop, and noise criteria ratings for each size device listed in manufacturer's current data.

D. Register and Grille Materials:
   1. Steel Construction: Manufacturer's standard steel frames and blades.
   2. Aluminum Construction: Manufacturer's standard extruded aluminum frames and blades.
   3. Stainless Steel Construction: Manufactures standard stainless steel frame and blades.

E. Register and Grille Faces: Provide fixed, single deflection, or double deflection blades as scheduled.

F. Register and Grille Mountings: Perimeter framed register or grille suitable for T-bar lay-in mounting or surface mounting as scheduled.

G. Dampers: Provide aluminum opposed blade dampers as scheduled.

H. Register and Grille Finishes: Provide manufacturers standard, baked white enamel finish, unless specified otherwise.

2.11 LOUVERS

A. Manufacturers:
   1. Ruskin Manufacturing Company.
   2. Greenheck Company.
   3. Industrial Louvers, Inc.
   4. Louvers and Dampers; A Mastek Company.
   5. Or equal.

B. Except as otherwise indicated, provide manufacturer's standard louvers where shown of size, shape, capacity, and performance equal to Ruskin Model ELF6375DX. Construct of materials and components as indicated and required for complete installation.

C. Performance: Provide weatherproof louver with performance characteristics as scheduled.

D. Louver Depth: 6-in.

E. Substrate Compatibility: Provide louvers with frame and sill styles that are compatible with adjacent substrate and specifically manufactured to fit into construction openings with accurate fit and adequate support for weatherproof installation. Refer to Drawings and Specifications for types of substrate which will contain each type of louver.
   1. Provide extended sill as scheduled.

F. Materials: Construct of aluminum extrusions, ASTM B221, Alloy 6063-T52. All welded construction.

G. Louver Screens: On inside face of exterior louvers, provide 1/2 in. sq. mesh anodized aluminum wire bird screens mounted in removable extruded aluminum frames.

H. Finish: Provide louvers with Ruskin’s superior finish FLUROPON, 70% PVDF paint finish, carbon/ fluorine bond, manufacturer 20-year warranty. All standard colors meet or exceed AAMA 2605-11. Louver color shall be selected by OWNER.

PART 3 - EXECUTION

3.1 GENERAL

A. Coordinate layout with suspended ceiling and lighting layouts and similar finished Work.

B. Coordinate duct installations with installation of accessories, dampers, coil frames, equipment, controls, and other associated items of ductwork system.

3.2 INSTALLATION OF DUCTWORK AND EQUIPMENT SLEEVES

A. Locate ductwork runs, except as otherwise indicated, vertically and horizontally, avoid diagonal runs wherever possible. Locate runs as indicated by diagrams, run ductwork in shortest route not obstructing usable space or block access for servicing building and equipment. Install close to walls, overhead construction, and other structural and permanent enclosure elements of building.

B. Complete fabrication of Work at Project necessary to match shop-fabricated work and accommodate installation requirements.

C. Install each run with minimum of joints. Align ductwork accurately at connections, within 1/8 in. misalignment tolerance and with internal surfaces smooth.

D. Support ductwork with suitable ties, braces, hangers, and anchors of type holding ducts true to shape and preventing buckling. Comply with SMACNA "HVAC Duct Construction Standards". Ductwork hangars shall be two rod trapeze type incorporating a structural or bent metal angle. Strap type hangers are not allowed.

E. Assemble, install, and seal ductwork in accordance with recognized industry practices to achieve airtight (less than 5% leakage) and noiseless (no objectionable noise) systems, capable of performing each indicated service.

3.3 INSTALLATION OF DUCTWORK ACCESSORIES

A. Install ductwork accessories in accordance with manufacturer's installation instructions, with applicable portions of details of construction shown in SMACNA standards, and in accordance with recognized industry practices to ensure products serve intended function.

B. Install turning vanes in all square and rectangular 90° elbows.

C. Install access doors to open against system air pressure. Install access doors at each automatic control damper and at both side of fire dampers.

D. Install motor operated dampers within or as close as possible to building envelope elements including roof decks and exterior walls.

3.4 CLEANING AND PROTECTION

A. Clean ductwork internally, unit by unit as installed, of dust and debris. Clean external surfaces of foreign substances.

B. Temporary Closure: At ends of ducts not connected to equipment or air distribution devices at time of ductwork installation, provide temporary closure of polyethylene film or other covering to prevent entrance of dust and debris until time connections are completed.

END OF SECTION 23 3010

SECTION 23 3116

NON-METALLIC DUCTWORK

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. PVC Ductwork.

1.2 DEFINITIONS

A. Low Pressure Ductwork: Ductwork subjected to velocities of 2,500 fpm or less, or operating pressures of 2 in. or less, positive or negative.

B. High Pressure Ductwork: Ductwork subjected to velocities of 2,500 to 4,000 fpm, or operating pressures of 2 in. or greater, positive or negative.

1.3 SUBMITTALS

A. Product Data:
   1. Manufacturer's specifications for duct system materials showing dimensions, thicknesses, weights, materials of construction, corrosion resistance characteristics, and method of construction.

B. Record Drawings: At Project closeout, submit record drawings of installed ductwork, duct accessories, and outlets and inlets in accordance with Section 01 7700.

C. Submit in accordance with Section 01 3300.

1.4 QUALITY ASSURANCE

A. Installer's Qualifications: Firm with at least 3 yrs successful installation experience on projects with nonmetallic ductwork systems similar to that required for Project.

B. Regulatory Requirements:
   1. SMACNA Standards: Comply with SMACNA - "Fibrous Glass Duct Construction Standards - 2003" and SMACNA - "Thermoplastic Duct Construction Manual - 1997" for fabrication and installation of thermoplastic ductwork.
      a. Have available at CONTRACTOR'S field office, copy of SMACNA - "Fibrous Glass Duct Construction Standards" and SMACNA - "Thermoplastic Duct Construction Manual".
   2. ASHRAE Standards: Comply with ASHRAE Handbook and Product Directory, 2008 HVAC Systems and 1983 Equipment Volume, Chapter 18, "Duct Construction," for fabrication and installation of nonmetallic ductwork.
   3. NFPA Compliance: Comply with NFPA Nos. 90A, 90B, and 91.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect shop-fabricated and factory-purchased ductwork, accessories, and purchased products from damage during shipping, storage, and handling. Prevent end damage and prevent dirt and moisture from entering ducts and fittings.

B. Where possible, store ductwork inside and protect from weather. Where necessary to store outside, store above grade and enclose with waterproof wrapping.

PART 2 - PRODUCTS

2.1 THERMOPLASTIC DUCT MATERIALS

A. Provide factory fabricated materials, free from visual imperfections including dents, cracks, discolorations or other imperfections.

B. Thermoplastic Sheet: Stress relieved ASTM D1784, Class 12454B (formerly Type 1, Grade 1).

C. Thermoplastic Round Duct:
   1. 20 in. diameter and Smaller: Seamless, extended ASTM D1784, Class 12454B (formerly Type 1, Grade 1).
   2. Larger than 20 in. diameter: Longitudinal seam, hot gas welded ASTM D1781, Class 12454B (formerly Type 1, Grade 1), bell and spigot joint.
   3. Strap Hangers: Minimum support spacing in accordance with Table 15843-1, 180° contact.
   4. Flanges: Thickness, bolt pattern in accordance with Table 1.
   5. Sealer: Non-hardening, non-migrating silicon based of type recommended by duct manufacturer for application.
   6. Gaskets: Minimum 0.125 in. thickness, non-hardening, chemically resistant, suitable for intended purpose.

2.2 THERMOPLASTIC DUCTWORK FABRICATION

A. Provide miscellaneous materials and products of types and sizes indicated, and where not otherwise indicated, provide type and size required to comply with ductwork system requirements, including proper connection of ductwork and equipment furnished under other sections.

B. Shop-fabricate ductwork in accordance with SMACNA - “Thermoplastic Duct Construction Manual”.

C. Fabricate duct fittings to match adjoining ducts and to comply with duct requirements as applicable to fittings. Except as otherwise indicated, fabricate elbows with centerline radius equal to 1.5 times duct width in plane of elbow. Limit includes angular taper to 45^{o} for contracting tapers and 30^{o} for expanding tapers.

D. Provide flanged connections for equipment mounted in thermoplastic ductwork for ease of removal and where joining to dissimilar materials. Join flanges with elastomeric gasket material, non-corrosive fasteners and seal to provide airtight, moisture tight joint.

E. Fabricate round ductwork in accordance with Table 1 to this section.

F. Fabricate and reinforce rectangular ductwork for pressure glass indicated on Drawings in accordance with SMACNA - “Thermoplastic Duct Construction Manual”.

2.3 THERMOPLASTIC DUCTWORK APPLICATION

A. Provide thermoplastic ductwork for exhaust fan systems from point of collection to building exit for the following areas:
   1. R107 - Corrosion Inhibitor
   2. R108 - Sodium Hydroxide
   3. R109 - Sodium Bisulfite
   4. R110 - Antiscalant

B. Do not use thermoplastic ductwork in following applications.
   1. Outdoors.
   2. Where velocities or pressures exceed manufacturer's published limitations.

PART 3 - EXECUTION

3.1 INSTALLATION OF DUCTWORK

A. Assemble and install ductwork in accordance with recognized industry practices to achieve airtight (less than 5% leakage) and noiseless (no objectionable noise) systems, capable of performing each indicated service. Install each run with minimum of joints. Align ductwork accurately at connections, within 1/8 in. misalignment tolerance and with internal surfaces smooth. Support ducts rigidly with suitable ties, braces, hangers, and anchors of type holding ducts true to shape and preventing buckling.

B. Pressure Class: Construct fibrous ductwork of SMACNA pressure class indicated on Drawings, or if not indicated, in accordance with following.
   1. Low Pressure Duct Systems:
      a. Constant volume supply, return, exhaust systems, and air transfer ductwork not employing air terminal devices with fan static pressures not greater than 2 in. wg and velocities not greater than 2,500 fpm. Construction to pressure classification equal to or greater than rated pressure of system fan.
      b. Variable volume supply and return systems with velocities not greater than 2,500 fpm.
         1) Downstream of supply air terminal devices: 1 in. wg class.
         2) Return air ductwork upstream of return fan: 1 in. wg class.
   2. High Pressure Duct Systems:
      a. Constant volume or variable volume distribution supply, return ductwork between fan, and air terminal devices less than 4,000 fpm of velocity. Construct to pressure class equal to stall static pressure of fan at manufacturer's rated fan speed for indicated capacity if fan stall pressure does not exceed 3 in. wg. If fan stall pressure exceeds 3 in. wg, use metallic ductwork.
      b. Constant volume supply and return system ductwork with fan static pressure exceeding 2 in. wg or velocities exceeding 2,500 fpm. Construct entire system to minimum pressure class equal to or greater than highest total pressure of air in duct system.

C. Seal ductwork, after installation, to seal class recommended and method prescribed in SMACNA.
   1. "Thermoplastic Duct Construction Manual."

D. Install concrete inserts for support of ductwork in coordination with formwork to avoid delays in Work.

E. Complete fabrication of Work at Project necessary to match shop-fabricated Work and accommodate installation requirements.

F. Locate ductwork runs, except as otherwise indicated, vertically and horizontally, avoid diagonal runs wherever possible. Locate runs as indicated by diagrams, run ductwork in shortest route which does not obstruct usable space or block access for servicing building and its equipment. Hold close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building. Limit clearance to 1/2 in. where furring shown for enclosure or concealment of ducts, but allow for insulation thickness, if any. Where possible, locate insulated ductwork for 1 in. clearance outside of insulation. Wherever possible in finished and occupied spaces, conceal ductwork from view, by locating in mechanical shafts, hollow wall construction or above suspended ceilings. Do not encase horizontal runs in solid partitions, except as specifically shown.

G. Coordinate layout with suspended ceiling and lighting layouts and similar finished Work.

H. Electrical Equipment Space: Do not run ductwork through transformer vaults and their electrical equipment spaces and enclosures.

I. Where ducts pass through interior partitions and exterior walls, conceal space between construction opening and duct with sheet metal flanges. Overlap opening on 4 sides by at least 1-1/2 in.

J. Coordinate duct installations with installation of accessories, dampers, coil frames, equipment, controls, and other associated with ductwork system.

K. Support ductwork in manner complying with SMACNA.
   1. SMACNA - “Thermoplastic Duct Construction Manual”
   2. Support PVC ductwork from strap hangers with minimum 180° contact of duct surface in accordance with NBS PS 15-69.

L. Provide frames constructed of angles, channels or flanges for coils, filters, dampers or other devices installed in duct systems and make final connections to items furnished under other systems. Secure frames with gaskets, nuts, bolts, and washers.

3.2 CLEANING AND PROTECTION

A. Clean ductwork internally, unit by unit as installed, of dust and debris. Clean external surfaces of foreign substances where ductwork is to be painted, which might interfere with painting or cause paint deterioration.

B. Temporary Closure: At ends of ducts not connected to equipment or air distribution devices at time of ductwork installation, provide temporary closure of polyethylene film or other covering to prevent entrance of dust and debris until connections complete.

3.3 FIELD QUALITY CONTROL

A. Balancing:
   1. Conform to Section 23 0593 for air distribution balancing.
   2. Seal leaks in ductwork that become apparent in balancing process.

B. Leakage Testing: Fibrous glass ductboard systems.
   1. After each duct system complete, test for duct leakage in accordance with Section 23 0593.

2. Repair leaks and repeat tests until total leakage less than 5% of system air flow.

C. Leakage Testing: Thermoplastic duct systems.
1. After each duct system completed, test for duct leakage in accordance with Section 23 0593.
2. Repair leaks and repeat tests until total leakage less than 1% of system air flow.
   a. Repair leaks in thermoplastic materials by fusion with thermoplastic filler materials.
   b. Repair leaks in FRP materials by hand lay-up method.
   c. Repair leaks between dissimilar materials with non-hardening sealer. Provide thermoplastic filler material when opening to be sealed exceeds thickness of duct material used.

TABLE 1 to Section 23 3116
MINIMUM POLY VINYL CHLORIDE (PVC)

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 23 3400

FANS AND ACCESSORIES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
1. Centrifugal ceiling exhausters.
2. Commercial ceiling fans.
3. Polypropylene utility blowers.
4. Variable frequency drives.

B. Refer to Division 26 for following; not Work of this section.
1. Power supply wiring from power source to power connection on fan motor. Include starters, disconnects, and required electrical devices, except where specified as furnished or factory-installed, by manufacturer.

C. Provide following electrical work as Work of this Section, complying with requirements of Division 26.
1. Interlock control wiring between fan units and field-installed control elements, indicating devices, and unit control panels.

1.2 SUBMITTALS

A. Schedule below identifies information required for each item of material or equipment.

Unit Type	Submittal Information Item
Centrifugal ceiling exhaust fans	1,2,3,4,5,6
Commercial ceiling fans	1,2,3,4,5,6
Polypropylene utility blowers	1,2,3,4,5,6
Variable frequency drives	1,2,3,4,5,6

B. Submittal information:
1. Product Data: Submit manufacturer's technical data for fans, including specifications, capacity ratings, certified sound power data, dimensions, weights, materials, accessories furnished, and installation instructions. Submit fan performance curves with operating point clearly indicated.
2. Shop Drawings: Submit assembly type drawings showing fan dimensions, required clearances, construction details, assembly of component methods, and field connection details.
3. Shop Drawings, Wiring Diagrams: Manufacturer's electrical requirements for power supply wiring to fans.
4. Shop Drawings, Wiring Diagrams: Manufacturer's ladder type for interlock and control wiring. Differentiate between portions of wiring factory-installed and portions to be field-installed.
5. Motors: For poly-phase motors 5 hp and larger, submit in accordance with Section 26 2000. For single-phase, definite purpose, special purpose and general purpose poly-phase motors less than 5 hp, submit NEMA design types, construction, insulation class, NEMA frame size,

horsepower, voltage and amp draw characteristics, and service factor for each common application.

6. Operating and Maintenance (O&M) Data:
   a. Maintenance instructions including lubrication instructions, filter replacement, motor and drive replacement, troubleshooting guide and spare parts lists.

C. Submit in accordance with Section 01 3300.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of fans of types and sizes required, whose products have been in satisfactory use in similar service for not less than 3 yrs.

B. Regulatory Requirements:
   1. AMCA Compliance: Provide power ventilators which have been tested and rated in accordance with AMCA standards, and bear AMCA Certified Ratings Seal.
   2. UL Compliance: Provide power ventilators UL listed and having UL label affixed.
   3. NEMA Compliance: Provide motors and electrical accessories complying with NEMA standards.

1.4 MAINTENANCE

A. Spare Parts:
   1. Furnish 1 spare set of belts for each belt driven fan provided.

PART 2 - PRODUCTS

2.1 CENTRIFUGAL CEILING EXHAUSTERS

A. Manufacturer's:
   1. Greenheck Fan Corporation.
   2. Cook (Loren) Company.
   3. Broan Manufacturing Company, Inc.
   4. PennBarry Company.
   5. Or equal.

B. Provide fan with AMCA certified ratings seal.

C. Type: Galvanized steel housing lined with acoustical insulation, adaptable for ceiling or wall installation. Centrifugal fan wheels mounted on motor shaft with fan shrouds, removable for service. Provide integral back draft damper at fan discharge.

D. Grille: Aluminum louvered grille with flange on intake with thumbscrew attachment to fan housing, white enamel finish.

E. Motor: Definite purpose, open drip-proof, permanently lubricated scintered bronze bushings with grounded cord and plug.

F. Electrical: Junction box for electrical connection on housing, and receptacle for motor plug-in.
   1. Furnish remote fan speed control, solid state, capable of controlling fan speed from full speed to approximately half speed.

G. Accessories: Provide following accessories as indicated and as scheduled.
   1. Motor with thermal overload.
   2. UL/cUL 507 listed – Electric Fan.
   3. Polypropylene wheel.
   4. Hooded wall cap.
   5. Round duct connection.
   6. Isolation kit.

2.2 COMMERCIAL GRADE AXIAL CIRCULATION FANS

A. Manufacturers:
   1. Northwest Envirofan Corporation.
   2. Or equal.

B. Provide factory fabricated circulation fans of size indicated with capacities and accessories as detailed, scheduled or specified.

C. Fan Units Construction: Factory assembled and tested consisting of cast iron motor housing, fan motor/ drive, 10 in. down rod with 3/4 in. diameter, aluminum curved 56 in. fan blades, manufacturer furnished support bracket, 13 in. secondary support safety cable, manufacturer's standard superior corrosion resistant finish.

D. Electrical: Unit to be provided with 16 in. 120 volt power cord with three prong plug.

E. Controls:
   1. Equipped with on/off/variable speed controller with reversing switch. See equipment schedule for multiple-fan operation requirements.

2.3 POLYPROPYLENE UTILITY BLOWERS

A. Manufacturer's:
   1. Plastec Ventilation, Inc.
   2. Industrial Plastic Fan.
   3. Or equal.

B. Provide factory fabricated polypropylene exhaust utility blowers of size indicated with capacities and accessories as detailed, scheduled or specified.

C. Construction: Housing shall be constructed of a single molded piece; strong high-density UV treated polypropylene for maximum corrosion resistance. Housing shall be reversible and rotatable to the discharge position shown on drawings.

D. Impeller/Wheel: Impeller/ Wheels shall be of forward-curved type and constructed of uniformly molded polypropylene blades and shall be electronically and dynamically balanced. Blower impeller/ wheel shall be supplied with a motor shaft bushing and hubcap constructed from polypropylene to protect shaft end.

E. Motor Support: Provide polypropylene or grey powder coated cast aluminum motor support for complete motor protection shall be provided as specified or as scheduled.

F. Motors: Motors shall be direct drive and of heavy-duty ball bearing type for continuous duty with voltage as scheduled. Motors shall be totally enclosed fan cooled (TEFC). Motors shall be UL and CSA approved.
   1. Provide high efficiency motor, inverter duty rated.

G. Performance: Fan performance shall be based on tests conducted in accordance with AMCA 210-85 and shall meet scheduled fan performance as scheduled.

H. Warranty: Provide two year manufacturer warranty including defects in material and workmanship from date of original shipment.

I. Accessories:
   1. 316 stainless steel metal stand.
   2. 316 stainless steel mounting brackets, wall mounted, shop fabricated by contractor.
   3. Nema-4X disconnect switch.
   4. PVC back draft damper.
   5. PVC volume damper.
   6. Variable Frequency Drive w/ Nema-4X enclosure.

2.4 Variable frequency Drives

A. Variable Frequency Drives: Variable frequency drives for the ¾ and 1/3 HP fans associated with fans(s) EF-1, EF-2, EF-3 and EF-4 are to be supplied by ABB, AC Tech, Cutler Hammer, Yaskawa, or Toshiba and HVAC / drive control wiring interface to be provided by approved System Integrators / Contractors (OnDrive Inc., HTS, EFI, Toshont Power Products or approved equivalent). Refer to HVAC control drawings and electrical drawings (where applicable) for functional description of HVAC / drive control wiring interface as basis for providing panel integrator drawings forming part of shop drawing submission. Provide approved VFDs with horsepower ratings to match the fan motors as indicated on the drawing schedules and complete with features and characteristics as follows:
   1. Suitable for 480 volt, 3-phase power supply with available fault level of 20,000 amperes and voltage variation of +15 percent and –10 percent.
   2. All VFDs of 25 HP and lower shall be supplied complete with Hammond RM Series or MTE three phase input line reactors or approved equivalent, required to provide line transient voltage protection. A minimum of 5 percent is required.
   3. All VFDs of 30 HP and above shall be equipped with MIRUS International Inc. LINEATOR™ Universal Harmonic Filter (UHF), MTE Matrix Filter or approved equivalent to reduce total harmonic current and voltage distortion to the limits specified by Standard IEEE 519 1992 at the input terminals of the harmonic filters. Input line reactors are not acceptable. A single Lineator is acceptable for both the supply and return fans.
   4. The VFD shall be of the fully digital pulse width modulated (PWM) type utilizing insulated gate bipolar transistors (IGBTs) in the inverter section of the VFD. The VFD shall accept AC line voltage variation of +10 percent to -15 percent. No transformers shall be used on either the input or output of the VFD.
   5. Displacement Power Factor: 0.98 over entire range of operating speed and load.
   6. Minimum Efficiency: 96 percent.
   7. Overload Capacity: 120 percent for Variable Torque Application and 150 percent for 1 minute for Constant Torque Applications.
   8. All drive parameters (set up, operating and adjustment settings) to be entered via keypad, without tools. Three adjustable setpoints to lock out continuous operation at frequencies which may produce mechanical resonance. Drive to be capable of determining the speed and

direction of a spinning motor and adjusting its output to "pick-up" the motor at the rotating speed. The flying start feature is to be operable with, or without, encoder feedback.

9. Provide NEMA 4X wall mounted enclosure for indoor applications located in Process and Basement Areas suitable for rack mounting, designed to provide electromagnetic shielding. Provide a Hand-Off-Auto switch on face of panel for control of VFD's as per HVAC control drawings.
10. NEMA 12 or Open (Protected) Chassis VFD with keypad/display installed through the door of the VFD panel enclosure (accessible on outside face of door).
11. Provide incoming, horsepower rated, disconnect switch with an operating mechanism.
12. Provide input line fuses coordinated with the VFDs electronic protection circuits so as not to blow under normal output faults such as overcurrent, short circuit and ground fault.
13. Provide output line reactors if the distance between the VFD and motor is greater than 160 feet.
14. Three contactor type by-pass arrangement and overloads to permit fan operation if VFD is faulty, with by-pass mode selected manually at the front of the VFD panel. On VFD units that are supplied complete with Lineator UHF units, the UHF must be electrically by-passed with the VFD (does not apply where a single Lineator is used for multiple drives).
15. When the Hand-Off-Auto switch is in either the "Hand" or "Auto" position, fan start is interlocked with the corresponding fan damper actuators end switch.
16. In both "Hand" and "Auto" mode, fan start is interlocked with a damper end switch, and the VFD is to ramp (adjustable to 90 seconds) the fan to a preselected slow speed when the remote damper end switches closes.
17. If the Hand-Off-Auto switch is in "Auto" the fan ramps up to its currently assigned speed setting over an adjustable time period (up to 90 seconds). If the Hand-Off-Auto switch is in "Hand" the fan ramps up to the minimum speed setting and is controlled thereafter from the VFD keypad display

B. Protection:
   1. Provide the VFD with internal protection features.
   2. Fault Sensing shall include but not be limited to:
      a. Power On
      b. Overload protection
      c. Overcurrent Protection
      d. Short Circuit Protection
      e. Inverter Fault
      f. External Fault
      g. Over Voltage
      h. Under Voltage and Phase Loss
      i. DC Bus Under-voltage/over-voltage Protection
      j. Over Temperature Protection
      k. Power Semi Conductor Protection
      l. Ground Fault Protection
      m. Heatsink over temperature Protection
      n. Output phase to phase & phase to ground short circuit protection

C. Environment:
   1. The VFD shall have the following minimum environmental tolerances.
      a. Ambient temperature range of 32 degrees F to 104 degrees F. Units located in non-heated areas shall be provided with thermostatically controlled heated weather enclosure.
      b. Maximum humidity of 95 percent non-condensing.

c. Maximum altitude of 1000 m for rated output.

D. Performance:
1. The VFD shall automatically restart after an inverter fault trip. The VFD shall attempt to restart automatically 5 times with Lockout after the third attempt if a restart has not occurred.
2. The VFD shall have automatic/manual signal follower for 4-20 mA or 0-10 VDC reference.
3. All drive parameters (set up, operating and adjustment settings) to be entered via keypad without tools.
4. "Ride through" of short power interruptions.
5. Auto restart following fault, except for ground and short circuit faults. The drive shall shut down and annunciate any fault conditions (as a minimum) and display the appropriate fault code on the display of the keypad.
6. Automatic/manual selection (Hand-Off-Auto) in manual or hand control, drive speed shall be controlled via the keypad. In automatic control drive speed shall be controller via 4-20 mA and/or a 0-10 VDC signal from the BMS (BMS connections by others).
7. In the event of loss of 4-20 mA reference signal the drive should give an alarm and maintain last reference (within 10 percent).

E. Inverter duty motors with insulated bearings, winding thermisters and suitable for operation from variable frequency drives.

F. Provide all wiring/circuits required to achieve functionality described in the control drawings, electrical drawings (where applicable) and specifications.

G. CSA certified, suitable for use with Class 1, Zone 1, explosion-proof fan motors supplied with the fans where scheduled.

H. In the "Auto" mode, the fan ramps up to high speed when a remote contact (pushbutton or gas detector) closure is sensed by VFD controls.

I. Output signals to be monitored by DDC control system as follows:
1. Analog (4-20 mA or 0-10 VDC) signal corresponding to fan speed.
2. Digital output (isolated contacts) for VFD fault indication.
3. Digital output (isolated contacts) for VFD run status.
4. Digital output (isolated contacts) for VFD "HAND" selected.
5. Digital output (isolated contacts) for VFD "AUTO" selected.

J. Provide thermistor operated relays.

K. VFD cabinets are to be complete with door interlocked fused disconnect switch.

L. Provide 3 spare fuses of each kind per VFD per unit.

M. VFD integrator or supplier is to provide start up assistance and training to the Owner's (Region) staff.

2.5 MOTORS

A. Except where more stringent requirements indicated in unit Specifications, or equipment schedules, provide manufacturer's standard motor complying with following requirements.

B. Definite Purpose Motors: NEMA MG 1-18.

C. General Purpose, Poly-phase Motors 5 hp and Larger: Comply with Section 26 2000.

D. Single-Phase Motors: Unless otherwise indicated, for motor requirements less than 1/2 hp, provide single-phase motors conforming to following.
   1. Type: Continuous duty, squirrel cage, induction, fractional horsepower motors, rated in accordance with NEMA MG1-10.33.
      a. 1/20 to 1/8 hp: Shaded pole, NEMA N or O as determined appropriate for application by equipment manufacturer.
      b. 1/6 to 1/3 hp: Permanent split capacitor, with internal overload protection, NEMA N or O as determined appropriate for application by equipment manufacturer.
      c. 1/3 hp and larger: 2-valve capacitor, NEMA L, M, N or O as determined appropriate for application by equipment manufacturer.
   2. Enclosure Classification: Open drip-proof machine, NEMA MG-1, unless otherwise indicated.
   3. Insulation Class Rating:
      a. Fractional horsepower motors: Class A.
      b. Integral horsepower motors: Class B.
      c. Definite purpose motors: Class A, B, F or H as determined appropriate for application by equipment manufacturer.

E. Poly-Phase Motors:
   1. Type: Continuous duty; squirrel cage; induction, fractional, and integral horsepower motors; rated in accordance with NEMA MG1-10.33.
      a. 1/3 to 3 hp: NEMA B or C as determined appropriate for application by equipment manufacturer.
      b. Where rated motor loads produce uncorrected motor power factors less than 0.90, provide capacitors for power factor correction to 0.95.
   2. Enclosure Classification: Open drip-proof machine, NEMA MG-1, unless otherwise indicated.
   3. Insulation Class Rating: Suitable for continuous operation in 40□C environment, tested in accordance with IEEE 112 and 114.
      a. Fractional horsepower motors: Class A.
      b. Integral horsepower motors: Class B.
      c. High starting torque motors: Class F.
      d. Definite purpose motors: Class A, B, F or H as determined appropriate for application by equipment manufacturer.

F. Service Factor: Minimum 1.15 for NEMA A, B, and C poly-phase motors, in accordance with NEMA MG 1-12.47 for fractional horsepower motors.

G. Bearings: Permanently lubricated ball or regreasable sleeve bearings with inner and outer shaft seals, designed to resist thrust loading.

H. Efficiency: Provide high efficiency poly-phase motors in accordance with IEEE 112, Test Method B.

I. Provide motors with reserve power to deliver 10% extra air at 20% higher static head without exceeding motor nameplate capacity or operating in motor service factor.

J. Variable Frequency Drive Applications: Provide special purpose, high efficiency motors specifically constructed for use with, and matched to, variable frequency drive. NEMA B, Class F insulation with nonwicking motor leads and copper windings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which fans to be installed. Do not proceed with Work until unsatisfactory conditions corrected.

3.2 INSTALLATION OF CENTRIFGUGAL FANS

A. Install centrifugal fans where indicated in accordance with manufacturer's installation instructions and recognized industry practices to ensure centrifugal fans comply with requirements and serve intended function.

B. Support fans from adjacent walls or structural roof members as required or as indicated on Drawings.

C. Install ceiling exhaust fans where shown on drawings. Secure each fan-housing rigidly in place in the ceiling space.
1. Install fan-motor assemblies and plug into housing receptacles.
2. Install accessories supplied loose.

D. Electrical Wiring: Install electrical devices furnished by manufacturer but not specified to be factory-mounted. Furnish copy of manufacturer's wiring diagram submittal to electrical installer.
1. Verify electrical wiring installation is in accordance with manufacturer's submittal and installation requirements of Division 26. Verify proper rotation direction of fan wheels. Do not proceed with equipment startup until wiring installation acceptable to equipment installer.

E. Remove shipping bolts and temporary supports within ventilators. Adjust dampers for free operation.

3.3 INSTALLATION OF AXIAL FANS

A. Install axial fans plum and level where indicated in accordance with manufacturer's installation instructions and recognized industry practices, ensuring axial fans comply with requirements and serve intended purposes.

B. Access: Provide access and service space around and over axial fans as indicated, but in no case less than recommended by manufacturer.

C. Electrical Wiring: Install electrical devices furnished by manufacturer but not specified to be factory-mounted. Furnish copy of manufacturer's wiring diagram submittal to electrical installer.

D. Verify electrical wiring installation is in accordance with manufacturer's submittal and installation requirements of Division 26. Verify proper rotation in direction indicated and intended for proper performance of axial fans. Do not proceed with equipment startup until wiring installation acceptable to equipment installer.

3.4 FIELD QUALITY CONTROL

A. After installation of fans complete, test each fan to demonstrate proper operation of units at performance requirements specified.

B. When possible, field correct malfunctioning units, then retest to demonstrate compliance.

C. Replace units which cannot be satisfactorily corrected.

3.5 CLEANING

A. Clean factory-finished surfaces. Repair marred or scratched surfaces with manufacturer's touch-up paint.

END OF SECTION 23 3400

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 23 8146

WATER-SOURCE HEAT PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Water-source heat pumps.
   2. Packaged controls.

B. Refer to Division 26 for following; not Work of this section.
   1. Power supply wiring from power source to power connection on unit. Include starters, disconnects, and required electrical devices, except where specified as furnished, or factory-installed by manufacturer.

C. Provide following electrical work as Work of this section, complying with requirements of Division 26.
   1. Control wiring between field-installed controls, indicating devices, and unit control panels.

1.2 SUBMITTALS

A. Product Data:
   1. Manufacturer’s technical product data including rated capacities of selected model clearly indicated.
   2. Operating weights.
   3. Furnished specialties and accessories.
   4. Installation, rigging, and start-up instructions.

B. Shop Drawings:
   1. Submit manufacturer’s assembly-type shop drawings indicating dimensions, required clearances, and methods of assembly of components.
   2. Wiring Diagrams: Submit manufacturer’s electrical requirements for power supply wiring to water-source heat pumps. Submit manufacturer’s ladder-type wiring diagrams for interlock and control wiring required for final installation of water-source heat pumps and controls. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.
   3. Submit manufacturer's approved calculations/drawings showing geothermal piping patterns, pressure drop, and areas sufficient to provide required heating/cooling capacities as scheduled.

C. Operating and Maintenance Data (O&M):
   1. Maintenance data and parts list for each water-source heat pump, control, and accessory; including “trouble- shooting” maintenance guide.

D. Submit in accordance with Section 01 3300.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of water-source heat pumps, of types and capacities required, whose products have been in satisfactory use in similar service for not less than 5 yrs.

B. Codes and Standards:
   1. ARI/ISO Compliance: Test and rate water-source heat pumps in accordance with ARI Standard 13256-1. Provide ARI/ISO and CUL Certification.
   2. ASHRAE Compliance: Design, construct, and assemble refrigerating system in accordance with ASHRAE 90.1 – 2016.
   3. IECC Compliance: Provide water-source heat pumps with not less than minimum COP/Efficiency levels as prescribed in IECC.
   4. UL Compliance: Design, construct, and assemble water-source heat pumps for use with duct systems so as to meet the safety requirements of UL 1995.
   5. UL Labels: Provide water-source heat pumps that are UL listed and labeled.
   6. National Electrical Code (NEC) Compliance: Install water-source heat pumps in accordance with National Fire Protection Association (NFPA) 70.

1.4 DELIVERY, STORAGE AND HANDLING

A. Handle water-source heat pumps and components carefully to prevent damage, breaking, denting and scoring. Do not install damaged water-source heat pumps or components; replace with new.

B. Store water-source heat pumps and components in clean dry place. Protect from weather, dirt, fumes, water, construction debris, and physical damage.

C. Comply with manufacturer's rigging and installation instructions for unloading water-source heat pumps and moving units to final location for installation.

1.5 WARRANTY

A. Warranty on Motor/Compressor: Provide written warranty, signed by manufacturer, agreeing to replace/repair, within warranty period, motors/compressors with inadequate or defective materials and workmanship, including leakage, breakage, improper assembly, or failure to perform as required; provided manufacturer's instructions for handling, installing, protecting, and maintaining units have been adhered to during warranty period. Replacement is limited to component replacement only and does not include labor for removal and reinstallation.
   1. Warranty Period: 5 yrs from Date of Substantial Completion.

1.6 MAINTENANCE

A. Extra Materials:
   1. 1 set of matched fan belts for each belt driven fan.
   2. 1 set filters for each unit.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Trane (The) Co.
   1. Contact Information:
      Micah Tjeerdsma

Account Manager – Trane Commercial Systems – Great Northern Plains
Work # (920)636-4215
Micah.tjeerdsma@trane.com

B. Water Furnace.

C. Daikin.

D. Or equal.

2.2 WATER-SOURCE HEAT PUMPS

A. Provide factory-assembled and tested packaged water- source heat pumps as indicated, consisting of cabinet; sealed refrigerant circuit including compressor, refrigerant to water heat exchanger, refrigerant to air heat exchanger (coil), and reversing valve; evaporator fans; hot gas by-pass, refrigeration and packaged temperature controls; filters; and dampers. Provide capacities and electrical characteristics as scheduled.

2.3 GENERAL:

A. Casings - Shall be corner post and panel construction with a minimum 16-gauge galvanized steel base pan. Compressor and airside compartment access panels shall be lined internally with acoustic type dual density fibrous glass insulation with edges sealed or tucked under flanges to prevent glass fibers from entering the supply air stream. All construction shall meet the National Fire Protection Association Standard NFPA 90A. All internal sheet metal parts subject to water exposure shall be galvanized or non-ferrous and coated with a baked-on, thermosetting plastic coating. Compressor mounting shall incorporate "double isolation."
1. Panels shall be insulated with ½-in. thick dual density bonded glass fiber. The exposed side is a high density erosion proof material suitable for use in air streams up to 3600 feet per minute. The insulation shall meet requirements of UL 181. It has a flame spread of less than 25 and a smoke developed classification of less than 50 per ASTM E-84 and UL 723.
2. The elastomeric foam shall be UL listed with a flammability rating of UL 94-5V.

B. Horizontal and Vertical Mounted Units – Each heat pump shall incorporate independent access panels to facilitate service and inspection to internal components. Unit shall have an insulated divider panel between compressor compartment and fan blower section. Access panels shall be designed to cover an individual unit section, such as the fan blower, while servicing compressor compartment and related refrigerant components.
1. The unit shall be installed for proper access.
2. Procedures for proper access inspection and cleaning of the unit shall be included in the maintenance manual.

C. Configuration – Units shall be provided configured as shown on the plans, in one of the following air-flow arrangements (Note: "Right" or "Left" side shall be determined when viewing the compressor compartment end panel):
1. Right Hand Return Air and Right-Hand Piping Connections unless shown otherwise on drawings or schedule.

D. Compressor – The unit shall contain a high efficiency rotary or scroll compressor. External vibration isolation shall be provided by rubber mounting devices located underneath the mounting base of the compressor.

1. Internal thermal overload protection shall be provided.
2. High pressure switch shall be provided for protection against excessive discharge pressure.
3. Low pressure switch shall be provided for protection against a loss of charge.

E. Blower - The blower shall be a forward-curved style wheel with multiple speed combinations available. All direct drive motors shall have sealed bearings that do not require field lubrication. The motor has a permanent split capacitor with thermal overload protection. Options of standard static or high static can be selected. The motor contains a quick disconnect plug. They are constructed of corrosion resistant galvanized material. Removal of the motor and fan wheel is made with the assistance of a factory provided orifice ring device. This device attaches the wheel and motor to the fan housing in a single assembly eliminating the need for access to the set screw on the backside of the fan hub.
1. Options of the blower motor/fan packages shall be selected and wired from the factory to match performance criteria scheduled. Fan(s) shall be placed in a draw-through configuration.

F. Electrical – The unit control box shall contain all necessary devices to allow heating and cooling operation to occur from a remote thermostat. These devices shall be as follows:
1. 24 VAC energy limiting class II 50 VA (minimum) transformer.
2. 24 VAV blower motor relay.
3. 24 VAC compressor contactor for compressor control.
4. 24 VAC control valve contactor(s) for 2-way valve and 3-way (diverting) valve control.
5. 24 VAC circulating pump contactor for pump control.
6. Field thermostat connections shall be provided for ease of hook-up to terminal strip located in the unit's control box.
7. Lockout relay which controls cycling of compressor shall be provided to protect the compressor during adverse operating conditions. The device may be reset by interrupting power to the 24 VAC control circuit. Reset may be done either at the remote thermostat or through a momentary main power interruption.

G. Air-to-refrigerant Coil – The air-to-refrigerant coil shall consist of copper tubes mechanically bonded into evenly spaced aluminum fins. All coils shall be leak tested to 450 psig and pressure tested to 650 psig at the factory to ensure the pressure integrity. The tubes to be completely evacuated of air and correctly charged with proper volume of R410A refrigerant prior to shipment.
1. Refrigerant filters furnished for field installation.

The refrigerant coil distributor assembly shall be of orifice style with round copper distributor tubes. The tubes shall be sized consistently with the capacity of the coil. Suction headers shall be fabricated from rounded copper pipe. A thermostatic expansion valve shall be factory selected and installed for a wide range of control.

H. Sound Attenuation Package – Sound attenuation shall be provided as standard feature in the product design. The sound reduction package (0.50 to 5-ton units) shall include vibration isolation to the compressor and water-to refrigerant coil, unit base stiffeners, insulated metal compressor enclosure, and a second stage of vibration isolation to the compressor and water-to-refrigerant base pan.
1. Unit shall be tested and rated in accordance with AHRI 260.

I. Internal Electric Heat – Boilerless control electric heat shall be factory wired and tested. The boilerless control option shall be composed of a nichrome open wire coil designed for approximately 2-kw per unit ton. It shall consist of a single stage of electric heat used as a primary heating source when compressor lockout has occurred due to the entering water temperature falling

below set-point temperature with range of 25°F to 60°F. Once the entering water temperature rises above 60°F, the boilerless controller return the unit to normal operation and locks out the electric heater. All power connections to the electric heat shall be made in the equipment's control box.

1. Electric heating capacity shall be provided as scheduled.

J. Water-to-refrigerant System – The Water-to-Refrigerant heat exchanger shall be constructed from a high-quality coaxial coil for maximum heat transfer. The water side heat exchanger shall be constructed from cupro-nickel and shall be deeply fluted to enhance heat transfer and minimize fouling and scaling. The coil shall have a working pressure of 400 psig on the water side and 650 psig on the refrigerant side.

1. Reversing Valve – The reversing valve is a pilot operating sliding piston type with replaceable encapsulated magnetic coil. This valve is energized in cooling mode.
2. Tubing – The refrigerant tubing shall be of 99% pure copper. The system shall be free from contaminants and conditions such as drilling fragments, dirt, and oil. All water lines that are located in the indoor air stream and refrigerant lines that are located in the indoor air stream that are not directly over the drain pan shall be insulated with 3/8-in. thick elastomeric insulation.

K. Thermostatic Expansion Valve – The unit shall be provided with a bi-directional thermal expansion valve. This device allows operation of the equipment in the range of 25°F to 120°F entering fluid temperatures and 40°F to 95°F entering air temperatures. The equipment operates with one variable (entering water temperature, entering air temperature, cfm, or gpm) at an extreme condition. All other variables must be within the nominal range of operation.

L. Hot Gas Reheat – Dehumidification shall be provided through a hot gas reheat option as scheduled. The coil shall consist of 3/8-in. or ½-in. copper tubes mechanically expanded into evenly spaced aluminum fins. All coils shall be proof and leak tested. The proof test must be performed at 1.5 times the maximum operation pressure and the leak test performed at the maximum operating pressure.

M. Air Section - The air section of the unit shall be isolated from the compressor and control section with an insulated divider panel to minimize the transmission of compressor noise and to permit operational service testing with the compressor compartment cover removed.

N. Filters – A 2-in. MERV 13 filter(s) shall be provided with the unit. A MERV 13 rating requires 90% efficiency on 1-3 micron particles and greater than 90% efficiency on 3-10 micron particles when tested in accordance with ASHRAE Test Standard 52.2.

1. Filter access shall be side removal and easily accessible.

O. Piping Connections - Supply and return raw water piping connections – shall be FPT fittings, brazed copper water tubes and securely flush mounted to the cabinet corner post allowing for connection to a flexible hose without the use of a back-up wrench. Condensate drain connection shall not be less than 3/4" FPT fitting securely flush mounted to the corner post. Supply, return, and condensate drain piping shall be connected and installed as detailed on mechanical drawings.

P. Polymer Drain Pan – The polymer drain pan shall be constructed of polymer material complying with UL94-5V flammability requirements. The bottom of the drain pan shall be sloped on two planes which pitches the condensate to the drain connection, complying with ASHRAE 62 for IAQ conformity.

2.4 CONTROLS

A. Individual Heat Pump Controls – Provide a microprocessor-based control board conveniently located in the control box. The board is unique to water-source products and is designed to control the unit as well as provide outputs for unit status and fault detection. The board is factory wired to a terminal strip to provide all necessary terminals for field connections. Board will include the following points:
   1. 18-pole strip for low voltage field wiring.
   2. For 0.5 to 5 tons, 50 VA transformer.
   3. For 6 to 25 tons, 75 VA transformer.
   4. Anti-short cycle compressor protection.
   5. Brown out protection.
   6. Compressor contactor.
   7. Compressor delay on start.
   8. Compressor lock-out relay.
   9. Condensate overflow.
   10. Electric heat and compressor enable (6 to 25 tons).
   11. Freeze protection.
   12. High pressure switch.
   13. Hot gas reheat.
   14. Low pressure switch.
   15. Low pressure time delay.
   16. Multi-speed fan motor.
   17. Reversing valve coil.
   18. Soft lockout mode.
   19. Random start delay.
   20. Water circulating pump run relay.

B. Provide Heat Pump System Controls as follows:
   1. Trane Tracer UC400 System controller.
   2. Or equal.

C. The system controller can be used in a stand-alone application or as part of a Trane® Integrated Comfort™ System (ICS). The Tracer® UC400 is LonTalk® certified. It is capable of working with and talking to other LonTalk® certified controllers.

D. System controls will provide the following functions:
   1. Compressor Operation - The compressor is cycled on and off to meet heating or cooling zone demands. Units (for 6 to 25 tons, single and dual compressor) use the unit capacity and pulse width modulation (PWM) logic along with minimum on/off timers to determine the compressor's operation. The compressor is controlled ON for longer periods as capacity increases and shorter periods as capacity decreases.
   2. Condensate Overflow - When condensate reaches the trip point, a condensate overflow signal generates a diagnostic which disables the fan, unit water valves (if present), and compressor. The unit will remain in a halted state until the condensation returns to a normal level. At this time, the switch in the drain pan will automatically reset. However, the controller's condensate overflow diagnostic must be manually reset to clear the diagnostic and restart the unit.
   3. Data Sharing - The Tracer® UC400 controller is capable of sending or receiving data (setpoints, fan request, or space temperature) to and from other controllers on the communication link. This allows multiple units to share a common space temperature sensor in both stand-alone and building automation applications.

4. Dehumidification - Dehumidification1 for the water-source heat pump is applicable with the UC400. The controller is capable of directing one stage of DX cooling in conjunction with one stage of reheat (hot gas reheat). Dehumidification can only occur when the controller is in the cooling mode. A humidity sensor is used to measure the zone's relative humidity (RH), then compares the zone relative humidity to the relative humidity enable/disable setpoint parameters. The dehumidification enable and disable points are configurable.
5. Fan Operation - The supply air fan operates at the factory wired speed in the occupied or occupied standby mode. When switch is set to AUTO, the fan is configured for cycling ON with heating or cooling. In heat mode, the fan will run for 30 seconds beyond compressor shutdown in both occupied and unoccupied mode.
6. Filter Maintenance Timer - The controller filter status is based on the unit fan's cumulative run hours. The controller compares the fan run time against an adjustable fan run hours limit and recommends unit maintenance as required.
7. High and Low Pressure Switches - The Tracer® UC400 detects the state of the high pressure or low pressure switches. When a fault is sensed by one of these switches, the corresponding message is sent to the controller to be logged into the fault log. When the circuit returns to normal, the high pressure control and low pressure control automatically reset. If a second fault is detected within a thirty-minute time span, the unit must be manually reset.
8. Occupancy Modes - The four operations of the Tracer® UC400 controller include occupied, occupied standby, occupied bypass and unoccupied:
    a. In an OCCUPIED situation, the controller uses occupied heating and cooling setpoints to provide heating and cooling to the building. This occupied operation is normally used during the daytime hours when the building is at the highest occupancy level.
    b. In an OCCUPIED STANDBY situation, the controllers heating and cooling setpoints are usually wider than the occupied setpoints. This occupied standby operation is used during daytime hours when people are not present in the space (such as lunchtime or recess). To determine the space occupancy, an occupancy sensor is applied.
    c. In an UNOCCUPIED situation, the controller assumes the building is vacant, which normally falls in evening hours when a space may be empty. In the unoccupied mode, the controller uses the default unoccupied heating and cooling setpoints stored in the controller. When the building is in unoccupied mode, individual units may be manually placed into timed override of the unoccupied mode at the units wall sensor. During timed override, the controller interprets the request and initiates the occupied setpoint operation, then reports the effective occupancy mode as occupied bypass.
    d. In the OCCUPIED BYPASS mode, the controller applies the occupied heating and cooling setpoint for a 120-minute time limit.
9. Random Start - To prevent all of the units in a building from energizing major loads at the same time, the controller observes a random start from 0 to 25 seconds. This timer halts the controller until the random start time expires.
10. Reversing Valve Operation - For cooling, the reversing valve output is energized simultaneously with the compressor. It will remain energized until the controller turns on the compressor for heating. At this time, the reversing valve moves to a de-energized state. In the event of a power failure or controller OFF situation, the reversing valve output will default to the heating (de-energized) state.
11. Entering Water Temperature Sampling - The controller will sample the entering water temperature to determine proper control action for units equipped with boilerless electric heat or waterside economizer as scheduled.
12. Waterside Economizer - Entering water temperature (EWT) sampling will automatically occur at power up when the unit is equipped with a waterside economizer (WSE). The EWT is used to determine if economizing is feasible. When the conditions are met, the isolation

valve(s) are driven open for three minutes and the EWT reading is taken. The determination as to whether or not the economizer can be enabled will be made and the controller will take appropriate action. The isolation valve will remain open regardless if the WSE or the DX cooling is enabled. The unit's waterside economizer will contain a 2-position water valve wired to the controller. The economizing water coil will be optimized to provide 100% of the unit capacity at 80.6°F/66.2°F return air temperature with 45°F entering water. The flow rate is established at 86 F entering water temperature and 96°F leaving water temperature. Low leaving air protection will be furnished to protect the unit against delivering air that is cold enough to sweat discharge air grilles. Coil icing protection will also be provided. Waterside economizer cooling will be active during occupied, unoccupied and standby cooling modes.

13. Water Isolation Valve - Variable speed pumping systems are supported by the controller when water isolation valves (12 VA max) are present, up to two isolation valves are supported by the ZN524 controller (one for each compressor circuit). The valves are normally closed unless DX heating, DX cooling, waterside economizer or dehumidification is requested. When the isolation valves are driven open for operation, the outputs will be driven for 20 seconds to ensure adequate water flow before the compressor outputs are energized. Once an isolation valve has been opened, it will remain open for a 10-minute minimum to reduce excessive cycling of the valve.
14. Isolation Valve “ON” Control - The isolation valve output will be energized (controlled open) during compressor heating, compressor cooling, waterside economizing or dehumidification. When the isolation valve is driven open for compressor operation, the output will be energized 20 seconds prior to the compressor and indoor fan (if not already energized) outputs to ensure adequate water flow to the heat exchanger. To reduce excessive cycling of the isolation valve once opened, the isolation valve will remain open for a minimum of 10 minutes.
15. Isolation Valve “OFF” Control - The isolation valve output will be de-energized (controlled closed) when there is no longer a call for compressor or WSE operation and the 10-minute minimum on time has expired.

E. Commercial Touch Screen Programmable Zone Sensor – The Trane® programmable zone sensor is an economical control solution for stand-alone space control applications. Schedule function supports 7-day, 5+2 day, 5+1+1 day schedule options with up to three occupied/unoccupied event pairs per day. The display can be configured to prevent occupant access to temperature setpoints and schedules. Installer password protects configuration and diagnostic screens. Battery free design, all settings and schedules are saved ton non-volatile memory. Settings are maintained through power failure.

F. Auxiliary Relay Output: A 24VAC signal which is turned on when the system control unit is in alarm mode.

G. Warranty - The contractor shall provide one full year warranty for furnishing parts on site which becomes defective in normal operation, from the date of start-up by the manufacturer’s representative, or first beneficial use of the unit. The hermetic motor compressor shall be warranted for an additional four years.

1. Manufacturer’s warranty time periods may or may not coincide with the contractor’s time period of obligation, but where the manufacturer’s warranty contains an expiration date based upon the equipment shipping date, the contractor shall not be relieved of responsibility for covering the full time periods listed above.
2. The contractor shall be responsible for all shipping expenses not included by the manufacturer, both to procure the replacement part, and to return any defective parts to the manufacturer, as they may require.

3. The contractor's replacement warranty obligation after the first year shall be limited to furnishing of replacement parts only and shall not include repair labor costs or materials such as refrigerant, oils, dehydration, refrigerant- moisture dryers, air filters, or drive belts.
4. The owner shall be responsible for providing replacement filters beyond the spares provided in the original contract, and for filter installation labor.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which water-source heat pumps are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General:
1. Install water-source heat pumps in accordance with manufacturer's instructions.
2. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer's recommended clearances.

B. Electrical Wiring: Install electrical devices furnished by manufacturer but not specified to be factory-mounted.
1. Verify that electrical wiring installation is in accordance with manufacturer's submittal and installation requirements of Division 26 sections. Do not proceed with equipment start-up until wiring installation is acceptable to equipment Installer.

C. Connect supply and return ducts to heat pumps with flexible duct connections. Provide transitions to exactly match unit duct connection size.

D. Connect supply and return raw water piping to heat pump as required by manufacturer and as detailed on Mechanical drawings.

E. Condensate Drain Piping: Route condensate drain pipe to floor drain located near water source heat pump or as detailed on Mechanical drawings.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Services:
1. Supplier's or manufacturer's representative for equipment specified herein shall be present at jobsite or classroom designated by OWNER for mandays indicated, travel time excluded, for assistance during plant construction, plant startup, and training of OWNER'S personnel for plant operation. Include:
a. 1/2 manday for Installation Services.
b. 1/2 manday for Instructional Services.
2. Supplier or manufacturer shall direct services to system and equipment operation, maintenance, troubleshooting, and equipment and system-related areas. See Section 01 7500.

B. Start-up water-source heat pumps, in accordance with manufacturer's start-up instructions. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.

END OF SECTION 23 8146

SECTION 23 8325

ELECTRIC HEATING TERMINALS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Fan-forced wall heaters.
   2. Corrosion-resistant (wash down) unit heaters.
   3. Propeller unit heaters.

B. Refer to Division 26 for electrical wiring work required in conjunction with heating terminals; not Work of this section.

1.2 SUBMITTALS

A. Schedule below identifies equipment required for each item of material or equipment.

Terminal Unit Type	Submittal Information Item
Fan-Forced Wall Heaters	1, 2, 3, 4, 5, 6
Propeller Unit Heaters	1, 2, 3, 4, 5, 6
Corrosion-resistant Unit Heaters.	1, 2, 3, 4, 5, 6

B. Submittal Information:
   1. Submit manufacturer's technical product data including rated capacities of selected model clearly indicated, unit weights, furnished specialties and accessories, and installation and startup instructions. Provide gauges, color and finish of materials.
   2. Shop Drawings: Submit manufacture's assembly type Shop Drawings indicating dimensions, weight loadings, required clearances, and methods of assembly of components
   3. Wiring Diagrams: Manufacturer's electrical requirements for power supply wiring to terminal units.
   4. Wiring Diagrams: Manufacturer's ladder type for interlock and control wiring. Differentiate between portions of wiring factory-installed and portions to be field-installed.
   5. Motors: For single-phase, definite purpose, special purpose, and general purpose poly-phase motors less than 5 hp, submit NEMA design types, construction, insulation class, NEMA frame size, horsepower, voltage, and amp draw characteristics, and service factor for each common application.
   6. Operating and Maintenance (O&M) Data:
      a. Maintenance instructions including lubrication instructions, filter replacement, motor and drive replacement, and spare parts lists.

C. Submit in accordance with Section 01 3300.

1.3 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in manufacture of electrical heating terminal units, of types, ratings, and capacities required, whose products have been in satisfactory use in similar service for not less than 5 yrs.

B. Installer: Qualified with at least 3 yrs of successful installation experience on projects with electrical heating terminal installation work similar to that required for Project.

C. Regulatory Requirements:
   1. NFPA Compliance:
      a. Comply with applicable heating terminal installation requirements of NFPA pertaining to installation of space heating equipment and appliances.
      b. Comply with applicable requirements of NFPA No. 90A pertaining to installation of ac systems.
   2. UL Compliance: Comply with applicable requirements of UL 1042. Provide heating terminals UL listed and labeled.
   3. ARI Compliance: Provide fan coil ratings in accordance with ARI 440.
   4. Comply with applicable requirements of SMACNA's "Ducted Electric Heat Guide for Air Handling Systems."
   5. Mining Enforcement and Safety Administration (MESA).

PART 2 - PRODUCTS

2.1 FAN-FORCED WALL HEATERS

A. Manufacturers:
   1. QMark, A Marley Engineered Products Brand.
   2. Berko, A Marley Engineered Products Brand.
   3. Markel Products Company.
   4. Or equal.

B. Except as otherwise indicated, provide electric, fan-forced wall heater manufacturer's standard materials and components as indicated by published product information, designed and constructed as recommended by the manufacturer, and as required for complete installation.

C. Heating Elements:
   1. Provide elements of indicated duty and rated for indicated capacity, consisting of resistance elements in steel sheath with extended fins or in spiral sheath.
   2. Electric Heating Capacity: Size element for indicated fan speed, cfm, room heating load (Btuh), entering air temperature, and electric input (watts, voltage, phase) as specified on schedule.
   3. Heating elements shall cover entire air discharge area for uniform heating.

D. Back box: Back box shall be designed for duty as recessed rough-in box in either masonry or frame installations and also used with surface mounting frame in surface mounting installations.
   1. Back box shall be constructed of heavy gauge galvanized steel.
   2. Provide knockouts for electrical wiring.

E. Inner Frame Assembly: Heater assembly is mounted inside backbox and consists of heavy gauge steel fan panel upon which is mounted all of operational parts of heater.
   1. Inner frame assembly shall be completely pre-wired.

F. Motors and Controls:
   1. Fan motor shall be impedance protected, permanently lubricated and with totally enclosed motor.

2. Fan control shall be of bi-metallic, snap-action type and shall activated fan after heating element reaches operating temperature and continue to operate fan after thermostat is satisfied and until all heated air has been discharged.
3. Thermostat shall be single pole type.
4. Thermal cutout shall be bi-metallic, snap-action type designed to shut off heat in event of overheating.
5. Fan blade shall be five-bladed and aluminum.

G. Semi-recess Mounting Frame: The semi-recess mounting frame shall be of heavy gauge steel designed to mount around back box for semi-recessed installation.
1. 2-in Semi-recess Mounting Frame, bronze, Model CWHS1AG or equal.
2. Slot knockouts for power supply conduit.

H. Front Cover: Louvered front cover constructed of heavy gauge steel.
1. Plug button to replace thermostat knob and render unit tamper-resistant.

I. Finish: All sheet metal parts, except galvanized steel back box, shall be phosphatized and then completely painted by baked enamel finish selected from manufacturer's standard colors.

2.2 CORROSION-RESISTANT UNIT HEATERS

A. Manufacturers:
1. Industrial Engineering and Equipment Company (INDEECO).
2. QMark, Division of Marley Electric Heating Company.
3. Electromode, Division of Commercial Controls Corporation.
4. Ruffneck Heaters.
5. Or equal.

B. Except as otherwise indicated, provide corrosion-resistant electric unit heater materials and components as indicated by published product information, designed and constructed as recommended by manufacturer, and as required for complete installation.

C. Heating Elements:
1. Provide elements rated for indicated capacity, consisting of resistance elements in Monel steel sheath.
2. Electric Heating Capacity: Size elements for indicated fan speed, cfm, room heating load (Btuh), entering air temperature, and electric input (watts, voltage, phase).

D. Casing:
1. Provide removable, epoxy coated steel casings braced and reinforced to provide required stiffness and containing heating element supports. Provide rounded corners. Provide heavy duty, wall-mounted bracket included with unit heater.

E. Air Deflectors: Provide manufacturer’s standard air deflectors of following type.
1. Adjustable horizontal louvers.

F. Motors:
1. Provide epoxy coated, totally enclosed motors, Class B insulation, resiliently mounted, built-in thermal overload protection, sleeve bearings or permanently lubricated ball bearings. Current characteristics: 480 volt, 60 Hz, 3-ph.

2. Internal Wiring: Provide high temperature, heat-resistant wiring with terminal connections protected with heat shrink tubing. Provide wiring and control components in NEMA 4X enclosure. Provide fuses in motor and control circuit wiring.
3. Provide following devices.
    a. Thermally-activated fan switch to keep fan motor operating until residual heat dissipated.
    b. Moisture- and corrosion-resistant, automatic reset, high limit cutout switch.
    c. Moisture and corrosion resistant, UL listed thermostat in NEMA 4X enclosure.
    d. Magnetic contactors for motor and heating elements in NEMA 4X enclosure.

G. Fans: Provide spark proof, epoxy painted propeller fans, statically and dynamically balanced, of indicated capacity.

H. Mounting Bracket: Provide stainless steel swivel mounting bracket which can be used either for wall or ceiling mounting.

2.3 PROPELLER UNIT HEATERS

A. Manufacturers:
1. QMark, Division of Marley Electric Heating Company.
2. Berko Electric Manufacturing.
3. Markel Products Company.
4. Trane Company.
5. Or equal.

B. Except as otherwise indicated, provide manufacturer's standard electric propeller unit heater materials and components as indicated by published product information, designed and constructed as recommended by manufacturer, and as required for complete installation.

C. Heating Elements:
1. Provide elements of indicated duty and rated for indicated capacity, consisting of resistance elements in steel sheath with extended fins, or in spiral sheath.
2. Electric Heating Capacity: Size element for indicated fan speed, cfm, room heating load (Btuh), entering air temperature, and electric input (watts, voltage, phase).

D. Casing:
1. General:
    a. Provide casings braced and reinforced to provide required stiffness and containing heating element supports.
    b. Provide rounded corners.
    c. Include fan orifice (Venturi) in casing, as well as threaded hanger connections (weld nuts).
    d. Fabricate from 16 ga steel.

E. Air Deflectors:
1. Provide manufacturer's standard air deflectors.

F. Motors:
1. Provide totally enclosed shaded pole or permanent split capacitor motors, Class B insulation, resiliently mounted, tap wound with built-in thermal overload protection, sleeve bearings or permanently lubricated ball bearings.

2. Internal Wiring: Provide high temperature, heat resistant wiring in flexible metal conduit from terminal junction box to electrical devices. Provide fuses in motor and control circuit wiring.
3. Devices/ Accessories:
    a. Thermally activated fan switch to keep fan motor operating until residual heat dissipated.
    b. Disconnect switch.
    c. Automatic reset, high limit cut-out switch located in discharge air stream.
    d. Magnetic contactor.
    e. Transformer.
    f. Wall-mounted thermostat.
    g. Wall-mounting bracket.

G. Fans:
1. Provide aluminum propeller fans, balanced statically and dynamically of indicated capacity suitable for standard or spark-proof application.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install heating terminals as indicated and in accordance with equipment manufacturer's written instructions and recognized industry practices, to ensure heating terminal equipment fulfills requirements. Comply with applicable installation requirements of NEC and NECA's "Standard of Installation."

B. Coordinate with electrical work including wiring/cabling work, as necessary to interface installation of heating terminals with other Work.

C. Clean dust and debris from each heating terminal as installed to ensure cleanliness.

D. Comb out damaged fins where bent or crushed before covering elements with enclosures.

E. Touch up scratched or marred heating terminal enclosure surfaces to match original finishes.

3.2 GROUNDING

A. Provide equipment grounding connections, sufficiently tight to ensure permanent and effective ground for heating terminals as indicated.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Services:
1. Supplier or manufacturer shall direct services to system and equipment operation, maintenance, troubleshooting, and equipment and system-related areas. See Section 01 7500.

B. Testing:
1. Upon completion of installation of heating terminals and after building circuitry is energized, test heating terminals to demonstrate capability and compliance with requirements.
2. Where possible, field correct malfunctioning units then retest to demonstrate compliance.

END OF SECTION 23 8325

SECTION 23 8410

DEHUMIDIFIERS

PART 1 - GENERAL

1.1 SUBMITTALS

A. Product Data:
   1. Submit manufacturer's technical product data including rated capacities of selected model clearly indicated, weights, furnished specialties and accessories, electrical characteristics, and installation and startup instructions.
   2. Submit in accordance with Section 01 3300.

B. Operation and Maintenance (O&M) Data:
   1. Maintenance instructions including lubrication instructions, control motor and drive replacement, and spare parts lists.
   2. Submit in accordance with Section 01 3300.

1.2 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. Firms regularly engaged in manufacture of humidifier products of types and sizes indicated on drawings.

B. Requirements of Regulatory Agencies:
   1. Ohio Mechanical Code (2017).
   2. International Energy Conservation Code (2012).
   3. ASHRAE 90.1 (2010).

1.3 DELIVERY, STORAGE AND HANDLING

A. Protect against dirt, water, chemical, and mechanical damage.

1.4 WARRANTIES

A. Equipment shall be certified as to capacity.

B. Replace components without charge if faulty operation or unusual wear occur during guarantee period.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Quest Dehumidifiers by Therma-stor Products Inc.

B. Or equal.

2.2 GENERAL

A. Except as otherwise indicated, provide manufacturer's standard material and components, as indicated by published product information, designed and constructed as recommended by manufacturer, and required for complete installation.

2.3 DEHUMIDIFIERS

A. Portable refrigeration type dehumidification unit that passes treated air through condenser coil to reclaim heat. Unit shall be provided with four casters and 6 ft. power cord for easy portable use. Unit shall be provided with condensate hose and internal condensate pump capable of lifting condensate 12 ft.

B. Dehumidification to be complete with automatic controls consisting of humidistat with settings from 20 to 80 percent relative humidity, and “on” and “off” setting.

C. Dehumidifier units shall be of size and capacity shown on schedules or drawings. Provide two set of filters.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions under which units to be installed.

B. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to installer.

3.2 INSTALLATION

A. Install units in accordance with manufacturer's written instructions, recognized industry practices, and approved submittals to ensure products serve intended function.

B. Install as indicated on drawings. Route condensate hose to nearest floor or hub drain. Provide ridged metal protective drain covering for section of drain exposed to foot traffic.

3.3 ELECTRICAL CONNECTIONS

A. Electrical installation shall comply with Division 26.

3.4 FIELD QUALITY CONTROL

A. After installation of unit has been completed, test to demonstrate proper operation at performance requirements specified.

B. Correct malfunctioning units, retest to demonstrate compliance.

C. Replace units which cannot be satisfactorily corrected.

END OF SECTION 23 8410

SECTION 26 0505

BASIC ELECTRICAL REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to implement the following general administrative and procedural requirements in accordance with the plans and as specified herein.

B. Extent of Work: Work under this contract consists of furnishing, installing, testing, placing into operation, and guaranteeing complete electrical systems, as shown on the drawings and as specified in Division 26. The Contractor shall connect and place all wired equipment in proper working order. Refer to the plans and specifications for work included in this Contract. Some general guidelines to coordinating work between Division 26 and other Divisions are as follows:

1. Division 26 includes all power wiring and raceways for equipment furnished under other Divisions. Motor starters and disconnect switches for Division 23 equipment shall be provided under Division 26 unless otherwise noted. Remote two-wire control logic will be extended to the motor starters as work of Division 23. Where combined line voltage power/control is used for Division 23 equipment, the wiring and raceways are treated as power wiring and are work of Division 26.
2. Division 26 is responsible for providing appropriate wire and conduit between all distribution equipment and all electrical devices and utilization equipment shown on plans. It is also the responsibility of Division 26 to provide all wire, conduit, and devices necessary to accomplish all control functions as indicated by the control diagrams which are not specifically shown as work of another division.
3. Division 26 provides all power wiring and raceways for plant equipment provided under Division 40. Division 26 provides all control, signal, and communication wiring and conduit for the instrumentation and control equipment provided under Division 40

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.

1. All work shall be installed in full accordance with the latest edition of the National Electrical Code (NEC) as prepared and published by the National Fire Protection Association (NFPA) and any applicable local or state codes. All electrical equipment shall be listed and labeled by Underwriters' Laboratories, Inc. (UL) or any approved independent nationally recognized electrical testing laboratory where such standards exist. Optionally, in lieu of such listing and labeling, equipment pre-approved by the Electrical Inspector may be supplied. Wherever UL compliance is mentioned in the

specifications, the above alternatives shall be understood to apply to all listing and labeling requirements. This does not preempt or replace the specifications or replace the approval process. All service switches/circuit breakers shall be listed and labeled as outlined above for service entrance duty.

2. Comply with the requirements of NFPA Code 241 "Building Construction and Demolition Operations," the American National Standards Institute (ANSI) A10 Series standards for "Safety Requirements for Construction and Demolition," and the National Electrical Contractors Association (NECA) National Joint Guideline NJG-6 "Temporary Job Utilities and Services."
3. In addition to the requirements outlined under other sections of the Contract Documents, all Work, material, and equipment shall comply with all requirements of the latest editions and interim amendments of the National Electrical Safety Code, National Fire Protection Association, OSHA, the building Owner's insurance company, and all applicable federal, state, and local laws and ordinances. All materials shall be listed and labeled by UL and installed as required by the listing.
4. Should any changes in the Drawings or the Project Manual be required to conform to the above regulations, the Contractor shall notify the Engineer at the time of submitting his bid. After entering into the Owner-Contractor Agreement, the Contractor shall be held to complete all Work necessary to meet these requirements without additional expense to the Owner.

B. Permits and Regulations
1. The Contractor shall obtain all permits and inspections required by laws, ordinances, rules, regulations, and public authority having jurisdiction and shall obtain certificates of such inspections and shall submit same to the Engineer and shall pay all fees, charges, and expenses in connection therewith. The Contractor shall furnish to the Owner a certificate of final inspection from the proper authority prior to final payment. Obtain and pay for easements required to bring temporary utilities to the site, where the Owner's easement cannot be utilized for that purpose.
2. The Contractor shall not allow or cause any of the Work to be covered up or enclosed until the Engineer or Owner has been notified and given reasonable opportunity (2 working days) to review the Work. When required by law or regulations, the governmental agency having jurisdiction for inspections shall be given reasonable notice and opportunity to inspect the Work. Any Work that is enclosed or covered up before such inspection and test shall be uncovered at the Contractor's expense; after it has been inspected, the Contractor shall restore the Work to its original condition at his own expense.

C. Interpretation of Drawings and Project Manual
1. Any discrepancies among Drawings, Project Manual, Drawings and Project Manual, or between Drawings and Project Manual shall be promptly brought to the attention of the Engineer for clarification during the bidding period. No allowance shall subsequently be made to the Contractor by reason of his failure to have brought said discrepancies to the attention of the Engineer during the bidding period or of any error on the Contractor's part.
2. The locations of switch, receptacle, light, motor, etc., outlets shown on Drawings are approximate. The Contractor shall use good judgment in placing the preceding to eliminate all interference with ducts, piping, etc. Where any doubt exists, the exact location shall be determined by the Engineer.

3. Check all door swings so that light switches are not located behind doors. Relocate switches as required, with Engineer's review.
4. All general trades and mechanical Drawings shall be checked by the Contractor before installing any outlets, power wiring, etc.
5. Equipment sizes and locations shown on the Drawings are estimated. Before installing any wire or conduit, the Contractor shall obtain the exact equipment requirements, including wire and conduit entrance locations, and install wire, conduit, disconnect switches, motor starters, overload heaters, circuit breakers, or other items of the correct size and locations for the equipment actually installed. However, wire and conduit sizes shown on the Drawings shall be taken as a minimum and shall not be reduced without written approval from the Engineer.
6. The Contractor shall provide all wiring, including disconnect switches and starters for all electrically operated equipment shown on Drawings, specified or required, except that starters and/or disconnect switches need not be furnished where it is specifically noted that they are furnished with the equipment.
7. The Drawings show the general arrangement required for installation of equipment and materials. The Contractor shall follow these Drawings as closely as possible. Should conditions necessitate other arrangements, the Contractor shall prepare and submit drawings showing the changes to the Engineer for review before proceeding with the Work.
8. The Engineer reserves the right to make minor changes in the location of the installation of equipment and materials up to the time of roughing in at no extra cost to the Owner.
9. The Drawings do not show all offsets and do not detail every point at which unusual conditions of construction may require special attention. All additional fittings, conduits or specialties and other appurtenances necessary due to field conditions shall be provided by the Contractor.
10. In all cases where a device or part of the equipment is herein referred to in the singular, it is intended that such reference shall apply to as many such devices as are required to complete the installations.
11. Wherever in this Division 26 a Manufacturer is specified with the notation “or approved equal," the decision as to the material or equipment being "equal" shall be made by the Engineer, without exception, and this decision shall be accepted by the Contractor as final. Where the Contractor proposes to furnish equipment or material in accordance with the "or approved equal" notation, said equipment or materials shall be submitted to the Engineer for review in accordance with the requirements set forth in the "Substitutions" paragraph of the "Submittals" paragraph of this Section.

1.4 SUBMITTALS

A. Transmittal: Furnish manufacturer's product data, test reports, and materials certifications as required.
   1. Follow the procedures specified in Division 01 Section "Submittal Procedures" and in addition, the Contractor shall prepare and submit a complete submittal list to the Engineer. The submittal list shall include all submittal items covered in the Division 26 specification sections. In addition, the submittal list shall contain dates for all items to be submitted and shall accompany the first submittal. The submittal list shall be coordinated with the construction schedule and shall clearly show such coordination.
   2. Shop Drawings: Shop drawings shall be submitted to the Engineer for approval. Shop drawings shall identify the specific equipment and material being supplied, and all accessories, dimensions, descriptions, mounting and connection details, wiring diagrams,

elementary control diagrams, equipment interface diagrams, and any other information necessary to determine compliance with the plans and specifications. Fabrication and installation shall be in accordance with the approved shop drawings.

3. Permits and Easements: Submit copies of reports, permits, and easements necessary for installation, use, and operation.
4. Test Reports: Submit copies of reports of tests, inspections, and meter readings as specified. Tests, inspections, and meter readings shall be performed using the Contractor's temporary power source unless otherwise specified.

B. Additional copies may be required by individual sections of these specifications.

C. Coordination Drawings

1. Prepare coordination drawings in accordance with Division 01 section "Project Coordination; Bid Package Contracts" to a scale of 1/4 inch = 1 foot–0 inches or larger, detailing major elements, components, and systems of electrical equipment and materials in relationship with other systems, installations, and building components. Indicate locations where space is limited for installation and access and where sequencing and coordination of installations are of importance to the efficient flow of the work, including (but not necessarily limited to) the following:
    a. Submit conduit layout drawings showing all conduit sizes, the number and size of each conductor installed in each conduit, and the intended use for each conduit. Drawings should clearly delineate method of conduit installation and should include details of any special conduit support or mounting method. All wiring devices, lighting fixtures, and equipment supplying or requiring electrical power shall be located on the layout drawings. In addition, include the following:
        1) Clearances for servicing equipment, including space for equipment disassembly required for periodic maintenance.
        2) Exterior wall and foundation penetrations.
        3) Fire-rated wall and floor penetrations.
        4) Equipment connections and support details. Demonstrate evidence of dimensional coordination.
        5) Sizes and location of required concrete pads and bases.
    b. Prepare and submit point-to-point interconnection wiring diagrams. The diagrams shall identify all external interconnecting wiring associated with all new and modified existing equipment. The diagrams shall be developed for performance of the Work and to document terminations.
        1) The point-to-point interconnection wiring diagrams shall include:
            a) Wiring and conduit numbers
            b) Terminal strip numbers for each wire termination
            c) Color coding
            d) Raceway and boxes in which wiring is to be located
            e) Location and functional name of items to which wiring is connected.
        2) Use information obtained from approved submittals, record drawings, and field inspections as necessary to complete the diagrams.
    c. Indicate scheduling, sequencing, movement, and positioning of large equipment into the building during construction.
    d. Prepare floor plans, elevations, and details to indicate penetrations in floors, walls, and ceilings and their relationship to other penetrations and installations.

e. Prepare reflected ceiling plans to coordinate and integrate installations, air outlets and inlets, light fixtures, communications systems components, sprinklers, and other ceiling-mounted devices.

D. Record Documents: Prepare record documents in accordance with the requirements in Division 01 Section "Closeout Procedures". In addition to the requirements specified in Division 1, indicate installed conditions for:
1. Raceway systems, size, contents, and location, for both exterior and interior; locations of control devices; distribution and branch electrical circuitry; and fuse and circuit breaker size and arrangements.
2. Equipment locations (exposed and concealed), dimensioned from prominent building lines.
3. Approved substitutions, Contract Modifications, and actual equipment and materials installed.

E. Operations and Maintenance Manuals
1. Prepare maintenance manuals in accordance with Division 01 Section "Closeout Procedures". Compile and assemble the operation and maintenance data of equipment specified in Division 26 into a separate set of vinyl-covered three-ring binders, tabulated and indexed for easy reference. Data shall clearly indicate all options and accessories.
2. In addition to the requirements specified in Division 1, include the following information for equipment items:
a. Manual index.
b. Manufacturers' descriptive literature.
c. Final signed submittal copy of shop drawings.
d. As-built drawings.
e. Spare parts and replacement parts lists.
f. Manufacturers' maintenance and service manuals.
g. Project-specific description of operation.
h. Wiring diagrams.
i. Manufacturers' guarantee and warranty.
j. Test results.
k. Motor list, including motor description, motor horsepower, motor voltage, fuse size, fuse type, and overload size.
l. Fuse list including fuse location, fuse size, fuse type, and load description.
m. Fixture ballast schedule.
n. Lamp schedule.
3. Materials for more than one item shall clearly indicate which item or items are included on the Project.
4. Shop Drawings which are folded and punched for insertion in the Manual shall be such that the Drawings can be unfolded without removing them from the Manual, and all information shall be legible.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the project identified with names, model numbers, types, grades, compliance labels, and other information needed for identification.

1.6 SPECIAL WARRANTY

A. Compile and assemble the warranties specified in Division 26 into a separate set of vinyl-covered three-ring binders, tabulated and indexed for easy reference.

B. Provide complete warranty information for each item. Information to include:
   1. Product or equipment list.
   2. Date of beginning of warranty or bond.
   3. Duration of warranty or bond.
   4. Names, addresses, and telephone numbers and procedures for filing a claim and obtaining warranty services.

1.7 DEFINITIONS

A. Finished locations. The following are defined as finished locations:
   1. Areas with carpet or tile floors.
   2. Areas with lay-in ceiling tile, fixed ceiling tile, and special architectural ceiling treatment.
   3. Areas with tiled, plastered, or paneled walls.

B. Interior locations. The following are defined as interior locations:
   1. Any location within the boundaries of the foundation of any building.
   2. Any location within the superstructure of other structures not classified as buildings.

C. Wet locations. The following are defined as wet locations:
   1. All exterior locations.
   2. All interior locations below grade.
   3. All interior locations where wet materials are processed, pumped, transported, or stored.

D. Corrosive locations. The following are defined as corrosive locations.
   1. All locations with chemical feed/transfer equipment
   2. All locations with chemical storage tanks
   3. All locations where chemical storage drums are located.

E. Hazardous (classified) locations. The following are defined as hazardous (classified) locations.
   1. All hazardous (classified) locations and their hazard classification are shown.

1.8 FAULT CURRENT, COORDINATION, AND SELECTIVITY STUDY

A. The Contractor shall provide to the Engineer three copies of a written, detailed, documented selective power distribution system report showing fault currents available using log-log graphical representation. The report shall be stamped by a professional Electrical engineer registered in Ohio. The report shall be based upon data compiled by the Contractor from the actual equipment installed. The report must be submitted and approved prior to project closeout. At a minimum, the report shall contain the following:
   1. Overall system description and diagrams.
   2. System selectivity under fault and other overload conditions.
   3. Ground fault system operation and selectivity.
   4. Tabularized ratings and settings of protection devices verified by electrical testing to ensure coordination and selectivity. They shall include all:
      a. Momentary and interrupting ratings.
      b. Relays and shunt trip devices.
      c. Fuses.

d. Circuit breakers.

5. Conclusions and recommendations.

B. Calculated fault currents shall be provided at the secondary of each transformer, at each piece of service equipment, between service equipment and each motor control center, switchboard or switchgear and for at least one feeder/branch circuit for each motor control center, switchboard, or switchgear. They shall include:

1. Equipment and conductor damage curves.
2. Pick-up and time current characteristics.
3. Short circuit data.
4. Detailed description of test procedures.
5. Design calculations.

1.9 SCHEDULING

A. General: It is mandatory that the facility be maintained in operation during construction and that periods of shut-down due to "line changeovers, etc. are held to a minimum. These outages must be scheduled with and have the concurrence of the Engineer and the Owner. Further, it is mandatory that the completion of various stages of the electrical work coincide with the other phases of construction to maintain and permit operation of new installations as construction progresses.

1.10 COORDINATION WITH WORK OF OTHER TRADE CONTRACTORS

A. General

1. Coordinate all requirements of the Work of this Division with other Trade Contractors. Such requirements include, but are not limited to, locations, sizes, anchors, and similar items.
2. Provide all necessary information to other Trade Contractors for such coordination. Such information shall include conforming Shop Drawings, conforming Product Data, and all other required data.
3. This Contractor shall bear all costs for providing affected Work of related Trade Contractor(s) with no change to the Contract Sum or Date of Substantial Completion.

B. Foundations, Bases, Curbs, and Supports

1. Provide and coordinate all requirements for foundations, bases, curbs, and supports with the related Trade Contractor(s).
2. Provide required dimensions, templates, and all required information on anchors, sleeves, and cast-in-place accessories, including dimensions, to the related Trade Contractor(s).

C. Openings, Recesses, and Chases: Coordinate all requirements and locations for openings, recesses, and chases with the related Trade Contractor(s).

D. Final Connections: Coordinate with the related Trade Contractor(s) all requirements for roughing-in and final connections for equipment installed under this Division.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 INSTALLATION

A. Rough-In
   1. Verify final locations for rough-ins with field measurements and with the requirements of the actual equipment to be connected.
   2. Refer to equipment specifications in Divisions 02 through 40 for rough-in requirements.

B. Electrical Installations: Sequence, coordinate, and integrate the various elements of electrical systems, materials, and equipment. Comply with the following requirements:
   1. Coordinate electrical systems, equipment, and materials installation with other building components.
   2. Verify all dimensions by taking field measurements.
   3. Coordinate and provide chases, slots, and openings in other building components during progress of construction, to allow for electrical installations.
   4. Coordinate the installation of required supporting devices and sleeves to be set in poured-in-place concrete or supported from or on other structural components, as they are constructed.
   5. Sequence, coordinate, and integrate installations of electrical materials and equipment for efficient flow of the work. Give particular attention to large equipment requiring positioning prior to closing in the building and equipment which must be placed in service before further construction can take place.
   6. Where mounting heights are not detailed or dimensioned, install systems, materials, and equipment to provide the maximum headroom possible.
   7. Coordinate connection of electrical systems with exterior underground and overhead utilities and services. Comply with requirements of governing regulations, franchised service companies, and controlling agencies. Provide required connection for each service and place each in proper operating order.
   8. Install systems, materials, and equipment to conform with approved submittal data, including coordination drawings, to greatest extent possible. Conform to arrangements indicated by the Contract Documents, recognizing that the work is shown only in diagrammatic form. Where coordination requirements conflict with individual system requirements, refer conflict to the Engineer before final placement.
   9. Install systems, materials, and equipment level and plumb, parallel and perpendicular to other building systems and components, where installed exposed in finished spaces.
   10. Install electrical equipment to facilitate servicing, maintenance, and repair or replacement of equipment components. As much as practical, connect equipment for ease of disconnecting, with minimum of interference with other installations.
   11. Install systems, materials, and equipment giving right-of-way priority to systems required to be installed at a specified slope.
   12. Wiring for equipment furnished by other Contractors shall be provided as specified under the Electrical Contract based on the equipment rating and motor horsepower as specified in the Contract Documents. If the equipment provided by the General, and Mechanical Contractors has different rating or horsepower, the General and Mechanical Contractors shall provide for any necessary electrical changes to accommodate the equipment furnished at no change in contract price. This Contractor shall verify actual equipment nameplate electrical ratings (voltage, horsepower, amps, etc.) match the specified electrical system being supplied to the equipment. Any discrepancies shall be brought to the attention of the Engineer prior to equipment being connected.

3.2 LOAD BALANCING

A. It shall be the responsibility of the Contractor to balance the loads on the service system, all distribution systems, and all power equipment, so that the variation in amperes per phase readings shall not exceed 5% under normal operating conditions.

B. Special care shall be taken during load balancing to prevent reverse rotation of motors.

C. If, during load balancing, a load is shifted from one phase to another in a color-coded system, the Contractor shall paint or tape the ends of the wire at all outlet points with the proper color code for that phase. Failure to do so shall constitute justifiable grounds to require the Contractor to replace the entire circuit with the proper coded wire at no expense to the Owner or Engineer.

3.3 CUTTING AND PATCHING

A. General: Perform cutting and patching in accordance with the following requirements:
   1. Perform cutting, fitting, and patching of electrical equipment and materials required to:
      a. Uncover work to provide for installation of ill timed work.
      b. Remove and replace defective work.
      c. Remove and replace work not conforming to requirements of the Contract Documents.
      d. Remove samples of installed work as specified for testing.
      e. Install equipment and materials in existing structures.
      f. Upon written instructions from the Engineer, uncover and restore work to provide for the Engineer observation of concealed work.
   2. Cut, remove, and legally dispose of selected electrical equipment, components, and materials as indicated, including, but not limited to, removal of electrical items indicated to be removed and items made obsolete by the new work. Existing electrical items not indicated to be reused are to be removed.
   3. Protect the structure, furnishings, finishes, and adjacent materials not indicated or scheduled to be removed.
   4. Provide and maintain temporary partitions or dust barriers adequate to prevent the spread of dust and dirt to adjacent areas.
   5. Protection of Installed work. During cutting and patching operations, protect adjacent installations.
   6. Patch finished surfaces and building components using new materials specified for the original installation and experienced Installers. Installers' qualifications refer to the materials and methods required for the surface and building components being patched.
      a. Refer to Division 1 section "References" for definition of experienced "Installer."
   7. The Contractor shall install his work in such a manner and at such times as shall require a minimum of cutting and patching of the building structure.
   8. Certain areas require this Contractor to remove, add to, or relocate portions of existing Work. It shall be this Contractor's responsibility to remove ceilings, portions of walls, etc., in a manner so that he may install new Work. This Contractor shall then patch, repair and/or replace ceilings, walls etc., to match existing conditions. The above applies to all areas not specifically indicated on Architectural Drawings as Work to be performed by General Trades Contractor(s).
   9. If the Contractor fails to do any required patching or repair any damage resulting from the installation of the electrical Work, such patching or repairing shall be done by the Owner and the cost shall be paid by the Contractor.

3.4 ELECTRICAL DEMOLITION

A. General

1. In general, the notation to remove a piece of equipment as indicated on the Drawings shall be interpreted to also include the removal of all electrical equipment, conduit, wires and appurtenances associated with the equipment. This includes, but is not limited to: all wires and conduit from the motor control center starter to the equipment; and all disconnects, remote switches and starters; all controls, alarms, conduit and instrumentation, both local and remote, and all supports, braces and hangers.
2. Electrical removals also consist of the removal of existing transformers, distribution switchboards, control panels, motors, conduits and wires, poles and overhead wiring, panel boards, lighting fixtures, and miscellaneous electrical equipment all as shown, specified, or required to perform the Work.
3. All removals of electrical equipment and appurtenances shall be in complete conformance with the requirements of Division 26.
4. It is the Contractor's responsibility as part of this work to maintain all existing electrical systems including power, lighting, intercommunication and instrumentation in continuous, acceptable operation. It is possible that during the period of construction some wiring may be cut or damaged either accidentally or otherwise. The Contractor shall install and maintain any and all temporary wiring (as approved by the Owner) required to keep all electrical apparatus in acceptable operating condition.
5. As soon as possible, the Contractor shall reinstall cut or damaged circuits in their permanent locations.
6. Where any electrical system component is damaged during work on this project and replaced in accordance with this section, the replaced work shall meet all requirements specified in Division 26 even though the damaged components may not have met the requirements of Division 26 prior to being damaged.
7. Where existing electrically operated equipment is relocated, the power and control wiring and appurtenant devices shall be relocated to accommodate same. Installations and materials shall conform to requirements specified in Division 26.
8. Electrical equipment, conduit, wire, and fixtures shall be relocated as necessary to accommodate installation of new and relocated electrically operated equipment and to accommodate structural alterations to existing facilities such as floors, walls, entrance ways, ducting, process equipment, and piping.
9. All equipment and major lengths of wiring retired and removed shall remain the property of the Owner unless shown or directed otherwise and shall be placed in storage on the site by the Contractor where ordered.
10. Existing Conduit Location
    a. In existing structures at this project, there is electrical conduit embedded in concrete. It shall be the responsibility of the Contractor, under this section, to attempt to locate and mark the existence of any conduit embedded in areas where, as part of this Contract, the concrete is to be drilled or cut into for any purpose.
    b. Contractor shall use every available means possible to attempt to locate existing conduit. Whenever a hole is to be cut into an existing slab, wall, or other structural concrete, that area shall be X-rayed prior to drilling to show the locations of conduits and resteel.

B. Electrical Equipment and Fixtures

1. Remove existing electrical equipment and fixtures where shown or required with such care as may be required to prevent unnecessary damage, to keep existing systems in operation and to keep the integrity of the grounding systems.

C. Switchboards
   1. Remove and modify distribution switchboards as shown.
   2. Disconnect and dismantle switchboards that are to be removed and dispose of all components off the site.
   3. Remove circuit breakers and other control equipment that will no longer be used from modified switchboards unless otherwise shown or specified.
   4. Cut square all new openings into the modified switchboard panels and dress smooth to the dimensions required for the installation of the new equipment.

D. Motors
   1. Disconnect and remove motors where shown or specified.
   2. Remove from the site motors not designated to remain the property of the Owner.
   3. Store in an enclosed, heated storage area motors or other electrical gear designated for reuse.

E. Conduit and Wire
   1. Remove conduits and wires where shown, or associated with equipment being removed.
   2. Cut abandoned conduits in floor or ceiling slabs, or in walls, flush with the slab or wall at the point of entrance. Plug the conduit suitably and repair the area in a flush, smooth, approved manner.
   3. Disassemble and remove from the site exposed conduits and their supports.
   4. Repair all areas of work to prevent rust spots on exposed surfaces.
   5. Dispose of all removed wire, conduits, supports, and appurtenances.

F. Underground Ducts
   1. Remove wiring in the underground duct system where shown or otherwise required.
   2. Verify the function of all wiring before disconnecting and removing it.
   3. Plug ducts which are not to be reused, where they enter buildings and make watertight.

G. Direct-Burial Cable
   1. Abandon direct-burial cable where shown.
   2. Disconnect such cable at both ends of the run.
   3. Cut back the cable to the point of entrance of a building or structure.
   4. Patch and make watertight all openings in buildings for entrance of abandoned direct-burial cable.

H. Overhead Wiring
   1. Abandon poles and overhead wiring as shown and specified.
   2. Existing substation and poles owned by the local electric utility company will be removed by the local electric utility company.
   3. Remove completely from the site abandoned poles not owned by the local electric utility company.
   4. Perform this work after the new service has been completed and energized, and in accordance with the approved schedule.

5. Make all the necessary arrangements with the local electric utility company for the removal of their transformers and metering equipment after the new electrical system has been installed and energized.

I. Lighting Fixtures
   1. Carefully remove and relocate lighting fixtures as shown on the Drawings.
   2. Remove fixtures from the project site that are not shown to be relocated.

J. Panelboards
   1. Remove panelboards where shown and dispose of off the project site.
   2. Perform all cutting and patching necessary for the removal and replacement of panelboards.

K. Miscellaneous Electrical Equipment
   1. Remove wall switches, receptacles, starters, and other miscellaneous electrical equipment as required and dispose of off the project site.
   2. Remove all equipment with care so as to minimize damage to architectural and structural members. Repair any damage incurred as herein specified.

3.5 CLEANING

A. General: When all work is completed and has been tested and accepted by the Engineer, the Contractor shall clean all light fixtures, equipment, and exposed surfaces that have been directly affected by this work. The Contractor, insofar as the work is concerned, shall at all times keep the premises in a neat and orderly condition and at the completion of the work shall properly clean up and remove any excess materials from the site.

END OF SECTION 26 0505

SECTION 26 0510

BASIC ELECTRICAL MATERIALS AND METHODS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to provide basic electrical materials in accordance with the plans and as specified herein.

B. This section includes limited scope general construction materials and methods for application with electrical installations as follows:
   1. Excavation for underground utilities and services, including underground raceways, vaults, and equipment.
   2. Miscellaneous metals for support of electrical materials and equipment.
   3. Nailers, blocking, fasteners, and anchorage for support of electrical materials and equipment.
   4. Joint sealers for sealing around electrical materials and equipment, and for sealing penetrations in fire and smoke barriers, floors, and foundation walls.
   5. Concrete used for the following:
      a. Housekeeping pads.
      b. Pipe supports.
      c. Filling in boxouts in floor slabs, after conduit installation.
      d. Pole foundations.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work associated with basic electrical materials in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein. Where provisions of the pertinent codes and standards conflict with this specification, the more stringent provision shall govern.
   1. American Institute of Steel Construction (AISC) "Specifications for the Design, Fabrication, and Erection of Structural Steel for Buildings."
   2. American Welding Society (AWS) D1.1 "Structural Welding Code - Steel."
   3. National Electrical Code (NEC).

B. Qualifications
   1. Installer Qualifications. Engage an experienced Installer for the installation and application of joint sealers.
   2. Qualify welding processes and welding operators in accordance with American Welding Society (AWS) D1.1 "Structural Welding Code -Steel."
      a. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and materials certifications as required.

B. Submit the following in accordance with Conditions of Contract and Division 01 specification sections.
   1. Product data for joint sealers.
   2. Shop drawings detailing fabrication and installation for metal fabrications and wood supports and anchorage for electrical materials and equipment.
   3. Samples of joint sealer, consisting of strips of actual products showing full range of colors available for each product.
   4. Welder certificates, signed by Contractor, certifying that welders comply with requirements specified under "Quality Assurance" article of this section.

1.5 JOB CONDITIONS

A. Apply joint sealers under temperature and humidity conditions within the limits permitted by the joint sealer manufacturer. Do not apply joint sealers to wet substrates.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver joint sealer materials in original unopened containers or bundles with labels informing about manufacturer, product name and designation, color, expiration period for use, pot life, curing time, and mixing instructions for multicomponent materials.

B. Store and handle joint sealer materials in compliance with the manufacturer's recommendations to prevent their deterioration and damage.

1.7 DEFINITIONS

A. Additional Excavation: Where excavation has reached required subgrade elevations, if unsuitable bearing materials are encountered, continue excavation at the direction of the Engineer until suitable bearing materials are reached. The Contract Sum may be adjusted by an appropriate Contract Modification.

B. Subbase as used in this section refers to the compacted soil layer used in pavement systems between the subgrade and the pavement base course material.

C. Subgrade as used in this section refers to the compacted soil immediately below the slab or pavement system.

D. Unauthorized excavation as used in this section consists of removal of materials beyond indicated subgrade elevations or dimensions without specific direction from the Engineer.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Soil Materials: Provide soil materials as specified in Division 31 - Earthwork.

B. Miscellaneous Metals and Reinforcing Materials
   1. Provide steel plates, shapes, bars, and bar grating conforming to ASTM A 36.
   2. Provide cold-formed steel tubing conforming to ASTM A 500.
   3. Provide hot-rolled steel tubing conforming to ASTM A 501.
   4. Provide steel pipe conforming to ASTM A 53, Schedule 40, welded.
   5. Provide non-shrink, non-metallic grout which is pre-mixed, factory-packaged, non-staining, non-corrosive, non-gaseous grout, recommended for interior and exterior applications.
   6. Provide fasteners which are zinc-coated, type, grade, and class as required.
   7. Provide deformed reinforcing bars conforming to ASTM A615, Grade 40 or 60, unless otherwise indicated.
   8. Provide reinforcing materials with size and placement as shown on the plans.
   9. Provide welded wire fabric conforming to ASTM A185.

C. Miscellaneous Lumber
   1. Provide framing materials that are Standard Grade, light framing size lumber of any species. Number 3 Common or Standard Grade boards complying with West Coast Lumber Inspection Bureau (WCLIB) or American Wood Preservers Association (AWPA) rules, or Number 3 boards complying with Southern Pine Inspection Bureau (SPIB) rules. Lumber shall be preservative treated in accordance with AWPA LP-2, and kiln dried to a moisture content of not more than 19 percent.
   2. Provide construction panels which are plywood panels; American Plywood Association (APA) C-D PLUGGED INT, with exterior glue; thickness as indicated, or if not indicated, not less than 15/32 inch.

D. Joint Sealers
   1. Provide joint sealers, joint fillers, and other related materials compatible with each other and with joint substrates under conditions of service and application.
   2. Provide colors as selected by the Engineer from manufacturer's standard colors.
   3. Provide the following types of elastomeric joint sealers:
      a. One-part, mildew-resistant, silicone sealant complying with ASTM C 920, Type S, Grade NS, Class 25, for uses in non-traffic areas for glass, aluminum, and nonporous joint substrates, formulated with fungicide, intended for sealing interior joints with non-porous substrates; and subject to in-service exposure to conditions of high humidity and temperature extremes.
   4. Provide fire-resistant watertight joint sealers which are two-part, foamed-in-place, silicone sealant formulated for use in through-penetration firestopping around cables, conduit, pipes, and duct penetrations through fire-rated walls and floors. Sealants and accessories shall have fire resistance ratings indicated, as established by testing identical assemblies in accordance with ASTM E 814, by UL, or other testing and inspection agency acceptable to authorities having jurisdiction. Material shall be a closed-cell, non-adhering material.

E. Concrete: Provide concrete as specified in Division 03 - Concrete.

2.2 MANUFACTURERS

A. Available Products: Subject to compliance with requirements, products which may be incorporated in the Work include, but are not limited to, the following:
   1. One Part, Mildew-Resistant, Silicone Sealant
      a. "Dow Corning 786," Dow Corning Corp.

b. "SCS 1702 Sanitary," General Electric Co.
c. "863 #345 White," Pecora Corp.
d. "Proglaze White," Tremco Corp.
e. "OmniPlus," Sonneborn Building Products Div.

2. Fire Resistant Joint Sealers
   a. "Dow Corning Fire Stop Foam," Dow Corning Corp.
   b. "Pensil 851," General Electric Co.

PART 3 - EXECUTION

3.1 COORDINATION

A. Prior to all work of this section, carefully inspect the installed work of all other trades and verify that all such work is complete to the point where this installation may properly commence.

B. Field-verify all locations and dimensions to ensure that the equipment will be properly located, readily accessible, and installed in accordance with all pertinent codes and regulations, the contract documents, and the referenced standards.

C. The work shall be carefully laid out in advance, and where cutting, drilling, etc., of floors, walls, ceilings, or other surfaces is necessary for proper installation, this work shall be carefully done, and any drainage to building, piping, or equipment shall be repaired by skilled mechanics of the trades involved at no additional cost to the Owner.

D. In the event any discrepancies are discovered, immediately notify the Engineer in writing. Do not proceed with installation in areas of discrepancy until all such discrepancies have been fully resolved.

3.2 PREPARATION

A. Preparation for Joint Sealers
   1. Clean surfaces of joints immediately before applying joint sealers to comply with recommendations of joint sealer manufacturer.
   2. Apply joint sealer primer to substrates as recommended by joint sealer manufacturer. Protect adjacent areas from spillage and migration of primers, using masking tape. Remove tape immediately after tooling without disturbing joint seal.

3.3 EXCAVATION

A. Comply with the applicable requirements of Division 31 - Sitework.

B. For the excavation of underground vaults and electrical structures conform to elevations and dimensions shown within a tolerance of +0.10 foot and extending a sufficient distance to permit placing and removal of concrete formwork, installation of services, other construction, and for inspection.
   1. Excavate, by hand, area within drip line or large trees. Protect the root system from drainage and drying out. Maintain moist conditions for root system and cover exposed roots with burlap. Paint root cuts of 1 inch in diameter and larger with emulsified asphalt tree paint.
   2. Take care not to disturb bottom of excavation. Excavate by hand to final grade just before concrete reinforcement or precast concrete is placed.

C. Excavate trenches for electrical installation as follows:
   1. Excavate trenches to the uniform width, sufficiently wide to provide ample working room and a minimum of 6 to 9 inches clearance on both sides of raceways and equipment.
   2. Excavate trenches to depth indicated or required.
   3. Limit the length of open trench to that in which installations can be made and the trench backfilled within the same day.
   4. Where rock is encountered, carry excavation below required elevation and backfill with a layer of crushed stone or gravel prior to installation of raceways and equipment. Provide a minimum of 6 inches of stone or gravel cushion between rock bearing surface and electrical installations.

D. Backfill excavations as promptly as work permits, but not until completion of the following:
   1. Inspection, testing, approval, and locations of underground utilities have been recorded.
   2. Removal of concrete formwork.
   3. Removal of shoring and bracing, and backfilling of voids.
   4. Removal of trash and debris.

E. Where subsidence occurs at electrical installation excavation during the period 12 months after Substantial Completion, remove surface treatment (i.e., pavement, lawn, or other finish), add backfill material, compact to specified conditions, and replace surface treatment. Restore appearance, quality, and condition of surface or finish to match adjacent areas.

3.4 INSTALLATION

A. Erection of Metal Supports and Anchorage
   1. Cut, fit, and place miscellaneous metal fabrications accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.
   2. Provide field welding which complies with AWS "Structural Welding Code."

B. Erection of Wood Supports and Anchorage
   1. Cut, fit, and place nailers, blocking, and anchorage accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.
   2. Select fastener sizes that will not penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood members.
   3. Attach to substrates as required to support applied loads.

C. Application of Joint Sealers
   1. Comply with joint sealer manufacturers' printed application instructions applicable to products and applications indicated, except where more stringent requirements apply.
   2. Comply with recommendations of ASTM C 962 for use of elastomeric joint sealants.
   3. Immediately after sealant application and prior to time shinning or curing begins, tool sealants to form smooth, uniform beads, to eliminate air pockets, and to ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint. Do not use tooling agents that discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.
   4. Install firestopping sealant, including forming, packing, and other accessory materials, to fill openings around electrical services penetrating floors and walls, to provide fire stops with fire resistance ratings indicated for floor or wall assembly in which penetration occurs. Comply with installation requirements established by testing and inspecting agency. Use dams to obtain proper sealing.

D. Installation of Housekeeping Pads

1. Strength, spacing, and placement of equipment housekeeping pads. Provide a housekeeping pad for all floor-mounted equipment, unless noted otherwise. Fabricate pad as follows:
    a. Coordinate size of housekeeping pad with actual equipment provided. Fabricate base 4 inches larger in both directions than the overall dimensions of the supported equipment.
    b. Form concrete pads with framing lumber treated with form release compounds. Provide 1 inch chamfer on top edge and corners of pad.
    c. Install reinforcing bars and place anchor bolts and sleeves to facilitate securing equipment.

END OF SECTION 26 0510

SECTION 26 0519

WIRES, CABLES, AND CONNECTORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to install wires, cables, and connectors in accordance with the plans and as specified herein.

B. Miscellaneous: This section includes wires, cables, and connectors for power, lighting, signal, control, and related systems rated 600 volts and less.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work associated with wires, cables, and connectors in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
   1. National Fire Protection Association (NFPA) 70, National Electrical Code (NEC).
   2. Underwriters' Laboratories, Inc. (UL) Compliance. Provide components which are listed and labeled by UL under the following standards.
      a. UL Standard 83Thermoplastic Insulated Wires and Cables.
      b. UL Standard 486AWire Connectors and Soldering Lugs for Use with Copper Conductors.
      c. UL Standard 854 Service Entrance Cable.
   3. National Electrical Manufacturers Association/lnsulated Cable Engineers Association (NEMA/ICEA) Compliance. Provide components which comply with the following standards:
      a. WC-5 Thermoplastic Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.
      b. WC-7 Cross-Linked Polyethylene-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.
      c. WC-8 Ethylene Propylene Rubber-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.
   4. Institute of Electrical and Electronic Engineers (IEEE) Compliance. Provide components which comply with the following standards:
      a. Standard 82 Test Procedure for Impulse Voltage Tests on Insulated Conductors.

B. Regulatory Requirements: Comply with provisions of the following code and conform to applicable codes and regulations regarding toxicity of combustion products of insulating materials.

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and materials certifications as required.

B. Submittals: Submit the following in accordance with Conditions of Contract and Division 01 specification sections:
   1. Product data for electrical wires, cables, and connectors.
   2. Product data for Megger insulation testing instrument.
   3. Report sheets for Megger testing.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver wire and cable properly packaged in factory-fabricated-type containers, or wound on NEMA specified type wire and cable reels.

B. Store wire and cable in clean, dry space in original containers. Protect products from weather, damaging fumes, construction debris, and traffic.

C. Handle wire and cable carefully to avoid abrading, puncturing, and tearing wire and cable insulation and sheathing. Ensure that dielectric resistance integrity of wires/cables is maintained.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Wires and Cables
   1. Provide electrical wires and cables of manufacturer's standard materials as indicated by published product information designed and constructed as recommended by manufacturer for a complete installation, and for application indicated. Except as otherwise indicated, provide copper conductors with conductivity of not less than 98% at 20 deg C (68 deg F).
   2. Provide factory-fabricated wires of sizes, ampacity ratings, and materials for applications and services indicated. Where not indicated, provide proper wire selection as determined by Installer to comply with project's installation requirements, NEC and NEMA standards. Select from the following UL types those wires with construction features which fulfill project requirements:
      a. Provide Type RHW for dry and wet locations, maximum operating temperature 75 deg C (167 deg F). Insulation, moisture and heat-resistant cross-linked polyethylene; outer covering, moisture-resistant, flame-retardant, non-metallic covering; conductor, annealed copper, Class B stranding.
      b. Provide Type XHHW for dry locations, maximum operating temperature 90 deg C (194 deg F). Insulation, flame-retardant, cross-linked polyethylene; conductor, annealed copper, Class B stranding.
      c. Provide Type THW for dry and wet locations; maximum operating temperature 75 deg C (167 deg F). Insulation, moisture and heat-resistant, flame-retardant thermoplastic; conductor, annealed copper, Class B stranding.

d. Provide Type THWN/THHN for dry and wet locations; maximum operating temperature 75 deg C (167 deg F). Insulation, moisture and heat-resistant, flame-retardant thermoplastic; conductor, annealed copper, Class C stranding.
e. Provide Type MTW for dry locations, maximum operating temperature 90 deg C (167 deg F). Insulation, flame-retardant, moisture, heat and oil-resistant thermoplastic, Class C stranding.

3. VFD Cable
   a. General
      1) UL 1277, UL 1581.
      2) Flexible multi-conductor motor supply cable.
      3) 100% Overall foil or tape shield, drain wire, and PVC jacket.
      4) Bare uncoated copper ground conductor.
      5) Rated 1000VAC / 2000VAC Peak.
   b. Conductors
      1) ASTM B8/B33.
      2) Tinned copper conductors.
      3) Class C stranding.
   c. Insulation: Flame-retardant, moisture-resistant thermoset (XLP) insulation.
   d. Conductor Types: Type XHHW conductors, 1000-Volt, 90 deg C, wet or dry locations, UL 44.
4. Provide color coding for phase identification in accordance with requirements in Division 26 Section "Electrical Identification".

B. Connectors and Terminals
1. General: Provide UL-type factory-fabricated metal connectors and terminals of sizes, ampacity ratings, materials, types, and classes indicated.
2. Twist-on Connectors: Conforming to UL 486 C, consisting of a tapered spring with insulated outer covering.
3. Compression Connectors: Tin-plated copper. Configuration shall be tee, in-line, etc., as required.
4. Terminals: Tin-plated copper, compression locking fork tongue with insulated barrel.
5. Compression Lugs: Tin-plated copper, standard barrel, one-hole or two-hole as required.
6. Heat-Shrink Insulation: Heat-shrinkable polyolefin with an internally applied adhesive watertight sealant.
7. Motor Connection Kit: Consisting of compression lugs bolted together, cloth tape cover, and heat-shrink insulation.
8. Splice Kit: Consisting of compression connector and heat-shrink insulation.

C. Wire and Cable Accessories
1. Tapes and Insulating Materials
   a. Designed for use as electrical insulating tape.
   b. Plastic Tape: Vinyl, 7 mil, 3/4-inch wide, -15 to 100 deg C, UL 510.
   c. Rubber Tapes: Self-fusing, corona-resistant, compatible with specified insulations, minimum dielectric strength of 800 V per mil, 0 to 90 ^{0}C.
   d. Arc-Proofing: Thirty mil, up to 3-inches wide, rated for a 200-amp arc for 30 seconds.
   e. Heat Shrink Insulation: Heat shrinkable polyolefin, internal adhesive sealant, UL 486D.
2. Hardware
   a. General: Carbon steel, cadmium plated.
   b. Bolts: ASTM 449, hex-head, SAE Grade 5, UNC, Class 2B threads.

c. Nuts: ASME B18.2.2, hexagon, SAE Grade 5, UNC, Class 2B threads.
d. Flat Washers: ASME B18.22.1; type A plain, wide-series.
e. Compression (Belleville) Washers: Conical type washer, 0.0005-in.-thick.

3. Wire-Pulling Lubricant
a. Listed by Underwriters Laboratories.
b. Biodegradable, non-flammable, and non-toxic.
c. Solid residue of not more than 1.5 percent and a viscosity of at least 50,000 C.P.S.
d. Compatible with conductor insulation per IEEE 1210.

2.2 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include, but are not limited to, the following:

1. Wire and Cable
a. American Insulated Wire Corp.
b. Brintec Corp.
c. Carol Cable Co., Inc.
d. Senator Wire and Cable Co.
e. Southwire Company.

2. Connectors and Terminals for Wires and Cable Conductors
a. AMP.
b. Burndy Corporation.
c. Ideal Industries, Inc.
d. 3M Company.
e. O-Z/Gedney Co.
f. Raychem.
g. Thomas and Betts Corp.

3. Tapes and Insulating Materials
a. Okonite Company
b. Plymouth Rubber Company
c. Raychem
d. 3M Company
e. Tyco Corporation, AMP products

4. Wire-Pulling Lubricant
a. Polywater J.
b. High Performance Cable Lubricant.
c. Ideal.
d. Aqua-Jel 2.

PART 3 - EXECUTION

3.1 WIRE AND CABLE INSTALLATION

A. Uses Permitted

1. Install UL Type USE cable for all conductors provided between utility transformers and service entrance rated equipment.
2. Install UL Type RHW or XHHW cable for power feeders, motor branch circuits, panelboard feeder circuits, and below grade or exterior control and metering circuits.
3. Install UL Type THWN/THHN, THW, or XHHW wiring in conduit, for branch circuits for lighting, receptacles, and interior control and metering circuits.

4. Install UL Type MTW wiring interior to instrument and control panels. Conductors shall be stranded with at least 19 strands in the conductor.
5. Install VFD Cable for all branch circuits of VFD controlled equipment.

B. Install electrical cables, wires, and connectors in compliance with NEC.

C. Coordinate cable installation with other work.

D. Pull conductors simultaneously where more than one is being installed in same raceway. Use UL-listed pulling compound or lubricant, where necessary.

E. Use pulling means, including fish tape, cable, rope, and basketweave wire/cable grips which will not damage cables or raceways. Do not use rope hitches for pulling attachment to wire or cable.

F. Conceal all cable in finished spaces.

G. Install exposed cable parallel and perpendicular to surfaces or exposed structural members, and follow surface contours, where possible.

H. Power conductors shall be No. 12 AWG minimum. Control conductors may be No. 14 AWG where circuit amperes and the NEC allow and when length does not pose a voltage drop problem.

I. Conductors shall be sized such that voltage drop does not exceed 3% for branch circuits or 5% for feeder/branch circuit combination.

J. Provide adequate length of conductors within electrical enclosures and train the conductors to terminal points with no excess. Bundle multiple conductors, with conductors larger than No. 10 AWG cabled in individual circuits. Make terminations so there is no bare conductor at the terminal.

K. Provide connectors, splices, or lugs as required for all oversized conductors due to voltage drop.

3.2 CONNECTOR, TERMINAL, AND SPLICE INSTALLATION

A. Uses Permitted
1. Install twist-on connectors for lighting, communication, and receptacle branch circuits and utilization equipment only in size No. 8 AWG and smaller and only in finished areas.
2. Install forked-tongue terminals on control and metering conductors which connect to terminal blocks.
3. Install motor connection kits on all polyphase induction motors.
4. Install compression connectors and lugs for all other connections.

B. Use splice and tap connectors which are compatible with conductor material.

C. Install all compression connectors, splices, and lugs with a racheting tool which will not release until proper compression is achieved.

D. Install splices which possess equivalent-or-better mechanical strength and insulation ratings than conductors being spliced.

E. Service entrance conductors shall be installed without splices. Electrical equipment feeders shall be spliced only where shown or specifically approved. Control and metering conductors shall be installed without splices.

F. All splices shall be made only by specific permission of the A/E, and then only in manholes or pullboxes, and shall be sealed watertight with a heat-shrink insulation.

G. Tighten electrical connectors and terminals in accordance with manufacturer's published torque tightening values. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Standards 486A and 486B.

3.3 FIELD QUALITY CONTROL

A. The Contractor shall test each electrical circuit after permanent cables are in place with terminators installed, but before cable or wire is connected to equipment or devices to demonstrate that each circuit is free from improper grounds and short circuits.

B. The Contractor shall test by Megger Test, the insulation resistance between phases and from each phase to ground for each of the following feeder and motor branch circuits:
1. Motor Control Center.
2. Panelboard.
3. Switchboards.
4. Switchgear.
5. Motors.

C. The Megger Testing shall be witnessed by the A/E. The A/E shall be notified at least 48 hours in advance of testing.

D. Measure the insulation resistance at 500 volts dc with a hand-cranked or motor-driven "Megger" insulation testing instrument. Battery-operated test instruments are not permitted. All test instruments are to be provided by the Contractor.

E. If any insulation resistance measures less than 50 megohms, the cable shall be considered faulty with the cable failing the insulation test. In moist environments, bag the ends of the cable to prevent a faulty Megger test.

F. Any cable which fails the insulation tests or which fails when tested under full load conditions shall be replaced with new cable for the full length and retested. Corrective action and repeated tests shall be accomplished at the Contractor's own expense.

G. Maintain testing report sheets identifying each cable tested, what each feeder or motor branch circuit will be connected to, and the level of insulation resistance measured. Test reports shall be signed by the tester, initialed by the A/E and sent to the A/E within 48 hours.

END OF SECTION 26 0519

SECTION 26 0523

SIGNAL AND COMMUNICATION CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 specification sections, apply to this section.

B. Related Sections: The following sections contain requirements that relate to this section:
   1. Division 26 Section “Basic Electrical Requirements”.
   2. Division 26 Section “Basic Electrical Materials and Methods”.
   3. Division 26 Section “Wires and Cables”.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to furnish and install communication and signal cables in accordance with the plans and as specified herein.

B. Cables and Accessories: This section includes cables and connectors designed for and used in communication, control, data, and signal circuits.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.

B. Connected Equipment Manufacturer Approval: Where cables specified in this section are used to provide signal paths for systems specified in other sections of these specifications or for systems furnished under other contracts, obtain review of the cable characteristics and approval for use with the connected system equipment by the connected equipment manufacturers.

C. Electrical Component Standard: Provide work complying with applicable requirements of National Fire Protection Association (NFPA) 70 "National Electrical Code (NEC)."

D. Toxicity: Comply with applicable codes and regulations regarding toxicity of combustion products of materials used in communication and signal cables.

E. National Electrical Manufacturer's Association/Insulated Cable Engineers Association (NEMA/ICEA) Compliance: Comply with NEMA/ICEA Standard Publication WC 5, "Thermoplastic Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy"; WC 30, "Color Coding of Wires and Cables," pertaining to signal transmission cable; and WC 41, "Coaxial Communication Cable."

F. American Society for Testing and Materials (ASTM) Compliance: Comply with applicable requirements of ASTM B 1, B 2, B 3, B 8, B 33, D 2219, and D 2220. Provide copper conductors with conductivity of not less than 98 percent at 20 deg C (68 deg F).

G. Underwriters' Laboratories, Inc. (UL) Compliance: Comply with applicable requirements of UL Standard 83, "Thermoplastic Wires and Cables"; UL 486 A, "Wire Connectors and Soldering Lugs for Use with Copper Conductors"; and UL 910, "Test Method for Fire and Smoke Characteristics of Cables Used in Air Handling Spaces." Provide products that are UL listed and labeled.

H. Electronic Industries Association (EIA) Compliance: Comply with EIA Standards EIA-230, "Color Marking of Thermoplastic Wire," EIA-258, "Semi-Flexible Air Dielectric Coaxial Cables and Connectors, 50 Ohms," and TIA/EIA-568A, "Commercial Building Telecommunications Cabling Standard."

I. MIL-SPEC Compliance: Comply with MIL-C-3093, "Telephone Cable; Inside Distribution Wiring," MIL-C-55021, "Twisted-Pair and Triplet Cables; Hookups General Specifications," MIL-C-17/28, "Radio Frequency Flexible Coaxial Cables, 50 Ohms," and MIL-C-17/29, "Radio Frequency Flexible Coaxial Cables, 75 Ohms."

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and material certifications as required.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver wire and cable properly packaged in factory fabricated type containers, or wound on NEMA specified type wire and cable reels.

B. Store wire and cable in clean dry space in original containers. Protect products from weather, damaging fumes, construction debris, and traffic.

C. Handle wire and cable carefully to avoid abrading, puncturing, and tearing wire, cable insulation, and sheathing. Ensure that dielectric resistance and characteristic impedance integrity of the cable are maintained.

PART 2 - PRODUCTS

2.1 SHIELDED TWISTED PAIR CABLES

A. 600 Volt Rated Shielded Twisted Pair or Triplet Cables: Shielded twisted pair or triplet cable, 16 AWG stranded tinned copper conductors, polyethylene insulation, aluminum tape shield, 18 AWG tinned copper drain wire, UV stabilized PVC jacket, 100 percent shield coverage. Suitable for direct burial. Multiple pair cables shall have an overall shield and an overall PVC jacket.

2.2 CONTROL NETWORK CABLES

A. Ethernet: Four pair, unshielded, Category 6, 24 AWG, stranded copper with PVC insulation and PVC jacket. Cable shall be UL listed.

B. Fiber-Optic:

1. Multimode graded index, tight-buffered, optical glass fiber cores cable:
    a. Compatible with LED-based transmission system and suitable for fiber optic Ethernet LAN standards including point-to-point Fiber Optic Inter-Repeater Link (FOIRL) network, and ANSI standard Fiber Distribution Data Interface (FDDI) networks.
    b. Do not use cable with plastic fiber core construction.
    c. The number of cables and the number of fibers in each cable shall be as specified herein and as shown on the Drawings.
    d. Splitter Kits: The cable shall be provided with the necessary number of splitter kits to accommodate the number of terminations shown for each interconnection box on the Drawings.
    e. Cable shall be assembled with inner strength members, polyester core separator tape, Aramid yarn or similar strength members.
    f. Jackets: Inner PVC jacket with rip cord, and polyethylene outer jacket rip cord. Provide a cable outer jacket that is UV inhibited, fungus resistant and flame retardant.
    g. Attenuation losses: Shall be 3.5 dB/km or less at a wavelength of 850 nm and 1.0 dB/km or less at a wavelength of 1300 nm.
    h. Bandwidth: Minimum bandwidth shall be 160 MHz-km at 850 nm and 500 MHz-km at 1300 nm.
    i. Provide cable unaffected by continuous or intermittent submergence in water, damage from lightning strikes. Shall be resistant to fuel, petro-chemicals and other caustic or noxious materials.
    j. Cable shall be suitable for indoor and outdoor use conduit installation.
    k. Provide continuous inter- and intra- building installation, closet to closet, suitable for passing through inside conduit locations directly from outside conduit.
    l. Cable shall be UL listed as type OFN per NEC 770-51 and NEC 770-53.
    m. Cable specifications are as follows:
        1) Fiber Size: 62.5 micron/125 micron (core/cladding)
        2) Fiber Count: 12 fibers
        3) Nominal Cable Diameter: 0.256 inches
        4) Nominal Cable Weight: 33 pounds per 1000 ft
        5) Crush Resistance: 500 pounds per inch
        6) Maximum Tensile Load: 600 pounds (installation)
        7) Maximum Tensile Load: 135 pounds (in-service)
        8) Minimum Bend Radius: 5.1 inches (installation)
        9) Minimum Bend Radius: 2.6 inches (in-service)
        10) Operating Temperature: -40 to 80degC (core/cadding)
        11) Guaranteed to achieve 300/550 meters at 850/1300 nm for Gigabit Ethernet (IEEE 802.3z) standard-compliant links.
2. Single mode, tight-buffered, optical glass fiber cores cable:
    a. Compatible with laser-based transmission system and suitable for fiber optic Ethernet LAN standards including point-to-point Fiber Optic Inter-Repeater Link (FOIRL) network, and ANSI standard Fiber Distribution Data Interface (FDDI) networks.
    b. Do not use cable with plastic fiber core construction.
    c. The number of cables and the number of fibers in each cable shall be as specified herein and as shown on the Drawings.

d. Splitter Kits: The cable shall be provided with the necessary number of splitter kits to accommodate the number of terminations shown for each interconnection box on the Drawings.
e. Cable shall be assembled with inner strength members, polyester core separator tape, Aramid yarn or similar strength members.
f. Jackets: Inner PVC jacket with rip cord, and polyethylene outer jacket rip cord. Provide a cable outer jacket that is UV inhibited, fungus resistant and flame retardant.
g. Attenuation losses: Shall be 0.5 dB/km or less at a wavelength of 1310 nm and 0.4 dB/km or less at a wavelength of 1550 nm.
h. Provide cable unaffected by continuous or intermittent submergence in water, damage from lightning strikes.
i. Cable shall be suitable for indoor and outdoor use conduit installation.
j. Cable shall be UL listed as type OFN per NEC 770-51 and NEC 770-53.
k. Cable specifications are as follows:
    1) Fiber Size: 8.3 micron/125 micron (core/cladding)
    2) Fiber Count: 12 fibers
    3) Nominal Cable Diameter: 0.256 inches
    4) Nominal Cable Weight: 33 pounds per 1000 ft
    5) Crush Resistance: 500 pounds per inch
    6) Maximum Tensile Load: 600 pounds (installation)
    7) Maximum Tensile Load: 135 pounds (in-service)
    8) Minimum Bend Radius: 5.1 inches (installation)
    9) Minimum Bend Radius: 2.6 inches (in-service)
    10) Operating Temperature: -40 to 80degC (core/cadding)

2.3 CONNECTORS AND TERMINALS

A. Shielded Twisted Pair:
1. Provide terminals as specified in Division 26 Section "Wires, Cables, and Connectors."

B. Ethernet Cable:
1. Provide RJ45 plug at each end.

C. Fiber-Optic Cable:
1. Furnish connect micron core/claddings and components and use specific tools and methods as recommended by the connector manufacturer to form a complete connector system.
2. Provide fiber optic SC simplex connectors; multimode and single mode versions to match cable type. Connectors shall be polymer body with a precision zirconia ferrules.
    a. Connector Specifications
        1) Insertion Loss: 0.15/0.30 dB (typical/maximum)
        2) Durability Delta: 0.1 dB (1000 matings)
        3) Operating Temperature: -40 to +80°C
        4) Cable Retention: 40 pounds
3. Splicing/Splitting
    a. Contractor shall field splice each fiber to a pigtail cable at the termination enclosures. All splices shall be made by the fusion process and shall have a splice loss no greater than 0.35 dB. Loss measurement shall be performed at the time of splicing and documentation shall be furnished for each splice. Splice testing shall

be witnessed by the Owner's project representative. Prior to stripping the cable, Contractor shall record the cable length from the cable jacket. This length shall be documented and included in the test documentation.

2.4 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering control/signal cabling products that may be incorporated in the work include but are not limited to the following:

B. Manufacturers: Subject to compliance with requirements, provide products of one of the following:
   1. Cables.
      a. Alpha Communications.
      b. American Insulated Wire Corp.
      c. AT&T Network Systems.
      d. Belden Div; Cooper Industries.
      e. Berk-Tek Company.
      f. Cable Continental Cables Co.
      g. Furon Dekoron Division.
      h. Guardian Products Division, General Cable Corporation.
      i. Mohawk Wire & Cable Corp.
      j. Phelps Dodge Cable and Wire Co.
      k. Pirelli Cable Corp.
   2. Connectors.
      a. Thomas & Betts Corporation.
      b. 3M Company.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which communication and signal cables are to be installed. Notify Engineer/Architect in writing of conditions detrimental to proper completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer/Architect.

3.2 COORDINATION

A. Coordinate with other work, including wires/cables, boxes, and raceways, as necessary to interface installations of communication and signal cables with other work.

3.3 APPLICATIONS

A. Use 300 volt rated single or multiple pair signal cables for all analog dc signals (4-20 mA, 1-5 volt, etc.).

B. Use Ethernet cable for all telephone lines.

C. Use Ethernet cable for all control network connections, unless noted otherwise on the Drawings.

3.4 INSTALLATION

A. General: Install communication and signal cables in accordance with manufacturer's written instructions, in compliance with NEC, and in accordance with standard industry practice.

B. Coordinate installation with other work.

C. Install communication and signal cables without damaging conductors, shield, or jacket. Do not either in handling or installation bend cable to smaller radii than minimum recommended by manufacturer. Ensure that medium manufacturer's recommended pulling tensions are not exceeded. Pull conductors simultaneously where more than one is being installed in same raceway. Use pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Use pulling means, including fish tape, cable, rope, and basket weave wire/cable grips that will not damage cable or raceway.

D. Install all cables in conduit.

E. Splices are allowed only at indicated splice points. Where splices are indicated, use splice and tap connectors that are compatible with media material.

F. Tighten connectors and terminals, including screws and bolts, in accordance with manufacturer's published instructions for torque tightening values.

G. Cable Terminations: Terminate cables on numbered terminal blocks where cable terminations are made on backboards and in cabinets and outlet boxes.

H. Wiring at Backboards and Cabinets: Install conductors parallel to and at right angles to walls. Bundle, lace, and train the conductors to terminal points with no excess. Use wire distribution spools at points where cables are fanned or conductors turned. Label each terminal.

I. Conductor Terminations: Terminate conductors of cables on terminal blocks using tools recommended by terminal block manufacturer.

3.5 GROUNDING

A. Provide equipment grounding connections for telephone systems as indicated. Tighten connections to comply with tightening torque specified in UL Standard 486A to ensure permanent and effective grounding.

3.6 FIELD QUALITY CONTROL

A. Copper Cabling.
   1. Provide at least 10-days notice in writing when the cabling network is ready for final acceptance testing.
   2. All testing shall be in the presence of the Owner’s project representative.
   3. Test each UTP cable in accordance with EIA/TIA-568B guidelines to Category 6 performance testing parameters.
   4. Factory test results for patch cables will be acceptable where the factory testing parameters clearly meet or exceed the EIA/TIA-568B guidelines.
   5. Electronic test results shall be provided to the Owner’s project representative for review.

6. Any cable that fails to meet its specified performance characteristics shall be replaced with a new cable and retested.

B. Fiber-Optic Cabling.
1. Test each fiber strand in accordance with manufacturer's published test procedures.
2. Test each fiber strand at dual wavelengths.
   a. 850 nm and 1300 nm for multimode.
3. Cable performance shall meet or exceed the following performance criteria: multimode - 3.75 dB/km at 850 nm and 1.5 dB/km at 1310 nm.
4. Test each fiber strand with an optical time domain reflectometer (OTDR).
5. The OTDR anomaly resolution shall be within one foot in runs up to 1,000 feet in length.
6. Test all cable segments and patch cords for faulty connectors, splices, and terminations and for the integrity of the cable and its component parts at 850 and 1300 nm multimode.
7. Each connector shall test to a maximum of .1 dB loss.
8. Replace connectors on cables that exceed the .1dB limit and retest.
9. Replace connectors and retest new materials until satisfactory performance is achieved.
10. Use a time domain reflectometer to record transmission characteristics, waveform, and performance of all fiber strands.
11. Use an optical loss test set (OLTS) to measure the optical transmission loss (attenuation) on each optical fiber strand in the system.
12. Electronic test results shall be provided to the Owner’s project representative for review.

END OF SECTION 26 0523

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 0526

GROUNDING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to furnish and install grounding materials in accordance with the plans and as specified herein.

B. Grounding: This section includes solid grounding of electrical systems and equipment. It includes basic requirements for grounding for protection of life, equipment, circuits, and systems. Grounding requirements specified in this section may be supplemented in other sections of these Specifications.

C. Applications of electrical grounding and bonding work in this section include the following:
1. Underground metal piping.
2. Underground metal and steel reinforced concrete structures.
3. Electrical power systems.
4. Grounding electrodes.
5. Counterpoise loops.
6. Separately derived systems.
7. Raceways.
8. Service equipment.
9. Enclosures.
10. Equipment.
11. Lighting standards.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work to furnish and install grounding in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
1. Electrical Code Compliance: Comply with applicable local electrical code requirements of the authority having jurisdiction, and National Electrical Code (NEC) as applicable to electrical grounding and bonding, pertaining to systems, circuits and equipment. Use of conduit system for ground conductor shall not be allowed.
2. Underwriters' Laboratories, Inc. (UL) Compliance: Comply with applicable requirements of UL Standards Nos. 467, "Grounding and Bonding Equipment", and 869 "Reference Standard for Service Equipment", pertaining to grounding and bonding of systems, circuits and equipment. In addition, comply with UL Standard 486A, "Wire Connectors and Soldering Lugs for Use with Copper Conductors". Provide grounding and bonding products which are UL listed and labeled for their intended usage.

3. Institute of Electrical and Electronic Engineers (IEEE) Compliance: Comply with applicable requirements and recommended installation practices of IEEE Standards 80, 81, 141 and 142 pertaining to grounding and bonding of systems, circuits and equipment.

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and materials certifications as required.

B. Submittals: Submit the following in accordance with Conditions of Contract and Division 01 specification sections:
   1. Product data for ground rods, connectors and connection materials, and grounding fittings. Field testing organization certificate, signed by the Contractor, certifying that the organization performing field tests complies with the requirements specified in Quality Assurance below.
   2. Report of field tests and observations certified by the testing organization.

1.5 DELIVERY, HANDLING, AND STORAGE

A. Deliver ground wire properly packaged in factory fabricated type containers, or wound on NEMA specified type wire reels.

B. Handle grounding wire carefully to avoid abrading, puncturing and tearing wire insulation. Ensure that dielectric resistance of the cable is maintained

C. Store grounding materials and ground wire in clean dry space in original containers. Protect products from weather damaging fumes, construction debris, and traffic.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Grounding and Bonding Products
   1. Products: Of types indicated and of sizes and ratings to comply with NEC. Where types, sizes, ratings, and quantities indicated are in excess of NEC requirements, the more stringent requirements and the greater size, rating, and quantity indications govern.
   2. Conductor Materials: Copper

B. Wire and Cable Conductors
   1. General: Comply with Division 26 Section “Wires, Cables and Connectors”.
   2. Equipment Grounding Conductor
      a. Minimum ground wire size for power circuits shall be No. 12 AWG, except where otherwise noted. Wire size No. 8 AWG and larger shall be stranded, and all smaller wires shall be solid, except where otherwise noted.
      b. Minimum ground wire size for control circuits shall be No. 14 AWG, except where otherwise noted.
      c. All wire sizes shown on Plan Drawings, Details, and Sketches are based on insulated copper wire based on 60 deg C for circuits 125 amperes and less, and the use of 75 deg C for higher ampere rated circuits.
      d. Conductors for grounding system shall be soft or medium hard drawn, stranded, bare copper, except where otherwise noted.

3. All conductors buried in ground shall be bare.
4. Grounding Electrode Conductor: Stranded cable
5. Bare Copper Conductors: Conform to the following:
    a. Solid Conductors: ASTM B-3.
    b. Assembly of Stranded Conductors: ASTM B-8.
    c. Tinned Conductors: ASTM B-33.

C. Identification of Ground Conductors
1. Ground conductors shall have conductor identification.
2. Ground conductor identification shall be as called for in the National Electric Code, where covered.
3. Ground conductors larger than No. 6 AWG may be identified by taped color coding at all splices and terminations.
4. Ground conductors No. 6 AWG and smaller shall be color coded.
5. Ground conductor color coding shall be green throughout.
6. Wire markers made of paper tape shall not be used.

D. Miscellaneous Conductors
1. Ground Bus: Bare annealed copper bars of rectangular cross section with 98 percent conductivity, rigidly attach to structure.
2. Braided Bonding Jumpers: Copper tape, braided No. 30 gauge bare copper wire, terminated with copper ferrules.
3. Bonding Strap Conductor/Connectors: Soft copper, 0.05 inch thick and 2 inches wide, except as indicated.

E. Connector Products
1. General: Listed and labeled as grounding connectors for the materials used.
2. Pressure Connectors: High conductivity plated units.
3. Bolted Clamps: Heavy duty units listed for the application.
4. Exothermic Welded Connections: Provided in kit form and selected for the specific types, sizes, and combinations of conductors and other items to be connected.

F. Grounding Electrodes
1. Ground Rods: Copper clad steel with high strength steel core and electrolytic grade copper outer sheath, molten welded to core.
    a. Size: 3/4 inch by 20 feet.

2.2 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in the work include the following:
1. Anixter Bros., Inc.
2. Bashlin Industries, Inc.
3. Buckingham Mfg. Co.
4. A.B. Chance Co.
5. Dossert Corp.
6. Engineered Products Co.
7. Erico Products, Inc.
8. Galvan Industries, Inc.
9. GB Electrical, Inc.
10. General Machine Products Co., Inc.

11. Hastings Fiber Glass Products, Inc.
12. Ideal Industries, Inc.
13. Kearney-National.
14. McGill Mfg.
15. O-Z/Gedney Co.
16. Raco, Inc.
17. Thomas & Betts Corp.
18. W.H. Salisbury & Co.
19. Utilco Co.

B. Exothermic Weld Connections
1. Cadweld.
2. Therm-O-Weld.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General
1. Ground electrical systems and equipment in accordance with NEC requirements except where the Drawings or Specifications exceed NEC requirements.
2. Ground Rods: Locate a minimum of one rod length from each other and at least the same distance from any other grounding electrode. Interconnect all ground rods with bare conductors buried at least 24 inches below grade. Connect bare cable ground conductors to ground rods by means of exothermic welds. Make these connections without damaging the copper coating or exposing the steel. Drive rods until tops are 2'-6" below finished floor or final grade except as otherwise indicated.
3. Metallic Water Service Pipe: Provide insulated copper ground conductors, sized as indicated, in conduit from the building main service equipment, or the ground bus, to main metallic water service entrances to the building. Connect ground conductors to the main metallic water service pipes by means of ground clamps. Where a dielectric main water fitting is installed, connect the ground conductor to the street side of the fitting. Do not install a grounding jumper around dielectric fittings. Bond the ground conductor conduit to the conductor at each end.
4. Braided Type Bonding Jumpers: Install to connect ground clamps on meter piping to bypass meters electrically. Use elsewhere for flexible bonding and grounding connections.
5. Route grounding conductors along the shortest and straightest paths possible without obstructing access or placing conductors where they may be subjected to strain, impact, or damage, except as indicated.
6. Provide ground rods and ground grid at service entrance equipment as required.
7. Bond the neutral of each transformer to building steel.
8. All underground grounding conductors shall be a minimum of 2'-6" below grade.
9. Provide a ground wire in all feeder circuits.
10. Provide a ground wire in all branch circuit conduits.
11. Where grounding conductors are subject to mechanical injury, they shall be protected by encasement in concrete or installed in a rigid schedule 80 PVC raceway.
12. All connection of ground conductors to ground rods, bus bars, structural members, pipes, or fences and splices of ground conductors shall be made by exothermic welds, except where otherwise noted.
    a. All connections to bar lugs shall be exothermic weld or compression type.

b. Bolted type connection of ground conductors may only be made where terminal lugs or blocks have been furnished and installed in equipment by the Manufacturer.
c. Prior to the installation of any exothermic weld on connector, all connecting surfaces shall be thoroughly cleaned in accordance with the Manufacturer's recommendations.
d. Failure to thoroughly clean connecting surfaces shall constitute justifiable ground to require the Contractor to remove and re-install all similar connections at no expense to the Owner or Engineer.

13. The Contractor shall not allow or cause any connection or splice for the grounding system to be covered up or enclosed until it has been inspected and approved by the Inspecting Authority.
    a. Any connection or splice that is covered up or enclosed before such inspection and approval shall be uncovered at the Contractor's expense.
    b. After it has been inspected and approved, the Contractor shall cover up or enclose the connection or splice it at his own expense.
14. The resistance to ground for the entire grounding system shall not exceed 25 ohms under normal dry conditions. Tests of grounding resistance shall not be made within 24 hr after a rainfall. If, after testing the system, it is found that the resistance exceeds the specified value, the Contractor shall install the necessary number of ground rods to reduce the resistance to less than the specified value.

B. Connections
1. General: Make connections in such a manner as to minimize possibility of galvanic action or electrolysis. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact will be galvanically compatible.
    a. Use electroplated or hot tin coated materials to assure high conductivity and make contact points closer in order of galvanic series.
    b. Make connections with clean bare metal at points of contact.
    c. Coat and seal connections involving dissimilar metals with inert material such as red lead paint to prevent future penetration of moisture to contact surfaces.
2. Exothermic Welded Connections: Use for connections to structural steel, connections to ground rods, and for all underground connections. Install at connections to ground rods. Comply with manufacturer's written recommendations. Welds that are puffed up or that show convex surfaces indicating improper cleaning are not acceptable.
3. Terminate insulated equipment grounding conductors for feeders and branch circuits with pressure type grounding lugs. Where metallic raceways terminate at metallic housings without mechanical and electrical connection to the housing, terminate each conduit with a grounding bushing. Connect grounding bushings with a bare grounding conductor to the ground bus in the housing. Bond electrically non-continuous conduits at both entrances and exits with grounding bushings and bare grounding conductors.
4. Tighten grounding and bonding connectors and terminals, including screws and bolts, in accordance with manufacturer's published torque tightening values for connectors and bolts. Where manufacturer's torquing requirements are not indicated, tighten connections to comply with torque tightening values specified in UL 486A and UL 486B.
5. Compression Type Connections: Use hydraulic compression tools to provide the correct circumferential pressure for compression connectors. Use tools and dies recommended by the manufacturer of the connectors. Provide embossing die code or other standard method to make a visible indication that a connector has been adequately compressed on the ground conductor.

6. Moisture Protection: Where insulated ground conductors are connected to ground rods or ground buses, insulate the entire area of the connection and seal against moisture penetration of the insulation and cable.

C. Underground Distribution System Grounding
   1. Manholes, Handholes, and Underground Pullboxes: Install a driven ground rod close to the wall and set the rod depth such that 4 inches will extend above the finished floor. Where necessary, install ground rod before the manhole is placed and provide a No. 1 AWG bare tinned copper conductor from the ground rod into the manhole through a waterproof sleeve in the manhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure sensitive tape or heat shrunk insulating sleeve from 2 inches above to 6 inches below the concrete. Seal floor opening with waterproof nonshrink grout.
   2. Connections at Manholes, Handholes, and Underground Pullboxes: Connect exposed metal parts, such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole to the ground rod or ground conductor. Connect circuit ground wire to ground rod. Make connections with minimum No. 4 AWG stranded hard drawn copper wire. Train conductors plumb or level around corners and fasten to manhole or handhole walls. Connect to cable armor and cable shields by means of tinned terminals soldered to the armor or shield, or as recommended by manufacturer of splicing and termination kits.
   3. Grounding System: Ground noncurrent carrying metallic items associated with manholes, substations, and pad mounted equipment by connecting them to bare underground cable and grounding electrodes arranged as indicated.

3.2 APPLICATION

A. Equipment Grounding Conductor Application: Comply with NEC Article 250 for sizes and quantities of equipment grounding conductors, except where larger sizes or more conductors are indicated. Use of conduit system for ground conductor shall not be allowed.
   1. Install separate insulated equipment grounding conductors with circuit conductors for the following in addition to those locations where required by code:
      a. Feeders and branch circuits.
   2. Nonmetallic Raceways: Install an insulated equipment ground conductor in nonmetallic raceways unless they are designated for telephone or data cables.

B. Underground Conductors: Bare, tinned, stranded copper except as otherwise indicated.

C. Separately derived systems required by NEC to be grounded shall be grounded in accordance with NEC paragraph 250-30.

D. Metal Poles Supporting Outdoor Lighting Fixtures: Ground pole to a grounding electrode as indicated in addition to separate equipment grounding conductor run with supply branch circuit.

3.3 FIELD QUALITY CONTROL

A. Independent Testing Organization: Arrange and pay for the services of a qualified independent electrical testing organization to perform tests described below.

B. Test the complete station ground system for continuity and for resistance to ground using an electrical ground resistance tester.

C. Ground test shall be performed only after two days of dry weather. Dry weather is defined as 0.0-inch of precipitation in a 48 hour period.

D. Use a hand-cranked or motor-driven ground test set by Biddle, or approved equal.

E. Resistance to ground shall be 5 ohms or less. Drive additional ground rods as required to meet the 5 ohm maximum resistance.

F. All tests are to be witnessed by the Owner's Representative. Notify the Owner's Representative at least 24 hours in advance of testing.

END OF SECTION 26 0526

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 0529

SUPPORTING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to work of this Section.

B. This section is a Division 26 section and is a part of each Division 26 section making reference to electrical supporting devices specified herein.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to furnish and install supporting devices in accordance with the plans and as specified herein.

B. Supports: Types of supports, anchors, sleeves and seals specified in this section include the following:
1. Clevis hangers.
2. Riser clamps.
3. C-clamps.
4. I-beam clamps.
5. One hole conduit straps.
6. Two hole conduit straps.
7. Round steel rods.
8. Lead expansion anchors.
9. Toggle bolts.
10. Wall and floor seals.
11. U-channel strut system.

C. Supports, anchors, sleeves and seals furnished as part of factory fabricated equipment, are specified as part of that equipment assembly in other divisions and Division 26 sections.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
1. National Electrical Code (NEC) Compliance: Comply with NEC requirements as applicable to construction and installation of electrical supporting devices.
2. Manufacturer's Standardization Society (MSS) Compliance: Comply with applicable MSS standard requirements pertaining to fabrication and installation practices for pipe hangers and supports.
3. National Electrical Contractors Association (NECA) Compliance: Comply with NECA's "Standard of Installation" pertaining to anchors, fasteners, hangers, supports, and equipment mounting.

4. Underwriters' Laboratories, Inc. (UL) Compliance: Provide electrical components which are UL listed and labeled.
5. Federal Specification (FS) Compliance: Comply with FS FF-S-760 pertaining to retaining straps for conduit, pipe and cable.

1.4 DEFINITIONS

A. Abbreviations
1. PVC: Polyvinyl chloride.

B. Finished Locations: The following are defined as finished locations:
1. Areas with carpet or tile floors.
2. Areas with lay-in ceiling tile, fixed ceiling tile, and special architectural ceiling treatment.
3. Areas with tiled, plastered, or paneled walls.

C. Interior Locations: The following are defined as interior locations:
1. Any location within the boundaries of the foundation of any building.
2. Any location within the superstructure of other structures not classified as buildings.

D. Wet Locations: The following are defined as wet locations:
1. All exterior locations.
2. All interior locations below grade.
3. All interior locations where wet materials are processed, pumped, transported, or stored.

E. Corrosive Locations: The following are defined as corrosive locations.
1. All locations with chemical feed/transfer equipment
2. All locations with chemical storage tanks
3. All locations where chemical storage drums are located.

F. Hazardous (classified) Locations: The following are defined as hazardous (classified) locations.
1. All hazardous (classified) locations and their hazard classification are shown.

1.5 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and materials certifications as required.

B. Submit the following in accordance with Conditions of Contract and Division 01 specification sections:
1. Product data for the U-channel strut system.

1.6 DELIVERY, HANDLING, AND STORAGE

A. Deliver supporting devices properly packaged in factory fabricated type container.

B. Store supporting devices in clean dry space in original containers. Protect products from weather damaging fumes, construction debris and traffic.

C. Handle supporting devices carefully to avoid damage.

PART 2 - PRODUCTS

2.1 MANUFACTURED SUPPORTING DEVICES

A. Raceway Supports: Products shall include but are not limited to the following:
   1. Materials
      a. Corrosive locations. Type 316 stainless steel or PVC coated galvanized steel.
      b. Exterior locations. Type 316 stainless steel.
      c. All other locations. Steel or malleable iron, electro-galvanized.
   2. Clevis Hangers: For supporting rigid metal conduit.
      a. 3/8-inch rod for 2 inch and smaller conduit.
      b. 1/2-inch rod for 2 1/2 inch and larger conduit.
   3. Threaded Rod: 1/2-inch minimum size except as stated in 1 above with hexagon nuts.
   4. Beam Clamp: With 1/4-inch tapped side and back holes for attachment of conduit clamps.
   5. Swivel Beam Clamp: Swivel eye hook, closed in the installed position, swivel eye tapped for the threaded rod, and jamb nut.
   6. One-Hole Conduit Straps: One hole.
   7. Clamp Backs: For use with one hole conduit strap to support conduit away from wall or ceiling surface.
   8. Conduit Hangers: For hanging conduit from beam clamps, 1/4-20 closure bolt and square nut, hole for 1/2-13 threaded rod.
   9. Conduit Spacers: Nonmetallic spacers to support conduit and maintain spacing during concrete pours.
   10. Manufacturers: Subject to compliance with requirements, available manufacturers include, but are not limited to, the following:
      a. Appleton.
      b. Cal Conduit Products.
      c. Cantex, Inc.
      d. Carlon.
      e. Cooper B-line
      f. Crouse-Hinds.
      g. Gibson Stainless and Specialty, Inc.
      h. Killark.
      i. Occidental Coating Co.
      j. Raco, Inc.
      k. Robroy.
      l. Thomas & Betts Corp.

B. Cable and Cord Supports
   1. External Cable Grips
      a. For flexible cords and cables longer than 6 feet and steel support wire.
      b. Lace type split wire mesh.
      c. Single or double weave as required to support the load with a safety factor of 10 times the supported load.
      d. Type 302/304 stainless steel
   2. Manufacturers: Subject to compliance with requirements, available manufacturers include, but are not limited to, the following:
      a. B-Line Systems.
      b. Condux International, Inc.
      c. Kellems, Division of Hubbell, Inc.

d. O-Z/Gedney.
e. Pass & Seymour/Legrand.
f. Red Seal Electric Co.

2.2 U-CHANNEL STRUT SYSTEMS

A. General
1. Provide equipment that is listed and labeled.
2. U-channel
3. Materials
a. Corrosive locations: Type 316 stainless steel.
b. Exterior locations: Type 316 stainless steel.
c. All other locations: Cold rolled steel, ASTM A570, grade 33, 12 gauge, hot dip galvanized after fabrication.
4. Outside dimensions of 1-5/8 inch x 1-5/8 inch, unless otherwise noted.
5. Holes, 9/16 inch diameter at 1-7/8 inch on center, unless otherwise noted.
6. Provide spring nuts, clamps, hangers, and hardware made of the same materials at the U-channel.

B. Manufacturers: Subject to compliance with requirements, available manufacturers include, but are not limited to, the following:
1. Cooper/B-Line.
2. Gibson Stainless and Speciality, Inc.
3. Kindorf/Thomas & Betts.
4. Seasafe, Inc.
5. Unistrut Corporation.

2.3 FABRICATED SUPPORTS

A. General.
1. Constructed of individual structural shapes or assemblies of structural shapes welded together to form a complete, secure, and durable assembly.
2. Structural tubing, angles, channels, or W-shapes as shown on the drawings or required to support equipment or systems.
3. Size support members to perform their support functions without deflection of more than one half percent of total height for vertical members and 1 percent of total span for other than vertical members.
4. Materials
a. Corrosive locations: Type 316 stainless steel.
b. Exterior locations: Type 316 stainless steel.
c. All other locations: Cold rolled steel, ASTM A 36 hot dip galvanized after fabrication.

B. Fabrication
1. Steel: Assemble fabricated supports by full penetration welded connections.
2. Ground welds smooth and flush.
3. Wire brush areas around welds to remove slag and spall.

2.4 WALL AND FLOOR SEALS

A. General: Provide seals around conduits that penetrate below grade or water-bearing concrete walls and floors.

B. Wall Opening
   1. New Walls: Molded non-metallic high density polyethylene sleeves with integral water stop and end caps to prevent deformation during concrete pour.
   2. Existing Walls: Core drilled hole, size as recommended by seal manufacturer.

C. Modular seal.
   1. Inter-locking synthetic rubber links shaped to fill the annular space between the conduit and the wall opening.
   2. Glass reinforced nylon polymer pressure plates.
   3. Type 316 stainless steel bolts and flange hex nuts.

D. Manufacturers: Subject to compliance with requirements, available manufacturers include, but are not limited to, the following:
   1. PSI-Thunderline/Link-Seal.
   2. Or approved equal.

2.5 FIRE-STOPS

A. General
   1. Provide fire-stops around any electrical work penetrating fire rated walls, floors, or ceilings.
   2. Provide fire-stops that conform to the following:
      a. UL Standard 1479, "Penetration Fire-stop Systems."
      b. UL Standard 263, "Fire Tests of Building Construction and Materials."

B. Busway, Cable Tray, Armored Cable, and Conduit Penetration Fire-Stopping
   1. Provide expanding foam or elastomeric putty or pillows to fire-stop penetrations in fire rated assemblies.
      a. RTV Foam
         1) Dow Corning 3-6548 Silicone RTV Foam.
         2) 3M Fire Barrier 2001 Silicone RTV Foam.
      b. Elastomeric Putty
         1) 3M Fire Barrier 2000 (nonslump).
         2) 3M Fire Barrier 2003 (self-leveling).
         3) Nelson CLK N/S (nonsag).
         4) Nelson CLK S/L (self-leveling).
   2. Provide fire resistive panels on both sides of the fire barrier penetration if required to obtain the necessary fire resistance rating or to provide a cofferdam to restrain the sealant material during the installation and curing process.
      a. 3M Fire Barrier CS-195+.
      b. Nelson CPS.
      c. Or approved equal.

2.6 ANCHORS AND FASTENERS

A. General
   1. Provide anchors and fasteners, including bolts, nuts, washers of types, sizes and materials indicated.
   2. Materials
      a. Corrosive locations: Stainless steel.
      b. Exterior locations: Stainless steel.
      c. All other locations: Galvanized steel.
   3. Anchors for securing 3/4 or 1 inch conduit straps and device boxes to sound concrete walls and ceilings shall be self-tapping anchors, similar and equal to Hilti Kwik-Con II or ITW Buildex Blue Max, 3/16 inch by minimum 1 1/4 inches long, in areas not requiring stainless steel.
   4. For anchors for use in securing conduit larger than 1 inch, heavier equipment than device boxes, and all fasteners to be used in areas enumerated above as requiring stainless steel fasteners, provide stud type expansion anchors, drop-in two-piece expansion anchors, or adhesive stud anchors, similar and equal to Hilti Kwik-Bolt II, Hilti HDI Drop-in, or Hilti HVA Adhesive Anchor System.
   5. Lead Expansion Anchors: 1/2 inch.
   6. Toggle Bolts: Springhead, 3/16 inch x 4 inch.

B. Manufacturers: Subject to compliance with requirements, available manufacturers include, but are not limited to, the following:
   1. Ackerman Johnson Fastening Systems Inc.
   2. Ideal Industries, Inc.
   3. Hilti.
   4. Joslyn Manufacturing and Supply Co.
   5. ITW Buildex.
   6. Ideal Industries, Inc.
   7. Rawlplug Co.
   8. Star Expansion Co.
   9. U.S. Expansion Bolt Co.

PART 3 - EXECUTION

3.1 INSTALLATION OF SUPPORTING DEVICES

A. Install hangers, anchors, sleeves and seals as indicated, in accordance with manufacturer's written instructions and with recognized industry practices to insure supporting devices comply with requirements. Comply with requirements of NECA and NEC for installation of supporting devices.

B. Coordinate with other electrical work, including raceway and wiring work, as necessary to interface installation of supporting devices with other work.

C. Install hangers, supports, clamps and attachments to support piping properly from building structure. Arrange for grouping of parallel runs of horizontal conduits to be supported together on trapeze type hangers where possible. Install supports with spacings indicated and in compliance with NEC requirements.

D. Install conduit seals for conduit penetrations of slabs on grade and exterior walls below grade and where indicated. Tighten sleeve seal screws until sealing grommets have expanded to form watertight seal. Provide seals for the interior of conduits which penetrate exterior or water bearing walls, consisting of gland type sealing bushings or RTV closed cell silicone foam.

END OF SECTION 26 0529

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 0533

RACEWAY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes
1. Flexible metal conduit (FMC).
2. Intermediate metal conduit (IMC).
3. Liquid-tight flexible metal conduit (LFMC).
4. Liquid-tight flexible non-metallic conduit (LFNC).
5. PVC coated rigid metal conduit.
6. Rigid aluminum conduit (RAC).
7. Rigid non-metallic conduit (RNC).
8. Surface raceway.
9. Wireway.

B. Related Sections
1. Division 01 section "Submittal Procedures."
2. Division 26 section "Basic Electrical Requirements."
3. Division 26 section "Basic Electrical Materials and Methods."
4. Division 26 section "Grounding."
5. Division 26 section "Supporting Devices."
6. Division 26 section "Electrical Identification."
7. Division 31 section "Excavation and Fill."

1.3 REFERENCES

A. Unless otherwise stated, references are to the latest edition of the standard.

B. American National Standards Institute (ANSI)
1. C80.1 Standard for Electrical Rigid Steel Conduit (ERSC).
2. C80.3 Standard for Steel Electrical Metallic Tubing (EMT).
3. C80.5 Standard for Electrical Rigid Aluminum Conduit (ERAC).

C. National Electrical Contractors Association (NECA) Electrical Installation Standards
1. 101-2006 Standard for Installing Steel Conduit (Rigid, IMC, EMT)

7. Standard 514A Metallic Outlet Boxes
8. Standard 514B Fittings for Cable and Conduit
9. Standard 651 Schedule 40 and 80 Rigid PVC Conduit
10. Standard 651A Type EB and A Rigid PVC Conduit and HDPE Conduit
11. Standard 797 Electrical Metallic Tubing
12. Standard 1242 Intermediate Metal Conduit
13. Standard 1660 Liquid-Tight Flexible Nonmetallic Conduit

1.4 DEFINITIONS

A. Abbreviations
1. AHJ: Authority having jurisdiction.
2. NRTL: Nationally recognized testing laboratory.
3. PVC: Polyvinyl chloride.

B. Finished Locations: The following are defined as finished locations:
1. Areas with carpet or tile floors.
2. Areas with lay-in ceiling tile, fixed ceiling tile, and special architectural ceiling treatment.
3. Areas with tiled, plastered, or paneled walls.

C. Interior Locations: The following are defined as interior locations:
1. Any location within the boundaries of the foundation of any building.
2. Any location within the superstructure of other structures not classified as buildings.

D. Wet Locations: The following are defined as wet locations:
1. All exterior locations.
2. All interior locations below grade.
3. All interior locations where wet materials are processed, pumped, transported, or stored.

E. Corrosive Locations: The following are defined as corrosive locations.
1. All locations with chemical feed/transfer equipment
2. All locations with chemical storage tanks
3. All locations where chemical storage drums are located.

F. Hazardous (Classified) Locations: The following are defined as hazardous (classified) locations.
1. All hazardous (classified) locations and their hazard classification are shown.

1.5 SUBMITTALS

A. General
   1. Comply with the requirements of Division 01 Section “Submittal Procedures”.
   2. Submit information as described below.
   3. Provide all information necessary to determine compliance with the plans and specifications.
   4. Identify all products submitted as substitutions.

B. Product Data
   1. Manufacturer’s technical product data sheets for all products specified in this section.
   2. Delete or cross out all inappropriate or non-applicable information.

C. Shop Drawings
   1. Materials list. Submit a list with quantities, manufacturer’s name, and catalog numbers.
   2. Dimensional drawings. Submit dimensional drawings for all products.
   3. Mounting details.
   4. Wiring diagrams: Submit wiring diagrams for all products.
      a. Show all components and features specified.
      b. Differentiate between factory and field installed wiring and components.

D. Samples

E. Quality Control Submittals
   1. Test Reports
      a. Field test report. Submit certified copies of the field test reports.

1.6 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with the following:
   1. All applicable federal, state, and local codes and regulatory requirements.
   2. National Electrical Code (NEC).

1.7 DELIVERY, STORAGE, AND HANDLING

A. General: Comply with Division 1 Product Requirements Sections.

B. Packing and shipping
   1. Package equipment as required to prevent damage during shipment.
   2. Mount heavy items on pallets or skids to facilitate handling.

C. Storage and protection
   1. Store the products until they can be installed.
   2. Meet the storage requirements of the manufacturer.

1.8 PROJECT/SITE CONDITIONS

A. Field Measurements: Field verify all locations and dimensions.

PART 2 - PRODUCTS

2.1 PRODUCT REQUIREMENTS – GENERAL

A. General
   1. Provide new and unused products of current manufacture.
   2. Provide products free from defects affecting performance.

B. Listing and Labeling
   1. Provide UL listed and labeled products.
   2. Provide products listed and labeled by an approved independent NRTL.
   3. Products not bearing an NRTL label must be pre-approved in writing by the AHJ.

2.2 CONDUITS

A. Minimum Conduit Size
   1. For Connection to Recessed Lighting Fixtures: 1/2 inch.
   2. For Connection to Field Instruments with Only 1/2 Inch Openings or Hubs: 1/2 inch.
   3. Duct Banks: 1 inch.
   4. All Other Uses: 3/4 inch.

B. Metal Conduit and Tubing
   1. Rigid Aluminum Conduit: Rigid aluminum conduit, threaded type, ANSI C80.5, UL6A.
   2. Intermediate Steel Conduit. Intermediate grade, hot dip galvanized, ANSI C80.1, UL 1242.
   3. Flexible Metal Conduit. Continuous, spirally wound, interlocked aluminum, UL 1
   4. Liquid-tight Flexible Metal Conduit: Continuous, spirally wound, interlocked aluminum, flexible liquid-tight PVC jacket, UL 360.
   5. Available Manufacturers: Subject to compliance, metal conduit manufacturers include, but are not limited to:
      a. AFC.
      b. Alflex Corp.
      c. Allied Tube and Conduit.
      d. Alumax.
      e. Electri-Flex Company.
      f. LTV Steel Tubular Products Co.
      g. Occidental Coating Co.
      h. Perma-Cote Industries.
      i. Robroy Industries, Inc.
      j. Shamrock Conduit Products.
      k. Tiften Aluminum Co.
      l. Triangle PWC, Inc.
      m. VAW of America Inc.
      n. Wheatland Tube Co.

C. Nonmetallic Conduit
   1. Rigid Nonmetallic Conduit: PVC, Schedule 40, NEMA TC-2, UL 651.
   2. Rigid Nonmetallic Conduit (Heavy Wall): PVC, Schedule 80, NEMA TC-2, UL 651.
   3. Liquid-tight Flexible Nonmetallic Conduit: Continuous hard PVC spiral encapsulated with flexible PVC, UL 1660.
   4. Available Manufacturers: Subject to compliance, non-metallic conduit manufacturers include, but are not limited to:
      a. Alflex.
      b. Cantex Industries.
      c. Carlon.

d. Certainteed.
e. Cole Flex-Corp.
f. Electric-Flex.

2.3 CONDUIT FITTINGS AND ACCESSORIES

A. Conduit Bodies
1. Provide covers and gaskets secured with corrosion resistant screws.
2. Rigid Metal: Threaded aluminum, UL 514B.
3. Hazardous locations. Threaded aluminum approved for hazardous locations as identified on plans.
4. Nonmetallic: PVC, molded solvent weld connector, UL 514B.

B. Locknuts: Galvanized steel, bonding type with sharp edge for digging into metal, UL 514B, NEMA FB-1. Set screw type grounding terminal where required.

C. Bushings: Malleable iron, galvanized, integrally molded insulation, UL 514B, NEMA FB-1. Set screw type grounding terminal where required.

D. Conduit Hub Assemblies: Cast metal, ribbed body with female threads, o-ring gasket, integral conduit nipple with insulated throat, grounding type locknut, UL 514B.

E. Expansion Fittings
1. Rigid Aluminum Conduit: Aluminum body and sleeve, threaded ends, grounding type, rated for location where required.
2. Rigid Non-Metallic Conduit: PVC body and sleeve, two o-rings, socket connector each end.

F. Other Fittings
1. Rigid Metal: Threaded aluminum.
2. Liquid-Tight Flexible Metal: Compression type, galvanized steel or malleable iron body, steel ferrule, sealing gland and gasket, insulated throat.
3. Rigid Nonmetallic: PVC, molded solvent weld connector, NEMA TC 3.
4. Liquid-Tight Flexible Nonmetallic: PVC, one piece body, compression ferrule, sealing gland and gasket.

G. Explosion-Proof Seals: Rated use in Class I, Division 1, Group D atmosphere.

H. Explosion-proof couplings. Braided wire outer jacket, insulating inner liner, threaded ends, liquid-tight, length as required. Rated for use in Class I, Division 1, Group D hazardous locations.

I. Conduit Seals
1. Duct Sealing Putty
a. Gray pliable mastic.
b. Non-shrink, non-hardening and UV resistant.
c. Compatible with wire insulation.
d. Listed for use with conduit sealing fitting.
2. Mechanical Seals
a. Internal sealing bushing.
b. Two stainless steel pressure discs

c. Three stainless steel socket head cap screws
d. Neoprene gasket.
e. Pressure discs and gasket factory predrilled to match size/quantity of cables.
f. Rated to withstand 50 pounds per square inch gauge (psig) water or gas pressure.

3. Expanding foam sealant
   a. Two part foam that expands in place to fill voids between cables and conduits.
   b. Compatible with wire/cable insulation.
   c. Withstands 15 feet of water head.
4. Expanding Foam Fire Stop Sealant
   a. Two part silicone foam that expands to fill voids between cables and conduits.
   b. Compatible with wire/cable insulation.
   c. Intumescent, listed as a fire barrier.

J. Available Manufacturers: Subject to compliance, conduit fitting manufacturers include, but are not limited to:

1. Fittings
   a. Adalet/PLM.
   b. Appleton Electric.
   c. Carlon.
   d. Condux International, Inc.
   e. Crouse-Hinds.
   f. Delta Industrial Products.
   g. Electri-Flex Company.
   h. Killark Electric Mfg. Co.
   i. Kraloy Products Co.
   j. O.Z. Gedney.
   k. Perma-Cote Industries.
   l. Raco.
   m. Robroy Industries.
   n. Spring City Electrical Mfg. Co.
   o. Steel City.
2. Sealants
   a. 3M.
   b. Dow.
   c. Gardner Bender Electrical.
   d. Panduit.

2.4 WIREWAYS

A. General Purpose Wireways. NEMA 1 steel, front accessible, totally enclosed with bolted covers. Finished with rust-inhibiting primer and gray baked enamel finish.

B. Oil-tight Wireways. NEMA 12, oil-tight and dust-tight steel with hinged cover and gasket, external latches, and flanged joints with gaskets. Finished with gray baked enamel inside and outside.

C. Watertight Wireways. NEMA 4X, watertight, corrosion resistant stainless steel with hinged cover and gasket, screw clamps, and flanged joints with gaskets.

D. Available Manufacturers. Subject to compliance, wireway manufacturers include, but are not limited to:

1. American Electric.
2. Anchor Electric Co.
3. B-Line Systems, Inc.
4. Circle AW Products.
5. Cross Brothers, Inc.
6. Erickson Electric Equipment Co.
7. GS Metals Corp.
8. Hoffman Engineering Co.
9. Square D Company.
10. Wadsworth Electric Manufacturing Co., Inc.

2.5 SURFACE RACEWAYS

A. Metal Raceways. [Aluminum] [Galvanized steel] with snap-on covers. 1/8-inch mounting screw, knockouts in base approximately 8 inches on center. Finished with rust-inhibiting primer suitable for painting.

B. Nonmetallic Raceways. Two piece construction, rigid PVC with matte texture conforming to UL 94.

C. Available Manufacturers. Subject to compliance, surface raceway manufacturers include, but are not limited to:
1. Surface Metal Raceway.
    a. Alrey-Thompson Co., Inc.
    b. Allied Tube & Conduit.
    c. American Electric.
    d. B-Line Systems, Inc.
    e. Butler Mfg. Co.
    f. Erickson Electrical Equipment Co.
    g. GS Metals Corp.
    h. Haydon Corp.
    i. Hoffman Engineering Co.
    j. Isoduct Energy Systems.
    k. Isotrol Systems.
    l. Keystone/Rees, Inc.
    m. SL Industries, Inc.
    n. Square D Co.
    o. The Wiremold Co.
2. Surface Nonmetallic Raceway.
    a. Anixter Brothers, Inc.
    b. Hoffman Engineering Co.
    c. Hubbell, Inc.
    d. JBC Enterprises, Inc.
    e. Panduit Corp.
    f. Premier Telecom Products, Inc.
    g. Thermotools Co.
    h. The Wiremold Co.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions:
   1. Inspect installed work prior to performing the work of this section.
   2. Verify that the project has progressed to a point where this installation may begin.

B. Material Inspection.

C. Discrepancies:
   1. Immediately notify the Engineer in writing of conditions detrimental to proper completion of the work.
   2. Correct all unsatisfactory conditions before proceeding with installation.
   3. Resolution must be acceptable to the Engineer.

3.2 RACEWAY APPLICATIONS

A. Conduit
   1. Connections to Motors or Vibrating Equipment
      a. Hazardous locations: Flexible coupling rated for the area.
      b. Corrosive locations: Liquid-tight flexible non-metallic conduit, 18 inch maximum length.
      c. Wet locations: Liquid-tight flexible metal conduit, 18 inch maximum length.
      d. All other locations: Liquid-tight flexible metal conduit, 18 inch maximum length.
   2. Concealed in Walls and Fixed Ceilings
      a. Hazardous locations: Do not conceal conduits.
      b. Corrosive locations: Do not conceal conduits.
      c. Wet locations: Do not conceal conduits.
      d. Finished locations: Rigid aluminum conduit.
      e. All other locations: Do not conceal conduits.
   3. Concealed in Accessible Floors and Ceilings
      a. Finished locations: Rigid aluminum conduit.
      b. Connections to lighting fixtures: Flexible metal conduit, 6 feet maximum length.
      c. All other locations: Rigid aluminum conduit.
   4. Concealed in Concrete
      a. Hazardous locations: Schedule 40 PVC conduit.
      b. Corrosive locations: Schedule 40 PVC conduit.
      c. Wet locations: Schedule 40 PVC conduit.
      d. Transitions from concealed in concrete to exposed: Schedule 80 PVC conduit.
      e. All other locations: Schedule 40 PVC conduit.
   5. Exposed
      a. Hazardous locations: Rigid aluminum conduit.
      b. Corrosive locations: Schedule 80 PVC conduit.
      c. Wet locations: Rigid aluminum conduit.
      d. Finished locations: Do not expose conduits in finished areas.
      e. All other locations: Rigid aluminum conduit.
   6. Underground
      a. Direct buried: Schedule 80 PVC conduit
      b. Concrete encased: Schedule 40 PVC conduit.
      c. Transitions from underground to exposed: PVC coated RMC.

B. Fittings
   1. Use threaded fittings and conduit bodies for rigid aluminum conduit.
   2. Use reducing couplings or bushings for transitions between conduit sizes.

C. Conduit Seals
1. Use hazardous location sealing fitting where required by the NEC.
2. Use expanding foam fire stop sealant in fire rated wall, floor, and ceilings.
3. Use mechanical seals in exterior below grade walls, floors, and ceilings.
4. Use expanding foam sealant for all other conduit seals.

D. Wireways
1. Finished locations: Do not use wireways in finished locations.
2. All other locations: Use NEMA 4X wireways.

E. Surface raceway:
1. Use only where shown.

3.3 PREPARATION

A. Surface Preparation
1. Carefully lay out the work in advance.
2. Perform all cutting, drilling, etc. without damaging the building surfaces or equipment.

B. Rough-in
1. Refer to equipment submittals for rough-in requirements.
2. Verify rough-in locations by field measurements.
3. Maintain all manufacturer recommended clearances.

3.4 CONDUIT INSTALLATION

A. General
1. Install raceways in accordance with the following:
a. Manufacturer's written installation instructions
b. NECA 1, NEC, and UL
2. Remove and replace the damaged raceways with new undamaged material.
3. Install plumb and level.
4. Install complete runs before pulling in cables or wires.
5. Cap all conduits after installation with factory made closures.
6. Install pull rope in all spare or empty conduits.
7. Use polypropylene or monofilament plastic line with not less than 200-lb tensile strength.
8. Make pull-line continuous from outlet to outlet, with two feet of slack at each outlet.
9. Embed the ends in duct sealing compound.
10. Provide enough slack in flexible conduits to facilitate maintenance of equipment.
11. Limits bends between pull points to no more than 4 bends totaling 360 degrees.

B. Field fabrication and assembly
1. General
a. Make all bends with standard conduit bending tools and machines.
b. Do not to distort or vary the internal diameter when field bending.
c. Keep legs of bends in the same plane.
d. Keep straight legs of offsets parallel, unless otherwise indicated.
e. Make couplings and connections watertight.
f. Remove and replace dented or deformed conduit with new undamaged material.
g. Cut conduits straight
h. Ream cut ends to remove burrs.

2. Rigid Aluminum Conduit
    a. Ream cut ends before threading.
    b. Do not use running threads at conduit joints and terminations.
    c. Clean the threads and conduit interior with a degreasing spray.
3. PVC Coated RMC
    a. General
        1) Follow general conduit installation requirements except as modified below.
        2) Follow the manufacturer's recommended installation procedures.
        3) Protect PVC coating on conduit and fittings from damage prior to and during the Work.
    b. Cutting and threading.
        1) Cut conduit using only roller cutters.
        2) Replace pipe vise jaws with jaws designed for use with PVC coated conduit.
        3) Use power drive unit inserts designed for use with PVC coated conduit.
        4) Use half shell conduit clamps in chain vises.
        5) Machine threading tool stationary guide to accommodate the PVC coating.
        6) Make longitudinal release cuts in the PVC coating before threading.
        7) Clean the threads and conduit interior with a degreasing spray.
        8) Apply touchup compound to any unprotected metal.
    c. Bending
        1) Use bending shoes specifically designed for PVC coated conduit in mechanical bending equipment.
        2) Use shoes one size larger than the size of the conduit when hand bending.
        3) Use bending hickeys that have a PVC coating.
    d. Assembly
        1) Use strap wrenches or wide jaw pliers designed for PVC coated conduit.
        2) Use nut drivers for encapsulated fasteners on conduit body and enclosure covers.
    e. Repair and replacement
        1) If PVC coating of conduit or fittings is damage during installation, remove and replace with new undamaged materials.
        2) Repair minor scratches or damage in PVC coating with touchup compound where allowed by the Owner's representative.
4. Rigid Nonmetallic Conduit
    a. Solvent weld all joints in PVC conduit to provide a watertight seal.
    b. Provide a seal that maintains pressure of 25 pounds per square inch for 1 hour.

C. Routing
1. General.
    a. Locations are approximate unless dimensioned.
    b. Install exposed conduits parallel or perpendicular to walls, ceilings, or structural members.
    c. Run parallel or banked raceways together on common supports where practical.
    d. Make bends in parallel or banked runs from same center line.
    e. Use factory elbows only where elbows can be installed parallel; otherwise, provide field bends for parallel raceways.
    f. Avoid conflicts with equipment and building components.
    g. Do not run through structural members.
    h. Avoid horizontal runs within partitions or walls.
    i. Align raceways to enter boxes and cabinets squarely.
    j. Avoid ceiling inserts, lights, or ventilation ducts or outlets.

k. Do not run across pipe shafts or ventilation duct openings
l. Maintain 6 inches of separation to parallel runs of flues and other heat sources.
m. Install horizontal runs above water and steam piping wherever possible.
n. Install horizontal runs close to ceilings or beams.
o. Do not encroach into the head room of walkways and doors.
p. Do not install within fume/vent hoods except where serving the fume/vent hood.
q. Provide a low point in conduit runs before entering boxes/enclosures.
r. Install a tee conduit fitting and drain/breather at the low point.
s. Enter the bottom of boxes/enclosures located in wet, hazardous, or corrosive areas.

2. Finished Areas
   a. Conceal in walls, slabs, or ceilings.
   b. In existing areas, conceal in walls of stud construction and above suspended ceilings.
3. Installed in Concrete
   a. Install in concrete only where specifically shown or specified.
   b. Do not install in waterproofed or water-bearing walls.
   c. Do not install through concrete beams.
   d. Do not install in concrete that is less than 3 inches thick.
   e. Do not install in concrete with a thickness less than 3 times the conduit diameter.
   f. Do not install between the reinforcing steel and the surface of the concrete.
   g. Space parallel runs at twice the diameter of the largest conduit, center to center.
   h. Do not cross conduits in slabs unless reviewed by the Engineer/Architect for proper cover.
   i. Make transitions from embedded to exposed with a metal conduit extending 1 inch into concrete.
4. Other Interior Areas
   a. Where equipment is more than 3 feet from walls, run in or under the floor and stub up.
   b. Run all other interior conduits exposed.
5. Exposed Exterior
   a. Do not run exposed on the exterior surface of buildings.
   b. Do not run across access openings in handrail.
   c. Do not run on the inside walls of tanks.
6. Underground Conduits
   a. Encase all underground conduits in concrete unless otherwise noted.
   b. Where noted as direct buried, provide 6 inches of sand above and below conduits.
   c. Depth below finished grade to top of underground conduits.
      1) Circuits less than or equal to 600 Volts. 24 inches.
      2) Circuits greater than 600 Volts. 36 inches.
   d. Provide excavation and backfill as specified in Division 31 Section, “Excavation and Fill”.
   e. Make all changes of direction with bends of 30 inch radius minimum.
   f. Space conduits 7.5 inches center to center both horizontally and vertically.
   g. Slope away from buildings with a minimum pitch of 3 inches per 100 feet.
   h. Mark underground conduit runs as specified in Section 260553, Electrical Identification.
   i. Provide reinforcing steel for 5 feet beyond excavation where conduits cross back-filled areas.
   j. Run parallel to plant coordinate axes when outside of structures and underground, unless otherwise shown.

D. Supports
   1. Support all conduits as specified in Section 260529, Supporting Devices.
   2. Support all conduits entering structures as shown on the Drawings.
   3. Use only products listed as conduit supports.
   4. Do not attach any parts of the conduit system to ventilation ducts.
   5. Attached conduit supports to the building.
   6. Support conduits on each side of bends.
   7. Support conduits at a spacing not to exceed the following:
      a. Six feet for conduits smaller than 1-1/4 inches
      b. Eight feet for conduits 1-1/4 inches and larger.
   8. Use waterproof cement to set conduit anchors in water bearing or waterproofed walls.
   9. Securely anchor underground conduits to prevent movement during placement of concrete or backfill.
   10. Secure embedded raceways to reinforcing rods to prevent sagging or shifting during concrete placement.
   11. Use precast separators and heavy gauge wire ties or other approved fasteners.
   12. Support conduits independently of suspended ceilings, lighting fixtures.
   13. Unless otherwise shown or specified, support conduit independently of process piping, mechanical piping, or mechanical ducts.
   14. Support within 1 foot of changes of direction, and entries to boxes or enclosures.

E. Sealing and Penetrations
   1. Seal the interior of the following conduits to prevent migration of moisture and gases:
      a. Conduits passing from warm to cold locations.
      b. Conduits passing between areas where air pressure differential must be maintained.
      c. Conduits subject to condensation.
      d. Conduits passing from the interior to the exterior of a building.
      e. Conduits penetrating exterior below grade walls, floors, and ceilings.
      f. Conduits entering any panelboard, switchboard, switchgear, or motor control center.
      g. Conduits entering any control panel.
      h. Conduits entering all exterior manholes, handholes, and boxes.
      i. Empty or spare conduits.
   2. Seal the interior of all conduits penetrating fire rated walls, floors, and ceilings.
      a. Seal penetrations with a fire rated sealant.
      b. Install fire rated sealants in accordance with manufacturer's instructions.
      c. Provide a foam depth of at least one conduit trade size.
   3. Conduit Stub-Ups
      a. Protect stub-ups from damage where conduits rise through floor slabs.
      b. Arrange stub-ups so curved portion of bends are not visible above the finished slab.
      c. Terminate stub-ups that are more that 6 inches from a wall with a threaded metal coupling and plug installed flush with the floor.
      d. Terminate all other stub-ups with a threaded cap or a bushing and penny.
   4. Provide wall and floor seals at conduit penetrations as specified in Section 260529, Supporting Devices.
   5. Roofs:
      a. Penetrate roofs only where specifically shown in the Contract Documents.
      b. Provide penetrations that meet the requirements of Division 07, Thermal and Moisture Protection.

F. Grounding
1. Mechanically assemble metal raceways to form a continuous effective grounding path.
2. Ensure that terminations at boxes and enclosures provide an effective ground connection.
3. Provide grounding bushings for the following metallic conduit connections:
   a. Circuits of more than 100 amperes.
   b. Connections through concentric, eccentric or oversize knockouts.
   c. Flexible conduit connections
   d. Any enclosure entry without an effective electrical connection.
4. Locknut and Bushing Grounding Lugs
   a. Bond together all lugs within the same box or enclosure with bonding jumpers.
   b. Bond lugs to the enclosure ground bus where provided.
   c. If a ground bus is not provided, bond lugs to an enclosure grounding stud or screw.
   d. For conduit transitions to cable tray, bond bushing ground lug to tray ground clamp.
5. Size bonding jumpers in accordance with NEC table 250.102.
6. Apply approved conductive joint compound to mating surfaces of all grounding connections.

G. Painting and Coating
1. Coat all field cuts and threads with brush applied cold process galvanizing, ASTM A 780.
2. Coat aluminum conduits with a dielectric isolating compound where installed in contact with reinforced concrete.

H. Identification: Identify conduits as required in Division 26 Section “Electrical Identification”.

3.5 CONDUIT FITTING INSTALLATION

A. General
1. Join with fittings designed and approved for that purpose.
2. Make-up couplings, fittings, and locknuts wrench-tight.
3. Install locknuts with dished side against box.
4. Use approved conductive thread compounds on all threaded connections.
5. Install a bushing on all conduit ends.
6. Provide a tee fitting with drain/breather at all low points.
7. Terminate Rigid Aluminum Conduit at NEMA 1 and NEMA 12 boxes and enclosures with two locknuts, one inside and one outside, and a bushing.
8. Terminate Rigid Aluminum Conduit at NEMA 3R, NEMA 4, NEMA 4X boxes and enclosures with conduit hub assemblies or in integral hubs where available.

B. Hazardous Locations
1. Provide sealing fittings where required by the NEC.
2. Follow the installation instructions of the manufacturer.

C. Expansion Fittings
1. Provide expansion fittings wherever structural expansion joints are crossed.
2. Provide expansion fittings for every 200 feet of linear run.
3. Provide expansion and deflection couplings wherever shown.
4. Install expansion fittings within one foot to five feet of structural expansion joint.
5. Do not use expansion fittings to compensate for misalignment of conduits.
6. Seismic Areas:
   a. Provide a rigidly attached junction box on each side of structural expansion joints.

b. Connect junction boxes with flexible conduit and provide 15 inches of slack.

3.6 WIREWAY AND SURFACE RACEWAY INSTALLATION

A. General:
1. Install in accordance with the following:
   a. Manufacturer's written installation instructions
   b. NECA 1, NEC, and UL.
2. Install only where shown.
3. Install plumb and level.
4. Install parallel or perpendicular to wall, floors, ceilings, or structural members.
5. Mechanically assemble to form continuous electrical conductor.
6. Support as specified in Division 26 section "Supporting Devices."

B. Rough-in dimensions:
1. Use dimensions for utilization equipment that are provided in the submittals.
2. Maintain all manufacturer recommended clearances.
3. Install only after the locations clear with other trades.

C. Supporting: Support as specified in Division 26 section "Supporting Devices.".

3.7 FIELD QUALITY CONTROL

A. Check alignment and condition of conduits:
1. Pull a mandrel and swab through every completed conduit run.
2. Use an iron shot mandrel:
   a. Mandrel diameter: 1/4 inch less than nominal conduit size
   b. Mandrel length: Equal to the conduit diameter.
   c. Gasket diameter: Slightly larger than the conduit opening.
3. Draw mandrel through without mechanical assistance.
4. If obstructions are encountered that cannot be removed, correct or replace conduit.

B. Test Nonmetallic Conduits for Leaks
1. Test conduits after conduit run is complete and cemented joints are set.
2. Conduct test as recommended by manufacturer.
3. Exercise caution, low-pressure air can cause high thrust loads.

C. Notify the Engineer for inspection and sign-off of the following installations:
1. Conduits to be direct buried: Notify the Engineer prior to covering.
2. Conduits to be embedded in concrete: Notify the Engineer prior to pouring concrete.
3. Document when each conduit is tested and cleaned and submit test report.

3.8 CLEANING

A. Conduits
1. Pull a stiff brush through each conduit until it is clear of foreign materials.
2. Clean existing ducts used for new cable in the same manner as noted above.

B. Wireways: Remove any dirt or debris from wireways before installing wiring.

END OF SECTION 26 0533

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 0543

MANHOLES, HANDHOLES, AND UNDERGROUND PULL BOXES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to install manholes and handholes in accordance with the plans and as specified herein.

B. Underground Work: This section includes underground electrical work including the following:
   1. Manholes.
   2. Handholes.
   3. Underground pull boxes.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work associated with manholes and handholes in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.

B. Manufacturer Qualifications: Manufacturers of precast manholes and handholes shall be firms regularly engaged in manufacturing factory-fabricated manholes and handholes, of types and sizes required, whose products have been in satisfactory use in similar service for not less than 3 years.

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and material certification as required.

B. Submittals: Submit the following in accordance with Conditions of Contract and Division 01 specification sections.
   1. Product data for accessories for manholes and handholes and miscellaneous components include:
      a. Frames and covers.
      b. Pulling eye assemblies.
      c. Pulling and lifting hardware.
      d. Bolting inserts.
      e. Cable stanchions, arms, and insulators.
      f. Sump frames and cover.
      g. Manhole ladder.

C. Reference Submittals: Detail drawings and design calculations for precast manholes and handholes, including reinforcing steel. Drawings shall bear the stamp of a registered professional structural engineer.

1.5 JOB CONDITIONS

A. Existing Utilities: Information on underground utilities and possible obstructions in the path of construction under this section was obtained through investigations during the design of the project. This information is not intended as representations or warranties of accuracy regarding conditions and locations. The Owner will assume no responsibility of interpretations or conclusions drawn from this information.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store precast concrete units at site as recommended by manufacturer to prevent physical damage. Arrange so identification markings are visible.

B. Lift and support precast concrete units only at designated lifting or supporting points.

1.7 DEFINITIONS

A. Manhole: A below-the-surface enclosure or chamber, large enough for a person to enter, connecting with ducts, and affording facilities for installing, operating, and maintaining equipment or wiring.

B. Handhole: A below-the-surface enclosure in connection with ducts into which people reach, but do not enter, for the purpose of installing, operating, or maintaining equipment or wiring.

C. Underground Pull Box: A below-the-surface bottomless enclosure in connection with ducts into which people reach, but do not enter, for the purpose of installing, operating, or maintaining equipment or wiring.

1.8 SEQUENCING AND SCHEDULING

A. Coordination of the Work: Coordinate layout and installation of manholes and handholes with final arrangement of ducts as influenced by actual final location of other utilities in the field. Coordinate elevations of duct and raceway entrances into manholes and handholes with final profiles of conduits as determined by coordination with other utilities and underground obstructions. Revise locations and elevations from those indicated as required to suit field conditions and ensure duct runs drain to manholes and handholes and as approved by the A/E.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Precast Manholes and Handholes
1. Factory fabricated of reinforced concrete and in conformance with American National Standards Institute (ANSI) C 2, "National Electrical Safety Code (NESC)" and applicable requirements of American Society of Testing Materials (ASTM) C 478, "Specifications for Precast, Reinforced Concrete Manhole Sections." Manhole structure shall be designed

in accordance with requirements of the American Association of State Highway and Transportation Officials (AASHTO) publication "Standard Specifications for Highway Bridges." AASHTO H20 highway loading shall apply with 30% loading added for impact.

2. Handholes, unless otherwise indicated, shall be 4 feet W x 4 feet L x 4 feet D and shall be constructed of precast concrete in two sections. The reinforced concrete shall utilize Grade 60 reinforcing bars and Type II cement with a concrete strength equal to 4,500 pounds per square inch (psi).
3. Manholes, unless otherwise indicated, shall be 6 feet W x 8 feet L x 6 feet D and shall be constructed of precast concrete in two sections. The reinforced concrete shall utilize Grade 60 reinforcing bars and Type II cement with a concrete strength equal to 4,500 psi.
4. Precast units consisting of interlocking, mating sections, complete with accessory items, hardware, and features as indicated, including concrete knockout panels for conduit entrance and sleeve for ground rod.
5. Joint sealant for joints between precast sections shall be continuous extrusion of asphaltic butyl material compounded for the adhesion, cohesion, flexibility, and durability properties required for a permanent seal against the maximum hydrostatic pressures theoretically attainable at the installation location with the ground water level at grade.

B. Manhole/Handhole Hardware and Accessories

1. Frames and covers shall be cast iron conforming to American National Standards Institute (ANSI) C2, "National Electrical Safety Code," Rule 323. Furnish with cast-in legend, "Electric" or "Signal" as appropriate. Cover to frame bearing surfaces machined.
2. Sump frame and grate shall comply with PS RR-F 621, Type VII for frame, Type I for cover. Locate sump at center of manhole or handhole directly below the cover.
3. Pulling eyes in walls shall be eyebolt with rebar fastening insert. Two-inch-diameter eye, 1-inch x 4-inch long bolt. Working load embedded in 6-inch, 4,000 pounds per square inch (psi) concrete: 13,000 pounds minimum tension.
4. Pulling and Lifting Irons in Floor shall be 7/8-inch diameter hot-dipped galvanized, bent steel rod, stress-relieved after forming, and fastened to reinforced rod. Exposed triangular shaped opening. Ultimate yield strength, 40,000 pounds shear, 60,000 pounds tension.
5. Bolting inserts for cable stanchions shall be flared, threaded inserts of non-corrosive, chemical-resistant, non-conductive thermoplastic material. One-half-inch internal diameter by 2-3/4 inches deep, flared to 1-1/4-inch minimum at base. Tested ultimate pull-out strength: 12,000 pounds, minimum.
6. Expansion anchors for installation after concrete is cast shall be zinc-plated carbon steel wedge-type with stainless steel expander clip 1/2-inch bolt size, 5,300-pound-rated pull-out strength, and 6,800-pound-rated shear strength, minimum.
7. Barriers shall be provided for voltage separation of electrical, telephone, and instrumentations cables.
8. Cable stanchions shall be hot-rolled, hot-dipped galvanized "T" section steel, 2 1/4-inch size, punched with 14 holes on 1-1/2-inch centers for cable arm attachment.
9. Cable arms shall be 3/16-gauge hot-rolled, hot-dipped galvanized sheet steel pressed to channel shape, approximately two 12 inches wide x 14 inches long and arranged for secure mounting in horizontal position at any position on cable stanchions.
10. Cable support insulators shall be high-glaze, wet-process porcelain arranged for mounting on cable arms.

C. Underground Pull Boxes
   1. Underground pull boxes shall be factory-fabricated of fiberglass-reinforced polymer concrete. Boxes shall be stackable with minimum dimensions 17 inches W x 30 inches L x 12 inches D.
   2. Covers: Provide heavy-duty covers rated for a service load of 15,000 pounds over a 10-inch-square area. Covers shall read either "Electric," "Telephone," or "Signal," depending on the application. Covers shall be secured with stainless steel penta-head bolts.
   3. Openings: Openings shall be provided for duct number and size as indicated on plan.
   4. Underground pull boxes shall be Quazite type "PC" or equal.

D. Manhole and Handhole Moisture Proofing: Conform to Division 07 for waterproofing.

E. Ladder: Fiberglass manhole ladder, specifically designed for electrical manhole use. Minimum length equal to the distance from the deepest manhole floor to grade, + 3 feet.

F. Raceway/Duct Sealing Compound: Compound shall be non-hardening, putty-like consistency, workable at temperatures as low as 35 deg F. Compound shall not slump at a temperature of 300 deg F, and shall readily adhere to clean surfaces of plastic ducts, metallic conduits conduit coatings, concrete, masonry, lead, cable sheaths, cable jackets, insulation materials, and the common metals. Compound shall have no injurious effect on worker's hands and on materials.

G. Extra Materials
   1. Furnish the following extra materials matching products installed, packaged with protective covering for storage and with identification labels clearly describing contents.
   2. Cable stanchions, support arms, insulators, and associated fasteners in the quantity of 10% of those installed for actual use in this project.

2.2 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in the work include the following:
   1. Precast Manholes, Handholes, and Underground Pull Boxes.
      a. CDR Systems Corporation.
      b. Christy Concrete Products, Inc.
      c. Elrnhurst-Chicago Stone Co.
      d. Hartford Concrete Products, Inc.
      e. Norwalk Concrete Industries.
      f. Quazite Corporation.
      g. Rotondo/Penn-Cast, Inc.
      h. Smith-Midland Corp.
      i. Utility Vault Co.
      j. Wausau Concrete Co.
      k. Or equivalent.
   2. Frames and Covers
      a. East Jordan Iron Works, Inc.
      b. Campbell Foundry Co.
      c. McKinley Iron Works.
      d. Neenah Foundry Co.
      e. Or equivalent.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Duct Entrances to Manholes and Handholes: End bells spaced approximately 10 inches center to center for 5-inch ducts and varied proportionately for other duct sizes. The change from regular spacing to end bell spacing shall start 10 feet from the end bell and shall be made without reducing duct line slope and without forming a trap in the line. Grout end bells into manhole and handhole walls from both sides to provide watertight entrances.

B. General: Provide manholes, handholes, and underground pull boxes of sizes, shapes, and locations as indicated. Determine final grading of ducts as influenced by possible adjustments in other utilities and surface features and discovery of underground obstructions before installing manholes, handholes, and underground pull boxes. Obtain A/E's approval for manhole, handhole, and underground pull box installation adjustments necessitated by the above. Install units plumb and level and with orientation and depth coordinated with arrangement of connecting ducts to minimize bends and deflections required for proper entrances.

C. Elevation: Install manholes and handholes with rooftop 15 inches below finished grade, minimum. Where indicated, cast handhole cover frame directly into roof of handhole and set roof surface 1 inch above grade.

D. Drainage: Install drains in bottom of units where indicated. Arrange to coordinate with drainage provisions indicated or specified.

E. Precast Access: Install access to manhole/handhole through cast iron frame and cover. For manholes and handholes, use 30-inch-diameter cover, except as indicated. Install precast concrete rings and seal with joint sealant as described in Part 2 of this specification. In addition, caulk all seams and joints inside and out. Set frames in paved areas and traffic ways flush with finished grade. Set other frames 1 inch above finished grade.

F. Waterproofing: Apply waterproofing to exterior surfaces of units after concrete has cured at least 3 days. Apply in accordance with requirements of Division 07. After ducts have been connected and grouted in, and prior to backfilling, waterproof joints and connections and touch up abrasions and scars. Waterproof exterior of manhole/handhole chimneys after brick mortar has cured at least 3 days.

G. Hardware: Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators as required for installation and support of cable and conductors and as indicated.

H. Field Installed Bolting Anchors: Do not drill deeper than 3-7/8 inches for anchor bolts installed in the field. Use a minimum of two anchors for each cable stanchion.

I. Install barriers for voltage separation of electrical, telephone, and instrumentation cables.

J. Grounding: Ground manholes, handholes, and underground pull boxes in accordance with Division 26 Section “Grounding”.

3.2 INSTALLATION OF PRECAST MANHOLES, HANDHOLES AND UNDERGROUND PULL BOXES

A. Install in accordance with ASTM C 891, "Practice for Installation of Underground Precast Concrete Utility Structures," and manufacturer's instructions.

B. Support units on a minimum 4-inch-deep level bed of crushed stone or gravel, graded from the 1-inch sieve to the No. 4 sieve and compacted to same density as adjacent undisturbed earth.

C. Compact backfill as required to set units securely in place. Backfill and grading shall be sloped to drain surface water away from access covers.

3.3 FIELD TESTING

A. Grounding: Test grounding provisions to ensure electrical continuity of bonding and grounding connections. Make ground resistance test at each ground rod and submit a report of the results. Use an instrument specifically designed for ground resistance measurements.

B. Watertightness: Make internal inspection of manholes/handholes 3 months after completion of construction for indications of water ingress. Where leakage is noted, remove any water found and seal leakage sources. Reinspect after 2 months and reseal any remaining leakage sources. Repeat process at 2-month intervals until leakage is corrected.

3.4 CLEANING AND RESTORATION

A. Clean Manholes: Clean all internal surfaces of manholes, including sump. Remove all foreign material.

END OF SECTION 26 0543

SECTION 26 0553

ELECTRICAL IDENTIFICATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to perform the work in accordance with the plans and as specified herein.

B. This section includes identification of electrical materials, equipment, and installations. It includes requirements for electrical identification components including, but not limited to, the following:
   1. Buried electrical line warnings.
   2. Identification labeling for raceways, cables, and conductors.
   3. Operational instruction signs.
   4. Warning and caution signs.
   5. Equipment labels and signs.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work associated with electrical identification in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.

B. Electrical Component Standard: Components and installation shall comply with National Fire Protection Association (NFPA) 70 "National Electrical Code (NEC)."

C. American National Standards Institute (ANSI) Compliance: Comply with requirements of ANSI Standard A13.1, "Scheme for the Identification of Piping Systems," with regard to type and size of lettering for raceway and cable labels.

1.4 DEFINITIONS

A. Abbreviations
   1. AHJ: Authority having jurisdiction.

1.5 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and materials certifications as required

B. Provide submittal for approval of format, descriptions, and contents prior to fabrication.

C. Submit the following in accordance with Conditions of Contract and Division 01 specification sections:
   1. Product data for each type of product specified.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Box, Conduit, and Raceway Identification
   1. Adhesive Labels: Preprinted, flexible, self-adhesive orange vinyl labels with black legend. Legend covered with clear weather and chemical resistant coating.
   2. Plastic Sleeves: Preprinted, pretensioned, snap-on, flexible, wraparound plastic sleeves with black legend. Sized to fit conduit diameter.
   3. Plasticized Card Stock Tags: Vinyl cloth with preprinted and field printed legends. Orange background, except as otherwise indicated, with eyelet for fastener.
   4. Buried Line Warning Tape: Permanent, bright colored, continuous printed, plastic warning tape not less than 6 inches wide by 4 mils thick with continuous metallic strip or core. Printed legend indicative of general type of underground line below.

B. Wire and Cable Identification
   1. Colored Marking Tape: Self-adhesive vinyl tape not less than 7 mils thick and 3/4 inch wide.
   2. Wire Labels: Self-adhesive wraparound labels with clear heat shrinkable jacket or permanent plastic heat shrinkable labels. Preprinted legends.

C. Nameplates and Signs
   1. Laminated Plastic: Engraving stock plastic laminate, 1/16 inch minimum thick for signs up to 20 square inches, or 8 inches in length; 1/8 inch thick for larger sizes. Engrave legend in black letters on white face unless otherwise noted and punched for mechanical fasteners.
   2. Metal Backed Butyrate: Weather resistant, nonfading, preprinted cellulose acetate butyrate signs with 20 gauge, galvanized steel backing, with colors, legend, and size appropriate to the location. Provide 1/4 inch grommets in corners for mounting.
   3. Brass or Aluminum Tags: Metal tags with stamped legend, punched for fasteners. Dimensions: 2 inches by 2 inches by 19 gauge.

D. Accessories
   1. Fasteners: Self-tapping stainless steel screws or number 10/32 stainless steel machine screws with nuts and flat and lock washers.
   2. Cable Ties: Fungus inert, self-extinguishing, one piece, self-locking nylon cable ties, 0.18 inch minimum width, 50 pound minimum tensile strength, and suitable for a temperature range from minus 40 degrees Fahrenheit (° F.) to 185° F. Provide ties in specified colors when used for color coding.

2.2 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in the work include, but are not limited to, the following:
   1. American Labelmark Co.; Labelmaster Subsidiary
   2. Brady USA, Inc.; Industrial Products Div.
   3. Calpico, Inc.

4. Carlton Industries, Inc.
5. Champion American, Inc.
6. Cole-Flex Corp.
7. D&G Sign and Label.
8. Emed Co., Inc.
9. George-Ingraham Corp. (The)
10. Grimco, Inc.
11. Ideal Industries, Inc.
12. Kraftbilt.
13. LEM Products, Inc.
14. Markal Corp.
15. National Band and Tag Co.
16. Panduit Corp.
17. Radar Engineers.
18. Ready Made Sign Co.; Cornerstone Direct Corp. Div.
19. Seton Name Plate Co.
20. Standard Signs, Inc.
21. W. H. Brady, Co.

PART 3 - EXECUTION

3.1 APPLICATIONS

A. Conduits
1. Underground Lines: Identify with warning tape in trench above conduits.

B. Boxes
1. Code Required Caution Signs: Self-adhesive labels indicating system voltage. Install on outside of box cover.
2. Circuit Identification: Self-adhesive labels indicating contained circuits.

C. Wires and Cables
1. Color Coding
a. Color code service, feeder, and branch circuit conductors as follows:

208/120 Volts	**Phase**	**480/277 Volts**
Black	A	Brown
Red	B	Orange*
Blue	C	Yellow
White	Neutral	White
Green	Ground	Green
*Where not permitted by inspecting authority, use purple.		

b. Use conductors with color factory applied for sizes No. 8 AWG and smaller.
c. Use colored marking tape for sizes larger than No. 8 AWG. Apply for a distance of 6 inches from terminal points and in boxes where splices or taps are made.

2. Circuit Identification: Use aluminum wraparound marker bands to identify feeders and branch circuits in manholes, handholes, and pull boxes.
3. Conductor Labeling: Use wire labels to identify conductors as follows:
   a. Conductors indicated to be for future connection or connection under another contract with identification indicating source and circuit numbers.
   b. Where multiple branch circuits or control wiring or communications/signal conductors are present in the same box or enclosure (except for three circuit, four wire home runs), label each conductor or cable. Provide legend indicating source, voltage, circuit number, and phase for branch circuit wiring. Phase and voltage of branch circuit wiring may be indicated by means of coded color of conductor insulation.
   c. Label all control, communication, signal, and metering conductors with wire numbers matching the numbers on the approved shop drawings from the system integrator.
   d. Match identification markings with designations used in panelboards, shop drawings, Contract Documents, and similar previously established identification schemes for the facility's electrical installations.
   e. Provide securely attached nameplates identifying all ground buses. Provide securely attached nametags to each accessible termination, attachment, or bonding location for each equipment grounding conductor, grounding electrode conductor, and bonding conductor.

D. Signs
1. Install warning, caution, or instruction signs where required by NEC, where indicated, or where reasonably required to ensure safe operation and maintenance of electrical systems and of the items to which they connect. Install engraved plastic laminated instruction signs with approved legend where instructions or explanations are needed for system or equipment operation. Install butyrate signs with metal backing for outdoor items.
2. For emergency operating signs, install engraved laminate signs with white legend on red background with minimum 3/8 inch high lettering for emergency instructions on power transfer, load shedding, or other emergency operations.
3. Provide code required signs for multiple main switches, for standby power systems, and, where required, for generator ground connection.

E. Nameplates
1. General: Provide equipment identification nameplates for each major unit of electrical equipment, including central or master units of each electrical system. This includes communication/signal/alarm systems unless unit is specified with its own self-explanatory identification. Text shall match terminology and numbering of the contract documents and shop drawings.
2. Provide 1-1/2 inch high engraved plastic laminated nameplates (2 inches high where two lines of text are required) with 1/2 inch lettering for the following:
   a. Panelboards, electrical cabinets, and enclosures.
   b. Switchboards.
   c. Motor control centers.
   d. Motor starters.
   e. Power transfer equipment.
   f. Contactors.

g. Transformers.
h. Enclosed circuit breakers.
i. Disconnect switches.
j. Control panels.

3. Provide 5/8 inch high engraved plastic laminated nameplates (1 inch high where two lines of text are required) with 1/4 inch high lettering for individual compartments of the following:
   a. Switchboards.
   b. Motor control centers.
4. Provide 5/8 inch high engraved plastic laminated nameplates (1 inch high where two lines of text are required) with 1/4 inch high lettering for the following:
   a. Control stations.
   b. Control devices.
   c. Light switches.
5. Install labels at locations indicated and at locations for best convenience of viewing without interference with operation and maintenance of equipment. All code requirements for signage shall be met.

3.2 INSTALLATION

A. General
   1. Lettering and Graphics: Coordinate names, abbreviations, colors, and other designations used for electrical identification with corresponding designations specified or indicated. Install numbers, lettering, and colors as approved in submittals and as required by code.
   2. Install identification devices in accordance with manufacturer's written instructions and requirements of NEC. Clean surfaces of dust, loose material, and oily films before applying.
   3. Sequence of Work: Where identification is to be applied to surfaces that require finish, install identification after completion of finish work.
   4. Install labels where indicated or at locations for best viewing without interference with operation and maintenance of equipment.

B. Buried Line Warning Tape: During trench backfilling, for exterior underground power, control, signal, and communications cables and conduits, install continuous underground plastic line marker, located directly above line at 6 to 8 inches below finished grade. Where multiple lines are installed in a common trench or concrete envelope, do not exceed an overall width of 16 inches; install a single line marker.

C. Tape: Apply colored, pressure sensitive plastic tape in half-lapped turns. Apply the last two turns of tape with no tension to prevent possible unwinding. Do not obliterate cable identification markings by taping. Tape locations may be adjusted slightly to prevent such obliteration.

D. Metal Tags: Attach metal tags with one piece self-locking nylon cable ties.

E. Cable Ties: Apply cable ties with a special tool or pliers; tighten for snug fit and cut off excess length.

SECTION 26 0573

POWER SYSTEM STUDY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes
   1. Short-circuit analysis.
   2. Protective device coordination study.
   3. Arc flash analysis.
   4. Harmonic analysis.

B. Related sections. The following sections contain requirements that relate to this section.
   1. Division 01 section, "Submittal Procedures."
   2. Division 01 section, "Closeout Procedures."
   3. Division 01 section, "Operation and Maintenance Data."
   4. Division 26 section, "Basic Electrical Requirements."
   5. Division 26 section, "Basic Electrical Materials and Methods."

1.3 REFERENCES

A. Unless otherwise stated, references are to the latest edition of the standard.

B. National Fire Protection Association (NFPA)
   1. NFPA 70 – The National Electrical Code.
   2. NFPA 70E Standard for Electrical Safety in the Workplace.

C. American National Standards Institute (ANSI)
   1. ANSI C2, National Electrical Safety Code.

D. Institute for Electrical and Electronics Engineers (IEEE)

1.4 DEFINITIONS

A. Abbreviations
   1. AHJ. Authority having jurisdiction.
   2. NRTL. Nationally recognized testing laboratory.

1.5 SYSTEM DESCRIPTION

A. Electrical system description.
   1. The studies shall include all portions of the electrical distribution system necessary to ensure that all electrical power components are within their manufacturer’s recommended load and short-circuit ratings, and that all settings and/or sizes are properly coordinated.

The study shall begin at the normal and emergency power sources. Normal system connections and those which result in maximum fault conditions shall be adequately covered in the study.

2. Electrical service from utility at 15kV.
3. Unit substation to transform from 15kV to 480Y/277V.
4. All downstream distribution and branch panelboards, motor control centers, and significant motor locations.
5. Standby generator and associated emergency power distribution equipment, including automatic transfer switches and generator ground fault protection.
6. Refer to the one line power diagrams.

1.6 SUBMITTALS

A. General.
   1. Comply with the requirements of Division 01 section, "Submittals."
   2. Manufacturer's literature for software to be used for studies, showing software capabilities applicable to the study to be performed.

B. Report of the Power System Study.
   1. Submit the report simultaneously with the protective equipment.
   2. Equipment submittals will not be approved without the completion and review of the power systems study.
   3. Summarize the results of the power system study.
   4. Include the one line diagram.
      a. Transformer rating, voltage ratio, impedance, and winding connection.
      b. Feeder cable phase, neutral and ground sizes, length of cable, conductor material, and conduit size and type.
      c. Switchgear, switchboards, panelboards, motor control centers, fuses, circuit breakers, automatic transfer switches and switches continuous current ratings.
      d. Protective relays with appropriate device numbers and current transformers and potential transformers with associated ratios.
      e. Detailed legend indicating device type identification and other significant details.
   5. Include tables equipment ratings versus calculated short circuit values and X/R ratios.
   6. Protective device coordination plots.
   7. Tables of protective device settings and fuse selection.
   8. Engineering analysis, commentary and recommendations.

C. Quality Control Submittals
   1. Submit qualification data for firms and persons performing the study.
   2. Include list of completed projects with project names, addresses, names of A/E and Owner, and other information specified.

1.7 QUALITY ASSURANCE

A. Preparer's Qualifications
   1. Experienced in the analysis, evaluation, and coordination of electrical distribution systems similar to the system for this project.
   2. Minimum of one million dollars of Professional Liability Insurance in addition to standard general insurance.
   3. Minimum of five years experience in the analysis, evaluation, and coordination of electrical distribution systems.

4. Study prepared, signed, and sealed by a Professional Engineer registered in the State of Ohio.

B. Regulatory requirements: Comply with the following:
1. All applicable federal, state, and local codes and regulatory requirements.
2. National Electrical Code (NEC).

1.8 SEQUENCING AND SCHEDULING

A. Sequencing.
1. Studies must be completed prior to final approval of the electrical distribution equipment shop drawings.
2. Equipment must not be released for manufacturing until study has been submitted and reviewed.

PART 2 - PRODUCTS

2.1 PREPARERS

A. Preparers. Subject to compliance, select one of the following companies to perform the specified studies:

B. Available preparers. Companies available to perform the specified studies include but are not limited to the following:
1. General Electric Industrial Systems, Columbus, OH 614-899-8923.
2. High Voltage Maintenance, Dayton, OH 937-278-0811.
3. Pahl Engineering, Mansfield, OH 419-756-8430.
4. Cutler-Hammer, Columbus, OH 614-899-4105.

2.2 SHORT-CIRCUIT ANALYSIS

A. General.
1. Have the report prepared and stamped by a Registered Professional Engineer that specializes in power system studies.
2. Base the report upon the actual equipment installed under the Contract.
3. Provide all information required to complete the study.
4. Obtain the available fault current from the local utility
5. Submit three copies of the report prior to project closeout.
6. Perform the study using recognized electrical analysis software meeting the calculation requirements of ANSI C.37 and IEEE Std. 399.

B. Report. As a minimum, provide the following:
1. One-line power diagram of the electrical system showing the following:
a. All electrical equipment and wiring protected by the overcurrent devices
b. Available short circuit current from the electric utility.
c. Short circuit current contributions from each motor.
d. Calculated fault impedance, X/R ratio, short circuit current and ground fault current for the following:
1) Each bus.
2) Every feeder.
e. Momentary and interrupting ratings for each overcurrent protective device.

f. Fault withstand ratings of all distribution equipment.
g. Capacity, voltage, impedance, X/R ratios, and wiring connections for all transformers.
h. Voltage at each bus.
i. Identification of each bus.
j. Conduit material, feeder sizes, length, and X/R ratios.

2. Overcurrent protective device time-current and short circuit curves.
3. Table showing the following information for each overcurrent protective device:
   a. Device identification and load controlled.
   b. Type of device.
   c. Operating voltage
   d. Interrupting current rating
   e. Calculated short circuit current
4. Fault Analysis
   a. Analyze the short circuit calculations.
   b. Highlight any equipment that is underrated as specified.
   c. Propose approaches to effectively protect the underrated equipment.
   d. Recommend modifications required to conform with the study.

2.3 PROTECTIVE DEVICE COORDINATION STUDY

A. General.
1. Have the report prepared and stamped by a Registered Professional Engineer that specializes in power system studies.
2. Base the report upon the actual equipment installed under the Contract.
3. Provide all information required to complete the study.
4. Submit three copies of the report prior to project closeout.
5. Perform the study using commercially available electrical analysis software.

B. Report. As a minimum, provide the following:
1. Overcurrent protective device time-current and short circuit curves.
2. Table showing the following information for each overcurrent protective device:
   a. Device identification and load controlled.
   b. Type of device.
   c. Operating voltage
   d. Interrupting current rating
   e. Calculated short circuit current
3. Overcurrent protective device settings table with the following information:
   a. Device identification and load controlled.
   b. Fuse rating and type.
   c. Circuit breaker trip rating or rating plug.
   d. Circuit breaker long time, short time, and instantaneous settings.
   e. Ground fault pickup and time delay settings.
   f. Relay CT ratios and protection setpoints for electronic relays.
   g. Relay curve selection.
4. Coordination plots.
   a. Plot the protective device time-current characteristics
   b. Use a logarithmical scale for both time and current.
   c. Provide a separate sheet for the largest branch circuit protective device connected each bus.
   d. Show the following information on the same sheet:

1) Curves for all upstream devices including the service equipment.
2) ANSI damage point for each transformer.
3) Device identification.
4) Voltage and current ratios for curves.
5) Minimum melt and total clearing curves for fuses.
6) Cable damage curves.
7) Transformer inrush points
8) Total connected kVA inrush for feeder circuits.
9) Maximum short circuit cutoff point

5. Coordination Analysis
   a. Highlight areas lacking coordination.
   b. Provide a technical evaluation with a discussion of the logical compromises for best coordination.

C. Certification.
1. Certify that the protective devices have been adjusted and set in accordance with the approved protective device coordination study.
2. Prior to final acceptance, provide four copies of a certificate signed by the preparer.

2.4 ARC FLASH HAZARD STUDY

A. Calculate the short circuit fault current levels and protective device settings feeding switchboards, panelboards, industrial control panels, and motor control centers.

B. Calculate the following:
1. Flash hazard boundary
2. Amount of incident energy
3. Shock hazard
4. Limited approach distance
5. Restricted approach distance
6. Prohibited approach distance
7. Type of personnel protective equipment (PPE) needed.

C. Provide colored custom stick-on labels for each switchboard, panelboard, industrial control panel, and motor control center.
1. Label shall be 3”x5”, have rounded corners, thermal transfer type of high adhesion polyester – chemically resistant and suitable for UV. No hand marking on label. Label shall comply with ANSI Z535.4-2011 Product Safety Signs and Labels. If equipment front face is not large enough to accommodate arc flash label, use an approved plastic backing for the label and use a nylon tie-wrap to tie the arc flash label to the incoming conduit.
2. Each label must have the following information:
   a. Arc flash hazard boundary.
   b. Calories per square centimeter at 36 inches.
   c. Personnel protective equipment (PPE) required.
   d. Voltage of Shock Hazard when cover is removed.
   e. Distance for limited approach.
   f. Distance for Restricted Approach.
   g. Distance for Prohibited Approach.

D. Comply with NEC Article 110.16 and NFPA 70E

E. Comply with IEEE Standard 1584-2002, Guide for Arc Flash Hazard Analysis when performing the arc flash analysis.

2.5 HARMONICS ANALYSIS

A. The harmonic analysis shall be performed by a computer aided circuit simulation of the distribution system specific to this project. These calculations shall show that the total harmonic voltage distortion shall be less than 5 percent due to the contribution of all VFD's supplied.

2.6 COMPONENTS

A. Short-circuit and protective device evaluation and coordination study.
   1. The short-circuit study shall be performed with the aid of a digital computer program.
   2. In the short-circuit study, provide calculation methods and assumptions, the base per unit quantities selected, one-line diagrams, source impedance data including power company system characteristics, typical calculations, tabulations of calculation quantities and results, conclusions, and recommendations. Calculate short-circuit interrupting and momentary (when applicable) duties for an assumed 3-phase bolted fault at each supply switchgear lineup, unit substation primary and secondary terminals, low-voltage switchgear lineup, switchboard, motor control center, distribution panelboard, pertinent branch circuit panelboard, and other significant overcurrent protective device locations throughout the system. Provide a ground fault current study for the same system areas, including the associated zero sequence impedance data. Include in tabulations fault impedance, X to R ratios, asymmetry factors, motor fault contribution, short circuit kVA, and symmetrical and asymmetrical fault currents.
   3. In the protective device coordination study, provide time-current curves graphically indicating the coordination proposed for the system, centered on conventional, 8 1/2 x 11 log-log forms. Include with each curve sheet a complete title and one-line diagram with legend identifying the specific portion of the system covered by that particular curve sheet. Include a detailed description of each protective device identifying its type, function, manufacturer, and time-current characteristics. Tabulate recommended device tap, time dial, pickup, instantaneous, and time delay settings.
   4. Include on the time-current curve sheets power company relay and fuse characteristics, medium-voltage equipment protective relay and fuse characteristics, low-voltage equipment circuit breaker trip device characteristics, pertinent transformer characteristics, pertinent motor and generator characteristics, and characteristics of other system load protective devices. In addition, include all devices down to the largest branch circuit and largest feeder circuit breaker in each motor control center, and main breaker in branch panelboards.
   5. Include all adjustable settings for ground fault protective devices. Include manufacturing tolerance and damage bands in plotted fuse characteristics. Show transformer full load currents, transformer magnetizing inrush, ANSI transformer withstand parameters, and significant symmetrical fault currents. Terminate device characteristic curves at a point reflecting the maximum symmetrical fault current to which the device is exposed.
   6. Select each primary protective device required for a delta-wye connected transformer so that its characteristic or operating band is within the transformer characteristics, including a point equal to 58 percent of the ANSI withstand point to provide secondary line-to-ground fault protection. Separate transformer primary protective device characteristic curves from associated secondary device characteristics by a 16 percent current margin to provide proper coordination and protection in the event of secondary line-to-line faults.

Separate medium-voltage relay characteristic curves from curves for other devices by at least a 0.4-second time margin.

7. Include complete fault calculations as specified herein based on contract documents.
8. Make all additions or changes as required by the reviewer, after reviewing the reports.
9. Contractor shall obtain all existing sizes and settings for the study by field survey. Data for new equipment shall be obtained from shop drawings.
10. Notify the CMT in writing of existing circuit protective devices not properly rated for fault conditions.
11. When an emergency generator is provided, include phase and ground coordination of the generator protective devices. Show the generator decrement curve and damage curve along with the operating characteristic of the protective devices. Contractor shall obtain the information from the generator manufacturer and include the generator actual impedance value, time constants and current boost data in the study. Do not use typical values for the generator.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Perform field adjustments of the protective devices as required to place the equipment in final operating condition.

B. All settings shall be in accordance with the approved short-circuit study and protective device coordination study.

END OF SECTION 26 0573

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 0900

CONTROL DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes
   1. Pilot devices (push buttons, pilot lights, etc.).
   2. Elapsed time meters.
   3. Relays and timers.
   4. Intrinsically Safe Relays.
   5. Zener Barriers.
   6. Sensing devices (limit switches, proximity switches, etc.).
   7. Alarms and signals.

B. Related Sections
   1. Division 01 section, "Submittal Procedures."
   2. Division 01 section, "Operation and Maintenance Data."
   3. Division 26 Section “Electrical Identification”.

1.3 REFERENCES

A. Unless otherwise stated, references are to the latest edition of the standard.

B. Underwriter's Laboratory (UL)

C. National Electrical Manufacturers Association (NEMA)

D. National Fire Protection Association (NFPA)

E. American National Standards Institute (ANSI)

F. Institute for Electrical and Electronics Engineers (IEEE)

G. The Instrumentation, Systems, and Automation Society (ISA)

H. American Society for Testing and Materials (ASTM)

1.4 DEFINITIONS

A. Abbreviations
   1. AHJ: Authority having jurisdiction.
   2. DPDT: Double pole double throw.
   3. NRTL: Nationally recognized testing laboratory.

4. SPST: Single pole single throw.
5. SPDT: Single pole double throw.

B. Finished Locations: For the purposes of this specification, the following are finished locations:
1. Areas with carpet or tile floors.
2. Areas with lay-in ceiling tile, fixed ceiling tile, and special architectural ceiling treatment.
3. Areas with tiled, plastered, or paneled walls.

C. Interior Locations: For the purposes of this specification, the following are interior locations:
1. Any location within the boundaries of the foundation of any building.
2. Any location within the superstructure of other structures not classified as buildings.

D. Wet Locations: For the purposes of this specification, the following are wet locations:
1. All exterior locations.
2. All interior locations below grade.
3. All interior locations where wet materials are processed, pumped, transported, or stored.

E. Corrosive Locations: For the purposes of this specification, the following are corrosive locations.
1. All locations with chemical feed/transfer equipment, chemical storage tanks, or chemical storage drums are located.

F. Hazardous (Classified) Locations
1. Hazardous (classified) locations as defined by the NEC.
2. Hazardous locations and their classification are shown.

1.5 SUBMITTALS

A. General
1. Comply with the requirements of Division 01 Section “Submittal Procedures”.
2. Provide all information necessary to determine compliance with the plans and specifications.

B. Product Data
1. Manufacturer’s technical product data sheets for all products specified in this section.
2. Delete or cross out all inappropriate or non-applicable information.

C. Shop Drawings
1. Wiring Diagrams: Submit wiring diagrams for all products.
a. Show all components and features specified.
b. Differentiate between factory and field installed wiring and components.

D. Contract Closeout Submittals: Operation and maintenance (O&M) data.

1.6 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with the following:
1. All applicable federal, state, and local codes and regulatory requirements.
2. National Electrical Code (NEC).

PART 2 - PRODUCTS

2.1 PRODUCT REQUIREMENTS – GENERAL

A. General
   1. Provide new and unused products of current manufacture.
   2. Provide products free from defects affecting performance.
   3. All units of the same type must be from the same manufacturer.

B. Listing and Labeling
   1. Provide UL listed and labeled products.
   2. Provide products listed and labeled by an approved independent NRTL.
   3. Products not bearing an NRTL label must be pre-approved in writing by the AHJ.

2.2 PILOT DEVICES

A. General
   1. Round, heavy-duty, 30.5 mm.
   2. NEMA rated equal to enclosure.
   3. 5 amp NEMA B600 sealed contacts.
   4. Type and quantity of contacts as shown on drawings.

B. Push Buttons
   1. Momentary contact.
   2. Extended head
   3. Color as shown on drawings or specified in other specification sections.

C. Emergency Stop Push Buttons
   1. Maintained contact
   2. Push/pull operator
   3. 2-1/4 inch diameter mushroom head
   4. Red.

D. Selector Switches
   1. Maintained contact, unless otherwise shown.
   2. Number of positions as shown on drawings.

E. Cylinder Lock Operator
   1. Push button or selector switch type as shown on drawings.
   2. Operable only with key in lock.
   3. Provide two keys.

F. Pilot Lights
   1. Push-to-test LED type.
   2. Lens and lamp color as shown on drawings.

G. Legend Plates
   1. Extra large size
   2. Engraved laminated plastic
   3. Color
      a. Normal: Black legend on white background
      b. Emergency stop: Black legend on red background.

H. Accessories: Provide the following accessories where shown on the drawings.
   1. Padlocking Cover. Pad-lockable cover to prevent operation of pilot device.
   2. Protective Boot. Flexible plastic designed to prevent entrance of foreign materials.

I. Available Manufacturers: Subject to compliance, available manufacturers of products specified include, but are not limited to, the following:
   1. Allen Bradley Company.
   2. Cutler Hammer.
   3. Square D Company.

2.3 ELAPSED TIME METERS

A. General: 120 volt, synchronous motor driven, mechanical register indicating up to 99,999.9 hours.

B. Window Kit: Type 304 stainless steel frame, brushed finish, polycarbonate window, oil resistant gasket, NEMA 4X rated.

C. Available Manufacturers: Subject to compliance, available manufacturers of products specified include, but are not limited to, the following:
   1. Cramer Company.
   2. Hobbs.
   3. Industrial Timer Company.
   4. Redington Counters, Inc.
   5. Syrelec/Crouset Corporation.
   6. Weschler.

2.4 RELAYS AND TIMERS

A. General Purpose Relays: General purpose, plug in, tube base, transparent polycarbonate housing, 3PDT, 10 amp contact rating, coil voltage as shown on drawings.

B. General Purpose Timing Relays: General purpose, plug in, tube base, solid state, DPDT, 10 amp contacts, switch selectable timing mode (on delay, off delay, repeat cycle), switch selectable timing range (up to 10 hours). Voltage rating as shown on drawings.

C. Power Relays: DPDT, 30 amp, 1-1/2 horsepower rated contacts, coil voltage as shown on drawings.

D. Alternators: Two load alternator, plug in, tube base, 10 amp contact rating, DPDT cross connected, solid state alternating circuit, load 1-alternate-load 2 selector switch, voltage rating as shown on drawings.

E. Mounting Sockets: Surface mounted, tube base, screw terminals, with retaining strap.

F. Shall include a LED and mechanical visual indicator to indicate relay is energized.

G. Shall include push-to-test-pull-to-lock button manual operator.

H. Available Manufacturers: Subject to compliance, available manufacturers of products specified include, but are not limited to, the following:

1. Allen Bradley Company.
2. Cutler Hammer.
3. Furnas Electric Company.
4. General Electric Company.
5. Potter and Brumfield, Inc.
6. Releco.
7. Square D Company.
8. SSAC, Inc.
9. Time Mark Corporation.

2.5 INTRINSICALLY SAFE RELAYS

A. Type: Dual or single channel transformer type intrinsic safety barrier with built-in amplifier.

B. Power: 120VAC, 50-60Hz.

C. Power Consumption: 10VA maximum.

D. Input: Isolated from output and supply.

E. Output: Relay type SPST 2A/250V.

F. Mounting: DIN rail.

G. Operation Temperature: -45 deg F to + 131 deg F.

H. State Mode of Operation: Switch selectable each channel.

I. Fault Monitoring: LED indicator each channel (lead breakage).

J. Output Status Monitoring: LED indicator each channel.

K. Approvals:
1. UL Listed or recognized component.
2. Approved for providing intrinsically safe circuits for use in Class I, Div. 1 Hazardous Locations.

L. Manufacturers:
1. Pepperl and Fuchs.
2. Phoenix Contact.
3. Or approved equal.

2.6 ZENER BARRIERS

A. Type: Dual channel zener barriers which accept 24Vdc field transmitter inputs and limit hazardous area energy to levels below that which could ignite a specific gas/air mixture.

B. Working Voltage: 27Vdc.

C. Maximum Voltage: 28Vdc.

D. Mounting: DIN rail.

E. Approvals: FM approved for Class I, Div. 1, Group D areas.

F. Operation Temperature: -45 deg F to + 131 deg F.

G. Manufacturers:
1. Pepperl and Fuchs.
2. Phoenix Contact.
3. Or approved equal.

2.7 SENSING DEVICES

A. Limit Switches.
1. NEMA 4X.
2. Four operating head mounting positions.
3. DPDT contacts, momentary.
4. Operating head style: As required per installation location.
5. Stainless steel operating lever.

B. Proximity Sensors.
1. Inductive, shielded type.
2. Stainless steel housing, 30 mm cylindrical.
3. NEMA 4X, unless otherwise noted.
4. Normally open contact.
5. Voltage rating as shown on drawings.

C. Door Switches.
1. Two piece, surface mount.
2. Magnet assembly for mounting on the door.
3. Magnetically actuated reed switch assembly for mounting on the door jamb.
4. Normally open contact, 24 VDC.

D. Manufacturers. Subject to compliance, provide products manufactured by one of the following:

E. Available Manufacturers. Subject to compliance, available manufacturers of products specified include, but are not limited to, the following:
1. Allen Bradley Company.
2. Cutler Hammer.
3. Edwards.
4. Furnas Electric Company.
5. General Electric.
6. Simplex.
7. Square D Company.

2.8 ALARMS AND SIGNALS

A. Horns.
1. Vibrating diaphragm type.
2. Minimum sound output of 100 decibels (dB) at 10 feet.
3. Enclosure. NEMA 4X, with matching mounting box.
4. Voltage rating. 120 VAC, unless otherwise shown.

B. Warning Lights.
   1. Rotating sealed beam type.
   2. Incandescent lamp, 100 watt.
   3. NEMA 4X cast aluminum housing.
   4. Lexan dome color as shown on plans.
   5. Voltage rating. 120 VAC, unless otherwise shown.

C. Strobe Lights.
   1. High intensity strobe, 100,000 candlepower minimum.
   2. Self-contained power supply.
   3. NEMA 4X cast aluminum housing.
   4. Lexan dome color as shown on plans
   5. Voltage rating. 120 VAC, unless otherwise shown.

D. Manufacturers. Subject to compliance, provide products manufactured by one of the following:

E. Available Manufacturers. Subject to compliance, available manufacturers of products specified include, but are not limited to, the following:
   1. Benjamin Division, Thomas Industries.
   2. Federal Signal Corporation.
   3. Maxi Signal Products, Division of MV Specialties.

2.9 TERMINAL BLOCKS

A. General: NEMA style, rail mounted, tin-plated copper, screw type with pressure plate, 600 volt rated, wire range No. 22 to No. 8 American Wire Gauge (AWG).

B. Fuse Blocks: Integral fuse puller and blown fuse indicator.

C. Isolating Blocks: Knife style.

D. Accessories
   1. Mounting rail.
   2. End barriers and end anchors.

E. Available Manufacturers: Subject to compliance, available manufacturers of products specified include, but are not limited to, the following:
   1. Allen Bradley Company.
   2. Buchanan.
   3. Cutler-Hammer Products.
   4. Phoenix Contact.
   5. Square D Company.

2.10 CONTROL POWER TRANSFORMERS

A. General: Copper windings, vacuum impregnated, open type, 480 volt primary and 120 volt secondary unless otherwise shown, with top mounted fuse block.

B. Available Manufacturers: Subject to compliance, available manufacturers of products specified include, but are not limited to, the following:
   1. Allen Bradley Company.

2. Cutler-Hammer Products.
3. Heavy Duty.
4. Square D Company.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions
1. Inspect installed work prior to performing the work of this section.
2. Verify that the project has progressed to a point where this installation may begin.

B. Discrepancies
1. Immediately notify the Engineer in writing if any discrepancies are found.
2. Resolve all discrepancies before proceeding with installation.
3. Resolution must be acceptable to the Engineer.

3.2 PREPARATION

A. Surface Preparation
1. Carefully lay out the work in advance.
2. Perform any cutting , drilling, etc. without damaging the building surfaces or equipment.

B. Rough-In
1. Refer to equipment submittals for rough-in requirements.
2. Verify rough-in locations by field measurements.

3.3 INSTALLATION OF CONTROL DEVICES

A. General.
1. Install in accordance with manufacturer's written instructions.
2. Follow applicable requirements of National Electrical Contractors Association's (NECA) "Standard of Installation."
3. Coordinate with other work, including painting.
4. Install control devices only in boxes that are clean and free from dirt and debris.
5. Install control and indicating devices after wiring work is completed.
6. Install control devices in enclosures as required under other sections and as shown.
7. Tighten connectors and terminals to manufacturer's published torque tightening values.
8. Where manufacturer's torque requirements are not indicated, comply with UL 486A.

B. Grounding
1. Provide equipment grounding connections for control and indicating devices.
2. Tighten connection to comply with tightening torque specified in UL Standard 486A.

3.4 TESTING

A. General.
1. Prior to energizing circuitry, test control stations for electrical continuity.
2. After completion, demonstrate capability and compliance with project requirements.

END OF SECTION 26 0900

SECTION 26 2000

POLYPHASE INTEGRAL HORSEPOWER MOTORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. The Contractor shall provide all labor, materials, equipment and incidentals required to provide polyphase integral horsepower motors as shown on the Drawings, specified or required. This electric motor specification describes minimum requirements for motors furnished as part of driven equipment specified under other Sections.

1.3 REFERENCES

A. Reference Standards:
   1. NEMA MG 1, Motors and Generators
   2. Anti-Friction Bearing Manufacturers Association (AFBMA), Standards
   3. NFPA 70, National Electrical Code (NEC)

1.4 SYSTEM DESCRIPTION

A. Refer to the Specification Section for the driven equipment.

B. Motors shall be suitable for installation in Wet and Corrosive conditions, unless otherwise noted.

1.5 SUBMITTALS

A. Submittals for motors shall accompany the submittals for the driven equipment specified in other Sections. Submittals for motors that are not associated with equipment specified in other Sections shall be submitted under this Section.

B. Shop Drawings:
   1. Shop Drawings shall be certified.
   2. Motor wiring diagrams shall include optional internal devices and accessories and wire identification numbers.
   3. Copy of Manufacturer's instructions for storage, handling, and installation.
   4. Performance curves and data, for each motor, showing the starting, accelerating, and running characteristics, including: Current in amperes, torque in pound-feet, output hp including initial hp if motor was derated, speed in revolutions per minutes and first-half cycle inrush current at stated design point.
      a. Motors up to 100 hp: Provide performance curves and data for typical motor.
      b. Motors above 100 hp: Provide performance curves and data for each individual motor.

5. Motor Data Sheet:

MOTOR EQUIPMENT NO. *	PROJECT FILE NO.
1. Hp (if motor is derated also indicate initial motor hp)	
2. Voltage (V)	
3. Phase	
4. Hertz (Hz)	
5. Type (sq. cage, sync, etc.)	
6. Manufacturer	
7. rpm – full load	
8. Enclosure	
9. Ambient temperature (F or C)	
10. Current – No Load (A)	
11. Current – Full Load (A)	
12. Current – Locked Rotor (A)	
13. Inrush current at stated design point	
14. NEMA frame size	
15. Mounting (Horiz., Vert.)	
16. Insulation Class	
17. Rotation	
18. Bearing Type	
19. Duty Cycle	
20. Service factor	
21. NEMA design	
22. NEMA efficiency index code	
23. kVA code	
24. Special modifications	

Oversize conduit box
Space heater (watts) 120VAC
Motor winding thermal protection switch or contact noted 120VAC
*If data is for more than one motor, list equipment numbers and quantity involved.

C. Product Data:
1. Manufacturer's literature, illustrations, specifications and engineering design data including dimensions, materials, size and weight for each motor. Product Data shall be submitted in sufficient detail to permit an item-by-item comparison with the requirements of this Section.
2. Motor full-load power factor and maximum capacitor rating where motor and capacitor are switched as a unit.
3. Motor inrush current at stated design point.
4. Certified copies of factory standard test reports
5. Motor first-half cycle inrush current
6. Manufacturer's qualifications

D. Quality Assurance:
1. Factory Test Procedures
2. Factory Test Report
3. Field Test Report
4. Manufacturer's Field Start-up Report

5. Manufacturer's Certification

E. Driven Equipment Witnessed Factory Testing Information:
1. Submittals meeting the requirements of the driven equipment Specification Section shall be provided.

F. Project Record Document Submittals:
1. Submit Project Record Documents: one-line diagram showing the driven equipment designation, the furnished motor hp including motor initial hp if motor was derated, and the furnished motor rpm.

1.6 QUALITY ASSURANCE

A. Qualifications:
1. Manufacturer Qualifications: Manufacturer shall be experienced in manufacturing materials and equipment similar to that which is specified herein for at least 5 years with a record of successful in-service performance. When requested, a list of installations in satisfactory operation shall be provided.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Upon delivery at the jobsite, the Contractor shall inspect the motor thoroughly for damage.

B. Handling: The motor shall be lifted in accordance with the manufacturer's instruction. All necessary slings and spreader bars shall be provided by the Contractor. Under no circumstances shall the motor be lifted by using the shaft as an attachment point.

C. Storage: The motor should be installed as soon as possible. If storage is required, the motor shall be stored under cover, inside, in a clean, dry and heated location. If storage is anticipated to be longer than 2 months, the following additional steps shall be taken:
1. The motor space heaters shall be energized.
2. Motors with sleeve bearings shall have the oil reservoirs filled to the proper level with the specified oil.
3. Motors with anti-friction bearings shall receive an initial change of grease and then be re-greased every 6 months.
4. The motor shaft braces shall be removed and the motor shaft rotated every 2 weeks. The shaft braces shall be replaced prior to relocation to the installation site. Under no circumstances shall the motor be lifted without the braces in place.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. U.S. Motors – "Corro-Duty"

B. Or approved equal.

2.2 MANUFACTURED UNITS

A. Motors:

1. Motors connected to adjustable frequency drives shall be inverter duty rated and comply with NEMA MG-1, Part 31.
2. Motors shall be premium efficiency.
3. The motors hp rating shall be as indicated on the Drawings.
4. Shall be squirrel cage type, continuous duty, 1800 rpm or 1200 rpm unless otherwise specified in driven equipment specification section.
5. Shall be NEMA Design B, normal starting torque.
6. Shall have a service factor of 1.15 at 40C ambient temperature or a service factor of 1.0 for motors controlled by adjustable frequency drives.
7. Shall be 3-phase, 60Hz with the following voltage ratings:
    a. 1 through 20hp: 230/460V, unless shown on the Drawings or specified otherwise.
    b. 25 through 400hp: 460V
8. Shall have a continuous time rating.
9. Shall be of sufficient size so that there will be no overload on the motor above rated nameplate hp under and condition of operation imposed be the driven equipment.
10. Shall have the following construction:
    a. Enclosures:
        1) Shall be Totally Enclosed Fan Cooled (TEFC) or Totally Enclosed Non-Ventilated (TENV) unless otherwise shown on the Drawings or specified:
            a) Motors above 3hp shall be cooled by means of a shaft-mounted external fan covered with removable guard (TEFC).
            b) Motors 3hp and below may be self-cooled (TENV).
        2) Shall have machined ferrous metal fasteners, castings, and weldments only; no aluminum, other non-ferrous metals, or light gauge sheet metals shall be permitted in motor cases, end bells and tie bolts.
    b. Frames: Shall be cast iron for 182T frames and above or rolled steel for 143T and 145T frames.
    c. Windings: Shall be all copper; no aluminum windings shall be permitted.
    d. Insulation:
        1) Shall be non-hygroscopic.
        2) Shall be Class F materials and construction limited to Class B temperature rise. Motor insulation system shall be given a special varnish treatment for installation in atmospheres containing high concentrations of acid vapor, high relative humidity and excessive moisture. Insulation “U.S. Motors Insulife 2000”.
        3) Windings and Rotor: Shall have an additional coat of non-hygroscopic epoxy varnish.
    e. Main Conduit/Terminal Box:
        1) Shall be cast iron.
        2) Shall be oversized by one size on motors up to 250hp, and oversized by 2 sizes on motors larger than 250hp to allow mounting of auxiliary devices, and ample room for motor leads.
        3) Shall have lead positioning gasket
        4) Shall include a grounding stud connected directly to motor frame.
        5) Boxes shall be designed for rotation in 90 degree steps to receive conduit from any of 4 positions.
    f. Bearings: Shall be double shielded, vacuum degassed bearings with re-greasable fill and corrosion resistant drain plugs. Bearing shall be replaceable. Insulated bearings and shaft grounding shall be provided on each motor 250 hp and larger that is powered from an adjustable frequency drive.
    g. Bearing Life: Shall have a minimum AFBMA L-10 rating:

1) 15,000 hours for belt driven applications
2) 100,000 hours for direct drive applications

h. Shaft Slinger: Shall be neoprene

i. Motor Sound: The sound emanating from a motor shall not exceed the sound power limits of NEMA MG 1.

j. Paint: Corrosion treatment shall consist of anti-rust compounds on metal to metal fits, plated hardware, epoxy painted with manufacturer's standard color paint, including all aluminum parts and air deflectors, with stainless steel nameplates, resin and hardener or equivalent on rotor.

k. Nameplate: Shall be 316 stainless steel. Nameplate shall include:
1) Manufacturer
2) NEMA frame size
3) hp
4) rpm
5) Voltage (V)
6) Full load current (A)
7) Inrush current (A)
8) Hertz (Hz)
9) Service factor
10) NEMA design letter
11) NEMA efficiency index
12) Date code
13) Ambient temperature (F or C)
14) Duty Cycle
15) AFBMA bearing designation
16) Phase
17) Insulation Class
18) kVA code
19) Enclosure type
20) Connection diagram
21) Rotation (if unidirectional)

l. Additional Nameplate: Shall be 316 stainless steel. Nameplate data shall include:
1) Initial hp if motor was derated

m. Options and Accessories: See associated equipment

n. Bolts and Fasteners: Shall be zinc or cadmium plated for corrosion resistance.

o. Construction: Shall be fully gasketed for corrosion resistance.

p. Motor Leads:
1) Shall be stranded copper with non-wicking, moisture-resistant insulation. Leads shall be permanently numbered corresponding to nameplate connection diagram.
2) Shall have solderless lug terminals with at least 2 holes.

q. Two copper grounding pads shall be furnished and located on each side of the motor frame diagonally apart for medium voltage motors. Low voltage motors shall have grounding lug in the conduit box. All terminations shall be provided for the installation.

r. Motor lead splicing: Terminate motor leads using Raychem MCK Series motor connection kits.

s. Space Heaters: When motor is for outdoor service, 120 VAC space heaters shall be included with leads wired out to conduit/terminal box.

11. Thermal Protection:

a. Provide thermal protection related to hp as shown in following table:

		Thermal Device		
Motor Application/Type		Switch	Thermistor	RTDs
Constant Speed	Normal	--	50 ≤ hp ≤ 200	hp > 200
	Explosion Proof	hp ≤ 40		
Adjustable Speed	All	hp ≤ 25	25 > hp ≤ 200	hp > 200

b. Thermal Switch:
   1) Provide normally closed, sealed, thermostat type switch in each phase winding.
   2) The 3 switches shall be wired in series with the leads brought out to the motor terminal box.

c. Thermistor:
   1) Provide a positive temperature coefficient thermistor and a solid state relay.
   2) Completely sealed thermistor shall be installed in the end turns of the stator winding 1 per phase.
   3) Solid state relay shall be mounted in NEMA enclosure on or near the motor enclosure or in a control panel. Mount as shown on the Drawings.
   4) A dry contact shall be provided to shut down the motor in case of high temperature.

d. Resistance Temperature Detectors (RTDs): Provide 6 temperature detectors in the stator winding slots. The location of detectors shall conform to MG1-20.63.
   Each detector shall be 3-wire RTD, Platinum type, with a resistance of 100 ohms at 25°C and equipped with 3 leads. All detectors shall be wired to a terminal strip in an auxiliary terminal box.

e. Motor over temperature protection for motors powered by adjustable frequency drives shall meet the requirements of NEC paragraph 430.126.

2.3 FABRICATION

A. All motors shall be completely factory assembled prior to shipment.

2.4 FINISHES

A. All metal surfaces shall be chemically cleaned and treated to provide a bond between the primer paint and the metal surfaces to prevent the entrance of moisture and the formation of rust under the paint film.

B. All interior and exterior surfaces shall have a base coat and finish coat of corrosion-resistant epoxy paint.

2.5 SOURCE QUALITY CONTROL

A. Factory testing meeting the requirements of "Routine Tests" of the NEMA MG1 publication and the driven equipment Specification Section shall be provided.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Motors shall be installed in compliance with the Specification Section for the driven equipment.

B. Motors which are not pre-assembled to driven equipment shall be installed in conformance with motor manufacturer's instructions and driven equipment manufacturer's instructions.

C. Alignment tolerances shall be within the more stringent of the motor manufacturer's requirements or the driven equipment manufacturer's requirements.

D. All motors shall be installed with orientation such that nameplates are in full view.

E. Damaged or non-legible nameplates shall be replaced.

F. Motor overload heater selection shall be based on motor nameplate data (Full Load Amp and Service Factor).

G. Any and all shaft shipping braces shall be removed after the motor is placed in its final location.

H. The motor shall be mounted in accordance with the manufacturer's instructions. Special care shall be taken to ensure that the motor shaft is level.

I. The CONTRACTOR shall install the motor coupling in accordance with the coupling manufacturer's instruction. Under no circumstances shall the motor shaft be modified to accommodate the coupling.

J. The motor shall be aligned axially with driven equipment. This alignment shall be performed and tolerance shall be maintained in accordance with the manufacturer's instruction.

3.2 FIELD QUALITY CONTROL

A. Inspection:
   1. Motors shall be checked for correct phase sequencing and correct rotation in accordance with driven equipment manufacturer's startup procedures before energizing.
      a. Motors up to 100 hp: Bumping motors will not be permitted. CONTRACTOR shall use a battery- operated rotation testing instrument on motors to determine correct wiring sequence before power cables are connected.
      b. Motors above 100 hp: Disconnect motor from driven equipment and "Bump" motor to determine rotation. All permanent overload protective devices must be in place before connecting motor.
   2. Motors shall be checked for damage, moisture, alignment, freedom of rotation, proper lubrication, oil leaks, phase identification, and cleanliness before energizing.

B. Field Tests:
   1. Field tests shall be performed on motors 50 hp and larger.
   2. Insulation Resistance Test: An insulation resistance test shall be successfully completed immediately prior to energizing or beginning the dielectric test. Any machine not passing this test shall be dried and retested. All retesting shall be performed at Contractor’s expense.
      a. Motors less than 200 hp: Tests shall be applied between all phases tied together and ground, and shall include cable back to the starter. The measured insulation resistance at the motor temperature shall be corrected to 20C by multiplying the measured value by the correction factor corresponding to the motor temperature.

R_c = K_m x R_m, where

R_c = Corrected resistance (in megohms at 20°C).

R_m = Measured insulation resistance (in megohms) at temperature t.

K_m = Temperature correction factor for motors at temperature t.

Temp. °C	Temp. °F	Corr. Factor K_m
0	32	0.4
5	41	0.5
10	50	0.6
15	60	0.8
20	68	1.0
25	77	1.3
30	86	1.6
35	95	2.0
40	104	2.5

1) Corrected field test values must meet or exceed the manufacturer's minimum recommended values. If not known, minimum corrected resistance readings shall be as follows:

Equipment	Test Voltage	Minimum Corrected Reading-megohms
480 V 3-phase Induction Motor	1000	20

2) Tests must be held for one minute or until the reading maintains a constant value for 15 seconds.

b. Motors 200 hp and larger shall be given a polarization index test, 10 minutes divided by 1 minute of megohmmeter readings. This test method does not require temperature correction. The recommended minimum value shall be a 1.5 polarization index.

c. Motors 1000 hp and larger shall be field tested per the manufacturer's representative's direction.

d. All test readings and ambient temperature at the time of test shall be recorded, shall be signed by the tester and submitted within 10 days.

3. Final Acceptance: Final acceptance of rotating equipment cannot be made until the equipment is energized during test to ascertain that all design functions are satisfactorily performed. Testing shall include all remote control operation as well as local operation of all motor starters and actuation of all alarm and indication devices according to design specifications. All control circuits, automatic operations and interlocks must be tested by the Contractor for correct and positive operations.

C. Manufacturer’s Field Services:
   1. Motors 100hp and larger: Provide the services of a qualified factory-trained manufacturer’s representative for 8 hours to assist the Contractor in installation and startup of the equipment. The manufacturer’s representative shall provide technical direction and assistance to the Contractor in the general assembly of the motor, connections and adjustments, and testing of the motor and components contained therein.
   2. The following minimum work shall be performed by the Contractor under the technical direction of the manufacturer’s service representative:
      a. Verification of proper mounting and alignment
      b. Final inspection of the lubrication system
      c. Final inspection of the cooling system
      d. Supervision of the meggar test
      e. Supervision of the final coupled test
   3. Submit the manufacturer’s field startup report.

D. Manufacturer’s Certification:
   1. A qualified factory-trained manufacturer's representative shall certify in writing that the equipment has been installed, adjusted and tested in accordance with the manufacturer's recommendations.
   2. Submit the manufacturer's representative's certification.

3.3 ADJUSTING

A. The Contractor shall fill any oil reservoir with the manufacturer’s specified oil.

B. If the manufacturer requires that the anti-friction bearings receive an initial change of grease, the Contractor shall perform such work.

C. Motors that are supplied with provisions for flood lubrication: The Contractor shall assure that the proper supply pressure is present.

D. The motor shaft shall be turned by hand to ensure there is free rotation.

E. The area around the external fan inlet shall be checked for loose debris that could be drawn into the fan during operation.

F. All external, factory-made, bolted joints should be checked for tightness.

3.4 CLEANING

A. Any slushing compound on the shaft or other parts shall be removed using a petroleum-type solvent.

END OF SECTION 26 2000

(THIS PAGE INTENTIONALLY LEFT BLANK)

SECTION 26 2200

TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of Contract, including General and Supplementary Conditions and all divisions of specification sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to furnish and install transformers in accordance with the plans and as specified herein.

B. Work of this Section includes, but is not limited to:
   1. Dry-type distribution transformers.
   2. Individual K-rated dry type transformers.

1.3 QUALITY ASSURANCE

A. Codes and Standards: Perform all work to furnish and install transformers in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
   1. Electrical Component Standard: Components and installation shall comply with National Fire Protection Association (NFPA) 70 "National Electrical Code (NEC)."
   2. American National Standards Institute/Institute of Electrical and Electronic Engineers (ANSI/IEEE) Compliance: Comply with applicable requirements of ANSI/IEEE Standards including C2, "National Electrical Safety Code," and C57.12.80, "Terminology for Power and Distribution Transformers."
   3. Nationally Recognized Testing Laboratory Compliance (NRTL): Items provided under this section shall be NRTL listed and labeled. The term "NRTL" shall be as defined in Occupational Safety and Health Administration (OSHA) Regulation 1910.7.

B. Qualifications
   1. Manufacturer Qualifications: Member firm of National Electrical Manufacturers Association (NEMA) who is regularly engaged in manufacturing components that comply with the requirements of these specifications and that have been used on at least five projects of similar size and scope as this project.
   2. Testing: Manufacturer's standard shop test shall be performed in accordance with the latest version of ANSI and NEMA standards and shall include as a minimum the following. Provide certified factory test reports.
      a. Ratio tests at the rated voltage connection and at all tap connections.
      b. Polarity and phase relation tests on the rated voltage connection.
      c. Applied potential tests.
      d. Induced potential tests.
      e. No-load and excitation current at rated voltage on the rated voltage connection.
   3. Field Testing Organization Qualifications: To qualify for acceptance, an independent testing organization must demonstrate, based on evaluation of organization submitted

criteria conforming to American Society for Testing and Materials (ASTM) E 699, that it has the experience and capability to conduct satisfactorily the testing indicated.

1.4 SUBMITTALS

A. General: Furnish manufacturer's product data, test reports, and materials certifications as required.

B. Wiring diagrams from manufacturer differentiating between manufacturer installed and field installed wiring.

C. Product certificates, signed by manufacturer of transformers certifying that their products comply with the specified requirements.

PART 2 - PRODUCTS

2.1 TRANSFORMERS, GENERAL

A. Transformers: Factory assembled and tested, air cooled units of types specified, having characteristics and ratings as indicated. Units shall be designed for 60 Hertz (Hz) service.
   1. Cores: Grain oriented, non-aging silicon steel.
   2. Coils: Continuous copper windings without splices except for taps.
   3. Internal Coil Connections: Brazed or pressure type.

B. General Purpose, Dry Type Transformers
   1. Comply with NEMA Standard ST 20 "Dry Type Transformers for General Applications."
   2. Windings: Two winding type. Three phase transformers shall use one coil per phase in primary and secondary.
   3. Enclosures: Indoor ventilated, unless noted otherwise.
   4. Insulation Class: 185 deg C or 220 deg C class for transformers 15 kilovolt amperes (kVA) or smaller; 220 deg C class for transformers larger than 15 kVA.
   5. Insulation Temperature Rise: 115 deg C maximum rise above 40 deg C.
   6. Taps: For transformers 3 kVA and larger, full capacity taps in high voltage winding as follows:
      a. 15 - 500 kVA: Six 2.5% taps, two above and four below rated high voltage.
   7. Accessories: The following accessory items are required where indicated:
      a. Wall Mounting Brackets. Manufacturer’s standard brackets for transformers sized up to 75 kVA where wall mounting is indicated.
   8. Transformer sound levels shall not exceed ANSI standards.
   9. Transformers installed in an area which has sprinklers shall have a weathershield.

C. K-Rated Transformers: K-rated transformers shall be as specified above, and in addition shall have the following features:
   1. K-rating of not less than 13.
   2. Secondary neutral terminal shall be sized for 200% of the secondary phase current.
   3. Full width electrostatic shielding between primary and secondary winding and ground to the transformer core.

2.2 MANUFACTURERS

A. Subject to compliance with requirements, provide products by the following:
   1. Transformers
      a. Eaton Corporation.
      b. General Electric Company.
      c. Square D Company.
      d. Or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Arrange equipment with a minimum clearance of 6 inches from any wall, to provide adequate spacing for cooling air circulation.

B. Identify transformers in accordance with Division 26 Section “Electrical Identification”.

C. Tighten electrical connectors and terminals in accordance with manufacturer's published torque tightening values. Where manufacturer's torque values are not indicated, use those specified in UL Standards 486A and 486B.

D. Install units on vibration mounts as shown; comply with manufacturer's indicated installation method, if any.

E. Provide a housekeeping pad under all floor mounted transformers.

F. Install bracket for wall mounted transformers using anchors and fasteners suitable for the weight of the transformer and all accessories.

3.2 GROUNDING

A. Ground transformers and tighten connections to comply with tightening torques specified in UL Standard 486A.

B. Transformer secondary neutral shall be grounded to building structural steel in conformance with the NEC.

3.3 ADJUSTING AND CLEANING

A. Upon completion of installation, inspect interiors and exteriors of accessible components. Remove paint splatters and other spots, dirt, and construction debris. Touch up scratches and mars of finish to match original finish.

B. Adjust transformer taps to provide optimum voltage conditions at utilization equipment.

3.4 PROTECTION

A. Temporary Heating: Apply temporary heat in accordance with manufacturer's recommendations within enclosure of each transformer throughout periods during which equipment is not in a space that is continuously under normal control of temperature and humidity.

END OF SECTION 26 2200

SECTION 26 2413

SWITCHBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. General: Drawings and general provisions of the Contract, including General and Supplementary Conditions and all divisions of the specification sections, apply to this Section.

B. Related Sections include the following:
   1. Division 26 Section “Surge Protective Devices”.

1.2 DESCRIPTION OF WORK

A. General: The Contractor shall provide the labor, tools, equipment, and materials necessary to furnish and install switchboards in accordance with the Plans and as specified herein.

B. This section includes low voltage power service and distribution switchboards and associated auxiliary equipment rated 600 volts or less.

1.3 CODES AND STANDARDS

A. General: Perform all work to furnish and install switchboards in compliance with applicable requirements of governing agencies having jurisdiction and in accordance with these plans and as specified herein.
   1. Listing and Labeling: Provide switchboard assemblies that are listed and labeled.
      a. The terms "listed" and "labeled" as defined in the National Electrical Code (NEC), Article 100.
   2. Electrical Component Standard: Components and installation shall comply with National Fire Protection Association (NFPA) 70, "NEC."
   3. National Electrical Manufacturers Association (NEMA) Standard: Comply with NEMA Standard PB2, "Dead front Distribution Switchboards”.
   4. Underwriters' Laboratories, Inc. (UL) Standard: Comply with UL 891, "Dead front Switchboards."

1.4 QUALITY ASSURANCE

A. Manufacturer's Field Representative
   1. The Manufacturer of the Work of this Section shall provide a qualified field representative at the site.
   2. Such Manufacturer's field representative shall instruct the Contractor's personnel in the proper handling, installation, start-up, operation, and maintenance of the equipment.
   3. Such Manufacturer's field representative shall instruct the Owner's personnel in the proper start-up, operation, and maintenance of the equipment. The instruction period shall be a minimum of 8 hours.

B. Manufacturer's Qualifications: The Manufacturer of Work of this Section shall have 5 years minimum proven experience in such work and shall have satisfactorily completed 3 jobs of similar size and type within the last 5 years.

C. Testing
   1. Manufacturer's standard shop test shall be performed.
   2. Perform all tests indicated under PART 3 - EXECUTION.

1.5 SUBMITTALS

A. All submittals shall conform completely to the requirements of the Contract Documents, including all requirements set forth in Division 01 specification sections.

B. Reference Submittals
   1. Test procedures and test reports.
   2. Operating and maintenance instructions.
   3. Spare parts list.
   4. Agenda of training class.

C. Product Data
   1. Submit for each switchboard component.
   2. Including, but not limited to, shipping, storage, and installation instructions.
   3. Product features brochure.
   4. Time-current characteristic curves for overcurrent protective devices.

D. Shop Drawings
   1. Single line drawings.
   2. Dimensional plans and elevations showing major components and features.
   3. Component details.
   4. Accessories.
   5. Materials list.
   6. Nameplate legends.
   7. Size and number of bus bars and current rating for each bus including mains and branches of phase, neutral, and ground buses.
   8. Short-circuit current ratings of switchboards and components.
   9. Ratings of individual protective devices.
   10. Metering provisions.

1.6 DELIVERY, HANDLING, AND STORAGE

A. Deliver in shipping splits of lengths that can be moved past obstructions in delivery path as indicated.

B. Store so condensation will not occur on or in switchboards. Provide temporary heaters as required to assure avoiding condensation.

C. Handle switchboards in accordance with NEMA Standard PB2.1, "General Instructions for Proper Handling, Installation, Operation, and Maintenance of Deadfront Distribution Switchboards." Use factory installed lifting provisions.

1.7 EXTRA MATERIALS

A. Furnish extra materials matching products installed as described below, packaged with protective cover when moved for storage, and identified with labels clearly describing contents. Deliver to the Owner.
   1. Touch Up Paint: Three (3) half pint containers.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General: Description. Front connected, fully bused, front accessible, panel mounted main and branches, and sections rear aligned.

B. Enclosure and Accessories
   1. Enclosure Finish. Manufacturer's standard gray finish over a rust inhibiting primer on phosphatizing treated metal surface. Provide painted surfaces that conform to IEEE C37.20.1, "Standard for Metal Enclosed Low Voltage Power Circuit Breaker Switchgear," paragraph 5.2.8.
   2. Hinged Front Panels: Provide to allow access to breaker, metering, accessory, and blank compartments.
   3. Buses and Connections: Three phase, four wire except as otherwise indicated. Features as follows:
      a. Phase and Neutral Bus Material: Hard drawn silver-plated copper of 98 percent conductivity with feeder circuit breaker line connections.
      b. Bus shall be copper. Use copper for feeder circuit breaker line connections.
      c. Ground Bus: Full length, 1/4 inch by 2 inch minimum size, hard drawn silver plated copper of 98 percent conductivity, and equipped with pressure connector terminations for feeder and branch circuit ground conductors.
      d. Supports and Bracing for Buses: 65,000 A RMS symmetrical fault current at rated voltage.
      e. Contact Surfaces of Buses: Silver-plated.
      f. Main Phase Buses, Neutral Bus, and Equipment Ground Bus: Uniform capacity (non-tapered) the entire length of the switchboard main and distribution sections. Provide for future extensions from either end by means of bolt holes or other approved method and connecting links.
      g. Neutral Buses: One hundred percent ampacity of the phase buses, unless noted otherwise, equipped with pressure connector terminations for outgoing circuit neutral cables.

C. Overcurrent Protective Devices
   1. Comply with requirements of Division 26, Section "Overcurrent Protective Devices (OCPDs)", for types of OCPDs indicated. Provide indicated features, ratings, characteristics, and settings.
   2. Future Devices: Where provision for future overcurrent protective devices or space is indicated, equip compartments with mounting brackets, supports, bus connections, and necessary appurtenances, designed for the OCPD types and ampere ratings indicated for future installation of devices.

D. Other Circuit Control and Protective Devices
   1. Provide surge arresters.
      a. Comply with IEEE C62.11, "Standards for Metal Oxide Surge Arresters for AC Power Circuits," or IEEE C62.1 "Surge Arresters for Alternating Current Power Circuits."
      b. Coordinate impulse spark-over voltage with system circuit voltage, and provide factory mounting and connection.
   2. Surge Protective Devices (SPD). Provide SPDs as specified in Division 26, Section "Surge Protective Devices".

E. Instrumentation
   1. Instrument Transformers: As specified in Division 26, Section "Electrical Power Monitoring and Control."
   2. Multifunction Digital Metering:
      a. As specified in Division 26, Section "Electrical Power Monitoring and Control."
      b. Mount display and control unit flush or semi-flush in compartment door.

F. Ratings: Provide nominal system voltage, continuous main bus amperage, and short circuit current ratings as indicated.
   1. Nominal System Voltage: 480Y/277 volts, 60 hertz (Hz).
   2. Main Bus Continuous: As shown on plans.
   3. Short Time and Short Circuit Current Ratings: 65,000 AIC.

G. Accessory Components and Features
   1. Accessory Set: Include tools and miscellaneous items as required for overcurrent protective device test, inspection, maintenance, and operation.

H. Identification
   1. General: Refer to Division 26, Section "Electrical Identification". Identify units, devices, controls, and wiring with factory applied labels and signs.
   2. Compartment Nameplates: Engraved laminated plastic for each compartment, mounted with corrosion resistant screws.

2.2 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1. Eaton Corporation.
   2. General Electric Company.
   3. Square D Company.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install switchboards and accessory items in accordance with manufacturer's written installation instructions.

B. Anchor each switchboard assembly to two 4 inch minimum channel iron sills arranged in accordance with manufacturer's recommendations. Attach by bolting. Level and grout sills flush with switchboard mounting surface.

C. Housekeeping Pads: Provide 4-inch thick housekeeping pads for all switchboards.

D. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from switchboard units and components.

E. Operating Instructions: Frame and mount printed, basic operating instructions for switchboards, including control and key interlocking sequences, and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on the front of the switchboards.

F. Tighten switchboard bus joint bolts and electrical connector and terminal bolts in accordance with manufacturer's published torque tightening values. Where manufacturer's torque values are not stated, use those specified in UL Standards 486A and 486B.

3.2 IDENTIFICATION
